CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.52 DBA_HIST_SGA

DBA_HIST_SGA displays historical summary information about the system global area (SGA).

This view contains snapshots of V\$SGA.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
NAME	VARCHAR2 (64)	NOT NULL	SGA component group
VALUE	NUMBER	NOT NULL	Memory size (in bytes)
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

"V\$SGA"

5.53 DBA_HIST_SGA_TARGET_ADVICE

DBA_HIST_SGA_TARGET_ADVICE provides historical information about the SGA_TARGET initialization parameter.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
SGA_SIZE	NUMBER	NOT NULL	Size of the SGA
SGA_SIZE_FACTOR	NUMBER	NOT NULL	Ratio between the SGA_SIZE and the current size of the SGA
ESTD_DB_TIME	NUMBER	NOT NULL	Estimated DB_TIME for this SGA_SIZE
ESTD_PHYSICAL_READS	NUMBER		Estimated number of physical reads
CON_DBID	NUMBER		The database ID of the PDB for the sampled session

Column	Datatype	NULL	Description
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["SGA_TARGET"](#)

5.54 DBA_HIST_SGASTAT

DBA_HIST_SGASTAT displays detailed historical information on the system global area (SGA).

This view contains snapshots of V\$SGASTAT.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
NAME	VARCHAR2(64)		SGA component group
POOL	VARCHAR2(30)		Designates the pool in which the memory in NAME resides: <ul style="list-style-type: none"> • in-memory pool - Memory is allocated from the In-Memory pool • java pool - Memory is allocated from the Java pool • large pool - Memory is allocated from the large pool • numa pool - Memory is allocated from the NUMA pool • shared pool - Memory is allocated from the shared pool • streams pool - Memory is allocated from the Streams pool
BYTES	NUMBER		Memory size (in bytes)
CON_DBID	NUMBER		The database ID of the PDB for the sampled session

Column	Datatype	NULL	Description
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

"V\$SGASTAT"

5.55 DBA_HIST_SHARED_POOL_ADVICE

DBA_HIST_SHARED_POOL_ADVICE displays historical information about estimated parse time in the shared pool for different pool sizes.

This view contains snapshots of V\$SHARED_POOL_ADVICE.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
SHARED_POOL_SIZE_FOR_ESTIMATE	NUMBER	NOT NULL	Shared pool size for the estimate (in megabytes)
SHARED_POOL_SIZE_FACTOR	NUMBER		Size factor with respect to the current shared pool size
ESTD_LC_SIZE	NUMBER		Estimated memory in use by the library cache (in megabytes)
ESTD_LC_MEMORY_OBJECTS	NUMBER		Estimated number of library cache memory objects in the shared pool of the specified size
ESTD_LC_TIME_SAVED	NUMBER		Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a shared pool of the specified size. This is the time that would have been spent in reloading the required objects in the shared pool had they been aged out due to insufficient amount of available free memory.
ESTD_LC_TIME_SAVED_FACTOR	NUMBER		Estimated parse time saved factor with respect to the current shared pool size
ESTD_LC_LOAD_TIME	NUMBER		Estimated elapsed time (in seconds) for parsing in a shared pool of the specified size.
ESTD_LC_LOAD_TIME_FACTOR	NUMBER		Estimated load time factor with respect to the current shared pool size
ESTD_LC_MEMORY_OBJECT_HI_TS	NUMBER		Estimated number of times a library cache memory object was found in a shared pool of the specified size

Column	Datatype	NULL	Description
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$SHARED_POOL_ADVICE"](#)

5.56 DBA_HIST_SHARED_SERVER_SUMMARY

DBA_HIST_SHARED_SERVER_SUMMARY displays historical information for shared servers.

This includes information about shared server activity, the servers, common queues, and dispatcher queues. This view obtains information from V\$SHARED_SERVER, V\$DISPATCHER, V\$CIRCUIT, and V\$QUEUE, and is aggregated over all servers, dispatchers, queues, and circuits.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
NUM_SAMPLES	NUMBER		Total number of samples
SAMPLE_TIME	NUMBER		Last sample timestamp
SAMPLED_TOTAL_CONN	NUMBER		Cumulative sum of total number of connections over all samples. To determine the average number of connections between two snapshots, divide the difference in SAMPLED_TOTAL_CONN by the difference in NUM_SAMPLES.
SAMPLED_ACTIVE_CONN	NUMBER		Cumulative sum of active number of connections over all samples. To determine the average number of active connections between two snapshots, divide the difference in SAMPLED_ACTIVE_CONN by the difference in NUM_SAMPLES.
SAMPLED_TOTAL_SRV	NUMBER		Cumulative sum of total number of servers over all samples. To determine the average number of servers between two snapshots, divide the difference in SAMPLED_TOTAL_SRV by the difference in NUM_SAMPLES.

Column	Datatype	NULL	Description
SAMPLED_ACTIVE_SRV	NUMBER		Cumulative sum of active number of servers over all samples. To determine the average number of active servers between two snapshots, divide the difference in SAMPLED_ACTIVE_SRV by the difference in NUM_SAMPLES.
SAMPLED_TOTAL_DISP	NUMBER		Cumulative sum of total number of dispatchers over all samples. To determine the average number of dispatchers between two snapshots, divide the difference in SAMPLED_TOTAL_DISP by the difference in NUM_SAMPLES.
SAMPLED_ACTIVE_DISP	NUMBER		Cumulative sum of active number of dispatchers over all samples. To determine the average number of active dispatchers between two snapshots, divide the difference in SAMPLED_ACTIVE_DISP by the difference in NUM_SAMPLES.
SRV_BUSY	NUMBER		Total shared server busy time (in hundredths of a second)
SRV_IDLE	NUMBER		Total shared server idle time (in hundredths of a second)
SRV_IN_NET	NUMBER		Total shared server incoming network wait time (in hundredths of a second). This includes waits for receives and resets. This time is also included in SRV_BUSY.
SRV_OUT_NET	NUMBER		Total shared server outgoing network wait time (in hundredths of a second). This includes waits for sends and outbound connection requests. This time is also included in SRV_BUSY.
SRV_MESSAGES	NUMBER		Number of messages processed
SRV_BYTES	NUMBER		Total number of bytes in all messages
CQ_WAIT	NUMBER		Total time that all items in the common queue have waited (in hundredths of a second)
CQ_TOTALQ	NUMBER		Total number of items that have ever been in the common queue
DQ_TOTALQ	NUMBER		Total number of items that have ever been in a dispatcher queue
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "V\$SHARED_SERVER"
- "V\$DISPATCHER"

- "V\$QUEUE"

5.57 DBA_HIST_SNAP_ERROR

`DBA_HIST_SNAP_ERROR` displays information about the snapshot error information in the Workload Repository.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
TABLE_NAME	VARCHAR2 (128)	NOT NULL	Name of the table in which the error occurred
ERROR_NUMBER	NUMBER	NOT NULL	Error number for the error encountered
STEP_ID	NUMBER		For internal use only
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.58 DBA_HIST_SNAPSHOT

`DBA_HIST_SNAPSHOT` displays information about the snapshots in the Workload Repository.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
STARTUP_TIME	TIMESTAMP (3)	NOT NULL	Startup time of the instance
BEGIN_INTERVAL_TIME	TIMESTAMP (3)	NOT NULL	Time at the beginning of the snapshot interval
END_INTERVAL_TIME	TIMESTAMP (3)	NOT NULL	Time at the end of the snapshot interval; the actual time the snapshot was taken
FLUSH_ELAPSED	INTERVAL DAY (5) TO SECOND (1)		Amount of time to perform the snapshot

Column	Datatype	NULL	Description
SNAP_LEVEL	NUMBER		Snapshot level
ERROR_COUNT	NUMBER		Number of errors occurring in the tables for the particular snapshot
SNAP_FLAG	NUMBER		Condition under which the snapshot was inserted. Possible values are: 0 - Snapshot was taken automatically by the Manageability Monitor Process (MMON process) 1 - Manual snapshot created using a PL/SQL package 2 - Imported snapshot 4 - Snapshot taken while Diagnostic Pack or Tuning Pack was not enabled
SNAP_TIMEZONE	INTERVAL DAY(0) TO SECOND(0)		Snapshot time zone expressed as offset from UTC (Coordinated Universal Time) time zone
BEGIN_INTERVAL_TIME_TZ	TIMESTAMP(3) WITH TIME_ZONE		Time at the beginning of the snapshot interval, with timezone
END_INTERVAL_TIME_TZ	TIMESTAMP(3) WITH TIME_ZONE		Time at the end of the snapshot interval; the actual time the snapshot was taken, with timezone
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

[Table F-1](#) for more information about the MMON process

5.59 DBA_HIST_SQL_BIND_METADATA

DBA_HIST_SQL_BIND_METADATA displays historical information on metadata for bind variables used by SQL cursors.

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID for the snapshot
SQL_ID	VARCHAR2(13)	NOT NULL	SQL identifier of the parent cursor in the library cache
NAME	VARCHAR2(128)		Name of the bind variable
POSITION	NUMBER	NOT NULL	Position of the bind variable in the SQL statement
DUP_POSITION	NUMBER		If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable

Column	Datatype	NULL	Description
DATATYPE	NUMBER		Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.
DATATYPE_STRING	VARCHAR2 (15)		Textual representation of the bind data type. Beginning in Oracle Database 12c, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed.
CHARACTER_SID	NUMBER		National character set identifier
PRECISION	NUMBER		Precision (for numeric binds)
SCALE	NUMBER		Scale (for numeric binds)
MAX_LENGTH	NUMBER		Maximum bind length
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.60 DBA_HIST_SQL_PLAN

DBA_HIST_SQL_PLAN displays the execution plan information for each child cursor in the workload repository.

This view captures information from V\$SQL_PLAN and is used with the DBA_HIST_SQLSTAT view.

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID
SQL_ID	VARCHAR2 (13)	NOT NULL	SQL identifier of the parent cursor in the library cache
PLAN_HASH_VALUE	NUMBER	NOT NULL	Numerical representation of the SQL plan for the cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
ID	NUMBER	NOT NULL	A number assigned to each step in the execution plan
OPERATION	VARCHAR2 (30)		Name of the internal operation performed in this step (for example, TABLE ACCESS)
OPTIONS	VARCHAR2 (30)		A variation on the operation described in the OPERATION column (for example, FULL)
OBJECT_NODE	VARCHAR2 (128)		Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed.
OBJECT#	NUMBER		Object number of the table or the index

Column	Datatype	NULL	Description
OBJECT_OWNER	VARCHAR2(128)		Name of the user who owns the schema containing the table or index
OBJECT_NAME	VARCHAR2(128)		Name of the table or index
OBJECT_ALIAS	VARCHAR2(261)		Alias for the object
OBJECT_TYPE	VARCHAR2(20)		Type of the object
OPTIMIZER	VARCHAR2(20)		Current mode of the optimizer for the first row in the plan (statement line), for example, ALL_ROWS. When the operation is a database access (for example, TABLE ACCESS), this column indicates whether or not the object is analyzed.
PARENT_ID	NUMBER		ID of the next execution step that operates on the output of the current step
DEPTH	NUMBER		Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.
POSITION	NUMBER		Order of processing for all operations that have the same PARENT_ID
SEARCH_COLUMNS	NUMBER		Number of index columns with start and stop keys (that is, the number of columns with matching predicates)
COST	NUMBER		Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
CARDINALITY	NUMBER		Estimate, by the cost-based optimizer, of the number of rows produced by the operation
BYTES	NUMBER		Estimate, by the cost-based optimizer, of the number of bytes produced by the operation
OTHER_TAG	VARCHAR2(35)		Describes the contents of the OTHER column. See EXPLAIN PLAN for values.
PARTITION_START	VARCHAR2(64)		Start partition of a range of accessed partitions
PARTITION_STOP	VARCHAR2(64)		Stop partition of a range of accessed partitions
PARTITION_ID	NUMBER		Step that computes the pair of values of the PARTITION_START and PARTITION_STOP columns
OTHER	VARCHAR2(4000)		Other information specific to the execution step that users may find useful. See EXPLAIN PLAN for values.
DISTRIBUTION	VARCHAR2(20)		Stores the method used to distribute rows from producer query servers to consumer query servers
CPU_COST	NUMBER		CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
IO_COST	NUMBER		I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
TEMP_SPACE	NUMBER		Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.

Column	Datatype	NULL	Description
ACCESS_PREDICATES	VARCHAR2(4000)		Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.
FILTER_PREDICATES	VARCHAR2(4000)		Predicates used to filter rows before producing them
PROJECTION	VARCHAR2(4000)		Expressions produced by the operation
TIME	NUMBER		Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
QBLOCK_NAME	VARCHAR2(128)		Name of the query block
REMARKS	VARCHAR2(4000)		Remarks
TIMESTAMP	DATE		Timestamp for when the plan was produced
OTHER_XML	CLOB		Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML because it allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$SQL_PLAN](#)"
- "[DBA_HIST_SQLSTAT](#)"

5.61 DBA_HIST_SQL_SUMMARY

`DBA_HIST_SQL_SUMMARY` displays historical SQL summary information.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
TOTAL_SQL	NUMBER	NOT NULL	Total number of SQLs
TOTAL_SQL_MEM	NUMBER	NOT NULL	Total sharable memory in bytes for SQLs
SINGLE_USE_SQL	NUMBER	NOT NULL	Total number of single execution SQLs
SINGLE_USE_SQL_MEM	NUMBER	NOT NULL	Total sharable memory in bytes for single execution SQLs
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

5.62 DBA_HIST_SQL_WORKAREA_HSTGRM

DBA_HIST_SQL_WORKAREA_HSTGRM displays the historical cumulative work area execution statistics (cumulated since instance startup) for different work area groups.

This view contains snapshots of V\$SQL_WORKAREA_HISTOGRAM.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
LOW_OPTIMAL_SIZE	NUMBER	NOT NULL	Lower bound for the optimal memory requirement of work areas included in the row (in bytes)
HIGH_OPTIMAL_SIZE	NUMBER	NOT NULL	Upper bound for the optimal memory requirement of work areas included in the row (in bytes)
OPTIMAL_EXECUTIONS	NUMBER		Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in optimal mode since instance startup
ONEPASS_EXECUTIONS	NUMBER		Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in one-pass mode since instance startup
MULTIPASSES_EXECUTIONS	NUMBER		Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in multi-pass mode since instance startup

Column	Datatype	NULL	Description
TOTAL_EXECUTIONS	NUMBER		Sum of OPTIMAL_EXECUTIONS, ONEPASS_EXECUTIONS, and MULTIPASSES_EXECUTIONS
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$SQL_WORKAREA_HISTOGRAM"](#)

5.63 DBA_HIST_SQLBIND

DBA_HIST_SQLBIND displays historical information on bind variables used by SQL cursors.

This view contains snapshots of V\$SQL_BIND_CAPTURE.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
SQL_ID	VARCHAR2(13)	NOT NULL	SQL identifier of the parent cursor in the library cache
NAME	VARCHAR2(128)		Name of the bind variable
POSITION	NUMBER	NOT NULL	Position of the bind variable in the SQL statement
DUP_POSITION	NUMBER		If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable.
DATATYPE	NUMBER		Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.
DATATYPE_STRING	VARCHAR2(15)		Textual representation of the bind data type. Beginning in Oracle Database 12c, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed.
CHARACTER_SID	NUMBER		National character set identifier
PRECISION	NUMBER		Precision (for numeric binds)
SCALE	NUMBER		Scale (for numeric binds)
MAX_LENGTH	NUMBER		Maximum bind length

Column	Datatype	NULL	Description
WAS_CAPTURED	VARCHAR2 (3)		Indicates whether the bind value was captured (YES) or not (NO)
LAST_CAPTURED	DATE		Date when the bind value was captured. Bind values are captured when SQL statements are executed. To limit the overhead, binds are captured at most every 15 minutes for a given cursor.
VALUE_STRING	VARCHAR2 (4000)		Value of the bind represented as a string
VALUE_ANYDATA	ANYDATA		Value of the bind represented using the self-descriptive Sys.AnyData data type. This representation is useful to programmatically decode the value of the bind variable. This column is NULL if a PL/SQL-only data type appears in the DATATYPE column.
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

["V\\$SQL_BIND_CAPTURE"](#)

5.64 DBA_HIST_SQLCOMMAND_NAME

DBA_HIST_SQLCOMMAND_NAME displays the mapping between SQL opcodes and names.

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID
COMMAND_TYPE	NUMBER	NOT NULL	SQL command number
COMMAND_NAME	VARCHAR2 (64)		SQL command name
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.65 DBA_HIST_SQLSTAT

`DBA_HIST_SQLSTAT` displays historical information about SQL statistics.

This view captures the top SQL statements based on a set of criteria and captures the statistics information from `V$SQL`. The total value is the value of the statistics since instance startup. The delta value is the value of the statistics from the `BEGIN_INTERVAL_TIME` to the `END_INTERVAL_TIME` in the `DBA_HIST_SNAPSHOT` view.

This view is used with the `DBA_HIST_OPTIMIZER_ENV`, `DBA_HIST_SQLTEXT`, and `DBA_HIST_SQL_PLAN` views to provide a complete picture of historical SQL statistics.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
SQL_ID	VARCHAR2(13)	NOT NULL	SQL identifier of the parent cursor in the library cache
PLAN_HASH_VALUE	NUMBER	NOT NULL	Numerical representation of the SQL plan for the cursor. Comparing one <code>PLAN_HASH_VALUE</code> to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
OPTIMIZER_COST	NUMBER		Cost of the query given by the optimizer
OPTIMIZER_MODE	VARCHAR2(10)		Mode under which the SQL statement is executed
OPTIMIZER_ENV_HASH_VALUE	NUMBER		Hash Value for the optimizer environment
SHARABLE_MEM	NUMBER		Amount of shared memory used by the child cursor (in bytes)
LOADED VERSIONS	NUMBER		Indicates whether the context heap is loaded (1) or not (0)
VERSION_COUNT	NUMBER		Number of children associated with the cursor
MODULE	VARCHAR2(64)		Contains the name of the module that was executing at the time that the SQL statement was first parsed, which is set by calling <code>DBMS_APPLICATION_INFO.SET_MODULE</code>
ACTION	VARCHAR2(64)		Contains the name of the action that was executing at the time that the SQL statement was first parsed, which is set by calling <code>DBMS_APPLICATION_INFO.SET_ACTION</code>
SQL_PROFILE	VARCHAR2(64)		Name of the applied SQL Profile
FORCE_MATCHING_SIGNATURE	NUMBER		The signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>FORCE</code>
PARSING_SCHEMA_ID	NUMBER		Schema ID that was used to originally build the child cursor
PARSING_SCHEMA_NAME	VARCHAR2(128)		Schema name that was used to originally build the child cursor
PARSING_USER_ID	NUMBER		User ID that was used to originally build the child cursor
FETCHES_TOTAL	NUMBER		Cumulative number of fetches associated with the SQL statement

Column	Datatype	NULL	Description
FETCHES_DELTA	NUMBER		Delta number of fetches associated with the SQL statement
END_OF_FETCH_COUNT_TOTAL	NUMBER		Cumulative number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column.
END_OF_FETCH_COUNT_DELTA	NUMBER		Delta number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed.
SORTS_TOTAL	NUMBER		Cumulative number of sorts that were done for this child cursor
SORTS_DELTA	NUMBER		Delta number of sorts that were done for this child cursor
EXECUTIONS_TOTAL	NUMBER		Cumulative number of executions that took place on this object since it was brought into the library cache
EXECUTIONS_DELTA	NUMBER		Delta number of executions that took place on this object since it was brought into the library cache
PX_SERVERS_EXECS_TOTAL	NUMBER		Cumulative number of PX server executions
PX_SERVERS_EXECS_DELTA	NUMBER		Delta number of PX server executions
LOADS_TOTAL	NUMBER		Cumulative number of times the object was either loaded or reloaded
LOADS_DELTA	NUMBER		Delta number of times the object was either loaded or reloaded
INVALIDATIONS_TOTAL	NUMBER		Cumulative number of times this child cursor has been invalidated
INVALIDATIONS_DELTA	NUMBER		Delta number of times this child cursor has been invalidated
PARSE_CALLS_TOTAL	NUMBER		Cumulative number of parse calls for this child cursor
PARSE_CALLS_DELTA	NUMBER		Delta number of parse calls for this child cursor
DISK_READS_TOTAL	NUMBER		Cumulative number of disk reads for this child cursor
DISK_READS_DELTA	NUMBER		Delta number of disk reads for this child cursor
BUFFER_GETS_TOTAL	NUMBER		Cumulative number of buffer gets for this child cursor
BUFFER_GETS_DELTA	NUMBER		Delta number of buffer gets for this child cursor
ROWS_PROCESSED_TOTAL	NUMBER		Cumulative number of rows the parsed SQL statement returns
ROWS_PROCESSED_DELTA	NUMBER		Delta number of rows the parsed SQL statement returns
CPU_TIME_TOTAL	NUMBER		Cumulative value of CPU time (in microseconds) used by this cursor for parsing/executing/fetching

Column	Datatype	NULL	Description
CPU_TIME_DELTA	NUMBER		Delta value of CPU time (in microseconds) used by this cursor for parsing/executing/fetching
ELAPSED_TIME_TOTAL	NUMBER		Cumulative value of elapsed time (in microseconds) used by this cursor for parsing/executing/fetching. If the cursor uses parallel execution, then ELAPSED_TIME_TOTAL is the cumulative time for the query coordinator, plus all parallel query slave processes.
ELAPSED_TIME_DELTA	NUMBER		Delta value of elapsed time (in microseconds) used by this cursor for parsing/executing/fetching
IOWAIT_TOTAL	NUMBER		Cumulative value of user I/O wait time (in microseconds)
IOWAIT_DELTA	NUMBER		Delta value of user I/O wait time (in microseconds)
CLWAIT_TOTAL	NUMBER		Cumulative value of cluster wait time (in microseconds)
CLWAIT_DELTA	NUMBER		Delta value of cluster wait time (in microseconds)
APWAIT_TOTAL	NUMBER		Cumulative value of application wait time (in microseconds)
APWAIT_DELTA	NUMBER		Delta value of application wait time (in microseconds)
CCWAIT_TOTAL	NUMBER		Cumulative value of concurrency wait time (in microseconds)
CCWAIT_DELTA	NUMBER		Delta value of concurrency wait time (in microseconds)
DIRECT_WRITES_TOTAL	NUMBER		Cumulative value of direct writes
DIRECT_WRITES_DELTA	NUMBER		Delta value of direct writes
PLSEEXEC_TIME_TOTAL	NUMBER		Cumulative value of PL/SQL Execution Time (in microseconds)
PLSEEXEC_TIME_DELTA	NUMBER		Delta value of PL/SQL Execution Time (in microseconds)
JAVEXEC_TIME_TOTAL	NUMBER		Cumulative value of Java Execution Time (in microseconds)
JAVEXEC_TIME_DELTA	NUMBER		Delta value of Java Execution Time (in microseconds)
IO_OFFLOAD_ELIG_BYTES_TO_TAL	NUMBER		Cumulative value of number of I/O bytes which can be filtered by the Exadata storage system
IO_OFFLOAD_ELIG_BYTES_DE_LTA	NUMBER		Delta value of number of I/O bytes which can be filtered by the Exadata storage system
IO_INTERCONNECT_BYTES_TO_TAL	NUMBER		Cumulative value of number of I/O bytes exchanged between Oracle Database and the storage system
IO_INTERCONNECT_BYTES_DE_LTA	NUMBER		Delta value of number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS_TOTAL	NUMBER		Cumulative value of number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_REQUESTS_DELTA	NUMBER		Delta value of number of physical read I/O requests issued by the monitored SQL

Column	Datatype	NULL	Description
PHYSICAL_READ_BYTES_TOTAL	NUMBER		Cumulative value of number of bytes read from disks by the monitored SQL
PHYSICAL_READ_BYTES_DELTA	NUMBER		Delta value of number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS_TOTAL	NUMBER		Cumulative value of number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_REQUESTS_DELTA	NUMBER		Delta value of number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES_TOTAL	NUMBER		Cumulative value of number of bytes written to disks by the monitored SQL
PHYSICAL_WRITE_BYTES_DELTA	NUMBER		Delta value of number of bytes written to disks by the monitored SQL
OPTIMIZED_PHYSICAL_READS_TOTAL	NUMBER		Cumulative value of number of physical reads from the Database Smart Flash Cache or the Exadata Smart Flash Cache by the monitored SQL
OPTIMIZED_PHYSICAL_READS_DELTA	NUMBER		Delta value of number of physical reads from the Database Smart Flash Cache or the Exadata Smart Flash Cache by the monitored SQL
CELL_UNCOMPRESSED_BYTES_TOTAL	NUMBER		Cumulative value of number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells
CELL_UNCOMPRESSED_BYTES_DELTA	NUMBER		Delta value of number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells
IO_OFFLOAD_RETURN_BYTES_TOTAL	NUMBER		Cumulative value of number of bytes that are returned by the Exadata cell for smart scan only (that is, not including bytes for other database I/O)
IO_OFFLOAD_RETURN_BYTES_DELTA	NUMBER		Delta value of number of bytes that are returned by the Exadata cell for smart scan only (that is, not including bytes for other database I/O)
BIND_DATA	RAW(2000)		Bind data
FLAG	NUMBER		Reserved for internal use
OBSOLETE_COUNT	NUMBER		Number of times that a parent cursor became obsolete
CON_DBID	NUMBER		The database ID of the PDB for the sampled session

Column	Datatype	NULL	Description
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

5.66 DBA_HIST_SQLTEXT

DBA_HIST_SQLTEXT displays the text of SQL statements belonging to shared SQL cursors captured in the Workload Repository.

This view captures information from V\$SQL and is used with the DBA_HIST_SQLSTAT view.

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID
SQL_ID	VARCHAR2(13)	NOT NULL	SQL identifier of the parent cursor in the library cache
SQL_TEXT	CLOB		Full text for the SQL statement exposed as a CLOB column
COMMAND_TYPE	NUMBER		Oracle command type definition
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

- "[V\\$SQL](#)"
- "[DBA_HIST_SQLSTAT](#)"

5.67 DBA_HIST_STAT_NAME

`DBA_HIST_STAT_NAME` displays decoded statistic names for the statistics captured in the Workload Repository.

This includes OLAP statistics and OLAP timed events. This view captures information from `V$STATNAME` and is used with `DBA_HIST_SYSSTAT` and `DBA_HIST_SYS_TIME_MODEL`.

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID
STAT_ID	NUMBER	NOT NULL	Statistic identifier
STAT_NAME	VARCHAR2 (64)	NOT NULL	Statistic name
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that <code>CON_DBID</code> identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$STATNAME](#)"
- "[DBA_HIST_SYSSTAT](#)"
- "[DBA_HIST_SYS_TIME_MODEL](#)"

5.68 DBA_HIST_STREAMS_APPLY_SUM

`DBA_HIST_STREAMS_APPLY_SUM` displays information about each apply process and its activities.

This view contains a snapshot of `V$STREAMS_APPLY_COORDINATOR`, `V$STREAMS_APPLY_READER`, and `V$STREAMS_APPLY_SERVER`. This view is intended for use with Automatic Workload Repository (AWR).

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
APPLY_NAME	VARCHAR2(128)	NOT NULL	Name of the apply process
STARTUP_TIME	DATE	NOT NULL	Time that the apply process was last started
READER_TOTAL_MESSAGES_DEQUEUED	NUMBER		Total number of messages dequeued since the apply process was last started
READER_LAG	NUMBER		For captured messages, the delay (in seconds) between the creation of the last message and it being received by the apply process. For user enqueued messages, the delay between the message being enqueued in the local database and being received by the apply process.
COORD_TOTAL_RECEIVED	NUMBER		Total number of transactions received by the coordinator process since the apply process was last started
COORD_TOTAL_APPLIED	NUMBER		Total number of transactions applied by the apply process since the apply process was last started
COORD_TOTAL_ROLLBACKS	NUMBER		Number of transactions which were rolled back due to unexpected contention
COORD_TOTAL_WAIT_DEPS	NUMBER		Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions
COORD_TOTAL_WAIT_CMITS	NUMBER		Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits
COORD_LWM_LAG	NUMBER		For captured messages, the delay (in seconds) between the creation of the message corresponding to the low watermark and it being applied by the apply process. For user enqueued messages, the delay between the message being enqueued in the local database and being applied by the apply process.
SERVER_TOTAL_MESSAGES_APPLIED	NUMBER		Total number of messages applied by all the apply servers since the apply process was last started
SERVER_ELAPSED_DEQUEUE_TIME	NUMBER		Time elapsed (in hundredths of a second) dequeuing messages by all the apply servers since the apply process was last started
SERVER_ELAPSED_APPLY_TIME	NUMBER		Time elapsed (in hundredths of a second) applying messages by all the apply servers since the apply process was last started
CON_DBID	NUMBER		The database ID of the PDB for the sampled session

Column	Datatype	NULL	Description
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$STREAMS_APPLY_COORDINATOR](#)"
- "[V\\$STREAMS_APPLY_READER](#)"
- "[V\\$STREAMS_APPLY_SERVER](#)"

5.69 DBA_HIST_STREAMS_CAPTURE

DBA_HIST_STREAMS_CAPTURE displays information about each capture process.

This view is intended for use with Automatic Workload Repository (AWR).

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
CAPTURE_NAME	VARCHAR2 (128)	NOT NULL	Name of the capture process
STARTUP_TIME	DATE	NOT NULL	Time that the capture process was last started
LAG	NUMBER		Delay (in seconds) between the creation and capture of the most recently captured message
TOTAL_MESSAGES_CAPTURED	NUMBER		Total changes captured since the capture process was last started
TOTAL_MESSAGES_ENQUEUED	NUMBER		Total number of messages enqueued since the capture process was last started
ELAPSED_RULE_TIME	NUMBER		Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started
ELAPSED_ENQUEUE_TIME	NUMBER		Elapsed time (in hundredths of a second) enqueueing messages since the capture process was last started
ELAPSED_REDO_WAIT_TIME	NUMBER		Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state
ELAPSED_PAUSE_TIME	NUMBER		Elapsed pause time
CON_DBID	NUMBER		The database ID of the PDB for the sampled session

Column	Datatype	NULL	Description
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

5.70 DBA_HIST_STREAMS_POOL_ADVICE

DBA_HIST_STREAMS_POOL_ADVICE displays historical information about the estimated count of spilled or unspilled messages and the associated time spent in the spill or unspill activity for different Streams pool sizes.

This view is intended for use with Automatic Workload Repository (AWR).

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID of the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number of the snapshot
SIZE_FOR_ESTIMATE	NUMBER	NOT NULL	Pool size for the estimate (in megabytes)
SIZE_FACTOR	NUMBER		Size factor with respect to the current pool size
ESTD_SPILL_COUNT	NUMBER		Estimated count of messages spilled from the Streams pool
ESTD_SPILL_TIME	NUMBER		Estimated elapsed time (in seconds) to spill
ESTD_UNSPILL_COUNT	NUMBER		Estimated count of unspills (read back from disk)
ESTD_UNSPILL_TIME	NUMBER		Estimated elapsed time (in seconds) to unspill
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

5.71 DBA_HIST_SYS_TIME_MODEL

DBA_HIST_SYS_TIME_MODEL displays historical system time model statistics, including OLAP timed statistics.

This view contains snapshots of V\$SYS_TIME_MODEL.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
STAT_ID	NUMBER	NOT NULL	Statistic ID
STAT_NAME	VARCHAR2(64)	NOT NULL	Statistic name
VALUE	NUMBER		Statistic value
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$SYS_TIME_MODEL](#)"
- "[DBA_HIST_CON_SYS_TIME_MODEL](#)"
- "[V\\$CON_SYSMETRIC](#)"

5.72 DBA_HIST_SYSMETRIC_HISTORY

DBA_HIST_SYSMETRIC_HISTORY externalizes all available history of the system metric values for the entire set of data kept in the database.

This view contains snapshots of V\$SYSMETRIC_HISTORY.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
BEGIN_TIME	DATE	NOT NULL	Begin time of the interval
END_TIME	DATE	NOT NULL	End time of the interval
INTSIZE	NUMBER	NOT NULL	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	NOT NULL	Group ID
METRIC_ID	NUMBER	NOT NULL	Metric ID
METRIC_NAME	VARCHAR2(64)	NOT NULL	Metric name
VALUE	NUMBER	NOT NULL	Metric Value
METRIC_UNIT	VARCHAR2(64)	NOT NULL	Unit of measurement

Column	Datatype	NULL	Description
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$SYSMETRIC_HISTORY](#)"
- "[DBA_HIST_CON_SYSMETRIC_HIST](#)"
- "[V\\$CON_SYSMETRIC_HISTORY](#)"

5.73 DBA_HIST_SYSMETRIC_SUMMARY

DBA_HIST_SYSMETRIC_SUMMARY displays a history of statistical summary of all metric values in the System Metrics Long Duration group.

This view contains snapshots of V\$SYSMETRIC_SUMMARY.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
BEGIN_TIME	DATE	NOT NULL	Begin time of the interval
END_TIME	DATE	NOT NULL	End time of the interval
INTSIZE	NUMBER	NOT NULL	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	NOT NULL	Group ID
METRIC_ID	NUMBER	NOT NULL	Metric ID
METRIC_NAME	VARCHAR2(64)	NOT NULL	Metric name
METRIC_UNIT	VARCHAR2(64)	NOT NULL	Unit of measurement
NUM_INTERVAL	NUMBER	NOT NULL	Number of intervals observed
MINVAL	NUMBER	NOT NULL	Minimum value observed
MAXVAL	NUMBER	NOT NULL	Maximum value observed
AVERAGE	NUMBER	NOT NULL	Average over the period
STANDARD_DEVIATION	NUMBER	NOT NULL	One standard deviation
SUM_SQUARES	NUMBER		Sum of the squared deviations from the mean
CON_DBID	NUMBER		The database ID of the PDB for the sampled session

Column	Datatype	NULL	Description
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$SYSMETRIC_SUMMARY](#)"
- "[DBA_HIST_CON_SYSMETRIC_SUMM](#)"
- "[V\\$CON_SYSMETRIC_SUMMARY](#)"

5.74 DBA_HIST_SYSSTAT

DBA_HIST_SYSSTAT displays historical system statistics information, including OLAP kernel statistics.

This view contains snapshots of V\$SYSSTAT.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
STAT_ID	NUMBER	NOT NULL	Statistic identifier
STAT_NAME	VARCHAR2(64)	NOT NULL	Statistic name
VALUE	NUMBER		Statistic value
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$SYSSTAT"](#)

5.75 DBA_HIST_SYSTEM_EVENT

DBA_HIST_SYSTEM_EVENT displays historical information on total waits for an event.

This view contains snapshots of V\$SYSTEM_EVENT.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
EVENT_ID	NUMBER	NOT NULL	Identifier of the wait event
EVENT_NAME	VARCHAR2(64)	NOT NULL	Name of the wait event
WAIT_CLASS_ID	NUMBER		Identifier of the Class of the Wait Event
WAIT_CLASS	VARCHAR2(64)		Name of the Class of the Wait Event
TOTAL_WAITS	NUMBER		Total number of waits for the event
TOTAL_TIMEOUTS	NUMBER		Total number of timeouts for the event
TIME_WAITED_MICRO	NUMBER		Total amount of time waited for the event (in microseconds)
TOTAL_WAITS_FG	NUMBER		Total number of waits for the event, from foreground sessions
TOTAL_TIMEOUTS_FG	NUMBER		Total number of timeouts for the event, from foreground sessions
TIME_WAITED_MICRO_FG	NUMBER		Amount of time waited for the event (in microseconds), from foreground sessions
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$SYSTEM_EVENT"](#)

5.76 DBA_HIST_TABLESPACE

`DBA_HIST_TABLESPACE` displays tablespace information contained in the Workload Repository.

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID
TS#	NUMBER	NOT NULL	Tablespace number
TSNAME	VARCHAR2 (30)	NOT NULL	Tablespace name
CONTENTS	VARCHAR2 (30)		Tablespace contents: <ul style="list-style-type: none">• UNDO• PERMANENT• TEMPORARY
SEGMENT_SPACE_MANAGEMENT	VARCHAR2 (30)		Indicates whether the free and used space in the tablespace is managed using free lists (<code>MANUAL</code>) or bitmaps (<code>AUTO</code>)
EXTENT_MANAGEMENT	VARCHAR2 (30)		Indicates whether the extents in the tablespace are dictionary managed (<code>DICTIONARY</code>) or locally managed (<code>LOCAL</code>)
BLOCK_SIZE	NUMBER		Block size of the tablespace
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that <code>CON_DBID</code> identifies. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.77 DBA_HIST_TABLESPACE_STAT

`DBA_HIST_TABLESPACE_STAT` displays tablespace information from the control file.

This view contains snapshots of `V$TABLESPACE` and `DBA_TABLESPACES`.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
TS#	NUMBER	NOT NULL	Tablespace number
TSNAME	VARCHAR2 (30)		Tablespace name
CONTENTS	VARCHAR2 (9)		Tablespace contents: <ul style="list-style-type: none">• PERMANENT• TEMPORARY

Column	Datatype	NULL	Description
STATUS	VARCHAR2 (9)		Tablespace status: <ul style="list-style-type: none"> • ONLINE • OFFLINE • READ ONLY
SEGMENT_SPACE_MANAGEMENT	VARCHAR2 (6)		Indicates whether the free and used segment space in the tablespace is managed using free lists (MANUAL) or bitmaps (AUTO)
EXTENT_MANAGEMENT	VARCHAR2 (10)		Indicates whether the extents in the tablespace are dictionary managed (DICTIONARY) or locally managed (LOCAL)
IS_BACKUP	VARCHAR2 (5)		Indicates whether the tablespace is part of a backup
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "[V\\$TABLESPACE](#)"
- "[DBA_TABLESPACES](#)"

5.78 DBA_HIST_TBSPC_SPACE_USAGE

`DBA_HIST_TBSPC_SPACE_USAGE` displays historical tablespace usage statistics.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER		Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
TABLESPACE_ID	NUMBER		Tablespace ID
TABLESPACE_SIZE	NUMBER		Tablespace size (in database blocks)
TABLESPACE_MAXSIZE	NUMBER		Maximum size of the tablespace (in database blocks)
TABLESPACE_USEDSIZE	NUMBER		Used size of the tablespace (in database blocks)
RTIME	VARCHAR2 (25)		Runtime
CON_DBID	NUMBER		The database ID of the PDB for the sampled session

Column	Datatype	NULL	Description
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.79 DBA_HIST_TEMPFILE

DBA_HIST_TEMPFILE displays a history of the temp file information from the control file. This view contains snapshots of V\$TEMPFILE.

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID
FILE#	NUMBER	NOT NULL	File identification number
CREATION_CHANGE#	NUMBER	NOT NULL	Change number at which the temp file was created
FILENAME	VARCHAR2(513)	NOT NULL	Name of the temp file
TS#	NUMBER	NOT NULL	Tablespace number
TSNAME	VARCHAR2(30)		Name of the tablespace
BLOCK_SIZE	NUMBER		Block size of the temp file
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

"V\$TEMPFILE"

5.80 DBA_HIST_TEMPSTATXS

DBA_HIST_TEMPSTATXS displays information about temporary file read/write statistics.

This view contains snapshots of V\$TEMPSTAT.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
FILE#	NUMBER	NOT NULL	File identification number
CREATION_CHANGE#	NUMBER	NOT NULL	Change number at which the temp file was created
FILENAME	VARCHAR2(513)	NOT NULL	Name of the temp file
TS#	NUMBER	NOT NULL	Tablespace number
TSNAME	VARCHAR2(30)		Name of the tablespace
BLOCK_SIZE	NUMBER		Block size of the temp file
PHYRDS	NUMBER		Number of physical reads done
PHYWRTS	NUMBER		Number of times DBWR is required to write
SINGLEBLKRDS	NUMBER		Number of single block reads
READTIM	NUMBER		Time (in hundredths of a second) spent doing reads if the TIMED_STATISTICS parameter is true; 0 if false
WRITETIM	NUMBER		Time (in hundredths of a second) spent doing writes if the TIMED_STATISTICS parameter is true; 0 if false
SINGLEBLKRTIM	NUMBER		Cumulative single block read time (in hundredths of a second)
PHYBLKRD	NUMBER		Number of physical blocks read
PHYBLKWRT	NUMBER		Number of blocks written to disk, which may be the same as PHYWRTS if all writes are single blocks
WAIT_COUNT	NUMBER		Shows the number of waits at the file level for contended buffers. This value includes the individual wait events that are included in the buffer busy waits wait event.
			See Also: "buffer busy waits"
TIME	NUMBER		Time spent waiting for the wait events in the WAIT_COUNT column
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

"V\$TEMPSTAT"

5.81 DBA_HIST_THREAD

DBA_HIST_THREAD displays historical thread information from the control file.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
THREAD#	NUMBER	NOT NULL	Thread number
THREAD_INSTANCE_NUMBER	NUMBER		Instance number of the thread
STATUS	VARCHAR2(6)		Thread status (OPEN) or (CLOSED)
OPEN_TIME	DATE		Last time the thread was opened
CURRENT_GROUP#	NUMBER		Current log group
SEQUENCE#	NUMBER		Sequence number of the current log
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.82 DBA_HIST_TOLEVELCALL_NAME

DBA_HIST_TOLEVELCALL_NAME displays the mapping between Oracle top level calls and names.

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID
TOP_LEVEL_CALL#	NUMBER	NOT NULL	Oracle top level call number
TOP_LEVEL_CALL_NAME	VARCHAR2(64)		Oracle top level call name
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.83 DBA_HIST_UNDOSTAT

`DBA_HIST_UNDOSTAT` displays the history of histograms of statistical data to show how well the system is working.

The available statistics include undo space consumption, transaction concurrency, and length of queries executed in the instance. This view contains snapshots of `V$UNDOSTAT`.

Column	Datatype	NULL	Description
BEGIN_TIME	DATE	NOT NULL	Identifies the beginning of the time interval
END_TIME	DATE	NOT NULL	Identifies the end of the time interval
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
UNDOTSN	NUMBER	NOT NULL	Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.
UNDOBLKS	NUMBER		Represents the total number of undo blocks consumed. You can use this column to obtain the consumption rate of undo blocks, and thereby estimate the size of the undo tablespace needed to handle the workload on your system.
TXNCOUNT	NUMBER		Identifies the total number of transactions executed within the period
MAXQUERYLEN	NUMBER		Identifies the length of the longest query (in number of seconds) executed in the instance during the period. You can use this statistic to estimate the proper setting of the <code>UNDO_RETENTION</code> initialization parameter. The length of a query is measured from the cursor open time to the last fetch/execute time of the cursor. Only the length of those cursors that have been fetched/ executed during the period are reflected in the view.
MAXQUERYSQLID	VARCHAR2 (13)		SQL identifier of the longest running SQL statement in the period
MAXCONCURRENCY	NUMBER		Identifies the highest number of transactions executed concurrently within the period
UNXPSTEALCNT	NUMBER		Number of attempts to obtain undo space by stealing unexpired extents from other transactions
UNXPBLKRELCNT	NUMBER		Number of unexpired blocks removed from certain undo segments so they can be used by other transactions
UNXPBLKREUCNT	NUMBER		Number of unexpired undo blocks reused by transactions
EXPSTEALCNT	NUMBER		Number of attempts to steal expired undo blocks from other undo segments
EXPBLKRELCNT	NUMBER		Number of expired undo blocks stolen from other undo segments

Column	Datatype	NULL	Description
EXPBLKREUCNT	NUMBER		Number of expired undo blocks reused within the same undo segments
SSOLDEERRCNT	NUMBER		Identifies the number of times the error ORA-01555 occurred. You can use this statistic to decide whether the UNDO_RETENTION initialization parameter is set properly given the size of the undo tablespace. Increasing the value of UNDO_RETENTION can reduce the occurrence of this error.
NOSPACEERRCNT	NUMBER		Identifies the number of times space was requested in the undo tablespace and there was no free space available. That is, all of the space in the undo tablespace was in use by active transactions. The corrective action is to add more space to the undo tablespace.
ACTIVEBLKS	NUMBER		Total number of blocks in the active extents of the undo tablespace for the instance at the sampled time in the period
UNEXPIREDBLKS	NUMBER		Total number of blocks in the unexpired extents of the undo tablespace for the instance at the sampled time in the period
EXPIREDBLKS	NUMBER		Total number of blocks in the expired extents of the undo tablespace for the instance at the sampled time in the period
TUNED_UNDORETENTION	NUMBER		System tuned value indicating the period for which undo is being retained The value of this column is not meaningful on an Oracle Active Data Guard standby database instance, because the system does not tune this value on such instances.
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

"V\$UNDOSTAT"

5.84 DBA_HIST_WAITCLASSMET_HISTORY

DBA_HIST_WAITCLASSMET_HISTORY displays the history of the wait event class metric data kept by the Workload Repository.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID of the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number of the snapshot
WAIT_CLASS_ID	NUMBER	NOT NULL	Identifier of the class of the wait event
WAIT_CLASS	VARCHAR2(64)		Name of the class of the wait event
BEGIN_TIME	DATE	NOT NULL	Begin time of the interval
END_TIME	DATE	NOT NULL	End time of the interval
INTSIZE	NUMBER	NOT NULL	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	NOT NULL	Metric group ID
AVERAGE_WAITER_COUNT	NUMBER	NOT NULL	Average waiter count
DBTIME_IN_WAIT	NUMBER	NOT NULL	Percent of database time spent in the wait
TIME_WAITED	NUMBER	NOT NULL	Time waited during the interval (in microseconds)
WAIT_COUNT	NUMBER	NOT NULL	Number of times waited
TIME_WAITED_FG	NUMBER		Time waited (in hundredths of a second), from foreground sessions
WAIT_COUNT_FG	NUMBER		Number of times waited, from foreground sessions
CON_DBID	NUMBER		The database ID of the PDB for the sampled session
CON_ID	NUMBER		The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.85 DBA_HIST_WAITSTAT

DBA_HIST_WAITSTAT displays historical block contention statistics. This view contains snapshots of V\$WAITSTAT.

Column	Datatype	NULL	Description
SNAP_ID	NUMBER	NOT NULL	Unique snapshot ID
DBID	NUMBER	NOT NULL	Database ID for the snapshot
INSTANCE_NUMBER	NUMBER	NOT NULL	Instance number for the snapshot
CLASS	VARCHAR2(18)	NOT NULL	Class of the block
WAIT_COUNT	NUMBER		Number of waits by the OPERATION for this CLASS of block
TIME	NUMBER		Sum of all wait times for all the waits by the OPERATION for this CLASS of block
CON_DBID	NUMBER		The database ID of the PDB for the sampled session

Column	Datatype	NULL	Description
CON_ID	NUMBER		<p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$WAITSTAT"](#)

5.86 DBA_HIST_WR_CONTROL

DBA_HIST_WR_CONTROL displays the control information for the Workload Repository.

Column	Datatype	NULL	Description
DBID	NUMBER	NOT NULL	Database ID
SNAP_INTERVAL	INTERVAL DAY(5) TO SECOND(1)	NOT NULL	Snapshot interval; how often to automatically take snapshots
RETENTION	INTERVAL DAY(5) TO SECOND(1)	NOT NULL	Retention setting for the snapshots; amount of time to keep the snapshots
TOPNSQL	VARCHAR2(10)		The number of Top SQL flushed for each SQL criteria (elapsed time, CPU time, parse calls, sharable memory, version count)
CON_ID	NUMBER		<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
SRC_DBID	NUMBER		Database ID of the non-CDB, CDB, or PDB where the AWR snapshot data was collected
SRC_DBNAME	VARCHAR2(128)		Database name of the non-CDB, CDB, or PDB where the AWR snapshot data was collected

5.87 DBA_HIST_WR_SETTINGS

DBA_HIST_WR_SETTINGS displays the settings and metadata for the Workload Repository.

Column	Datatype	NULL	Description
LOCAL_AWRDBID	NUMBER	NOT NULL	Database ID of the local database
VIEW_LOCATION	VARCHAR2 (8)		Data source of the DBA_HIST dictionary views. Possible values include: <ul style="list-style-type: none">• AWR_PDB: Views display AWR data stored in the PDB.• AWR_ROOT: Views display AWR data stored in the root.
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.88 DBA_HISTOGRAMS

DBA_HISTOGRAMS is a synonym for DBA_TAB_HISTOGRAMS.

 See Also:

["DBA_TAB_HISTOGRAMS"](#)

5.89 DBA_HIVE_COLUMNS

DBA_HIVE_COLUMNS describes all Hive columns in a Hive metastore. Its columns are the same as those in ALL_HIVE_COLUMNS.

 See Also:

["ALL_HIVE_COLUMNS"](#)

5.90 DBA_HIVE_DATABASES

DBA_HIVE_DATABASES describes all the Hive schemas in a Hadoop cluster. Its columns are the same as those in ALL_HIVE_DATABASES.

See Also:

["ALL_HIVE_DATABASES"](#)

5.91 DBA_HIVE_PART_KEY_COLUMNS

DBA_HIVE_PART_KEY_COLUMNS provides information about all Hive table partition columns in the database. Its columns are the same as those in ALL_HIVE_PART_KEY_COLUMNS.

See Also:

["ALL_HIVE_PART_KEY_COLUMNS"](#)

5.92 DBA_HIVE_TAB_PARTITIONS

DBA_HIVE_TAB_PARTITIONS provides information about all Hive table partitions in the database. Its columns are the same as those in ALL_HIVE_TAB_PARTITIONS.

See Also:

["ALL_HIVE_TAB_PARTITIONS"](#)

5.93 DBA_HIVE_TABLES

DBA_HIVE_TABLES provides information about all the Hive tables in the Hive metastore. Its columns are the same as those in ALL_HIVE_TABLES.

See Also:

["ALL_HIVE_TABLES"](#)

5.94 DBA_HOST_ACES

DBA_HOST_ACES describes access control entries defined in host access control lists.

Related View

USER_HOST_ACES describes the status of access control entries for the current user to access network hosts through PL/SQL network utility packages. This view does not display the ACE_ORDER, START_DATE, END_DATE, GRANT_TYPE, INVERTED_PRINCIPAL, PRINCIPAL, or PRINCIPAL_TYPE columns.

Column	Datatype	NULL	Description
HOST	VARCHAR2(1000)	NOT NULL	Network host
LOWER_PORT	NUMBER(5)		Lower bound of the port range
UPPER_PORT	NUMBER(5)		Upper bound of the port range
ACE_ORDER	NUMBER	NOT NULL	Order number of the access control entry
START_DATE	TIMESTAMP(6)		Start date of the access control entry
END_DATE	TIMESTAMP(6)		End date of the access control entry
GRANT_TYPE	VARCHAR2(5)		Indicates whether the access control entry grants or denies the privilege
INVERTED_PRINCIPAL	VARCHAR2(3)		Indicates whether the principal is inverted or not
PRINCIPAL	VARCHAR2(128)		Principal the privilege is applied to
PRINCIPAL_TYPE	VARCHAR2(16)		Type of the principal
PRIVILEGE	VARCHAR2(128)		Privilege

See Also:

"USER_HOST_ACES"

5.95 DBA_HOST_ACLS

DBA_HOST_ACLS describes access control lists assigned to restrict access to network hosts through PL/SQL network utility packages.

Column	Datatype	NULL	Description
HOST	VARCHAR2(1000)	NOT NULL	Network host
LOWER_PORT	NUMBER(5)		Lower bound of the port range
UPPER_PORT	NUMBER(5)		Upper bound of the port range
ACL	VARCHAR2(4000)		The name of the access control list
ACOLID	RAW(8)		The object ID of the access control list
ACL_OWNER	VARCHAR2(128)		The owner of the access control list

5.96 DBA_IDENTIFIERS

DBA_IDENTIFIERS displays information about the identifiers in all stored objects in the database. Its columns are the same as those in ALL_IDENTIFIERS.

 **See Also:**

"[ALL_IDENTIFIERS](#)"

5.97 DBA_ILMDATAMOVEMENTPOLICIES

DBA_ILMDATAMOVEMENTPOLICIES contains information specific to data movement-related attributes of an Automatic Data Optimization policy in a database.

Related View

USER_ILMDATAMOVEMENTPOLICIES contains information specific to data movement-related attributes of an Automatic Data Optimization policy for a user.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

Column	Datatype	NULL	Description
POLICY_NAME	VARCHAR2 (128)	NOT NULL	The Automatic Data Optimization policy name is autogenerated
ACTION_TYPE	VARCHAR2 (11)		Type of data movement action performed by the Automatic Data Optimization policy: <ul style="list-style-type: none"> • ANNOTATE • COMPRESSION • EVICT • STORAGE
SCOPE	VARCHAR2 (7)		Identifies the scope of the Automatic Data Optimization policy: <ul style="list-style-type: none"> • ROW • GROUP • SEGMENT
COMPRESSION_LEVEL	VARCHAR2 (30)		Compression level to move selected rows or the entire segment to, for a compression Automatic Data Optimization policy
TIER_TABLESPACE	VARCHAR2 (128)		Tablespace to move the object to, for a storage Automatic Data Optimization policy

Column	Datatype	NULL	Description
TIER_STATUS	VARCHAR2 (9)		This column is only valid for storage tiering policies, and indicates whether the storage tiering policy was specified with a <code>READ ONLY</code> clause. This column takes <code>READ ONLY</code> as a potential value. In all other cases, it is blank. In other words, this column indicates whether the tablespace the object is being moved to will be made <code>READ ONLY</code> after the movement.
CONDITION_TYPE	VARCHAR2 (22)		Column on which the condition for the policy is based. Possible values: <ul style="list-style-type: none">• LAST ACCESS TIME• LAST MODIFICATION TIME• CREATION TIME• USER DEFINED• LOW ACCESS
CONDITION_DAYS	NUMBER		Number of days in the condition for the policy
CUSTOM_FUNCTION	VARCHAR2 (128)		Optional function that evaluates the precondition on the policy
POLICY_SUBTYPE	VARCHAR2 (10)		Storage tier on which the policy is specified
ACTION_CLAUSE	CLOB		Text of the action executed by the policy
TIER_TO	VARCHAR2 (10)		Storage tier where the data is placed after the policy is executed

 **See Also:**["USER_ILMDATAMOVEMENTPOLICIES"](#)

5.98 DBA_ILMEVALUATIONDETAILS

`DBA_ILMEVALUATIONDETAILS` displays details on evaluation of Automatic Data Optimization policies considered for Automatic Data Optimization tasks.

It also shows the job name that executes the policy, in case the policy was selected for execution. If the policy was not selected for execution, this view provides a reason.

Related View

`USER_ILMEVALUATIONDETAILS` displays details on evaluation of Automatic Data Optimization policies considered for Automatic Data Optimization tasks for a user. It also shows the job name that executes the policy, in case the policy was selected for execution. If the policy was not selected for execution, this view provides a reason.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

Column	Datatype	NULL	Description
TASK_ID	NUMBER		Number that uniquely identifies a specific Automatic Data Optimization task
POLICY_NAME	VARCHAR2(128)	NOT NULL	Name of the Automatic Data Optimization policy
OBJECT_OWNER	VARCHAR2(128)	NOT NULL	Owner of the object associated with the Automatic Data Optimization policy
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of the object associated with the Automatic Data Optimization policy
SUBOBJECT_NAME	VARCHAR2(128)		Name of the subobject associated with the Automatic Data Optimization policy
OBJECT_TYPE	VARCHAR2(18)		Object type. Valid values include TABLE, TABLE PARTITION, and TABLE SUBPARTITION.
SELECTED_FOR_EXECUTION	VARCHAR2(42)		Indicates whether the policy has been selected for execution on the object. If not, the reason for not being selected is listed. Possible values: <ul style="list-style-type: none">• POLICY DISABLED• SELECTED FOR EXECUTION• POLICY OVERRULED• INHERITED POLICY OVERRULED• PRECONDITION NOT SATISFIED• JOB ALREADY EXISTS• NO OPERATION SINCE LAST ILM ACTION• TABLE HAS MATERIALIZED VIEW• TARGET COMPRESSION NOT HIGHER THAN CURRENT• STATISTICS NOT AVAILABLE The value SELECTED FOR EXECUTION means a job was created for this policy on the object. The other values state the reason why the policy on the object was selected for execution.
JOB_NAME	VARCHAR2(128)		Name of the job in the case where the policy is selected for execution on this object
COMMENTS	VARCHAR2(4000)		Reserved for future use

 See Also:["USER_ILMEVALUATIONDETAILS"](#)

5.99 DBA_ILMOBJECTS

DBA_ILMOBJECTS displays all the Automatic Data Optimization policies and objects in the database.

Many objects inherit policies via their parent objects or because they were created in a particular tablespace. This view provides a mapping between the policies and objects and indicates whether a policy is inherited by an object or is directly specified on it.

Related View

USER_ILMOBJECTS displays all the Automatic Data Optimization policies and objects for a user.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

Column	Datatype	NULL	Description
POLICY_NAME	VARCHAR2(128)	NOT NULL	Policy name is auto-generated
OBJECT_OWNER	VARCHAR2(128)	NOT NULL	Owner of the object associated with the Automatic Data Optimization policy
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of the object associated with the Automatic Data Optimization policy
SUBOBJECT_NAME	VARCHAR2(128)		Name of the subobject associated with the Automatic Data Optimization policy
OBJECT_TYPE	VARCHAR2(18)		Object type. Valid values include: <ul style="list-style-type: none"> • INDEX • INDEX PARTITION • LOB • LOB PARTITION • TABLE • TABLE PARTITION • TABLE SUBPARTITION Direct policies on Index, Index Partition, LOB, and LOB Partition are not supported in Oracle Database 12c.
INHERITED_FROM	VARCHAR2(20)		Indicates if the policy is inherited by the object or subobject, or directly specified on the object or subobject. If the policy is inherited, the level from which the policy is inherited (TABLE, TABLE PARTITION, TABLESPACE) is identified.
TBS_INHERITED_FROM	VARCHAR2(30)		The tablespace name, if the policy is inherited from a tablespace
ENABLED	VARCHAR2(7)		Indicates if the Automatic Data Optimization policy is enabled for the object (YES or NO)
DELETED	VARCHAR2(7)		Possible values: <ul style="list-style-type: none"> • YES - Indicates that the policy is deleted for any objects that may be added in the future, but is active for those objects that are currently associated with that policy • NO - Indicates that the policy is active

 **See Also:**

"USER_ILMOBJECTS"

5.100 DBA_ILMPARAMETERS

DBA_ILMPARAMETERS can be queried to provide information on the Automatic Data Optimization parameters in the database and their values.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

Column	Datatype	NULL	Description
NAME	VARCHAR2 (128)		Name of the Automatic Data Optimization environment parameter. The value is one of the constants defined in the DBMS_ILM_ADMIN package.
VALUE	NUMBER		Value of the parameter

 **See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the API interface for implementing Automatic Data Optimization strategies
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_ILM_ADMIN package

5.101 DBA_ILMPOLICIES

DBA_ILMPOLICIES displays details about Automatic Data Optimization policies in the database.

The view contains common details relevant to all types of Automatic Data Optimization policies, not just details relevant to the data movement-related Automatic Data Optimization policies.

Related View

USER_ILMPOLICIES displays details about Automatic Data Optimization policies owned by the user.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

Column	Datatype	NULL	Description
POLICY_NAME	VARCHAR2 (128)		The name of the Automatic Data Optimization policy is auto-generated
POLICY_TYPE	VARCHAR2 (13)		Type of the policy. Valid values include DATAMOVEMENT.
TABLESPACE	VARCHAR2 (30)		Tablespace name, in the case of a tablespace-level policy
ENABLED	VARCHAR2 (6)		Indicates whether the policy is enabled or not
DELETED	VARCHAR2 (7)		Possible values: <ul style="list-style-type: none"> YES - Indicates that the policy associated has been deleted (but shall remain active for this object) NO - Indicates that the policy is active

 **Note:**

Automatic Data Optimization policies cannot be set on tables with object types or materialized views.

 **See Also:**

"USER_ILMPOLICIES"

5.102 DBA_ILMRESULTS

DBA_ILMRESULTS displays information on data movement-related Automatic Data Optimization jobs in the database.

Related View

USER_ILMRESULTS displays information on data movement-related Automatic Data Optimization jobs for tasks created by the user.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

Column	Datatype	NULL	Description
TASK_ID	NUMBER		Number that uniquely identifies a specific Automatic Data Optimization task
JOB_NAME	VARCHAR2 (128)		Name of the Automatic Data Optimization job

Column	Datatype	NULL	Description
JOB_STATE	VARCHAR2 (35)		<p>State of the job. Possible values:</p> <ul style="list-style-type: none"> • JOB CREATED • COMPLETED SUCCESSFULLY • FAILED • STOPPED • JOB CREATION FAILED • DEPENDENT OBJECTS BEING REBUILT • FAILED TO REBUILD DEPENDENT OBJECTS
START_TIME	TIMESTAMP (6)		Start time of the Automatic Data Optimization job
COMPLETION_TIME	TIMESTAMP (6)		Completion time of the Automatic Data Optimization job
COMMENTS	VARCHAR2 (4000)		Additional information in cases where the Automatic Data Optimization job execution fails
STATISTICS	CLOB		Job specific statistics, such as space saved via compression. This column is in the form of comma separated name / value pairs, with each pair representing a particular statistic name and value.

 See Also:["USER_ILMRESULTS"](#)

5.103 DBA_ILMTASKS

DBA_ILMTASKS displays information on Automatic Data Optimization execution.

Related View

USER_ILMTASKS displays information on Automatic Data Optimization tasks created by a user.

 Note:

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

Column	Datatype	NULL	Description
TASK_ID	NUMBER		Number that uniquely identifies a specific Automatic Data Optimization task
TASK_OWNER	VARCHAR2 (128)	NOT NULL	User who initiates the task
STATE	VARCHAR2 (9)		<p>Possible values:</p> <ul style="list-style-type: none"> • INACTIVE: Indicates that the task was created for previewing • ACTIVE: Indicates that jobs have been created for the qualifying policies in the task • COMPLETE: Indicates that the task has completed

Column	Datatype	NULL	Description
CREATION_TIME	TIMESTAMP (6)		The time that the task was created
START_TIME	TIMESTAMP (6)		Start time of a specific task
COMPLETION_TIME	TIMESTAMP (6)		Completion time of a specific task

**See Also:**["USER_ILMTASKS"](#)

5.104 DBA_IM_EXPRESSIONS

DBA_IM_EXPRESSIONS provides information about the list of expressions (SYS_IME virtual columns) that are currently enabled for in-memory storage.

Typically, you can query this view after invoking the DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS PL/SQL procedure to see the list of hot expressions added to different tables across the database.

Based on this view, you can:

- Populate expressions on a particular table immediately
- Drop certain expressions that are marked for in-memory but not desired by users

Related View

USER_IM_EXPRESSIONS provides information about the list of expressions (SYS_IME virtual columns) that are currently enabled for in-memory storage in schemas owned by the current user. This view does not display the OWNER column.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (129)		Table owner
TABLE_NAME	VARCHAR2 (129)		Table name
OBJECT_NUMBER	NUMBER		Object number of the table
COLUMN_NAME	VARCHAR2 (128)	NOT NULL	Column name of the expression added to the table (with SYS_IME prefix)
SQL_EXPRESSION	LONG		SQL representation of the expression

**See Also:**["USER_IM_EXPRESSIONS"](#)

5.105 DBA_IMMUTABLE_TABLES

DBA_IMMUTABLE_TABLES describes all immutable tables in the database. Its columns are the same as those in ALL_IMMUTABLE_TABLES.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.11.

 **See Also:**

["ALL_IMMUTABLE_TABLES"](#)

5.106 DBA_IND_COLUMNS

DBA_IND_COLUMNS describes the columns of all the indexes on all tables and clusters in the database. Its columns are the same as those in ALL_IND_COLUMNS.

 **See Also:**

["ALL_IND_COLUMNS"](#)

5.107 DBA_IND_EXPRESSIONS

DBA_IND_EXPRESSIONS lists expressions of function-based indexes on all tables and clusters in the database. Its columns are the same as those in ALL_IND_EXPRESSIONS.

 **See Also:**

["ALL_IND_EXPRESSIONS"](#)

5.108 DBA_IND_PARTITIONS

DBA_IND_PARTITIONS displays, for each index partition in the database, the partition-level partitioning information, the storage parameters for the partition, and various partition statistics

generated by the `DBMS_STATS` package. Its columns are the same as those in `ALL_IND_PARTITIONS`.

 **See Also:**

["ALL_IND_PARTITIONS"](#)

5.109 DBA_IND_PENDING_STATS

`DBA_IND_PENDING_STATS` describes pending statistics for all tables, partitions, and subpartitions in the database collected using the `DBMS_STATS` package. Its columns are the same as those in `ALL_IND_PENDING_STATS`.

 **See Also:**

["ALL_IND_PENDING_STATS"](#)

5.110 DBA_IND_STATISTICS

`DBA_IND_STATISTICS` displays optimizer statistics for all indexes in the database collected using the `DBMS_STATS` package. Its columns are the same as those in `ALL_IND_STATISTICS`.

 **See Also:**

["ALL_IND_STATISTICS"](#)

5.111 DBA_IND_SUBPARTITIONS

`DBA_IND_SUBPARTITIONS` displays, for each index subpartition in the database, the subpartition-level partitioning information, the storage parameters for the subpartition, and various subpartition statistics generated by the `DBMS_STATS` package. Its columns are the same as those in `ALL_IND_SUBPARTITIONS`.

 **See Also:**

["ALL_IND_SUBPARTITIONS"](#)

5.112 DBA_INDEX_USAGE

`DBA_INDEX_USAGE` displays cumulative statistics for each index.

Column	Datatype	NULL	Description
OBJECT_ID	NUMBER	NOT NULL	Object ID for the index
NAME	VARCHAR2(128)	NOT NULL	Index name
OWNER	VARCHAR2(128)	NOT NULL	Index owner
TOTAL_ACCESS_COUNT	NUMBER		Total number of times the index has been accessed
TOTAL_EXEC_COUNT	NUMBER		Total executions the index has participated in
TOTAL_ROWS_RETURNED	NUMBER		Total rows returned by the index.
			Index usage is categorized into buckets of different ranges. Each bucket has a range of values for access count and rows returned. An entry is placed into a bucket if the rows returned or access counts falls within the range of that bucket.
BUCKET_0_ACCESS_COUNT	NUMBER		The index has not been accessed
BUCKET_1_ACCESS_COUNT	NUMBER		The index has been accessed once
BUCKET_2_10_ACCESS_COUNT	NUMBER		The index has been accessed between 2 and 10 times
BUCKET_2_10_ROWS_RETURNED	NUMBER		The index has returned between 2 and 10 rows
BUCKET_11_100_ACCESS_COUNT	NUMBER		The index has been accessed between 11 and 100 times
BUCKET_11_100_ROWS_RETURNED	NUMBER		The index has returned between 11 and 100 rows
BUCKET_101_1000_ACCESS_COUNT	NUMBER		The index has been accessed between 101 and 1000 times
BUCKET_101_1000_ROWS_RETURNED	NUMBER		The index has returned between 101 and 1000 rows
BUCKET_1000_PLUS_ACCESS_COUNT	NUMBER		The index has been accessed more than 1000 times
BUCKET_1000_PLUS_ROWS_RETURNED	NUMBER		The index has returned more than 1000 rows
LAST_USED	DATE		Time that the index was last used

 See Also:["V\\$INDEX_USAGE_INFO"](#)

5.113 DBA_INDEXES

DBA_INDEXES describes all indexes in the database. To gather statistics for this view, use the DBMS_STATS package. This view supports parallel partitioned index scans. Its columns are the same as those in ALL_INDEXES.

 See Also:["ALL_INDEXES"](#)

5.114 DBA_INDEXTYPE_ARRAYTYPES

DBA_INDEXTYPE_ARRAYTYPES displays information about the array types specified by all indextypes in the database. Its columns are the same as those in ALL_INDEXTYPE_ARRAYTYPES.

 **See Also:**

"[ALL_INDEXTYPE_ARRAYTYPES](#)"

5.115 DBA_INDEXTYPE_COMMENTS

DBA_INDEXTYPE_COMMENTS displays comments for all user-defined indextypes in the database. Its columns are the same as those in ALL_INDEXTYPE_COMMENTS.

 **See Also:**

"[ALL_INDEXTYPE_COMMENTS](#)"

5.116 DBA_INDEXTYPE_OPERATORS

DBA_INDEXTYPE_OPERATORS lists all the operators supported by indextypes in the database. Its columns are the same as those in ALL_INDEXTYPE_OPERATORS.

 **See Also:**

"[ALL_INDEXTYPE_OPERATORS](#)"

5.117 DBA_INDEXTYPES

DBA_INDEXTYPES describes all indextypes in the database. Its columns are the same as those in ALL_INDEXTYPES.

 **See Also:**

"[ALL_INDEXTYPES](#)"

5.118 DBA_INMEMORY_AIMTASKDETAILS

DBA_INMEMORY_AIMTASKDETAILS displays details for an Automatic In-Memory management task.

Column	Datatype	NULL	Description
TASK_ID	NUMBER		Number that uniquely identifies a specific automatic IM column store management task
OBJECT_OWNER	VARCHAR2(128)		Owner of the object subject to automatic IM column store management task action
OBJECT_NAME	VARCHAR2(128)		Name of the object subject to automatic IM column store management task action
SUBOBJECT_NAME	VARCHAR2(128)		Name of the subobject subject to automatic IM column store management task action
ACTION	VARCHAR2(16)		Action taken on the object
STATE	VARCHAR2(10)		Status of the action on the object

 **See Also:**

Oracle Database In-Memory Guide for more information about configuring the Automatic In-Memory feature

5.119 DBA_INMEMORY_AIMTASKS

DBA_INMEMORY_AIMTASKS displays information about Automatic In-Memory management tasks.

Column	Datatype	NULL	Description
TASK_ID	NUMBER		Number that uniquely identifies a specific automatic IM column store management task
CREATION_TIME	TIMESTAMP(6)		Creation time of the task
STATE	VARCHAR2(7)		State of the task

 **See Also:**

Oracle Database In-Memory Guide for more information about configuring the Automatic In-Memory feature

5.120 DBA_INTERNAL_TRIGGER

DBA_INTERNAL_TRIGGER describes internal triggers on all tables in the database. Its columns are the same as those in ALL_INTERNAL_TRIGGER.

 **See Also:**

"ALL_INTERNAL_TRIGGER"

5.121 DBA_INVALID_OBJECTS

DBA_INVALID_OBJECTS describes all invalid objects in the database. You can use this view to identify invalid objects before and after a database upgrade.

This view eliminates old versions of object types. It only includes the object type if it is the latest version.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Owner of the object
OBJECT_NAME	VARCHAR2 (128)		Name of the object
SUBOBJECT_NAME	VARCHAR2 (128)		Name of the subobject (for example, partition)
OBJECT_ID	NUMBER		Dictionary object number of the object.
DATA_OBJECT_ID	NUMBER		Dictionary object number of the segment that contains the object. Note: OBJECT_ID and DATA_OBJECT_ID display data dictionary metadata. Do not confuse these numbers with the unique 16-byte object identifier (<i>object ID</i>) that Oracle Database assigns to row objects in object tables in the system.
OBJECT_TYPE	VARCHAR2 (23)		Type of the object (such as TABLE, INDEX). The current version of the type is shown only if it is invalid. In other words, if prior versions of the type are invalid but the most recent version of the type is valid, it will not be in this list.
CREATED	DATE		Timestamp for the creation of the object
LAST_DDL_TIME	DATE		Timestamp for the last modification of the object and dependent objects resulting from a DDL statement (including grants and revokes)
TIMESTAMP	VARCHAR2 (19)		Timestamp for the specification of the object (character data)
STATUS	VARCHAR2 (7)		Status of the object: <ul style="list-style-type: none">• VALID• INVALID• N/A
TEMPORARY	VARCHAR2 (1)		Indicates whether the object is temporary (the current session can see only data that it placed in this object itself) (Y) or not (N)

Column	Datatype	NULL	Description
GENERATED	VARCHAR2 (1)		Indicates whether the name of this object was system-generated (Y) or not (N)
SECONDARY	VARCHAR2 (1)		Indicates whether this is a secondary object created by the ODCIIndexCreate method of the Oracle Data Cartridge (Y) or not (N)
NAMESPACE	NUMBER		Namespace for the object
EDITION_NAME	VARCHAR2 (128)		Name of the edition in which the object is actual
SHARING	VARCHAR2 (18)		Values: <ul style="list-style-type: none">• DATA LINK - If the object is data-linked or a data link to an object in the root• METADATA LINK - If the object is metadata-linked or a metadata link to an object in the root• EXTENDED DATA LINK - If the object is extended-data-linked or an extended data link to an object in the root• NONE - If none of the above applies
EDITIONABLE	VARCHAR2 (1)		Values: <ul style="list-style-type: none">• Y - For objects marked EDITIONABLE• N - For objects marked NONEDITIONABLE• NULL - For objects whose type is not editionable in the database
ORACLE_MAINTAINED	VARCHAR2 (1)		Denotes whether the object was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). An object for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script.
APPLICATION	VARCHAR2 (1)		Indicates whether the object is an Application common object (Y) or not (N)
DEFAULT_COLLATION	VARCHAR2 (100)		Default collation for the object
DUPLICATED	VARCHAR2 (1)		Indicates whether this object is duplicated on this shard (Y) or not (N)
SHARDED	VARCHAR2 (1)		Indicates whether this object is sharded (Y) or not (N)
CREATED_APPID	NUMBER		ID of the Application that created the object
CREATED_VSNID	NUMBER		ID of the Application Version that created the object
MODIFIED_APPID	NUMBER		ID of the Application that last modified the object
MODIFIED_VSNID	NUMBER		ID of the Application Version that last modified the object

5.122 DBA_JAVA_ARGUMENTS

DBA_JAVA_ARGUMENTS displays argument information about all stored Java classes in the database. Its columns are the same as those in ALL_JAVA_ARGUMENTS.

 **See Also:**

["ALL_JAVA_ARGUMENTS"](#)

5.123 DBA_JAVA_CLASSES

DBA_JAVA_CLASSES displays class level information about all stored Java classes in the database. Its columns are the same as those in ALL_JAVA_CLASSES.

 See Also:

["ALL_JAVA_CLASSES"](#)

5.124 DBA_JAVA_COMPILER_OPTIONS

DBA_JAVA_COMPILER_OPTIONS displays information about all native compiler options in the database. Its columns are the same as those in ALL_JAVA_COMPILER_OPTIONS.

 See Also:

["ALL_JAVA_COMPILER_OPTIONS"](#)

5.125 DBA_JAVA_DERIVATIONS

DBA_JAVA_DERIVATIONS displays mapping information about Java source objects and their derived Java class objects and Java resource objects for all Java classes in the database. Its columns are the same as those in ALL_JAVA_DERIVATIONS.

 See Also:

["ALL_JAVA_DERIVATIONS"](#)

5.126 DBA_JAVA_FIELDS

DBA_JAVA_FIELDS displays field information about all stored Java classes in the database. Its columns are the same as those in ALL_JAVA_FIELDS.

 See Also:

["ALL_JAVA_FIELDS"](#)

5.127 DBA_JAVA_IMPLEMENT

DBA_JAVA_IMPLEMENT describes interfaces implemented by all stored Java classes in the database. Its columns are the same as those in ALL_JAVA_IMPLEMENT.

See Also:

["ALL_JAVA_IMPLEMENT"](#)

5.128 DBA_JAVA_INNERS

DBA_JAVA_INNERS displays information about inner classes referred to by all stored Java classes in the database. Its columns are the same as those in ALL_JAVA_INNERS.

See Also:

["ALL_JAVA_INNERS"](#)

5.129 DBA_JAVA_LAYOUTS

DBA_JAVA_LAYOUTS displays class layout information about all stored Java classes in the database. Its columns are the same as those in ALL_JAVA_LAYOUTS.

See Also:

["ALL_JAVA_LAYOUTS"](#)

5.130 DBA_JAVA_METHODS

DBA_JAVA_METHODS displays method information about all stored Java classes in the database. Its columns are the same as those in ALL_JAVA_METHODS.

See Also:

["ALL_JAVA_METHODS"](#)

5.131 DBA_JAVA_NCOMPS

DBA_JAVA_NCOMPS displays ncomp-related information about all Java classes in the database. Its columns are the same as those in ALL_JAVA_NCOMPS.

 **See Also:**

["ALL_JAVA_NCOMPS"](#)

5.132 DBA_JAVA_POLICY

DBA_JAVA_POLICY describes Java security permissions for all users in the database.

Related View

USER_JAVA_POLICY describes Java security permissions for the current user.

Column	Datatype	NULL	Description
KIND	VARCHAR2 (8)		Indicates whether the permission is a positive (GRANT) or a limitation (RESTRICT)
GRANTEE	VARCHAR2 (128)	NOT NULL	Name of the user, schema, or role to which the permission object is assigned
TYPE_SCHEMA	VARCHAR2 (128)	NOT NULL	Schema in which the permission object is loaded
TYPE_NAME	VARCHAR2 (4000)		Permission class type, which is designated by a string containing the full class name, such as, java.io.FilePermission
NAME	VARCHAR2 (4000)		Target attribute (name) of the permission object. This name is used when defining the permission.
ACTION	VARCHAR2 (4000)		Action attribute for this permission. Many permissions expect a null value if no action is appropriate for the permission.
ENABLED	VARCHAR2 (8)		Indicates whether the permission is enabled (ENABLED) or disabled (DISABLED)
SEQ	NUMBER		Sequence number used to identify this row. This number should be supplied when disabling, enabling, or deleting the permission.

 **See Also:**

["USER_JAVA_POLICY"](#)

5.133 DBA_JAVA_RESOLVERS

DBA_JAVA_RESOLVERS displays information about resolvers of all Java classes in the database. Its columns are the same as those in ALL_JAVA_RESOLVERS.

 **See Also:**

"ALL_JAVA_RESOLVERS"

5.134 DBA_JAVA_THROWS

DBA_JAVA_THROWS displays information about exceptions thrown from methods of all Java classes in the database. Its columns are the same as those in ALL_JAVA_THROWSa.

 **See Also:**

"ALL_JAVA_THROWS"

5.135 DBA_JOBS

DBA_JOBS describes all jobs in the database.

Related View

USER_JOBS describes the jobs owned by the current user.

Column	Datatype	NULL	Description
JOB	NUMBER	NOT NULL	Identifier of job. Neither import/export nor repeated executions change this value.
LOG_USER	VARCHAR2(128)	NOT NULL	Login user when the job was submitted
PRIV_USER	VARCHAR2(128)	NOT NULL	User whose default privileges apply to this job
SCHEMA_USER	VARCHAR2(128)	NOT NULL	Default schema used to parse the job For example, if the SCHEMA_USER is SCOTT and you submit the procedure HIRE_EMP as a job, the Oracle Database looks for SCOTT.HIRE_EMP
LAST_DATE	DATE		Date on which this job last successfully executed
LAST_SEC	VARCHAR2(8)		Same as LAST_DATE. This is when the last successful execution started.
THIS_DATE	DATE		Date that this job started executing (usually null if not executing)
THIS_SEC	VARCHAR2(8)		Same as THIS_DATE. This is when the last successful execution started.
NEXT_DATE	DATE	NOT NULL	Date that this job will next be executed

Column	Datatype	NULL	Description
NEXT_SEC	VARCHAR2(8)		Same as NEXT_DATE. The job becomes due for execution at this time.
TOTAL_TIME	NUMBER		Total wall clock time spent by the system on this job (in seconds) when it last executed
BROKEN	VARCHAR2(1)		Y: no attempt is made to run this job N: an attempt is made to run this job
INTERVAL	VARCHAR2(200)	NOT NULL	A date function, evaluated at the start of execution, becomes next NEXT_DATE
FAILURES	NUMBER		Number of times the job has started and failed since its last success
WHAT	VARCHAR2(4000)		Body of the anonymous PL/SQL block that the job executes
NLS_ENV	VARCHAR2(4000)		Session parameters describing the NLS environment of the job
MISC_ENV	RAW(32)		Other session parameters of the session that created the job. The job is run using these parameters.
INSTANCE	NUMBER		ID of the instance that can execute or is executing the job. The default is 0.

 **See Also:**

["USER_JOBS"](#)

5.136 DBA_JOBS_RUNNING

DBA_JOBS_RUNNING lists all jobs that are currently running in the instance.

Column	Datatype	NULL	Description
SID	NUMBER		Identifier of process that is executing the job. See "V\$LOCK".
JOB	NUMBER		Identifier of job. This job is currently executing.
FAILURES	NUMBER		Number of times this job started and failed since its last success.
LAST_DATE	DATE		Date that this job last successfully executed.
LAST_SEC	VARCHAR2(8)		Same as LAST_DATE. This is when the last successful execution started.
THIS_DATE	DATE		Date that this job started executing.
THIS_SEC	VARCHAR2(8)		Same as THIS_DATE. This is when the last successful execution started.
INSTANCE	NUMBER		Indicates which instance can execute or is executing the job; the default is 0.

5.137 DBA_JOIN_IND_COLUMNS

DBA_JOIN_IND_COLUMNS describes all join conditions in the database. Its columns are the same as those in ALL_JOIN_IND_COLUMNS.

 **See Also:**

["ALL_JOIN_IND_COLUMNS"](#)

5.138 DBA_JOININGROUPS

DBA_JOININGROUPS describes join groups in the database. A join group is a user-created object that consists of two or more columns that can be meaningfully joined. The maximum number of columns that can be included in a join group is 255.

In certain queries, join groups enable the database to eliminate the performance overhead of decompressing and hashing column values. Join groups require an In-Memory column store (IM column store).

Related View

USER_JOININGROUPS describes join groups belonging to the user. This view does not display the JOINGROUP_OWNER column.

Column	Datatype	NULL	Description
JOINGROUP_OWNER	VARCHAR2 (128)	NOT NULL	Join group owner. This is the user that created the join group.
JOINGROUP_NAME	VARCHAR2 (128)	NOT NULL	This is the user specified name of the join group. The join group name is specified when the join group is created as part of the CREATE INMEMORY JOIN GROUP statement.
TABLE_OWNER	VARCHAR2 (128)	NOT NULL	Table owner
TABLE_NAME	VARCHAR2 (128)	NOT NULL	Table name
COLUMN_NAME	VARCHAR2 (128)	NOT NULL	Column name
FLAGS	VARCHAR2 (6)		Possible values: <ul style="list-style-type: none"> • MASTER: Indicates which column in the join group is mastering the global dictionary. A join group is a group of columns sharing a global dictionary; the global dictionary is associated with one column and the other columns share the same dictionary. The column with which the global dictionary is associated is called the mastering column. • NULL: Indicates that the column is not mastering the global dictionary.

Column	Datatype	NULL	Description
GD_ADDRESS	RAW(8)		The memory address of the global dictionary. Ideally, all the columns in one join group should have the same global dictionary address (that is, they share the same global structure). This might not always be the case (for example, a column might be added to a join group after it was populated into memory - in which case its GD_ADDRESS field will be NULL). In such cases, you should force re-populate the tables that are part of the join group and check the views after the repopulates complete.

 See Also:

- ["USER_JOINGROUPS"](#)
- *Oracle Database In-Memory Guide* for an introduction to join groups
- *Oracle Database SQL Language Reference* for information about creating a join group using the CREATE INMEMORY JOIN GROUP statement

5.139 DBA_JSON_COLUMNS

DBA_JSON_COLUMNS provides information on all JavaScript Object Notation (JSON) columns in the database. Its columns are the same as those in ALL_JSON_COLUMNS.

Each column that has an IS JSON check constraint in an AND condition appears in this view. This view enables a DBA to find all the JSON columns in the database.

For example, if a check constraint combines the IS JSON condition with another condition using logical condition OR, then the column is not listed in this view. In this case, it is not certain that the data in the column is JSON data. For example, the following constraint does not ensure that the data in column jcol is JSON data:

```
jcol is json OR length(jcol) < 1000
```

 See Also:

- ["ALL_JSON_COLUMNS"](#)
- *Oracle Database JSON Developer's Guide* for more information about using JSON with Oracle Database

5.140 DBA_JSON_DATAGUIDE_FIELDS

DBA_JSON_DATAGUIDE_FIELDS extracts the path and type information from all the data guides in the database, which are the data guides returned by the DBA_JSON_DATAGUIDE view. Its columns are the same as those in ALL_JSON_DATAGUIDE_FIELDS.

 **See Also:**

["ALL_JSON_DATAGUIDE_FIELDS"](#)

5.141 DBA_JSON_DATAGUIDES

DBA_JSON_DATAGUIDES provides information on all JavaScript Object Notation (JSON) columns in the database that have data guide enabled. Its columns are the same as those in ALL_JSON_DATAGUIDES.

 **See Also:**

["ALL_JSON_DATAGUIDES"](#)

5.142 DBA_KGLLOCK

DBA_KGLLOCK lists all the locks and pins held on KGL objects (objects in the Kernel Generic Library cache).

Column	Datatype	NULL	Description
kgllkuse	RAW (4)		Address of the user session that holds the lock or pin
kgllkhdl	RAW (4)		Address of the handle for the KGL object
kgllkmod	NUMBER		Current mode of the lock or pin
kgllkreq	NUMBER		Mode in which the lock or pin was requested
kgllktype	VARCHAR2 (4)		Whether this is a lock or a pin

5.143 DBA_LIBRARIES

DBA_LIBRARIES describes all libraries in the database. Its columns are the same as those in ALL_LIBRARIES.

 **See Also:**

["ALL_LIBRARIES"](#)

5.144 DBA_LMT_FREE_SPACE

DBA_LMT_FREE_SPACE describes the free extents in all locally managed tablespaces in the database.

Column	Datatype	NULL	Description
TABLESPACE_ID	NUMBER		Identifier number of the tablespace containing the extent
FILE_ID	NUMBER		File identifier number of the file containing the extent
BLOCK_ID	NUMBER		Starting block number of the extent
BLOCKS	NUMBER		Size of the extent (in Oracle blocks)

5.145 DBA_LMT_USED_EXTENTS

DBA_LMT_USED_EXTENTS describes the extents comprising the segments in all locally managed tablespaces in the database.

Column	Datatype	NULL	Description
SEGMENT_FILEID	NUMBER		File number of the segment header of the extent
SEGMENT_BLOCK	NUMBER		Block number of the segment header of the extent
TABLESPACE_ID	NUMBER		Identifier number of the tablespace containing the extent
EXTENT_ID	NUMBER		Extent number in the segment
FILEID	NUMBER		File identifier number of the file containing the extent
BLOCK	NUMBER		Starting block number of the extent
LENGTH	NUMBER		Number of blocks in the extent

5.146 DBA_LOB_PARTITIONS

DBA_LOB_PARTITIONS displays all LOB partitions in the database. Its columns are the same as those in ALL_LOB_PARTITIONS.

 See Also:

"ALL_LOB_PARTITIONS"

5.147 DBA_LOB_SUBPARTITIONS

DBA_LOB_SUBPARTITIONS displays partition-level attributes of all LOB data subpartitions in the database. Its columns are the same as those in ALL_LOB_SUBPARTITIONS.

 **See Also:**

"[ALL_LOB_SUBPARTITIONS](#)"

5.148 DBA_LOB_TEMPLATES

DBA_LOB_TEMPLATES describes all LOB subpartition templates in the database. Its columns are the same as those in ALL_LOB_TEMPLATES.

 **See Also:**

"[ALL_LOB_TEMPLATES](#)"

5.149 DBA_LOBS

DBA_LOBS displays the BLOBs and CLOBs contained in all tables in the database. BFILEs are stored outside the database, so they are not described by this view. This view's columns are the same as those in ALL_LOBS.

 **See Also:**

"[ALL_LOBS](#)"

5.150 DBA_LOCK

DBA_LOCK lists all locks or latches held in the database, and all outstanding requests for a lock or latch.

Column	Datatype	NULL	Description
SESSION_ID	NUMBER		Session holding or acquiring the lock
LOCK_TYPE	VARCHAR2(26)		Lock type See Also: For a listing of lock types, see Oracle Enqueue Names
MODE_HELD	VARCHAR2(40)		Lock mode
MODE_REQUESTED	VARCHAR2(40)		Lock mode requested
LOCK_ID1	VARCHAR2(40)		Type-specific lock identifier, part 1

Column	Datatype	NULL	Description
LOCK_ID2	VARCHAR2(40)		Type-specific lock identifier, part 2
LAST_CONVERT	NUMBER		The last convert
BLOCKING_OTHERS	VARCHAR2(40)		Whether the lock is currently blocking others
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.151 DBA_LOCK_INTERNAL

DBA_LOCK_INTERNAL displays a row for each lock or latch that is being held, and one row for each outstanding request for a lock or latch.

Column	Datatype	NULL	Description
SESSION_ID	NUMBER		Session holding or acquiring the lock
LOCK_TYPE	VARCHAR2(56)		Lock type See Also: For a listing of lock types, see Oracle Enqueue Names
MODE_HELD	VARCHAR2(40)		Lock mode
MODE_REQUESTED	VARCHAR2(40)		Lock mode requested
LOCK_ID1	VARCHAR2(1130)		Type-specific lock identifier, part 1
LOCK_ID2	VARCHAR2(40)		Type-specific lock identifier, part 2
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.152 DBA_LOCKDOWN_PROFILES

DBA_LOCKDOWN_PROFILES provides information about lockdown profiles.

The PRIVATE_DBaaS, PUBLIC_DBaaS, and SAAS lockdown profiles are empty placeholder profiles for the lockdown profiles of their corresponding deployment type. You can modify and add restrictions to these profiles based on their deployment purpose. For example, if you have a Software as a Service (SAAS) application, you can modify the SAAS lockdown profile and use it. You can also delete and re-create these profiles.

Column	Datatype	NULL	Description
PROFILE_NAME	VARCHAR2(128)	NOT NULL	Name of the lockdown profile
RULE_TYPE	VARCHAR2(128)		Rule type. A lockdown profile is used to restrict operations that can be performed by users connected to a given PDB. It provides the ability to add or remove different types of rules like STATEMENT, FEATURES or OPTIONS which will be restricted in the PDB.
RULE	VARCHAR2(128)		Rule to be enabled or disabled
CLAUSE	VARCHAR2(128)		Clause of the statement
CLAUSE_OPTION	VARCHAR2(128)		Option of the clause
OPTION_VALUE	VARCHAR2(4000)		Value of the option
MIN_VALUE	VARCHAR2(4000)		Minimum value allowed for the option
MAX_VALUE	VARCHAR2(4000)		Maximum value allowed for the option
LIST	VARCHAR2(4000)		List of allowed values for the option
STATUS	VARCHAR2(7)		Status of the lockdown profile: <ul style="list-style-type: none"> • ENABLE • DISABLE • EMPTY
USERS	VARCHAR2(6)		User type. Possible values: <ul style="list-style-type: none"> • COMMON • LOCAL • ALL
EXCEPT_USERS ¹	CLOB		For internal use only

¹ This column is available starting with Oracle Database 19c.

See Also:

- "[PDB_LOCKDOWN](#)"
- *Oracle Multitenant Administrator's Guide* for an introduction to PDB lockdown profiles
- *Oracle Database SQL Language Reference* for more information about creating lockdown profiles
- *Oracle Database SQL Language Reference* for more information about dropping lockdown profiles
- *Oracle Database SQL Language Reference* for more information about altering lockdown profiles

5.153 DBA_LOCKS

DBA_LOCKS is a synonym for DBA_LOCK.

 **See Also:**

["DBA_LOCK"](#)

5.154 DBA_LOG_GROUP_COLUMNS

DBA_LOG_GROUP_COLUMNS describes all columns in the database that are specified in log groups. Its columns are the same as those in ALL_LOG_GROUP_COLUMNS.

 **See Also:**

["ALL_LOG_GROUP_COLUMNS"](#)

5.155 DBA_LOG_GROUPS

DBA_LOG_GROUPS describes log group definitions on all tables in the database. Its columns are the same as those in ALL_LOG_GROUPS.

 **See Also:**

["ALL_LOG_GROUPS"](#)

5.156 DBA_LOGMNR_DICTIONARY_BUILDLOG

DBA_LOGMNR_DICTIONARY_BUILDLOG describes all successful LogMiner dictionary builds available for GoldenGate REGISTER EXTRACT.

When this view is queried from a PDB, it returns only LogMiner dictionary builds performed in that PDB.

Column	Datatype	NULL	Description
NAME	VARCHAR2 (384)		User-supplied name of the LogMiner dictionary build
DATE_OF_BUILD	VARCHAR2 (20)		Date and time at which the LogMiner dictionary build was performed
START_SCN	NUMBER		Begin SCN of the LogMiner dictionary build operation
END_SCN	NUMBER		End SCN of the LogMiner dictionary build operation
BUILD_TYPE	VARCHAR2 (20)		Internal string that identifies how the LogMiner dictionary build was initiated

Column	Datatype	NULL	Description
BUILD_OP	NUMBER		Internal number that identifies how the LogMiner dictionary build was initiated
CONTAINER_ID	NUMBER		ID of the container in which the LogMiner dictionary build was performed (the CDB root or a PDB)
CONTAINER_UID	NUMBER		Unique number that identifies the container in which the LogMiner dictionary build was performed (the CDB root or a PDB)
CONTAINER_NAME	VARCHAR2 (384)		Name of the container in which the LogMiner dictionary build was performed (the CDB root or a PDB)
RESETLOGS_CHANGE#	NUMBER		SCN that identifies the redo branch of the LogMiner dictionary build

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.10.

5.157 DBA_LOGMNR_LOG

DBA_LOGMNR_LOG displays all archived logs registered with active LogMiner persistent sessions in the database.

A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.

Column	Datatype	NULL	Description
LOGMNR_SESSION_ID	NUMBER	NOT NULL	Unique identifier of the persistent session
NAME	VARCHAR2 (513)		Name of the archived log
DBID	NUMBER	NOT NULL	Database identifier that produced the archived log
RESETLOGS_SCN	NUMBER	NOT NULL	SCN at which resetlogs operation was performed at the source database generating the archived log
RESETLOGS_TIME	NUMBER	NOT NULL	Timestamp at which resetlogs operation was performed at the source database generating the archived log
MODIFIED_TIME	DATE		Time at which the archived log was registered with LogMiner
THREAD#	NUMBER	NOT NULL	Redo thread at the source database that generated the archived log
SEQUENCE#	NUMBER	NOT NULL	Logfile sequence number
FIRST_SCN	NUMBER	NOT NULL	Lowest SCN of the redo record contained in the logfile
NEXT_SCN	NUMBER		Highest possible SCN of the redo record contained in the logfile
FIRST_TIME	DATE		Time of the first redo record contained in the logfile
NEXT_TIME	DATE		Time of the last redo record contained in the logfile

Column	Datatype	NULL	Description
DICTIONARY_BEGIN	VARCHAR2 (3)		Indicates whether the archived log contains the beginning of a LogMiner dictionary (YES) or not (NO)
DICTIONARY_END	VARCHAR2 (3)		Indicates whether the archived log contains the end of a LogMiner dictionary (YES) or not (NO)
KEEP	VARCHAR2 (3)		Indicates whether the logfile is still required for this LogMiner session (YES) or not (NO)
SUSPECT	VARCHAR2 (3)		Indicates whether the archived log content was deemed to be corrupt or the archived log is partially filled (YES) or not (NO)

5.158 DBA_LOGMNR_PURGED_LOG

DBA_LOGMNR_PURGED_LOG displays archived redo log files that have been applied to the logical standby database and can be deleted because they are no longer needed.

Files in this view are refreshed as a result of executing the DBMS_LOGSTDBY.PURGE_SESSION PL/SQL procedure for Oracle Data Guard SQL Apply:

Column	Datatype	NULL	Description
FILE_NAME	VARCHAR2 (513)		Fully qualified names of the archived redo log files that are no longer needed by SQL Apply and can be deleted from the operating system

 **See Also:**

Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_LOGSTDBY.PURGE_SESSION procedure

5.159 DBA_LOGMNR_SESSION

DBA_LOGMNR_SESSION displays all active LogMiner persistent sessions in the database.

A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.

Column	Datatype	NULL	Description
ID	NUMBER	NOT NULL	Unique session identifier
NAME	VARCHAR2 (128)	NOT NULL	Unique session name
SOURCE_DATABASE	VARCHAR2 (128)		Global name of the source database whose archived logs are to be mined in this persistent LogMiner session
SOURCE_DBID	NUMBER		Database ID of the source database
SOURCE_RESETLOGS_SCN	NUMBER		Resetlogs SCN associated with the incarnation of the source database whose archived logs are mined

Column	Datatype	NULL	Description
SOURCE_RESETLOGS_TIME	NUMBER		Resetlogs time associated with the incarnation of the source database whose archived logs are mined
FIRST_SCN	NUMBER		Only modifications that occurred on or after this SCN can be mined using this persistent session
END_SCN	NUMBER		No modifications that occurred on or after this SCN can be mined using this persistent session
BRANCH_SCN	NUMBER		SCN at which a branch will be taken in terms of the incarnation corresponding to the source database. This implies a point-in-time recovery was performed at the source database at this SCN.
WAIT_FOR_LOG	VARCHAR2 (3)		Indicates whether the persistent session waits for RFS to register new archived logs or to fill gaps (YES) or not (NO)
HOT_MINE	VARCHAR2 (3)		Indicates whether real-time mining is on (YES) or not (NO)
SAFE_PURGE_SCN	NUMBER		Persistent session can safely be purged up to this SCN
CHECKPOINT_SCN	NUMBER		SCN at which the latest checkpoint is taken by the persistent LogMiner session
PURGE_SCN	NUMBER		The session has been purged up to this SCN

5.160 DBA_LOGSTDBY_EVENTS

DBA_LOGSTDBY_EVENTS displays information about the activity of the logical standby database system.

It can be used to determine the cause of failures that occur when applying redo data to logical standby databases. This view is for logical standby databases only.

Column	Datatype	NULL	Description
EVENT_TIME	DATE		Time when the event was logged
EVENT_TIMESTAMP	TIMESTAMP (6)	NOT NULL	Timestamp when the event was logged
START_SCN	NUMBER		The SCN at which the associated transaction started at the primary database. This SCN refers to the system change number at the primary database.
CURRENT_SCN	NUMBER		SCN associated with the change at the primary database. If a failure occurred, then examine this column to determine which archived log file contains the source of the failure (for example, an unsupported record).
COMMIT_SCN	NUMBER		SCN value on which the change was committed at the primary database
XIDUSN	NUMBER		Transaction ID undo segment number at the primary database of the associated transaction
XIDSLT	NUMBER		Transaction ID slot number at the primary database of the associated transaction
XIDSQN	NUMBER		Transaction ID sequence number at the primary database of the associated transaction

Column	Datatype	NULL	Description
EVENT	CLOB		Statement that was being processed when the failure occurred
STATUS_CODE	NUMBER		Status (or Oracle error code) belonging to the STATUS message
STATUS	VARCHAR2 (2000)		Description of the current activity of the process or the reason why the apply operation stopped
SRC_CON_NAME	VARCHAR2 (30)		Identifies the PDB name at the primary database where the transaction was executed
SRC_CON_ID	NUMBER		Contains the PDB ID (the PDB_ID column from the DBA_PDBS view) of the primary database where the associated change was generated.

Note:

In a CDB, this view shows data only when queried in the root.

5.161 DBA_LOGSTDBY_HISTORY

DBA_LOGSTDBY_HISTORY displays the history of switchovers and failovers in a Data Guard configuration.

It does this by showing the complete sequence of redo log streams processed or created on the local system, across all role transitions. (After a role transition, a new log stream is started and the log stream sequence number is incremented by the new primary database.). This view is for logical standby databases only.

Column	Datatype	NULL	Description
STREAM_SEQUENCE#	NUMBER		<p>Lists the sequence numbers for all log streams created or applied on the local system.</p> <p>Note: A value of 0 indicates an unknown sequence order; this is reserved for future log streams.</p>
STATUS	VARCHAR2 (16)		<p>Description of the log stream processing:</p> <ul style="list-style-type: none"> • Past - The log stream has already been processed • Immediate Past - This is the most recently processed log stream; its status is transitioning from Current to Past • Current - The log stream is currently being processed • Immediate Future - This is the next log stream to be processed; its status is transitioning from Future to Current • Future - The log stream will be processed

Column	Datatype	NULL	Description
SOURCE	VARCHAR2 (5)		Describes how the log stream was started: <ul style="list-style-type: none"> • RFS - The RFS process created the log stream • User - A user registered the initial log file for the log stream • Synch - A user issued the ALTER DATABASE START LOGICAL STANDBY APPLY NEW PRIMARY DDL statement • Redo - The log stream information was recorded in the redo log
DBID	NUMBER		Database identifier of the primary database that created the log stream
FIRST_CHANGE#	NUMBER		Lowest system change number (SCN) in the current log file
LAST_CHANGE#	NUMBER		Highest system change number (SCN) in the current log file
FIRST_TIME	DATE		Time of the first SCN entry (FIRST_CHANGE#) in the current log file
LAST_TIME	DATE		Time of the last SCN entry (LAST_CHANGE#) in the current log file
DGNAME	VARCHAR2 (255)		Unique database name (DB_UNIQUE_NAME) of the primary database that produced the log stream. See V\$DATAGUARD_CONFIG to display all database DB_UNIQUE_NAME values defined in the Data Guard configuration.
MERGE_CHANGE#	NUMBER		SCN that should be used to flashback a failed primary (that created the log stream) or to flashback a bystander logical standby database following a failover, in the context of the associated redo log stream. It is the SCN up to which redo for the associated log stream can be merged safely in all databases using local copies of archived logs received from the primary database. In order to apply changes beyond this following a failover, you will need to fetch and mine the redo logs from the failover target.
PROCESSED_CHANGE#	NUMBER		Strict upper bound on the SCN up to which SQL Apply has applied redo records before it switched to a new log stream (either because it was activated and became the primary database, or in the case of a bystander logical standby database where it switched to a new log stream to accommodate a new primary database).

 **Note:**

In a CDB, this view shows data only when queried in the root.

5.162 DBA_LOGSTDBY_LOG

`DBA_LOGSTDBY_LOG` displays information about the logs registered for a logical standby database.

This view is for logical standby databases only.

Column	Datatype	NULL	Description
THREAD#	NUMBER	NOT NULL	Thread ID of the archive log. The THREAD number is 1 for a single instance. For Real Application Clusters, this column will contain different numbers.
RESETLOGS_CHANGE#	NUMBER	NOT NULL	Start SCN of the branch
RESETLOGS_ID	NUMBER	NOT NULL	Resetlogs identifier (a numeric form of the timestamp of the branch)
SEQUENCE#	NUMBER	NOT NULL	Sequence number of the archive log file
FIRST_CHANGE#	NUMBER	NOT NULL	System change number (SCN) of the current archive log
NEXT_CHANGE#	NUMBER		SCN of the next archive log
FIRST_TIME	DATE		Date of the current archive log
NEXT_TIME	DATE		Date of the next archive log
FILE_NAME	VARCHAR2 (513)		Name of the archive log
TIMESTAMP	DATE		Time when the archive log was registered
DICT_BEGIN	VARCHAR2 (3)		Indicates whether the beginning of the dictionary build is in this archive log (YES) or not (NO)
DICT_END	VARCHAR2 (3)		Indicates whether the end of the dictionary build is in this archive log (YES) or not (NO)
APPLIED	VARCHAR2 (8)		Indicates primarily whether a given foreign archived log has been applied fully by SQL Apply: <ul style="list-style-type: none">• YES - SQL Apply has fully applied the foreign archived log and no longer needs it• CURRENT - SQL Apply is currently applying changes contained in the foreign archived log• NO - SQL Apply has not started applying any changes contained in the foreign archived log• FETCHING - SQL Apply encountered a corruption while reading redo records from this foreign archived log, and is currently using the automatic gap resolution to refetch a new copy of the log from the primary database• CORRUPT - SQL Apply encountered a corruption while reading redo records from this foreign archived log, and refetching a new copy of the archived log did not resolve the problem. SQL Apply will not refetch a new copy of this archived log automatically, and will require user intervention to manually register a new copy of the foreign archived log.
BLOCKS	NUMBER		Number of blocks in the log
BLOCK_SIZE	NUMBER		Size of each block in the log

Note:

The SCN values in this view correlate to the SCN values shown in the DBA_LOGSTDBY_PROGRESS view.

Note:

In a CDB, this view shows data only when queried in the root.

5.163 DBA_LOGSTDBY_NOT_UNIQUE

DBA_LOGSTDBY_NOT_UNIQUE displays all tables that have no primary and no non-null unique indexes.

Most of the tables displayed by this view are supported because their columns contain enough information to be maintained in a logical standby database. Some tables, however, cannot be supported because their columns do not contain the necessary information. Unsupported tables usually contain a column defined using an unsupported data type.

In a CDB, the data displayed pertains to the container in which the view is queried.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Schema name of the non-unique table
TABLE_NAME	VARCHAR2 (128)		Table name of the non-unique table
BAD_COLUMN	VARCHAR2 (1)		<ul style="list-style-type: none"> • Y - Table column is defined using an unbounded data type, such as LONG or BLOB. If two rows in the table match except in their LOB columns, then the table cannot be maintained properly. Log apply services will attempt to maintain these tables, but you must ensure the application does not allow uniqueness only in the unbounded columns. • N - Enough column information is present to maintain the table in the logical standby database but the log transport services and log apply services would run more efficiently if you added a primary key. You should consider adding a disabled RELY constraint to these tables.

5.164 DBA_LOGSTDBY_PARAMETERS

DBA_LOGSTDBY_PARAMETERS displays the list of parameters used by SQL apply for logical standby databases.

This view is for logical standby databases only.

Column	Datatype	NULL	Description
NAME	VARCHAR2 (64)		<p>Name of the parameter:</p> <ul style="list-style-type: none"> • MAX_SGA - System global area (SGA) allocated for the log apply services cache (in megabytes) • MAX_SERVERS - Number of processes used by SQL Apply services • PREPARE_SERVERS - Controls the number of parallel execution servers used to prepare changes • APPLY_SERVERS - Controls the number of parallel execution servers used to apply changes • MAX_EVENTS_RECORDED - Number of events stored in the DBA_LOGSTDBY_EVENTS view • RECORD_SKIP_ERRORS - Indicates records that are skipped • RECORD_SKIP_DDL - Indicates skipped DDL statements • RECORD_APPLIED_DDL - Indicates applied DDL statements • RECORD_UNSUPPORTED_OPERATIONS - Shows whether SQL Apply will capture information about transactions that did unsupported operations at the primary database in the DBA_LOGSTDBY_EVENTS view • EVENT_LOG_DEST - Indicates where SQL Apply records the occurrence of an interesting event • LOG_AUTO_DELETE - Shows whether SQL Apply will automatically delete remote archived logs received from the primary database, once the contents of the logs are applied at the logical standby database. • LOG_AUTO_DEL_RETENTION_TARGET - How many minutes a remote archived log received from the primary database will be retained at the logical standby database, once the contents of the log are applied by SQL Apply. • PRESERVE_COMMIT_ORDER - Shows whether transactions are committed at the logical standby database in the same order that they were committed at the primary database
VALUE	VARCHAR2 (2000)		Value of the parameter
UNIT	VARCHAR2 (64)		Unit of the value, if applicable
SETTING	VARCHAR2 (64)		<p>Possible values are as follows:</p> <ul style="list-style-type: none"> • SYSTEM - Parameter value was not explicitly set by the user. However, the user can change it with an appropriate call to the <code>APPLY_SET</code> procedure. • USER - Parameter value was explicitly set by the user
DYNAMIC	VARCHAR2 (64)		<p>YES if the parameter can be set dynamically (that is, without having to stop SQL Apply)</p> <p>NO if setting the parameter requires that SQL Apply be stopped</p>

 **Note:**

In a CDB, this view shows data when queried in the root.

5.165 DBA_LOGSTDBY_PLSQL_MAP

`DBA_LOGSTDBY_PLSQL_MAP` shows the mapping between a supported user invokable (/external) PL/SQL procedure to the corresponding replicated internal PL/SQL procedure.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)	NOT NULL	Owner name of the procedure
PKG_NAME	VARCHAR2 (128)		Package name of the user invokable procedure
PROC_NAME	VARCHAR2 (128)		Procedure name of the user invokable procedure
INTERNAL_PKG_NAME	VARCHAR2 (128)		Package name of the internal procedure
INTERNAL_PROC_NAME	VARCHAR2 (128)		Procedure name of the internal procedure

 **Note:**

In a CDB, this view shows data when queried in the root or a PDB.

5.166 DBA_LOGSTDBY_PLSQL_SUPPORT

`DBA_LOGSTDBY_PLSQL_SUPPORT` shows the PL/SQL packages that are only supported during rolling operations.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)	NOT NULL	Owner name of the package
PKG_NAME	VARCHAR2 (128)		Package name of the user invokable procedure
SUPPORT_LEVEL	VARCHAR2 (12)		Logical standby PL/SQL support level for the package: <ul style="list-style-type: none"> • ALWAYS - PL/SQL replication is always supported for this package, whether it is called inside or outside of <code>DBMS_ROLLING</code> • DBMS_ROLLING: PL/SQL replication is supported only when the procedure is called inside <code>DBMS_ROLLING</code>

 **Note:**

In a CDB, this view shows data when queried in the root or a PDB.

 **See Also:**

Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_ROLLING package

5.167 DBA_LOGSTDBY_PROGRESS

DBA_LOGSTDBY_PROGRESS is deprecated. The information that was provided in this view is now provided in the V\$LOGSTDBY_PROGRESS view.

 **See Also:**

"V\$LOGSTDBY_PROGRESS"

5.168 DBA_LOGSTDBY_SKIP

DBA_LOGSTDBY_SKIP displays the skip rules that are used by SQL Apply.

This view is for logical standby databases only.

Column	Datatype	NULL	Description
ERROR	VARCHAR2(1)		Indicates how the skip rule was created: <ul style="list-style-type: none"> Y - For rules from DBMS_LOGSTDBY.SKIP_ERROR N - For rules from DBMS_LOGSTDBY.SKIP
STATEMENT_OPT	VARCHAR2(128)		Specifies the type of statement that should be skipped
OWNER	VARCHAR2(128)		Name of the schema under which the skip option should be used
NAME	VARCHAR2(261)		Name of the object that is being skipped
USE_LIKE	VARCHAR2(1)		Indicates whether the statement should use a SQL wildcard search when matching names (Y) or not (N)
ESC	VARCHAR2(1)		Escape character used when performing wildcard matches
PROC	VARCHAR2(392)		Name of a stored procedure that will be executed when processing the skip option

 **See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_LOGSTDBY.SKIP_ERROR procedure
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_LOGSTDBY.SKIP procedure

5.169 DBA_LOGSTDBY_SKIP_TRANSACTION

`DBA_LOGSTDBY_SKIP_TRANSACTION` displays the skip settings chosen. This view is for logical standby databases only.

Column	Datatype	NULL	Description
XIDUSN	NUMBER		Transaction ID undo segment number
XIDSLT	NUMBER		Transaction ID slot number
XIDSQN	NUMBER		Transaction ID sequence number
CON_NAME	VARCHAR2 (384)		Container name

5.170 DBA_LOGSTDBY_UNSUPPORTED

`DBA_LOGSTDBY_UNSUPPORTED` displays the schemas, tables, and columns in those tables that contain unsupported data types.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Owner of the unsupported table
TABLE_NAME	VARCHAR2 (128)		Name of the unsupported table
COLUMN_NAME	VARCHAR2 (128)		Name of the unsupported column
ATTRIBUTES	VARCHAR2 (39)		When possible, displays the reason why the table is not supported by SQL Apply. The ATTRIBUTES column may be NULL if the table structure itself is not supported by SQL Apply (for example, the table is system-partitioned), or when the structure of the table is supported but certain columns in the table have an unsupported datatype.
DATA_TYPE	VARCHAR2 (32)		Datatype of the unsupported column

 **Note:**

A rolling upgrade performed using the `DBMS_ROLLING` PL/SQL package supports more object types than a manual rolling upgrade performed using transient logical standby databases.

 **See Also:**

- "[DBA_ROLLING_UNSUPPORTED](#)" for more information about determining unsupported data types for a rolling upgrade using the DBMS_ROLLING package
- *Oracle Data Guard Concepts and Administration* for more information about rolling operations
- *Oracle Data Guard Concepts and Administration* for more information about unsupported tables for rolling upgrade operations
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_ROLLING package

5.171 DBA_LOGSTDBY_UNSUPPORTED_TABLE

`DBA_LOGSTDBY_UNSUPPORTED_TABLE` displays the data tables that are not supported by Logical Standby.

The data displayed pertains to the container in which the view is queried. This view is for logical standby databases only.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Owner of the unsupported table
TABLE_NAME	VARCHAR2 (128)		Name of the unsupported table

5.172 DBA_MEASURE_FOLDER_CONTENTS

`DBA_MEASURE_FOLDER_CONTENTS` describes the contents of all OLAP measure folders in the database. Its columns are the same as those in `ALL_MEASURE_FOLDER_CONTENTS`.

 **See Also:**

- "["ALL_MEASURE_FOLDER_CONTENTS"](#)"

5.173 DBA_MEASURE_FOLDER_SUBFOLDERS

`DBA_MEASURE_FOLDER_SUBFOLDERS` describes the OLAP measure folders contained within the database OLAP measure folders. Its columns are the same as those in `ALL_MEASURE_FOLDER_SUBFOLDERS`.

 **See Also:**

- "["ALL_MEASURE_FOLDER_SUBFOLDERS"](#)"

5.174 DBA_MEASURE_FOLDERS

DBA_MEASURE_FOLDERS describes all OLAP measure folders in the database. Its columns are the same as those in ALL_MEASURE_FOLDERS.

 **See Also:**

"[ALL_MEASURE_FOLDERS](#)"

5.175 DBA_METADATA_PROPERTIES

DBA_METADATA_PROPERTIES describes OLAP metadata properties in the database. Its columns are the same as those in ALL_METADATA_PROPERTIES.

 **See Also:**

"[ALL_METADATA_PROPERTIES](#)"

5.176 DBA_METHOD_PARAMS

DBA_METHOD_PARAMS describes the method parameters of all object types in the database. Its columns are the same as those in ALL_METHOD_PARAMS.

 **See Also:**

"[ALL_METHOD_PARAMS](#)"

5.177 DBA_METHOD_RESULTS

DBA_METHOD_RESULTS describes the method results of all object types in the database. Its columns are the same as those in ALL_METHOD_RESULTS.

 **See Also:**

"[ALL_METHOD_RESULTS](#)"

5.178 DBA_MINING_MODEL_ATTRIBUTES

DBA_MINING_MODEL_ATTRIBUTES describes all mining model attributes in the database. Its columns are the same as those in ALL_MINING_MODEL_ATTRIBUTES.

 **See Also:**

["ALL_MINING_MODEL_ATTRIBUTES"](#)

5.179 DBA_MINING_MODEL_PARTITIONS

DBA_MINING_MODEL_PARTITIONS describes all the model partitions accessible to the system. Its columns are the same as those in ALL_MINING_MODEL_PARTITIONS.

 **See Also:**

["ALL_MINING_MODEL_PARTITIONS"](#)

5.180 DBA_MINING_MODEL_SETTINGS

DBA_MINING_MODEL_SETTINGS describes all mining model settings in the database. Its columns are the same as those in ALL_MINING_MODEL_SETTINGS.

 **See Also:**

["ALL_MINING_MODEL_SETTINGS"](#)

5.181 DBA_MINING_MODEL_TABLES

DBA_MINING_MODEL_TABLES describes the tables that contain metadata about the mining models in the database.

Mining models are schema objects created by Oracle Data Mining.

Model tables reside in the schema of the mining model owner. The metadata stored in the tables is controlled by Oracle Data Mining APIs. The tables are read-only. They should not be modified by users.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)	NOT NULL	Owner of the mining model
MODEL_NAME	VARCHAR2 (128)	NOT NULL	Name of the mining model
TABLE_NAME	VARCHAR2 (128)	NOT NULL	Name of the table

Column	Datatype	NULL	Description
TABLE_TYPE	VARCHAR2(21)		The type of metadata stored in the table

5.182 DBA_MINING_MODEL_VIEWS

DBA_MINING_MODEL_VIEWS describes all model views in the database. Its columns are the same as those in ALL_MINING_MODEL_VIEWS.

 **See Also:**

["ALL_MINING_MODEL_VIEWS"](#)

5.183 DBA_MINING_MODEL_XFORMS

DBA_MINING_MODEL_XFORMS describes the user-specified transformations embedded in all models accessible in the system. Its columns are the same as those in ALL_MINING_MODEL_XFORMS.

 **See Also:**

["ALL_MINING_MODEL_XFORMS"](#)

5.184 DBA_MINING_MODELS

DBA_MINING_MODELS describes all mining models in the database. Its columns are the same as those in ALL_MINING_MODELS.

 **See Also:**

["ALL_MINING_MODELS"](#)

5.185 DBA_MVIEW_AGGREGATES

DBA_MVIEW_AGGREGATES describes the grouping functions (aggregated measures) that appear in the SELECT list of all aggregated materialized view in the database. Its columns are the same as those in ALL_MVIEW_AGGREGATES.

 **See Also:**

["ALL_MVIEW_AGGREGATES"](#)

5.186 DBA_MVIEW_ANALYSIS

DBA_MVIEW_ANALYSIS describes all materialized views in the database that potentially support query rewrite and that provide additional information for analysis by applications. Its columns are the same as those in ALL_MVIEW_ANALYSIS.

 **Note:**

This view excludes materialized views that reference remote tables or that include references to non-static values such as SYSDATE or USER. This view also excludes materialized views that were created as snapshots before Oracle8i and that were never altered to enable query rewrite.

 **See Also:**

"[ALL_MVIEW_ANALYSIS](#)"

5.187 DBA_MVIEW_COMMENTS

DBA_MVIEW_COMMENTS displays comments on all materialized views in the database. Its columns are the same as those in ALL_MVIEW_COMMENTS.

 **See Also:**

"[ALL_MVIEW_COMMENTS](#)"

5.188 DBA_MVIEW_DETAIL_PARTITION

DBA_MVIEW_DETAIL_PARTITION displays freshness information, with respect to partition change tracking (PCT) detail partitions, for all materialized views in the database. Its columns are the same as those in ALL_MVIEW_DETAIL_PARTITION.

 **See Also:**

"[ALL_MVIEW_DETAIL_PARTITION](#)".

5.189 DBA_MVIEW_DETAIL_RELATIONS

DBA_MVIEW_DETAIL_RELATIONS represents the named detail relations that are either in the FROM list of a materialized view, or that are indirectly referenced through views in the FROM list. Its columns are the same as those in ALL_MVIEW_DETAIL_RELATIONS.

 **See Also:**

["ALL_MVIEW_DETAIL_RELATIONS"](#)

5.190 DBA_MVIEW_DETAIL_SUBPARTITION

DBA_MVIEW_DETAIL_SUBPARTITION displays freshness information, with respect to partition change tracking (PCT) detail subpartitions, for all materialized views in the database. Its columns are the same as those in ALL_MVIEW_DETAIL_SUBPARTITION.

 **See Also:**

["ALL_MVIEW_DETAIL_SUBPARTITION"](#)

5.191 DBA_MVIEW_JOINS

DBA_MVIEW_JOINS describes a join between two columns in the WHERE clause of a subquery that defines a materialized view. Its columns are the same as those in ALL_MVIEW_JOINS.

 **See Also:**

["ALL_MVIEW_JOINS"](#)

5.192 DBA_MVIEW_KEYS

DBA_MVIEW_KEYS describes the columns or expressions in the SELECT list upon which materialized views in the database are based. Its columns are the same as those in ALL_MVIEW_KEYS.

 **See Also:**

["ALL_MVIEW_KEYS"](#)

5.193 DBA_MVIEW_LOG_FILTER_COLS

DBA_MVIEW_LOG_FILTER_COLS displays all columns (excluding primary key columns) being logged in the materialized view logs.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Owner of the master table being logged
NAME	VARCHAR2 (128)		Name of the master table being logged
COLUMN_NAME	VARCHAR2 (128)		Column being logged

5.194 DBA_MVIEW_LOGS

DBA_MVIEW_LOGS describes all materialized view logs in the database. Its columns are the same as those in ALL_MVIEW_LOGS.

 See Also:

"ALL_MVIEW_LOGS"

5.195 DBA_MVIEW_REFRESH_TIMES

DBA_MVIEW_REFRESH_TIMES describes refresh times of all materialized views in the database. Its columns are the same as those in ALL_MVIEW_REFRESH_TIMES.

 See Also:

"ALL_MVIEW_REFRESH_TIMES"

5.196 DBA_MVIEWS

DBA_MVIEWS describes all materialized views in the database. Its columns are the same as those in ALL_MVIEWS.

 See Also:

"ALL_MVIEWS"

5.197 DBA_MVREF_CHANGE_STATS

`DBA_MVREF_CHANGE_STATS` displays the change data load information on the base tables associated with a refresh run for all the materialized views for the database.

Related View

`USER_MVREF_CHANGE_STATS` displays the change data load information on the master tables associated with a refresh run for all the materialized views in the database that are accessible to the current user.

Column	Datatype	NULL	Description
TBL_OWNER	VARCHAR2(128)	NOT NULL	Owner of the master table for the materialized view
TBL_NAME	VARCHAR2(128)	NOT NULL	Name of the master table for the materialized view
MV_OWNER	VARCHAR2(128)	NOT NULL	Owner of the materialized view
MV_NAME	VARCHAR2(128)	NOT NULL	Name of the materialized view
REFRESH_ID	NUMBER	NOT NULL	The refresh ID of the refresh run
NUM_ROWS_INS	NUMBER		The number of inserts in the materialized view log of the table (applicable only if the table has a materialized view log)
NUM_ROWS_UPD	NUMBER		The number of updates in the materialized view log of the table (applicable only if the table has a materialized view log)
NUM_ROWS_DEL	NUMBER		The number of deletes in the materialized view log of the table (applicable only if the table has a materialized view log)
NUM_ROWS_DL_INS	NUMBER		The number of direct load inserts on the table
PMOPS_OCCURRED	CHAR(1)		Indicates whether a partition-maintenance operation (PMOP) occurred. Possible values: <ul style="list-style-type: none"> • Y • N • NULL: Indicates an unknown value
PMOP_DETAILS	VARCHAR2(4000)		Details of the PMOPs in the following format: <ul style="list-style-type: none"> • TRUNCATE (low_bound, high_bound) • EXCHANGE (low_bound, high_bound)
NUM_ROWS	NUMBER		The number of rows in the table at the start of the refresh operation

See Also:

["USER_MVREF_CHANGE_STATS"](#)

5.198 DBA_MVREF_RUN_STATS

`DBA_MVREF_RUN_STATS` has information about each refresh run for all the materialized views for the database, with each run being identified by the `REFRESH_ID`. The information includes timing statistics related to the run and the parameters specified in that run.

Related View

`USER_MVREF_RUN_STATS` has information about each refresh run for the materialized views accessible for the current database user, with each run being identified by the `REFRESH_ID`. The information includes timing statistics related to the run and the parameters specified in that run. This view does not display the `RUN_OWNER` column.

Column	Datatype	NULL	Description
<code>RUN_OWNER</code>	VARCHAR2 (128)	NOT NULL	Owner of the refresh operation (the user who launched the operation)
<code>REFRESH_ID</code>	NUMBER	NOT NULL	The refresh ID of the refresh run
<code>NUM_MVS</code>	NUMBER	NOT NULL	The number of materialized views being refreshed in the run
<code>MVIEWS</code>	VARCHAR2 (4000)		Shows the list of comma separated parameters specified in the API for the materialized view refresh operation
<code>BASE_TABLES</code>	VARCHAR2 (4000)		For internal use only
<code>METHOD</code>	VARCHAR2 (4000)		The <code>METHOD</code> parameter specified by the API
<code>ROLLBACK_SEG</code>	VARCHAR2 (4000)		The <code>ROLLBACK_SEG</code> parameter specified by the API
<code>PUSH_DEFERRED_RPC</code>	CHAR (1)		The <code>PUSH_DEFERRED_RPC</code> parameter specified by the API
<code>REFRESH_AFTER_ERRORS</code>	CHAR (1)		The <code>REFRESH_AFTER_ERRORS</code> parameter specified by the API
<code>PURGE_OPTION</code>	NUMBER		The <code>PURGE_OPTION</code> parameter specified by the API
<code>PARALLELISM</code>	NUMBER		The <code>PARALLELISM</code> parameter specified by the API
<code>HEAP_SIZE</code>	NUMBER		The <code>HEAP_SIZE</code> parameter specified by the API
<code>ATOMIC_REFRESH</code>	CHAR (1)		The <code>ATOMIC_REFRESH</code> parameter specified by the API
<code>NESTED</code>	CHAR (1)		The <code>NESTED</code> parameter specified by the API
<code>OUT_OF_PLACE</code>	CHAR (1)		The <code>OUT_OF_PLACE</code> parameter specified by the API
<code>NUMBER_OF_FAILURES</code>	NUMBER		The number of failures that occurred in processing the API
<code>START_TIME</code>	TIMESTAMP (6)		Start time of the refresh run
<code>END_TIME</code>	TIMESTAMP (6)		End time of the refresh run
<code>ELAPSED TIME</code>	NUMBER		The length of time for the refresh run, in seconds
<code>LOG_SETUP_TIME</code>	NUMBER		Log setup time (in seconds) for the materialized view for a non-atomic refresh; <code>NULL</code> for an atomic refresh
<code>LOG_PURGE_TIME</code>	NUMBER		Log purge time (in seconds) for the materialized view in the case of atomic refresh; <code>NULL</code> in the case of non-atomic refresh

Column	Datatype	NULL	Description
COMPLETE_STATS_AVAILABLE	CHAR(1)		<p>Indicates whether all the complete refresh statistics are available for this run:</p> <ul style="list-style-type: none"> • Y: All the statistics are available • N: All the statistics are not available

 See Also:["USER_MVREF_RUN_STATS"](#)

5.199 DBA_MVREF_STATS

DBA_MVREF_STATS shows the REFRESH_ID associated with each refresh run of each materialized view for the database. It also provides some basic timing statistics related to that materialized view's refresh in that run.

Related View

USER_MVREF_STATS shows the REFRESH_ID associated with each refresh run of each materialized view for the database that is accessible to the current user. It also provides some basic timing statistics related to that materialized view's refresh in that run. This view does not display the MV_OWNER column.

Column	Datatype	NULL	Description
MV_OWNER	VARCHAR2(128)	NOT NULL	Owner of the materialized view
MV_NAME	VARCHAR2(128)	NOT NULL	Name of the materialized view
REFRESH_ID	NUMBER	NOT NULL	The refresh ID of the refresh run
REFRESH_METHOD	VARCHAR2(30)		<p>The refresh method used to refresh the materialized view:</p> <ul style="list-style-type: none"> • FAST • PCT • COMPLETE • OUT OF PLACE FAST • OUT OF PLACE PCT • OUT OF PLACE COMPLETE
REFRESH_OPTIMIZATIONS	VARCHAR2(4000)		The refresh optimization, for example, a null refresh, or a primary key/foreign key that is applied during refresh of the materialize view
ADDITIONAL_EXECUTIONS	VARCHAR2(4000)		The additional executions, for example, an index rebuild, or log operations involved during refresh of the materialized view
START_TIME	TIMESTAMP(6)		Start time of the refresh run
END_TIME	TIMESTAMP(6)		End time of the refresh run
ELAPSED_TIME	NUMBER		The length of time for the refresh run, in seconds
LOG_SETUP_TIME	NUMBER		Log setup time (in seconds) for the materialized view for a non-atomic refresh; NULL for an atomic refresh

Column	Datatype	NULL	Description
LOG_PURGE_TIME	NUMBER		Log purge time (in seconds) for the materialized view in the case of atomic refresh; <code>NULL</code> in the case of non-atomic refresh
INITIAL_NUM_ROWS	NUMBER		Initial number of rows in the materialized view (at the start of the refresh)
FINAL_NUM_ROWS	NUMBER		Final number of rows in the materialized view (at the end of the refresh)

 See Also:["USER_MVREF_STATS"](#)

5.200 DBA_MVREF_STATS_PARAMS

`DBA_MVREF_STATS_PARAMS` displays the refresh statistics properties associated with each materialized view. These properties can be modified with the `DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS` procedure.

Related View

`USER_MVREF_STATS_PARAMS` displays the refresh statistics properties associated with each materialized view accessible to the current user. These properties can be modified with the `DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS` procedure.

Column	Datatype	NULL	Description
MV_OWNER	VARCHAR2 (128)	NOT NULL	Owner of the materialized view
MV_NAME	VARCHAR2 (128)	NOT NULL	Name of the materialized view
COLLECTION_LEVEL	VARCHAR2 (8)		The collection level for the materialized view
RETENTION_PERIOD	NUMBER		The retention period for the materialize view

 See Also:["USER_MVREF_STATS_PARAMS"](#)

5.201 DBA_MVREF_STATS_SYS_DEFAULTS

`DBA_MVREF_STATS_SYS_DEFAULTS` displays the system-wide defaults for the refresh history statistics properties for materialized views. These values can be altered with the `SET_SYSTEM_DEFAULTS` procedure by a database administrator.

This view contains exactly two rows corresponding to the collection-level and retention-period properties; their initial values are `TYPICAL` and `31` respectively.

Related View

`USER_MVREF_STATS_SYS_DEFAULTS` displays the system-wide defaults for the refresh history statistics properties for materialized views accessible to the current user. These values can be altered with the `SET_SYSTEM_DEFAULTS` procedure by a database administrator.

Column	Datatype	NULL	Description
PARAMETER_NAME	CHAR (16)		Value of the <code>parameter_name</code> parameter: <ul style="list-style-type: none"> • <code>COLLECTION_LEVEL</code> • <code>RETENTION_PERIOD</code>
VALUE	VARCHAR2 (40)		The system-wide default value for the parameter

 **See Also:**

["USER_MVREF_STATS_SYS_DEFAULTS"](#)

5.202 DBA_MVREF_STMT_STATS

`DBA_MVREF_STMT_STATS` shows information associated with each refresh statement of a materialized view in a refresh run.

Related View

`USER_MVREF_STMT_STATS` shows information associated with each refresh statement of a materialized view accessible to the current user in a refresh run.

Column	Datatype	NULL	Description
MV_OWNER	VARCHAR2 (128)	NOT NULL	Owner of the materialized view
MV_NAME	VARCHAR2 (128)	NOT NULL	Name of the materialized view
REFRESH_ID	NUMBER	NOT NULL	The refresh ID of the refresh run
STEP	NUMBER	NOT NULL	A number indicating the step in the refresh process in which the statement is executed for the materialized view. Steps are numbered consecutively starting at 1.
SQLID	VARCHAR2 (14)	NOT NULL	The SQL ID of the statement
STMT	CLOB	NOT NULL	The text of the SQL statement
EXECUTION_TIME	NUMBER	NOT NULL	The time it took to execute the statement (in seconds)
EXECUTION_PLAN	XMLTYPE STORAGE BINARY		For internal use only

 **See Also:**

["USER_MVREF_STMT_STATS"](#)

5.203 DBA_NESTED_TABLE_COLS

DBA_NESTED_TABLE_COLS describes the columns of all nested tables in the database. Its columns are the same as those in ALL_NESTED_TABLE_COLS.

To gather statistics for this view, use the DBMS_STATS package.

 **See Also:**

["ALL_NESTED_TABLE_COLS"](#)

5.204 DBA_NESTED_TABLES

DBA_NESTED_TABLES describes all nested tables contained in all tables in the database. Its columns are the same as those in ALL_NESTED_TABLES.

 **See Also:**

["ALL_NESTED_TABLES"](#)

5.205 DBA_NETWORK_ACL_PRIVILEGES

DBA_NETWORK_ACL_PRIVILEGES describes the network privileges defined in all access control lists that are currently assigned to network hosts.

 **Note:**

This DBA_NETWORK_ACL_PRIVILEGES view is deprecated in Oracle Database 12c Release 1 (12.1). Oracle recommends that you use the DBA_HOST_ACES view, instead.

Column	Datatype	NULL	Description
ACL	VARCHAR2(4000)		Path of the access control list
ACLID	RAW(8)	NOT NULL	Object ID of the access control list
PRINCIPAL	VARCHAR2(128)		Principal (database user or role) whom the privilege is granted to or denied from
PRIVILEGE	VARCHAR2(128)		Network privilege
IS_GRANT	VARCHAR2(5)		Indicates whether the privilege is granted (<code>true</code>) or denied (<code>false</code>)
INVERT	VARCHAR2(5)		Indicates whether the access control entry contains invert principal (<code>true</code>) or not (<code>false</code>)
START_DATE	TIMESTAMP(6)		Start date of the access control entry
END_DATE	TIMESTAMP(6)		End date of the access control entry

Column	Datatype	NULL	Description
ACL_OWNER	VARCHAR2 (128)		Owner of the access control list

 **See Also:**

["DBA_HOST_ACES"](#)

5.206 DBA_NETWORK_ACLS

DBA_NETWORK_ACLS describes the access control list assignments to network hosts.

 **Note:**

This DBA_NETWORK_ACLS view is deprecated in Oracle Database 12c Release 1 (12.1). Oracle recommends that you use the DBA_HOST_ACLS view, instead.

Column	Datatype	NULL	Description
HOST	VARCHAR2 (1000)	NOT NULL	Network host
LOWER_PORT	NUMBER (5)		Lower bound of the port range
UPPER_PORT	NUMBER (5)		Upper bound of the port range
ACL	VARCHAR2 (4000)		Path of the access control list
ACOLID	RAW (8)		Object ID of the access control list
ACL_OWNER	VARCHAR2 (128)		Owner of the access control list

 **See Also:**

["DBA_HOST_ACLS"](#)

5.207 DBA_OBJ_AUDIT_OPTS

DBA_OBJ_AUDIT_OPTS describes auditing options on all objects.

 **Note:**

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED_AUDIT_TRAIL.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

Related View

USER_OBJ_AUDIT_OPTS describes auditing options on all objects owned by the current user. This view does not display the OWNER column.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Owner of the object
OBJECT_NAME	VARCHAR2 (128)		Name of the object
OBJECT_TYPE	VARCHAR2 (23)		Type of the object
ALT	VARCHAR2 (3)		Auditing ALTER WHENEVER SUCCESSFUL / UNSUCCESSFUL
AUD	VARCHAR2 (3)		Auditing AUDIT WHENEVER SUCCESSFUL / UNSUCCESSFUL
COM	VARCHAR2 (3)		Auditing COMMENT WHENEVER SUCCESSFUL / UNSUCCESSFUL
DEL	VARCHAR2 (3)		Auditing DELETE WHENEVER SUCCESSFUL / UNSUCCESSFUL
GRA	VARCHAR2 (3)		Auditing GRANT WHENEVER SUCCESSFUL / UNSUCCESSFUL
IND	VARCHAR2 (3)		Auditing INDEX WHENEVER SUCCESSFUL / UNSUCCESSFUL
INS	VARCHAR2 (3)		Auditing INSERT WHENEVER SUCCESSFUL / UNSUCCESSFUL
LOC	VARCHAR2 (3)		Auditing LOCK WHENEVER SUCCESSFUL / UNSUCCESSFUL
REN	VARCHAR2 (3)		Auditing RENAME WHENEVER SUCCESSFUL / UNSUCCESSFUL
SEL	VARCHAR2 (3)		Auditing SELECT WHENEVER SUCCESSFUL / UNSUCCESSFUL
UPD	VARCHAR2 (3)		Auditing UPDATE WHENEVER SUCCESSFUL / UNSUCCESSFUL
EXE	VARCHAR2 (3)		Auditing EXECUTE WHENEVER SUCCESSFUL / UNSUCCESSFUL
CRE	VARCHAR2 (3)		Auditing CREATE WHENEVER SUCCESSFUL / UNSUCCESSFUL
REA	VARCHAR2 (3)		Auditing READ WHENEVER SUCCESSFUL / UNSUCCESSFUL
WRI	VARCHAR2 (3)		Auditing WRITE WHENEVER SUCCESSFUL / UNSUCCESSFUL

Column	Datatype	NULL	Description
FBK	VARCHAR2 (3)		Auditing FLASHBACK WHENEVER SUCCESSFUL / UNSUCCESSFUL

 See Also:

- "[USER_OBJ_AUDIT_OPTS](#)"

- *Oracle Database SQL Language Reference* for more information about the SQL AUDIT statement for traditional auditing
- *Oracle Database Security Guide* to learn how to find information about audited activities

5.208 DBA_OBJ_COLATTRS

`DBA_OBJ_COLATTRS` describes object columns and attributes contained in all tables in the database. Its columns are the same as those in `ALL_OBJ_COLATTRS`.

 See Also:

- "["ALL_OBJ_COLATTRS"](#)"

5.209 DBA_OBJECT_SIZE

`DBA_OBJECT_SIZE` lists the sizes, in bytes, of various PL/SQL objects.

Related View

- `USER_OBJECT_SIZE` lists the size of PL/SQL objects owned by the current user.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)	NOT NULL	Owner of the object
NAME	VARCHAR2 (128)	NOT NULL	Name of the object
TYPE	VARCHAR2 (18)		Type of the object: TYPE, TYPE BODY, TABLE, VIEW, SYNONYM, SEQUENCE, PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, JAVA SOURCE, JAVA CLASS or JAVA RESOURCE
SOURCE_SIZE	NUMBER		Size of the source in bytes. Must be in memory during compilation, or dynamic recompilation.
PARSED_SIZE	NUMBER		Size of the parsed form of the object, in bytes. Must be in memory when an object is being compiled that references this object.

Column	Datatype	NULL	Description
CODE_SIZE	NUMBER		Code size, in bytes. Must be in memory when this object is executing.
ERROR_SIZE	NUMBER		Size of error messages, in bytes. In memory during the compilation of the object when there are compilation errors.

 See Also:["USER_OBJECT_SIZE"](#)

5.210 DBA_OBJECT_TABLES

DBA_OBJECT_TABLES describes all object tables in the database. Its columns are the same as those in ALL_OBJECT_TABLES.

 See Also:["ALL_OBJECT_TABLES"](#)

5.211 DBA_OBJECT_USAGE

DBA_OBJECT_USAGE displays statistics about index usage gathered from the database for all the indexes in the database.

You can use this view to monitor index usage. All indexes that have been used at least once can be monitored and displayed in this view.

Related View

- USER_OBJECT_USAGE displays statistics about index usage gathered from the database for the indexes owned by the current user.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)	NOT NULL	Index owner
INDEX_NAME	VARCHAR2 (128)	NOT NULL	Index name in sys.obj\$.name
TABLE_NAME	VARCHAR2 (128)	NOT NULL	Table name in sys.obj\$.name
MONITORING	VARCHAR2 (3)		Indicates whether the monitoring feature is turned on. Possible values: <ul style="list-style-type: none">• YES• NO
USED	VARCHAR2 (3)		Indicates whether the index has been accessed. Possible values: <ul style="list-style-type: none">• YES• NO

Column	Datatype	NULL	Description
START_MONITORING	VARCHAR2(19)		Start monitoring time in sys.object_stats.start_monitoring
END_MONITORING	VARCHAR2(19)		End monitoring time in sys.object_stats.end_monitoring

 **See Also:**

["USER_OBJECT_USAGE"](#)

5.212 DBA_OBJECTS

DBA_OBJECTS describes all objects in the database. Its columns are the same as those in ALL_OBJECTS.

 **See Also:**

["ALL_OBJECTS"](#)

5.213 DBA_OBJECTS_AE

DBA_OBJECTS_AE describes all objects (across all editions) in the database. Its columns are the same as those in ALL_OBJECTS_AE.

 **See Also:**

["ALL_OBJECTS_AE"](#)

5.214 DBA_OPANCILLARY

DBA_OPANCILLARY provides ancillary information for all operator bindings in the database. Its columns are the same as those in ALL_OPANCILLARY.

 **See Also:**

["ALL_OPANCILLARY"](#)

5.215 DBA_OPARGUMENTS

DBA_OPARGUMENTS provides argument information for all operator bindings in the database. Its columns are the same as those in ALL_OPARGUMENTS.

See Also:

"ALL_OPARGUMENTS"

5.216 DBA_OPBINDINGS

DBA_OPBINDINGS describes the binding functions and methods on all operators in the database. Its columns are the same as those in ALL_OPBINDINGS.

See Also:

"ALL_OPBINDINGS"

5.217 DBA_OPERATOR_COMMENTS

DBA_OPERATOR_COMMENTS displays comments for all user-defined operators in the database. Its columns are the same as those in ALL_OPERATOR_COMMENTS.

See Also:

"ALL_OPERATOR_COMMENTS"

5.218 DBA_OPERATORS

DBA_OPERATORS describes all operators in the database. Its columns are the same as those in ALL_OPERATORS.

See Also:

"ALL_OPERATORS"

5.219 DBA_OPTSTAT_OPERATION_TASKS

`DBA_OPTSTAT_OPERATION_TASKS` displays the history of tasks that are performed as part of statistics operations (recorded in `DBA_OPTSTAT_OPERATIONS`). Each task represents a target object to be processed in the corresponding parent operation.

Column	Datatype	NULL	Description
OPID	NUMBER		Internal identifier for the statistics operation that the task belongs to
TARGET	VARCHAR2(100)		Name of the object that this task operates on
TARGET_OBJN	NUMBER		Object number of the target object
TARGET_TYPE	VARCHAR2(40)		Type of the target object. Possible values are: <ul style="list-style-type: none"> • TABLE • TABLE (GLOBAL STATS ONLY): Task is created to gather only global statistics of a partitioned table • TABLE (COORDINATOR JOB): Coordinator task for a partitioned table when concurrency is on • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION
TARGET_SIZE	NUMBER		Target size (in number of blocks) when the task started
START_TIME	TIMESTAMP(6) WITH TIME ZONE		Task start time
END_TIME	TIMESTAMP(6) WITH TIME ZONE		Task end time
STATUS	VARCHAR2(49)		Current task status. Possible values are: <ul style="list-style-type: none"> • PENDING: Task is queued for processing • IN PROGRESS: Task is currently running • COMPLETED: Task has completed successfully • FAILED: Task has failed • SKIPPED: Task has been skipped, as it does not exist any more, or its stats are not stale (applies only to only automatic statistics gathering) • TIMED OUT: Maintenance window was not enough to complete this task (applies only to automatic statistics gathering)
JOB_NAME	VARCHAR2(50)		Name of the scheduler job that executes this task (for example, when concurrency is on)
ESTIMATED_COST	NUMBER		Estimated cost of the task (measured as elapsed time in seconds). This column is populated only when concurrency is on.
BATCHING_COEFF	NUMBER		For internal use only
ACTIONS	NUMBER		For internal use only
PRIORITY	NUMBER		Rank of the task among all target objects for the parent operation

Column	Datatype	NULL	Description
FLAGS	NUMBER		For internal use only
NOTES	VARCHAR2 (4000)		Notes about the underlying task, such as the failure message for tasks with status FAILED.

 **See Also:**

["DBA_OPTSTAT_OPERATIONS"](#)

5.220 DBA_OPTSTAT_OPERATIONS

DBA_OPTSTAT_OPERATIONS contains a history of statistics operations performed at the schema and database level using the DBMS_STATS package.

Column	Datatype	NULL	Description
ID	NUMBER		Internal ID of the statistics operation
OPERATION	VARCHAR2 (64)		Operation name
TARGET	VARCHAR2 (64)		Target on which the operation was performed
START_TIME	TIMESTAMP (6) WITH TIME ZONE		Time at which the operation started
END_TIME	TIMESTAMP (6) WITH TIME ZONE		Time at which the operation ended
STATUS	VARCHAR2 (49)		Current operation status. Possible values are: <ul style="list-style-type: none"> • IN_PROGRESS: Operation is currently running • COMPLETED: Operation has completed successfully • FAILED: Operation has failed • TIMED_OUT: Maintenance window was not enough to complete this operation (applies only to automatic statistics gathering)
JOB_NAME	VARCHAR2 (32)		Name of the scheduler job that executes this operation (for example, a user scheduled statistics gathering job)
SESSION_ID	NUMBER		ID of the session in which this operation is invoked
NOTES	VARCHAR2 (4000)		Notes about the operation, such as a failure message for operations with status FAILED

 See Also:

- "[DBA_OPTSTAT_OPERATION_TASKS](#)"

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_REPAIR.ADMIN_TABLES procedure
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_REPAIR.DUMP_ORPHAN_KEYS procedure

5.221 DBA_ORPHAN_KEY_TABLE

`DBA_ORPHAN_KEY_TABLE` reports key values from indexes where the underlying base table has block corruptions.

To create the view, run the DBMS_REPAIR.ADMIN_TABLES procedure. To populate the orphan key table for an index, run the DBMS_REPAIR.DUMP_ORPHAN_KEYS procedure on the index. For each key in the index that points to a corrupt data block, Oracle inserts a row into the orphan key table.

Column	Datatype	NULL	Description
SCHEMA_NAME	VARCHAR2(128)	NOT NULL	Schema name of the index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the index
IPART_NAME	VARCHAR2(128)	NULL	Name of the index partition or subpartition
INDEX_ID	NUMBER	NOT NULL	Dictionary object ID of the index
TABLE_NAME	VARCHAR2(128)	NOT NULL	Name of the base table of the index
PART_NAME	VARCHAR2(128)	NULL	Name of the base table partition or subpartition
TABLE_ID	NUMBER	NOT NULL	Dictionary object ID of the base table
KEYROWID	ROWID	NOT NULL	Physical rowid of the corrupt data row
KEY	ROWID	NOT NULL	Key values for the index entry
DUMP_TIMESTAMP	DATE	NOT NULL	Timestamp when the entry was made into the orphan key table

5.222 DBA_OUTLINE_HINTS

`DBA_OUTLINE_HINTS` describes the set of hints stored in all outlines in the database.

Related View

`USER_OUTLINE_HINTS` describes the set of hints stored in the outlines owned by the current user. This view does not display the OWNER column.

Column	Datatype	NULL	Description
NAME	VARCHAR2(128)		Name of the outline
OWNER	VARCHAR2(128)		Name of the user who created the outline

Column	Datatype	NULL	Description
NODE	NUMBER		ID of the query or subquery to which the hint applies. The top-level query is labeled 1. Subqueries are assigned sequentially numbered labels, starting with 2.
STAGE	NUMBER		Outline hints can be applied at three different stages during the compilation process. This column indicates the stage at which this hint was applied.
JOIN_POS	NUMBER		Position of the table in the join order. The value is 0 for all hints except access method hints, which identify a table to which the hint and the join position apply.
HINT	CLOB		Text of the hint

 See Also:["USER_OUTLINE_HINTS"](#)

5.223 DBA_OUTLINES

DBA_OUTLINES describes all stored outlines in the database.

Related View

USER_OUTLINES describes the stored outlines owned by the current user. This view does not display the OWNER column.

Column	Datatype	NULL	Description
NAME	VARCHAR2 (128)		User-specified or generated name of the stored outline. The name must be of a form that can be expressed in SQL.
OWNER	VARCHAR2 (128)		Name of the user who created the outline
CATEGORY	VARCHAR2 (128)		User-defined name of the category to which the outline belongs
USED	VARCHAR2 (6)		Indicates whether the outline has ever been used (USED) or not (UNUSED)
TIMESTAMP	DATE		Timestamp of outline creation
VERSION	VARCHAR2 (64)		Oracle version that created the outline
SQL_TEXT	LONG		SQL text of the query, including any hints that were a part of the original statement. If bind variables are included, the variable names are stored as SQL text, not the values that are assigned to the variables. Note: This field may contain sensitive information about your database or application. Therefore, use discretion when granting SELECT or VIEW object privileges on these views.
SIGNATURE	RAW (16)		Signature uniquely identifying the outline SQL text
COMPATIBLE	VARCHAR2 (12)		Indicates whether the outline hints were compatible across a migration (COMPATIBLE) or not (INCOMPATIBLE)

Column	Datatype	NULL	Description
ENABLED	VARCHAR2 (8)		Indicates whether the outline is enabled (ENABLED) or disabled (DISABLED)
FORMAT	VARCHAR2 (6)		Hint format: <ul style="list-style-type: none">• NORMAL• LOCAL
MIGRATED	VARCHAR2 (12)		Indicates whether the outline has been migrated to a SQL plan baseline (MIGRATED) or not (NOT-MIGRATED)

 See Also:["USER_OUTLINES"](#)

5.224 DBA_OUTSTANDING_ALERTS

DBA_OUTSTANDING_ALERTS describes alerts which the server considers to be outstanding.

Column	Datatype	NULL	Description
SEQUENCE_ID	NUMBER		Alert sequence number
REASON_ID	NUMBER	NOT NULL	ID of the alert reason
OWNER	VARCHAR2 (128)		Owner of the object on which the alert was issued
OBJECT_NAME	VARCHAR2 (513)		Name of the object
SUBOBJECT_NAME	VARCHAR2 (128)		Name of the subobject (for example: partition)
OBJECT_TYPE	VARCHAR2 (64)		Object type (for example: table, tablespace)
REASON	VARCHAR2 (4000)		Reason for the alert
TIME_SUGGESTED	TIMESTAMP(6) WITH TIME ZONE		Time when the alert was last updated
CREATION_TIME	TIMESTAMP(6) WITH TIME ZONE		Time when the alert was first created
SUGGESTED_ACTION	VARCHAR2 (4000)		Advice of the recommended action
ADVISOR_NAME	VARCHAR2 (128)		Name of the advisor to be invoked for more information
METRIC_VALUE	NUMBER		Value of the related metrics
MESSAGE_TYPE	VARCHAR2 (12)		Message type: <ul style="list-style-type: none">• Notification• Warning
MESSAGE_GROUP	VARCHAR2 (64)		Name of the message group to which the alert belongs
MESSAGE_LEVEL	NUMBER		Message severity level (1 to 32)
HOSTING_CLIENT_ID	VARCHAR2 (64)		ID of the client or security group to which the alert relates
MODULE_ID	VARCHAR2 (64)		ID of the module that originated the alert
PROCESS_ID	VARCHAR2 (128)		Process ID
HOST_ID	VARCHAR2 (256)		DNS host name of the originating host

Column	Datatype	NULL	Description
HOST_NW_ADDR	VARCHAR2(256)		IP or other network address of the originating host
INSTANCE_NAME	VARCHAR2(16)		Originating instance name
INSTANCE_NUMBER	NUMBER		Originating instance number
USER_ID	VARCHAR2(128)		User ID
EXECUTION_CONTEXT_ID	VARCHAR2(128)		Execution Context ID
ERROR_INSTANCE_ID	VARCHAR2(142)		ID of an error instance plus a sequence number
STATE_TRANSITION_NUMBER	NUMBER		Sequence number of the state transition for the alert
PDB_NAME	VARCHAR2(128)		PDB name
CON_ID	NUMBER	NOT NULL	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

5.225 DBA_PARALLEL_EXECUTE_CHUNKS

`DBA_PARALLEL_EXECUTE_CHUNKS` displays the chunks for all tasks in the database.

Related View

`USER_PARALLEL_EXECUTE_CHUNKS` displays the chunks for tasks created by the current user.
This view does not display the `TASK_OWNER` column.

Column	Datatype	NULL	Description
CHUNK_ID	NUMBER	NOT NULL	Unique ID for the chunk
TASK_OWNER	VARCHAR2(128)	NOT NULL	Owner of the task
TASK_NAME	VARCHAR2(128)	NOT NULL	Name of the task
STATUS	VARCHAR2(20)		Status of the chunk: <ul style="list-style-type: none">• UNASSIGNED• ASSIGNED• PROCESSED• PROCESSED_WITH_ERROR
START_ROWID	ROWID		Rowid for the first row in the chunk
END_ROWID	ROWID		Rowid for the last row in the chunk
START_ID	NUMBER		Number column value of the first row in the chunk
END_ID	NUMBER		Number column value of the last row in the chunk
JOB_NAME	VARCHAR2(128)		Name of the job which processed this chunk
START_TS	TIMESTAMP(6)		Processing start time for the chunk
END_TS	TIMESTAMP(6)		Processing end time for the chunk
ERROR_CODE	NUMBER		Error code returned during the execution of the chunk if the <code>STATUS</code> column is <code>PROCESSED_WITH_ERROR</code>

Column	Datatype	NULL	Description
ERROR_MESSAGE	VARCHAR2(4000)		Error message returned during the execution of the chunk if the STATUS column is PROCESSED_WITH_ERROR

 **See Also:**

["USER_PARALLEL_EXECUTE_CHUNKS"](#)

5.226 DBA_PARALLEL_EXECUTE_TASKS

DBA_PARALLEL_EXECUTE_TASKS displays all tasks in the database.

Related View

USER_PARALLEL_EXECUTE_TASKS displays the tasks created by the current user. This view does not display the TASK_OWNER column.

Column	Datatype	NULL	Description
TASK_OWNER	VARCHAR2(128)	NOT NULL	Owner of the task
TASK_NAME	VARCHAR2(128)	NOT NULL	Name of the task
CHUNK_TYPE	VARCHAR2(12)		Type of parallel update: <ul style="list-style-type: none"> • UNDECLARED • ROWID_RANGE • NUMBER_RANGE
STATUS	VARCHAR2(19)		Status of the task: <ul style="list-style-type: none"> • CREATED • CHUNKING • CHUNKING_FAILED • CHUNKED • PROCESSING • FINISHED • FINISHED_WITH_ERROR • CRASHED
TABLE_OWNER	VARCHAR2(128)		Owner of the table to be chunked
TABLE_NAME	VARCHAR2(128)		Name of the table to be chunked
NUMBER_COLUMN	VARCHAR2(128)		Name of the column holding IDs (only applicable to NUMBER_RANGE chunking type)
TASK_COMMENT	VARCHAR2(4000)		Comment field
JOB_PREFIX	VARCHAR2(128)		Prefix of the job name executing this task
SQL_STMT	CLOB		Argument used in the previous DBMS_PARALLEL_EXECUTE.RUN_TASK
LANGUAGE_FLAG	NUMBER		Argument used in the previous DBMS_PARALLEL_EXECUTE.RUN_TASK
EDITION	VARCHAR2(130)		Argument used in the previous DBMS_PARALLEL_EXECUTE.RUN_TASK

Column	Datatype	NULL	Description
APPLY_CROSSEDITION_TRIGGER_ER	VARCHAR2(130)		Argument used in the previous DBMS_PARALLEL_EXECUTE.RUN_TASK
FIRE_APPLY_TRIGGER	VARCHAR2(10)		Argument used in the previous DBMS_PARALLEL_EXECUTE.RUN_TASK
PARALLEL_LEVEL	NUMBER		Argument used in the previous DBMS_PARALLEL_EXECUTE.RUN_TASK
JOB_CLASS	VARCHAR2(128)		Argument used in the previous DBMS_PARALLEL_EXECUTE.RUN_TASK

 See Also:

- "[USER_PARALLEL_EXECUTE_TASKS](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_PARALLEL_EXECUTE.RUN_TASK procedure

5.227 DBA_PART_COL_STATISTICS

DBA_PART_COL_STATISTICS displays column statistics and histogram information for all table partitions in the database. Its columns are the same as those in ALL_PART_COL_STATISTICS.

 See Also:

["ALL_PART_COL_STATISTICS"](#)

5.228 DBA_PART_HISTOGRAMS

DBA_PART_HISTOGRAMS displays the histogram data (endpoints per histogram) for the histograms on all table partitions in the database. Its columns are the same as those in ALL_PART_HISTOGRAMS.

 See Also:

["ALL_PART_HISTOGRAMS"](#)

5.229 DBA_PART_INDEXES

DBA_PART_INDEXES displays the object-level partitioning information for all partitioned indexes in the database. Its columns are the same as those in ALL_PART_INDEXES.

See Also:

["ALL_PART_INDEXES"](#)

5.230 DBA_PART_KEY_COLUMNS

DBA_PART_KEY_COLUMNS describes the partitioning key columns for all partitioned objects in the database. Its columns are the same as those in ALL_PART_KEY_COLUMNS.

See Also:

["ALL_PART_KEY_COLUMNS"](#)

5.231 DBA_PART_LOBS

DBA_PART_LOBS displays table-level information for all partitioned LOBs in the database, including default attributes for LOB data partitions. Its columns are the same as those in ALL_PART_LOBS.

See Also:

["ALL_PART_LOBS"](#)

5.232 DBA_PART_TABLES

DBA_PART_TABLES displays the object-level partitioning information for all partitioned tables in the database. Its columns are the same as those in ALL_PART_TABLES.

See Also:

["ALL_PART_TABLES"](#)

5.233 DBA_PARTIAL_DROP_TABS

DBA_PARTIAL_DROP_TABS describes all tables in the database that have partially completed DROP COLUMN operations. Its columns are the same as those in ALL_PARTIAL_DROP_TABS.

 **See Also:**

"ALL_PARTIAL_DROP_TABS"

5.234 DBA_PDB_HISTORY

DBA_PDB_HISTORY describes the lineage of the PDB to which it belongs.

Column	Datatype	NULL	Description
PDB_NAME	VARCHAR2(128)	NOT NULL	Name of this PDB in one of its incarnations
PDB_ID	NUMBER	NOT NULL	Container ID of this PDB in one of its incarnations.
PDB_DBID	NUMBER	NOT NULL	Database ID of this PDB in one of its incarnations
PDB_GUID	RAW(16)	NOT NULL	Globally unique ID of this PDB in one of its incarnations
OP_SCNBAS	NUMBER	NOT NULL	SCN base when an operation was performed on one of the incarnations of this PDB
OP_SCNWRP	NUMBER	NOT NULL	SCN wrap when an operation was performed on one of incarnations of this PDB
OP_TIMESTAMP	DATE	NOT NULL	Timestamp of an operation performed on one of the incarnations of this PDB
OPERATION	VARCHAR2(16)	NOT NULL	Operation that was performed on one of the incarnations of this PDB
DB_VERSION	NUMBER	NOT NULL	Database version
CLONED_FROM_PDB_NAME	VARCHAR2(128)		Name of a PDB from which one of the incarnations of this PDB was cloned
CLONED_FROM_PDB_DBID	NUMBER		Database ID of a PDB from which one of the incarnations of this PDB was cloned
CLONED_FROM_PDB_GUID	RAW(16)		Globally unique ID of a PDB from which one of the incarnations of this PDB was cloned
DB_NAME	VARCHAR2(128)		Name of a CDB in which one of the incarnations of this PDB was created
DB_UNIQUE_NAME	VARCHAR2(128)		Unique name of a CDB in which one of the incarnations of this PDB was created
DB_DBID	NUMBER		Database ID of a CDB in which one of the incarnations of this PDB was created
CLONETAG	VARCHAR2(128)		Clone tag name for the PDB if the PDB was cloned using the snapshot copy mechanism
DB_VERSION_STRING	VARCHAR2(204)		Database version string

5.235 DBA_PDB_SAVED_STATES

`DBA_PDB_SAVED_STATES` shows information about the current saved PDB states in the CDB.

This view is a data link, so the data is also available within the PDB.

Column	Datatype	NULL	Description
CON_ID	NUMBER	NOT NULL	The ID of the PDB
CON_NAME	VARCHAR2 (128)	NOT NULL	Name of the PDB
INSTANCE_NAME	VARCHAR2 (128)	NOT NULL	Name of the instance for which the state is saved
CON_UID	NUMBER	NOT NULL	Unique ID assigned to the PDB at creation time
GUID	RAW (16)		Globally unique immutable ID assigned to the PDB at creation time
STATE	VARCHAR2 (14)		Open state of the PDB
RESTRICTED	VARCHAR2 (3)		Restricted mode of the PDB

See Also:

Oracle Database SQL Language Reference for more information about preserving a PDB's open mode across an instance restart

5.236 DBA_PDB_SNAPSHOTFILE

`DBA_PDB_SNAPSHOTFILE` displays the files associated with snapshots taken of pluggable databases (PDBs).

You can use this view in conjunction with the `DBA_PDB_SNAPSHOT` view. Join the `SNAPSHOT_SCN` column in this view with the `SNAPSHOT_SCN` column in `DBA_PDB_SNAPSHOT` to determine the files associated with a particular PDB snapshot. A PDB snapshot consists of an archive log file, one or more data files, and one or more XML files. A row is added to this view for each file associated with a PDB snapshot.

Column	Datatype	NULL	Description
CON_ID	NUMBER	NOT NULL	The ID of the PDB
SNAPSHOT_SCN	NUMBER	NOT NULL	SCN at which the snapshot was taken
SNAPSHOT_FILENAME	VARCHAR2 (513)	NOT NULL	Snapshot file name
SNAPSHOT_FILETYPE	VARCHAR2 (8)	NOT NULL	Snapshot file type. Possible values: <ul style="list-style-type: none"> • ARCH: Archive log file • DATA: Data file • XML: XML file

 **Note:**

This view is available starting with Oracle Database 19c.

 **See Also:**

"[DBA_PDB_SNAPSHOTS](#)"

5.237 DBA_PDB_SNAPSHOTS

`DBA_PDB_SNAPSHOTS` describes the snapshots taken of pluggable databases (PDBs).

Rows are added to this view when a snapshot of a PDB is taken by using the `ALTER PLUGGABLE DATABASE SNAPSHOT` SQL statement.

Column	Datatype	NULL	Description
CON_ID	NUMBER	NOT NULL	The ID of the PDB
CON_UID	NUMBER	NOT NULL	Unique ID assigned to the PDB at creation time
CON_NAME	VARCHAR2(128)	NOT NULL	Name of the PDB
SNAPSHOT_NAME	VARCHAR2(128)	NOT NULL	Snapshot name of the PDB
SNAPSHOT_SCN	NUMBER	NOT NULL	SCN at which the snapshot was taken
PREVIOUS_SNAPSHOT_SCN	NUMBER	NOT NULL	SCN at which the previous snapshot for the PDB was taken
SNAPSHOT_TIME	NUMBER	NOT NULL	Timestamp at which the snapshot was taken
PREVIOUS_SNAPSHOT_TIME	NUMBER	NOT NULL	Timestamp of the previous snapshot for this PDB
FULL_SNAPSHOT_PATH	VARCHAR2(4000)	NOT NULL	Full path for the snapshot

 **Note:**

This view does not display snapshot copy PDBs, which are created by using the `CREATE PLUGGABLE DATABASE ... SNAPSHOT COPY` SQL statement.

 **See Also:**

"[DBA_PDB_SNAPSHOTFILE](#)" for information about the files associated with a particular PDB snapshot

5.238 DBA_PDBS

DBA_PDBS describes PDBs belonging to a given CDB.

When queried from a CDB root, this view describes all PDBs that belong to the CDB. When queried from an application root, it describes all PDBs that belong to the application container. When queried from a regular PDB or from an application PDB, it describes the regular PDB or the application PDB.

Column	Datatype	NULL	Description
PDB_ID	NUMBER	NOT NULL	Container ID of the PDB
PDB_NAME	VARCHAR2(128)	NOT NULL	Name of the PDB
DBID	NUMBER	NOT NULL	PDB identifier calculated when the PDB is created and stored in all file headers associated with the PDB
CON_UID	NUMBER	NOT NULL	Unique identifier associated with the container
GUID	RAW(16)		Globally unique immutable ID assigned to the PDB at creation time
STATUS	VARCHAR2(10)		<p>State of the PDB. Possible values:</p> <ul style="list-style-type: none"> • NEW - The PDB has never been opened since it was created. It must be opened in READ WRITE mode for Oracle to perform processing needed to complete the integration of the PDB into the CDB and mark it NORMAL. An error will be thrown if an attempt is made to open the PDB read only. • NORMAL - The PDB is ready to be used. • UNPLUGGED - The PDB has been unplugged. The only operation that can be performed on it is DROP PLUGGABLE DATABASE. • RELOCATING - The PDB is in the process of being relocated to a different CDB. • RELOCATED - The PDB has been relocated to a different CDB. • REFRESHING - The PDB is a refresh PDB. • UNDEFINED - The PDB is in an undefined state. • UNUSABLE - The PDB is being created or an unrecoverable error was encountered during its creation. The PDB cannot be opened while its state is set to UNUSABLE. If the PDB remains in this state because of an error encountered during its creation, it can only be dropped. The alert log can be checked to determine if there was an error during PDB creation.
CREATION_SCN	NUMBER		Creation SCN
VSN	NUMBER		The version number of the PDB
LOGGING	VARCHAR2(9)		<p>Shows the current logging mode for the PDB. Possible values:</p> <ul style="list-style-type: none"> • LOGGING • NOLOGGING
FORCE_LOGGING	VARCHAR2(3)		<p>Specifies whether force logging is turned on for the PDB. Possible values:</p> <ul style="list-style-type: none"> • NO • YES

Column	Datatype	NULL	Description
FORCE_NOLOGGING	VARCHAR2(3)		Specifies whether force nologging is turned on for the PDB. Possible values: <ul style="list-style-type: none">• NO• YES
APPLICATION_ROOT	VARCHAR2(3)		Indicates whether the PDB is an application root.
APPLICATION_PDB	VARCHAR2(3)		Indicates whether a PDB is an application PDB
APPLICATION_SEED	VARCHAR2(3)		Indicates whether a PDB is an application seed (an application seed is also an application PDB)
APPLICATION_ROOT_CON_ID	NUMBER		If this PDB is an application PDB, the container ID of an application root to which this application PDB belongs. If this PDB is an application root clone, the container ID of an application root to which this application root clone belongs. Otherwise, NULL.
IS_PROXY_PDB	VARCHAR2(3)		Indicates whether this PDB is a proxy PDB
CON_ID	NUMBER	NOT NULL	The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
UPGRADE_PRIORITY	NUMBER		The upgrade priority of the PDB.
APPLICATION_CLONE	VARCHAR2(3)		Indicates whether this PDB is an application root clone (YES) or not (NO)
FOREIGN_CDB_DBID	NUMBER		The foreign CDB's DBID
UNPLUG_SCN	NUMBER		SCN at which the PDB was unplugged
FOREIGN_PDB_ID	NUMBER		The foreign PDB ID
CREATION_TIME	DATE	NOT NULL	PDB creation timestamp
REFRESH_MODE	VARCHAR2(6)		PDB refresh mode. Possible values: <ul style="list-style-type: none">• MANUAL• AUTO
REFRESH_INTERVAL	NUMBER		PDB refresh interval. This is applicable only when REFRESH_MODE is AUTO.
TEMPLATE	VARCHAR2(3)		For internal use only
LAST_REFRESH_SCN	NUMBER		System change number (SCN) of the last refresh operation
TENANT_ID	VARCHAR2(255)		Pluggable database tenant key
SNAPSHOT_MODE	VARCHAR2(6)		Pluggable database snapshot mode
SNAPSHOT_INTERVAL	NUMBER		Pluggable database snapshot interval, in minutes
CREDENTIAL_NAME ¹	VARCHAR2(262)		Credential object name associated with the PDB

¹ This column is available starting with Oracle Database 19c.

5.239 DBA_PENDING_CONV_TABLES

DBA_PENDING_CONV_TABLES describes all pending conversion tables in the database. Its columns are the same as those in ALL_PENDING_CONV_TABLES.

 **See Also:**

["ALL_PENDING_CONV_TABLES"](#)

5.240 DBA_PENDING_TRANSACTIONS

DBA_PENDING_TRANSACTIONS describes unresolved transactions (either due to failure or if the coordinator has not sent a commit/rollback).

Column	Datatype	NULL	Description
FORMATID	NUMBER		The format identifier of the transaction identifier
GLOBALID	RAW (64)		The global part (gtrid) of the transaction identifier
BRANCHID	RAW (64)		The branch qualifier (bqual) of the transaction identifier

5.241 DBA_PLSQL_COLL_TYPES

DBA_PLSQL_COLL_TYPES describes all named PL/SQL collection types in the database. Its columns (except for CHAR_USED) are the same as those in ALL_PLSQL_COLL_TYPES.

 **See Also:**

["ALL_PLSQL_COLL_TYPES"](#)

5.242 DBA_PLSQL_OBJECT_SETTINGS

DBA_PLSQL_OBJECT_SETTINGS displays information about the compiler settings for all stored objects in the database. Its columns are the same as those in ALL_PLSQL_OBJECT_SETTINGS.

 **See Also:**

["ALL_PLSQL_OBJECT_SETTINGS"](#)

5.243 DBA_PLSQL_TYPE_ATTRS

DBA_PLSQL_TYPE_ATTRS describes the attributes of all PL/SQL types in the database. Its columns are the same as those in ALL_PLSQL_TYPE_ATTRS.

 **See Also:**

["ALL_PLSQL_TYPE_ATTRS"](#)

5.244 DBA_PLSQL_TYPES

DBA_PLSQL_TYPES describes all PL/SQL types in the database. Its columns are the same as those in ALL_PLSQL_TYPES.

 **See Also:**

["ALL_PLSQL_TYPES"](#)

5.245 DBA_POLICIES

DBA_POLICIES describes all Oracle Virtual Private Database (VPD) security policies in the database. Its columns are the same as those in ALL_POLICIES.

A security policy is a list of security requirements and rules that regulate row level access to database objects.

 **See Also:**

["ALL_POLICIES"](#)

5.246 DBA_POLICY_ATTRIBUTES

DBA_POLICY_ATTRIBUTES lists the attribute associations {Namespaces, Attributes} of all context-sensitive and shared context-sensitive Oracle Virtual Private Database (VPD) policies in the database. Its columns are the same as those in ALL_POLICY_ATTRIBUTES.

 **See Also:**

["ALL_POLICY_ATTRIBUTES"](#)

5.247 DBA_POLICY_CONTEXTS

DBA_POLICY_CONTEXTS describes all driving contexts in the database. Its columns are the same as those in ALL_POLICY_CONTEXTS.

 **See Also:**

["ALL_POLICY_CONTEXTS"](#)

5.248 DBA_POLICY_GROUPS

DBA_POLICY_GROUPS describes all policy groups in the database. Its columns are the same as those in ALL_POLICY_GROUPS.

 **See Also:**

["ALL_POLICY_GROUPS"](#)

5.249 DBA_PRIV_AUDIT_OPTS

DBA_PRIV_AUDIT_OPTS describes current system privileges being audited across the system and by user.

 **Note:**

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED_AUDIT_TRAIL.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

Column	Datatype	NULL	Description
USER_NAME	VARCHAR2(128)		User name if by user auditing; ANY_CLIENT if access by a proxy on behalf of a client is being audited; NULL for systemwide auditing
PROXY_NAME	VARCHAR2(128)		Name of the proxy user which is performing an operation for the client; NULL if the client is performing the operation directly
PRIVILEGE	VARCHAR2(40)	NOT NULL	Name of the system privilege being audited
SUCCESS	VARCHAR2(10)		Mode for WHENEVER SUCCESSFUL system auditing

Column	Datatype	NULL	Description
FAILURE	VARCHAR2(10)		Mode for WHENEVER NOT SUCCESSFUL system auditing

5.250 DBA_PRIV_CAPTURES

DBA_PRIV_CAPTURES lists the privilege analysis policies in the database.

Column	Datatype	NULL	Description
NAME	VARCHAR2(128)	NOT NULL	Name of the privilege analysis policy
DESCRIPTION	VARCHAR2(1024)		Description of the privilege analysis
TYPE	VARCHAR2(16)		Type of the privilege analysis policy. Possible values: <ul style="list-style-type: none">• G_DATABASE: Database wide privilege analysis• G_ROLE: Role privilege analysis• G_CONTEXT: Context privilege analysis• G_ROLE_AND_CONTEXT: Role and context privilege analysis
ENABLED	VARCHAR2(1)		Enabling status of the privilege analysis
ROLES	ROLE_ID_LIST		List of roles whose privileges to analyze if the privilege analysis type is G_ROLE or G_ROLE_AND_CONTEXT
CONTEXT	VARCHAR2(4000)		Context condition if the privilege analysis type is G_CONTEXT or G_ROLE_AND_CONTEXT
RUN_NAME	VARCHAR2(128)		Displays run name information for each run

See Also:

Oracle Database Security Guide for more information about privilege analysis

5.251 DBA_PRIVATE_TEMP_TABLES

DBA_PRIVATE_TEMP_TABLES describes all of the private temporary tables in the database.

Related View

USER_PRIVATE_TEMP_TABLES describes the private temporary tables in the current session. This view does not display the INST_ID column.

Column	Datatype	NULL	Description
SID	NUMBER		Session ID of the session that created the private temporary table
SERIAL#	NUMBER		Session serial number of the session that created the private temporary table
INST_ID	NUMBER		Instance ID of the session that created the private temporary table

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Owner name of the private temporary table
TABLE_NAME	VARCHAR2 (128)		Private temporary table name
TABLESPACE_NAME	VARCHAR2 (128)		Private temporary table's tablespace name
DURATION	VARCHAR2 (128)		Private temporary table's duration (for example, SESSION or TRANSACTION)
NUM_ROWS	NUMBER		Number of rows in the private temporary table when analyzed
BLOCKS	NUMBER		Number of blocks used by private temporary table
AVG_ROW_LEN	NUMBER		Average row length
LAST_ANALYZED	DATE		Timestamp of last analyze
TXN_ID	RAW (8)		Transaction ID of the transaction duration private temporary table
SAVE_POINT_NUM	NUMBER		Save point number of the transaction duration private temporary table

 See Also:

- "[USER_PRIVATE_TEMP_TABLES](#)"
- "[PRIVATE_TEMP_TABLE_PREFIX](#)"
- *Oracle Database Administrator's Guide* for an introduction to private temporary tables

5.252 DBA_PROCEDURES

`DBA_PROCEDURES` lists all functions and procedures that are available in the database, along with their associated properties. Its columns are the same as those in `ALL_PROCEDURES`.

 See Also:

- "[ALL_PROCEDURES](#)"
- "[DBA_ARGUMENTS](#)" for information about the arguments of all of the functions and procedures that are available in the database

5.253 DBA_PROFILES

`DBA_PROFILES` displays all profiles and their limits.

Column	Datatype	NULL	Description
PROFILE	VARCHAR2 (128)	NOT NULL	Profile name
RESOURCE_NAME	VARCHAR2 (32)	NOT NULL	Resource name

Column	Datatype	NULL	Description
RESOURCE_TYPE	VARCHAR2(8)		Indicates whether the resource profile is a KERNEL or a PASSWORD parameter
LIMIT	VARCHAR2(128)		Limit placed on this resource for this profile
COMMON	VARCHAR2(3)		Indicates whether a given profile is common. Possible values: <ul style="list-style-type: none"> • YES if a profile is common • NO if a profile is local (not common)
INHERITED	VARCHAR2(3)		Indicates whether the profile definition was inherited from another container (YES) or not (NO)
IMPLICIT	VARCHAR2(3)		Indicates whether this profile was created by an implicit application (YES) or not (NO)

5.254 DBA_PROPAGATION

DBA_PROPAGATION displays information about all propagations in the database. Its columns are the same as those in ALL_PROPAGATION.

See Also:

["ALL_PROPAGATION"](#)

5.255 DBA_PROXIES

DBA_PROXIES displays Information about all proxy connections in the database.

Related View

USER_PROXIES displays information about connections the current user is allowed to proxy. This view does not display the PROXY or PROXY_AUTHORITY columns.

Column	Datatype	NULL	Description
PROXY	VARCHAR2(128)		Name of the proxy user
CLIENT	VARCHAR2(128)	NOT NULL	Name of the client user who the proxy user can act on behalf of
AUTHENTICATION	VARCHAR2(3)		Indicates whether the proxy is required to supply the client's authentication credentials (YES) or not (NO)
AUTHORIZATION_CONSTRAINT	VARCHAR2(35)		Indicates the proxy's authority to exercise roles on the client's behalf: <ul style="list-style-type: none"> • NO CLIENT ROLES MAY BE ACTIVATED • PROXY MAY ACTIVATE ROLE • PROXY MAY ACTIVATE ALL CLIENT ROLES • PROXY MAY NOT ACTIVATE ROLE
ROLE	VARCHAR2(128)		Name of the role referenced in AUTHORIZATION_CONSTRAINT

Column	Datatype	NULL	Description
PROXY_AUTHORITY	VARCHAR2(9)		<p>Value is either:</p> <ul style="list-style-type: none"> • DIRECTORY if EUS proxy is enabled for that database user • DATABASE if this row describes a local proxy permission

 See Also:["USER_PROXYES"](#)

5.256 DBA_QUEUE_SCHEDULES

DBA_QUEUE_SCHEDULES describes all propagation schedules in the database. Its columns are the same as those in ALL_QUEUE_SCHEDULES.

 See Also:["ALL_QUEUE_SCHEDULES"](#)

5.257 DBA_QUEUE_SUBSCRIBERS

DBA_QUEUE_SUBSCRIBERS displays all subscribers on all queues in the database. Its columns are the same as those in ALL_QUEUE_SUBSCRIBERS.

 See Also:["ALL_QUEUE_SUBSCRIBERS"](#)

5.258 DBA_QUEUE_TABLES

DBA_QUEUE_TABLES contains information about the owner instance for a queue table.

A queue table can contain multiple queues. In this case, each queue in a queue table has the same owner instance as the queue table. Its columns are the same as those in ALL_QUEUE_TABLES.

 See Also:["ALL_QUEUE_TABLES"](#)

5.259 DBA_QUEUE

DBA_QUEUE describes the operational characteristics of every queue in a database. Its columns are the same as those in ALL_QUEUE.

See Also:

- ["ALL_QUEUE"](#)
- *Oracle Database Advanced Queueing User's Guide* for more information about Advanced Queueing

5.260 DBA_RAT_CAPTURE_SCHEMA_INFO

DBA_RAT_CAPTURE_SCHEMA_INFO displays the login schema and current schema that were in effect when SQL statements were recorded in a workload capture.

This view is useful when you perform a workload replay in extended PL/SQL mode. This type of replay may include SQL statements that perform table operations such as SELECT, UPDATE, and DELETE. If the current schema was different from the login schema at the time of the workload capture, then those table operations may have been performed with the privileges of the current user, not the login user. During workload replay, all operations are performed with the privileges of the login user. Therefore, errors can occur during replay if the login user does not have the necessary privileges to perform the table operations.

To resolve this issue, you can use this view in conjunction with the DBA_WORKLOAD_CAPTURE_SQLTEXT view. Join the CAPTURE_ID column in this view with the CAPTURE_ID column in DBA_WORKLOAD_CAPTURE_SQLTEXT to determine the login schema and current schema that were in effect when each SQL statement in DBA_WORKLOAD_CAPTURE_SQLTEXT was captured. Examine the SQL_TEXT column in DBA_WORKLOAD_CAPTURE_SQLTEXT to determine whether the SQL statement involved any table operations, and whether those table operations were performed with the privileges of the current user or the login user. You can then grant to the login user the necessary privileges for performing those table operations before performing a workload replay.

Column	Datatype	NULL	Description
CAPTURE_ID	NUMBER (38)		Internal key for the workload capture
SQL_ID	VARCHAR2 (13)		SQL identifier for the parent cursor in the library cache
LOGIN_SCHEMA	VARCHAR2 (128)		The schema of the user who logged on to the session in which the SQL statement was recorded in the workload capture. This value does not change during a session.
CURRENT_SCHEMA	VARCHAR2 (128)		The currently active default schema for the session when the SQL statement was recorded in the workload capture. This value may change during a session through use of an ALTER SESSION SET CURRENT_SCHEMA statement. It may also change during a session to reflect the owner of any active definer's rights object.

Note:

This view is available starting with Oracle Database 19c.

See Also:

["DBA_WORKLOAD_CAPTURE_SQLTEXT"](#)

5.261 DBA_RCHILD

`DBA_RCHILD` displays all the children in any refresh group.

Column	Datatype	NULL	Description
REFGROUP	NUMBER		Internal identifier of the refresh group
OWNER	VARCHAR2 (128)	NOT NULL	Owner of the object in the refresh group
NAME	VARCHAR2 (128)	NOT NULL	Name of the object in the refresh group
TYPE#	VARCHAR2 (128)		Type of the object in the refresh group

5.262 DBA_RECOVERABLE_SCRIPT

`DBA_RECOVERABLE_SCRIPT` provides details about recoverable operations.

Column	Datatype	NULL	Description
SCRIPT_ID	RAW (16)		Unique ID of the operation
CREATION_TIME	DATE		Time the operation was invoked
INVOKING_PACKAGE_OWNER	VARCHAR2 (128)		Invoking package owner of the operation
INVOKING_PACKAGE	VARCHAR2 (128)		Invoking package of the operation
INVOKING_PROCEDURE	VARCHAR2 (128)		Invoking procedure of the operation
INVOKING_USER	VARCHAR2 (128)		Script owner
STATUS	VARCHAR2 (12)		State of the recoverable script: GENERATING, NOT EXECUTED, EXECUTING, EXECUTED, or ERROR
TOTAL_BLOCKS	NUMBER		Total number of blocks for the recoverable script to be executed
DONE_BLOCK_NUM	NUMBER		Last block executed, thus far
SCRIPT_COMMENT	VARCHAR2 (4000)		Comment for the recoverable script

5.263 DBA_RECOVERABLE_SCRIPT_BLOCKS

`DBA_RECOVERABLE_SCRIPT_BLOCKS` provides details about recoverable script blocks.

Column	Datatype	NULL	Description
SCRIPT_ID	RAW(16)		Global unique ID of the recoverable script to which this block belongs
BLOCK_NUM	NUMBER		The <i>n</i> th block in the recoverable script to be executed
FORWARD_BLOCK	CLOB		Forward block to be executed
FORWARD_BLOCK_DBLINK	VARCHAR2(128)		Database where the forward block is executed
UNDO_BLOCK	CLOB		Block to roll back the forward operation
UNDO_BLOCK_DBLINK	VARCHAR2(128)		Database where the undo block is executed
STATUS	VARCHAR2(12)		Status of the block execution: GENERATING, NOT EXECUTED, EXECUTING, EXECUTED, or ERROR
BLOCK_COMMENT	VARCHAR2(4000)		Comment for the block

5.264 DBA_RECOVERABLE_SCRIPT_ERRORS

DBA_RECOVERABLE_SCRIPT_ERRORS provides details about errors that occurred during script execution.

Column	Datatype	NULL	Description
SCRIPT_ID	RAW(16)		Global unique ID of the recoverable script
BLOCK_NUM	NUMBER		The <i>n</i> th block that failed
ERROR_NUMBER	NUMBER		Number of the error encountered while executing the block
ERROR_MESSAGE	VARCHAR2(4000)		Error message encountered while executing the block
ERROR_CREATION_TIME	DATE		Time that the error was created

5.265 DBA_RECOVERABLE_SCRIPT_HIST

DBA_RECOVERABLE_SCRIPT_HIST displays details about executed or purged recoverable operations.

Column	Datatype	NULL	Description
SCRIPT_ID	RAW(16)		Unique id of the operation
CREATION_TIME	DATE		Time the operation was invoked
INVOKING_PACKAGE_OWNER	VARCHAR2(128)		Invoking package owner of the operation
INVOKING_PACKAGE	VARCHAR2(128)		Invoking package of the operation
INVOKING_PROCEDURE	VARCHAR2(128)		Invoking procedure of the operation
INVOKING_USER	VARCHAR2(128)		Script owner
STATUS	VARCHAR2(8)		state of the recoverable script: EXECUTED, PURGED
TOTAL_BLOCKS	NUMBER		total number of blocks for the recoverable script to be executed
DONE_BLOCK_NUM	NUMBER		last block so far executed
SCRIPT_COMMENT	VARCHAR2(4000)		comment for the recoverable script

5.266 DBA_RECOVERABLE_SCRIPT_PARAMS

`DBA_RECOVERABLE_SCRIPT_PARAMS` provides details about recoverable operation parameters.

Column	Datatype	NULL	Description
SCRIPT_ID	RAW(16)		Unique ID of the operation
PARAMETER	VARCHAR2(128)		Name of the parameter
PARAM_INDEX	NUMBER		Index for multi-valued parameter
VALUE	VARCHAR2(4000)		Value of the parameter

5.267 DBA_RECYCLEBIN

`DBA_RECYCLEBIN` displays information about all recycle bins in the database.

Related View

`USER_RECYCLEBIN` displays information about the recycle bin owned by the current user. This view does not display the `OWNER` column.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Name of the original owner of the object
OBJECT_NAME	VARCHAR2(128)	NOT NULL	New name of the object
ORIGINAL_NAME	VARCHAR2(128)		Original name of the object
OPERATION	VARCHAR2(9)		Operation carried out on the object: <ul style="list-style-type: none"> • DROP - Object was dropped • TRUNCATE - Object was truncated Note: The Oracle Database currently only supports recovering dropped objects from the recycle bin. The truncated objects cannot be recovered.
TYPE	VARCHAR2(25)		Type of the object: <ul style="list-style-type: none"> • TABLE • NORMAL INDEX • BITMAP INDEX • NESTED TABLE • LOB • LOB INDEX • DOMAIN INDEX • IOT TOP INDEX • IOT OVERFLOW SEGMENT • IOT MAPPING TABLE • TRIGGER • Table Partition • Table Composite Partition • Index Partition • Index Composite Partition • LOB Partition • LOB Composite Partition

Column	Datatype	NULL	Description
TS_NAME	VARCHAR2 (30)		Name of the tablespace to which the object belongs
CREATETIME	VARCHAR2 (19)		Timestamp for the creation of the object
DROPTIME	VARCHAR2 (19)		Timestamp for the dropping of the object
DROPSCN	NUMBER		System change number (SCN) of the transaction which moved the object to the recycle bin
PARTITION_NAME	VARCHAR2 (128)		Name of the partition which was dropped
CAN_UNDROP	VARCHAR2 (3)		Indicates whether the object can be undropped (YES) or not (NO)
CAN_PURGE	VARCHAR2 (3)		Indicates whether the object can be purged (YES) or not (NO)
RELATED	NUMBER	NOT NULL	Object number of the parent object
BASE_OBJECT	NUMBER	NOT NULL	Object number of the base object
PURGE_OBJECT	NUMBER	NOT NULL	Object number for the object which gets purged
SPACE	NUMBER		Number of blocks used by the object

 **See Also:**

["USER_RECYCLEBIN"](#)

5.268 DBA_REDEFINITION_ERRORS

DBA_REDEFINITION_ERRORS is an online redefinition view. It displays the dependent objects for which errors were raised while attempting to create similar objects on the interim table of the redefinition.

Column	Datatype	NULL	Description
OBJECT_TYPE	VARCHAR2 (12)		Type of the redefinition object: <ul style="list-style-type: none"> • TABLE • INDEX • CONSTRAINT • TRIGGER • NESTED TABLE • PARTITION • MV LOG
OBJECT_OWNER	VARCHAR2 (4000)		Owner of the redefinition object
OBJECT_NAME	VARCHAR2 (128)	NOT NULL	Name of the redefinition object
BASE_TABLE_OWNER	VARCHAR2 (128)		Owner of the base table of the redefinition object
BASE_TABLE_NAME	VARCHAR2 (128)		Name of the base table of the redefinition object
DDL_TXT	CLOB		DDL used to create the corresponding interim redefinition object
EDITION_NAME	VARCHAR2 (128)		Reserved for future use
ERR_NO	NUMBER (38)		Oracle error number corresponding to this error
ERR_TXT	VARCHAR2 (1000)		Oracle error text corresponding to this error

 **See Also:**

Oracle Database Administrator's Guide for more information about online redefinition

5.269 DBA_REDEFINITION_OBJECTS

`DBA_REDEFINITION_OBJECTS` is an online redefinition view. It displays the objects involved in the current redefinitions.

Column	Datatype	NULL	Description
OBJECT_TYPE	VARCHAR2(12)		Type of the redefinition object: <ul style="list-style-type: none"> • TABLE • INDEX • CONSTRAINT • TRIGGER • NESTED TABLE • PARTITION • MV LOG
OBJECT_OWNER	VARCHAR2(4000)		Owner of the redefinition object
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of the redefinition object
BASE_TABLE_OWNER	VARCHAR2(128)		Owner of the base table of the redefinition object
BASE_TABLE_NAME	VARCHAR2(128)		Name of the base table of the redefinition object
INTERIM_OBJECT_OWNER	VARCHAR2(4000)		Owner of the corresponding interim redefinition object
INTERIM_OBJECT_NAME	VARCHAR2(128)		Name of the corresponding interim redefinition object
EDITION_NAME	VARCHAR2(128)		Reserved for future use

 **See Also:**

Oracle Database Administrator's Guide for more information about online redefinition

5.270 DBA_REDEFINITION_STATUS

`DBA_REDEFINITION_STATUS` is an online redefinition view. It provides information about the online redefinition status.

Column	Datatype	NULL	Description
REDEFINITION_ID	NUMBER(38)	NOT NULL	ID for the redefinition object
BASE_TABLE_OWNER	VARCHAR2(128)		Owner of the base table of the redefinition object
BASE_TABLE_NAME	VARCHAR2(128)		Name of the base table of the redefinition object
BASE_OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of the base object of the redefinition object
BASE_OBJECT_TYPE	VARCHAR2(9)		Type of the base object of the redefinition object
INTERIM_OBJECT_OWNER	VARCHAR2(128)		Owner of the interim object of the redefinition object
INTERIM_OBJECT_NAME	VARCHAR2(128)		Name of the interim object of the redefinition object

Column	Datatype	NULL	Description
OPERATION	VARCHAR2(128)	NOT NULL	The current redefinition operation: <ul style="list-style-type: none"> • START_REDEF_TABLE • SYNC_INTERIM_TABLE • COPY_TABLE_DEPENDENTS • FINISH_REDEF_TABLE
STATUS	VARCHAR2(128)	NOT NULL	Status of the previous redefinition operation: <ul style="list-style-type: none"> • FAILURE • SUCCESS
RESTARTABLE	VARCHAR2(1)	NOT NULL	Indicates whether the previous operation can be restarted
ERR_TXT	VARCHAR2(1000)		The error message raised from the previous operation
ACTION	VARCHAR2(400)		The suggested action
REFRESH_DEP_MVIEWS	VARCHAR2(1)		Indicates whether the online redefinition will also refresh dependent materialized views when syncing the interim table (Y) or not (N)

 See Also:

Oracle Database Administrator's Guide for more information about online redefinition

5.271 DBA_REFRESH

DBA_REFRESH describes all refresh groups in the database. Its columns are the same as those in ALL_REFRESH.

 See Also:

"ALL_REFRESH"

5.272 DBA_REFRESH_CHILDREN

DBA_REFRESH_CHILDREN lists all of the objects in all refresh groups in the database. Its columns are the same as those in ALL_REFRESH_CHILDREN.

 See Also:

"ALL_REFRESH_CHILDREN"

5.273 DBA_REFS

DBA_REFS describes the REF columns and REF attributes in object type columns of all the objects in the database. Its columns are the same as those in ALL_REFS.

 **See Also:**

"ALL_REFS"

5.274 DBA_REGISTERED_ARCHIVED_LOG

DBA_REGISTERED_ARCHIVED_LOG displays information about all registered archived logfiles in the database.

Column	Datatype	NULL	Description
CONSUMER_NAME	VARCHAR2(128)	NOT NULL	Consumer name of the archived logs
SOURCE_DATABASE	VARCHAR2(128)		Name of the database which generated the redo logs
THREAD#	NUMBER	NOT NULL	Thread number of the archived redo log. The thread number is 1 for a single instance. For Real Application Clusters, this column will contain different numbers.
SEQUENCE#	NUMBER	NOT NULL	Sequence number of the archived redo log file
FIRST_SCN	NUMBER	NOT NULL	System change number (SCN) of the current archived redo log
NEXT_SCN	NUMBER		System change number (SCN) of the next archived redo log
FIRST_TIME	DATE		Date and time of the current archived redo log
NEXT_TIME	DATE		Date and time of the next archived redo log
NAME	VARCHAR2(513)		Name of the archived redo log
MODIFIED_TIME	DATE		Time when the archived redo log was registered
DICTIONARY_BEGIN	VARCHAR2(3)		Indicates whether the beginning of the dictionary build is in the archived redo log (YES) or not (NO)
DICTIONARY_END	VARCHAR2(3)		Indicates whether the end of the dictionary build is in the archived redo log (YES) or not (NO)
PURGEABLE	VARCHAR2(3)		Indicates whether the redo log can be permanently removed (YES) or not (NO)
RESET_LOGS_CHANGE#	NUMBER	NOT NULL	Resetlogs change number of the database when the log was written
RESET_TIMESTAMP	NUMBER	NOT NULL	Resetlogs time of the database when the log was written

5.275 DBA_REGISTERED_MVIEWS

`DBA_REGISTERED_MVIEWS` describes all registered materialized views (registered at a master site or a master materialized view site) in the database. Its columns are the same as those in `ALL_REGISTERED_MVIEWS`.

See Also:

["ALL_REGISTERED_MVIEWS"](#)

5.276 DBA_REGISTRY

`DBA_REGISTRY` displays information about all components in the database that are loaded into the component registry.

The component registry tracks components that can be separately loaded into the Oracle Database. When a SQL script loads the PL/SQL packages and other database objects for a component into the database, the script records the component name, status, and version. If scripts are used to upgrade/downgrade the dictionary elements for the component, then those scripts also record status and version information.

Related View

`USER_REGISTRY` displays information about the components owned by the current user that are loaded into the component registry.

Column	Datatype	NULL	Description
COMP_ID	VARCHAR2 (30)	NOT NULL	Component identifier
COMP_NAME	VARCHAR2 (255)		Component name
VERSION	VARCHAR2 (30)		Component version loaded
VERSION_FULL	VARCHAR2 (30)		Component full version
STATUS	VARCHAR2 (11)		Component status: <ul style="list-style-type: none"> • INVALID • VALID • LOADING • LOADED • UPGRADEING • UPGRADED • DOWNGRADING • DOWNGRADED • REMOVING • REMOVED
MODIFIED	VARCHAR2 (20)		Time when the component was last modified
NAMESPACE	VARCHAR2 (30)	NOT NULL	Component namespace
CONTROL	VARCHAR2 (128)	NOT NULL	User that created the component entry
SCHEMA	VARCHAR2 (128)	NOT NULL	User that contains the objects for the component
PROCEDURE	VARCHAR2 (61)		Validation procedure

Column	Datatype	NULL	Description
STARTUP	VARCHAR2 (8)		Indicates whether the component requires a startup after the upgrade (<code>REQUIRED</code>) or not
PARENT_ID	VARCHAR2 (30)		Parent component identifier
OTHER_SCHEMAS	VARCHAR2 (4000)		A list of ancillary schema names associated with the component

 See Also:["USER_REGISTRY"](#)

5.277 DBA_REGISTRY_BACKPORTS

`DBA_REGISTRY_BACKPORTS` displays backported bug fixes that were applied to the database. This view displays only bug fixes that changed the data dictionary of the database.

Column	Datatype	NULL	Description
BUGNO	NUMBER	NOT NULL	Bug number
VERSION_FULL	VARCHAR2 (30)	NOT NULL	Component full version
COMP_ID	VARCHAR2 (30)	NOT NULL	Component identifier
NAMESPACE	VARCHAR2 (30)	NOT NULL	Component namespace
BACKPORT_TYPE	VARCHAR2 (30)	NOT NULL	Type of backported bug fix The value of this column is always <code>DICTIONARY</code> , which indicates that the bug fix changed the data dictionary of the database.
BACKPORT_TIME	TIMESTAMP (6)	NOT NULL	Date and time at which the backported bug fix was applied

 Note:

This view is available starting with Oracle Database 19c.

5.278 DBA_REGISTRY_HIERARCHY

`DBA_REGISTRY_HIERARCHY` displays information about the components loaded into the database, grouped by owner and organized in the component hierarchy.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2 (30)	NOT NULL	Component namespace
COMP_ID	VARCHAR2 (4000)		Component identifier
VERSION	VARCHAR2 (30)		Component version loaded

Column	Datatype	NULL	Description
VERSION_FULL	VARCHAR2(30)		Component full version
STATUS	VARCHAR2(11)		Component status: <ul style="list-style-type: none"> • INVALID • VALID • LOADING • LOADED • UPGRADEING • UPGRADED • DOWNGRADEING • DOWNGRADED • REMOVING • REMOVED
MODIFIED	VARCHAR2(20)		Time when the component was last modified

5.279 DBA_REGISTRY_HISTORY

DBA_REGISTRY_HISTORY provides information about upgrades, downgrades, and critical patch updates that have been performed on the database.

Column	Datatype	NULL	Description
ACTION_TIME	TIMESTAMP(6)		The time the upgrade, downgrade, or patch action was completed
ACTION	VARCHAR2(30)		The specific action (for example, UPGRADE or DOWNGRADE)
NAMESPACE	VARCHAR2(30)		The namespace of the components affected (for example, SERVER)
VERSION	VARCHAR2(30)		The version number of the server (for example, 10.2.0.1.0)
ID	NUMBER		Bundle ID
COMMENTS	VARCHAR2(255)		Additional comments about the action taken
BUNDLE_SERIES	VARCHAR2(30)		If a bundle patch, the series (for example, PSU or DBBP)

5.280 DBA_REGISTRY_LOG

DBA_REGISTRY_LOG displays operating information about components loaded into the database.

Column	Datatype	NULL	Description
OPTIME	VARCHAR2(20)		Operation time
NAMESPACE	VARCHAR2(30)		Component namespace
COMP_ID	VARCHAR2(30)		Component identifier
OPERATION	VARCHAR2(11)		Operation name
MESSAGE	VARCHAR2(1000)		Message

5.281 DBA_REGISTRY_SCHEMAS

DBA_REGISTRY_SCHEMAS lists the primary and ancillary schemas included in the component registry. The ancillary schemas that are listed in this view are the same schemas that would be included in the OTHER_SCHEMAS column of the DBA_REGISTRY view.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2 (30)		Component namespace
COMP_ID	VARCHAR2 (30)		Component identifier
SCHEMA	VARCHAR2 (128)		User that contains the objects for the component

See Also:

- ["DBA_REGISTRY"](#)
- ["USER_REGISTRY"](#)

5.282 DBA_REGISTRY_SQLPATCH

DBA_REGISTRY_SQLPATCH contains information about the SQL patches that have been installed in the database.

A SQL patch is a patch that contains SQL scripts which need to be run after OPatch completes. DBA_REGISTRY_SQLPATCH is updated by the datapatch utility. Each row contains information about an installation attempt (apply or roll back) for a given patch.

Column	Datatype	NULL	Description
INSTALL_ID	NUMBER	NOT NULL	Unique numeric identifier for this datapatch session. All patches installed in the same invocation of datapatch will have the same value for INSTALL_ID.
PATCH_ID	NUMBER	NOT NULL	ID associated with the patch
PATCH_UID	NUMBER	NOT NULL	UPI (Universal Patch ID) associated with the patch
PATCH_TYPE	VARCHAR2 (10)	NOT NULL	Type of the patch. Possible values: <ul style="list-style-type: none"> • INTERIM: Interim patch • RU: Release Update • RUI: Release Update Increment • RUR: Release Update Revision • CU: Cumulative Update
ACTION	VARCHAR2 (15)	NOT NULL	APPLY or ROLLBACK
STATUS	VARCHAR2 (25)	NOT NULL	Possible values: <ul style="list-style-type: none"> • SUCCESS: Patch application has completed with no errors • WITH ERRORS: Patch application finished with errors
ACTION_TIME	TIMESTAMP (6)	NOT NULL	Timestamp when the install was performed
DESCRIPTION	VARCHAR2 (100)		Description of this patch from OPatch metadata

Column	Datatype	NULL	Description
LOGFILE	VARCHAR2(500)	NOT NULL	Location of the logfile for this apply or rollback attempt
RU_LOGFILE	VARCHAR2(500)		Logfile location for RU specific commands
FLAGS	VARCHAR2(10)		One or more of the following: <ul style="list-style-type: none">• J: Patch is a JVM patch• M: Patch installation was merged with another patch• N: Patch requires normal mode• R: Patch installation has been retried• U: Patch requires upgrade mode
PATCH_DESCRIPTOR	XMLTYPE		Contents of the XML descriptor for the patch
PATCH_DIRECTORY	BLOB		Contents of the patch directory under ORACLE_HOME/sqlpatch
SOURCE_VERSION	VARCHAR2(15)		5 digit version (for example, 18.3.2.0.0) for the version on which the patch was applied
SOURCE_BUILD_DESCRIPTION	VARCHAR2(80)		Build description (for example, Release_Update or Release_Update_Revision) for the version on which the patch was applied
SOURCE_BUILD_TIMESTAMP	TIMESTAMP(6)		Build timestamp for the version on which the patch was applied
TARGET_VERSION	VARCHAR2(15)		5 digit version (for example, 18.4.0.0.0) for the version to be installed
TARGET_BUILD_DESCRIPTION	VARCHAR2(80)		Build description (for example, Release_Update or Release_Update_Revision) for the version to be installed
TARGET_BUILD_TIMESTAMP	TIMESTAMP(6)		Build timestamp for the version to be installed

See Also:

<https://support.oracle.com/rs?type=doc&id=1585822.1>

5.283 DBA_REPAIR_TABLE

DBA_REPAIR_TABLE describes any corruptions found by the DBMS_REPAIR.CHECK_OBJECT procedure.

This information is used by the DBMS_REPAIR.FIX_CORRUPT_BLOCKS procedure on execution. To create this view, first run the DBMS_REPAIR.ADMIN_TABLES procedure. To populate the resulting repair table for an object, run the DBMS_REPAIR.CHECK_OBJECT procedure on the object.

 **Note:**

The table created by the DBMS_REPAIR.ADMIN_TABLES procedure is called REPAIR TABLE by default. If you specify a different name, this view will have the name you specify, preceded by "DBA_REPAIR_".

Column	Datatype	NULL	Description
OBJECT_ID	NUMBER	NOT NULL	Dictionary object number of the object with the corruption
TABLESPACE_ID	NUMBER	NOT NULL	Tablespace number of the corrupt object
RELATIVE_FILE_ID	NUMBER)	NOT NULL	Relative file number of the corrupt object
BLOCK_ID	NUMBER	NOT NULL	Block number of the corruption
CORRUPT_TYPE	NUMBER	NOT NULL	Type of corruption encountered
SCHEMA_NAME	VARCHAR2(128)	NOT NULL	Schema of the corrupt object
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of the corrupt object
BASEOBJECT_NAME	VARCHAR2(128)	NULL	If the object is an index, the name of its base table
PARTITION_NAME	VARCHAR2(128)	NULL	Partition or subpartition name, if applicable
CORRUPT_DESCRIPTION	VARCHAR2(2000)	NULL	Description of corruption
REPAIR_DESCRIPTION	VARCHAR2(200)	NULL	Description of repair action
MARKED_CORRUPT	VARCHAR2(10)	NOT NULL	Whether the block is marked corrupt (TRUE FALSE)
CHECK_TIMESTAMP	DATE	NOT NULL	Date and time when this row was inserted into the repair table
FIX_TIMESTAMP	DATE	NULL	Date and time when the block was modified by the FIX_CORRUPT_BLOCKS procedure, if applicable
REFORMAT_TIMESTAMP	DATE	NULL	Reserved for future use

 **See Also:**

Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_REPAIR package

5.284 DBA_REPL_DBNAME_MAPPING

DBA_REPL_DBNAME_MAPPING provides details about the database name mapping in replication. Its columns are the same as those in ALL_REPL_DBNAME_MAPPING.

 **See Also:**

"ALL_REPL_DBNAME_MAPPING"

5.285 DBA_REPLICATION_PROCESS_EVENTS

DBA_REPLICATION_PROCESS_EVENTS provides information about the replication processes events in the database. Its columns are the same as those in ALL_REPLICATION_PROCESS_EVENTS.

 **See Also:**

["ALL_REPLICATION_PROCESS_EVENTS"](#)

5.286 DBA_RESOURCE_INCARNATIONS

DBA_RESOURCE_INCARNATIONS lists all resource incarnations that are running or eligible for HA status notification.

Column	Datatype	NULL	Description
RESOURCE_TYPE	VARCHAR2(30)	NOT NULL	Type of resource
RESOURCE_NAME	VARCHAR2(256)		Name of resource
DB_UNIQUE_NAME	VARCHAR2(30)	NOT NULL	Database unique name
DB_DOMAIN	VARCHAR2(128)	NOT NULL	Database domain
INSTANCE_NAME	VARCHAR2(30)	NOT NULL	Name of instance at which resource is located
HOST_NAME	VARCHAR2(512)		Name of host at which resource is located
STARTUP_TIME	TIMESTAMP(9) WITH TIME ZONE		Resource startup date and time

5.287 DBA_RESUMABLE

DBA_RESUMABLE displays all resumable statements executed in the system.

Related View

USER_RESUMABLE displays the resumable statements executed by the current user. This view does not display the USER_ID column.

Column	Datatype	NULL	Description
USER_ID	NUMBER		User ID Number of the Resumable Statement Owner
SESSION_ID	NUMBER		Session Identifier of the Resumable Statement
INSTANCE_ID	NUMBER		Instance Number of the Resumable Statement
COORD_INSTANCE_ID	NUMBER		Instance Number on which the Parallel Coordinator is Running
COORD_SESSION_ID	NUMBER		Session Identifier of the Parallel Coordinator

Column	Datatype	NULL	Description
STATUS	VARCHAR2 (9)		Status of the resumable statement: <ul style="list-style-type: none"> • RUNNING • SUSPENDED • TIMEOUT • ERROR • ABORTED
TIMEOUT	NUMBER		Timeout of the resumable statement
START_TIME	VARCHAR2 (20)		Start time of the resumable statement
SUSPEND_TIME	VARCHAR2 (20)		Last time the resumable statement was suspended (initialized to NULL)
RESUME_TIME	VARCHAR2 (20)		Last time the suspended resumable statement was resumed (initialized to NULL)
NAME	VARCHAR2 (4000)		Name given in the resumable clause of the resumable statement
SQL_TEXT	VARCHAR2 (1000)		Resumable statement, selected from the V\$SQL view
ERROR_NUMBER	NUMBER		Error code of the last correctable error. When STATUS is set to RUNNING, its value will be 0.
ERROR_PARAMETER1	VARCHAR2 (80)		First parameter for the error message (NULL if no error)
ERROR_PARAMETER2	VARCHAR2 (80)		Second parameter for the error message (NULL if no error)
ERROR_PARAMETER3	VARCHAR2 (80)		Third parameter for the error message (NULL if no error)
ERROR_PARAMETER4	VARCHAR2 (80)		Forth parameter for the error message (NULL if no error)
ERROR_PARAMETER5	VARCHAR2 (80)		Fifth parameter for the error message (NULL if no error)
ERROR_MSG	VARCHAR2 (4000)		Error message corresponding to ERROR_NUMBER. It will be NULL when ERROR_NUMBER is 0.

 See Also:["USER_RESUMABLE"](#)

5.288 DBA_REWRITE_EQUIVALENCES

DBA_REWRITE_EQUIVALENCES describes all rewrite equivalences in the database. Its columns are the same as those in ALL_REWRITE_EQUIVALENCES.

 See Also:["ALL_REWRITE_EQUIVALENCES"](#)

5.289 DBA_RGROUP

`DBA_RGROUP` displays all refresh groups.

Column	Datatype	NULL	Description
REFGROUP	NUMBER		Internal identifier of the refresh group
OWNER	VARCHAR2 (128)	NOT NULL	Owner of the object in the refresh group
NAME	VARCHAR2 (128)	NOT NULL	Name of the object in the refresh group
IMPLICIT_DESTROY	VARCHAR2 (1)		Indicates whether the refresh group is destroyed when its last item is removed (Y) or not (N)
PUSH_DEFERRED_RPC	VARCHAR2 (1)		Indicates whether changes are pushed from the snapshot to the master before refresh (Y) or not (N)
REFRESH_AFTER_ERRORS	VARCHAR2 (1)		Indicates whether to proceed with refresh despite errors when pushing deferred RPCs (Y) or not (N)
ROLLBACK_SEG	VARCHAR2 (128)		Name of the rollback segment to use while refreshing
JOB	NUMBER	NOT NULL	Identifier of the job used to refresh the group automatically
PURGE_OPTION	NUMBER (38)		Method for purging the transaction queue after each push. 1 indicates quick purge option; 2 indicates precise purge option
PARALLELISM	NUMBER (38)		Level of parallelism for transaction propagation
HEAP_SIZE	NUMBER (38)		Size of the heap
JOB_NAME	VARCHAR2 (128)		The name of the job used to automatically refresh the group

5.290 DBA_ROLE_PRIVS

`DBA_ROLE_PRIVS` describes the roles granted to all users and roles in the database.

Related View

`USER_ROLE_PRIVS` describes the roles granted to the current user.

Column	Datatype	NULL	Description
GRANTEE	VARCHAR2 (128)		Name of the user or role receiving the grant
GRANTED_ROLE	VARCHAR2 (128)		Granted role name
ADMIN_OPTION	VARCHAR2 (3)		Indicates whether the grant was with the ADMIN OPTION (YES) or not (NO)
DELEGATE_OPTION	VARCHAR2 (3)		Indicates whether the grant was with the DELEGATE OPTION (YES) or not (NO)
DEFAULT_ROLE	VARCHAR2 (3)		Indicates whether the role is designated as a DEFAULT ROLE for the user (YES) or not (NO)

Column	Datatype	NULL	Description
COMMON	VARCHAR2 (3)		Indicates how the grant was made. Possible values: <ul style="list-style-type: none">• YES if the role was granted commonly (CONTAINER=ALL was used)• NO if the role was granted locally (CONTAINER=ALL was not used)
INHERITED	VARCHAR2 (3)		Indicates whether the role grant was inherited from another container (YES) or not (NO)

 See Also:["USER_ROLE_PRIVS"](#)

5.291 DBA_ROLES

DBA_ROLES describes all roles in the database.

Column	Datatype	NULL	Description
ROLE	VARCHAR2 (128)	NOT NULL	Name of the role
ROLE_ID	NUMBER	NOT NULL	ID number of the role
PASSWORD_REQUIRED	VARCHAR2 (8)		This column is deprecated in favor of the AUTHENTICATION_TYPE column
AUTHENTICATION_TYPE	VARCHAR2 (11)		Indicates the authentication mechanism for the role: <ul style="list-style-type: none">• NONE - CREATE ROLE <i>role1</i>;• EXTERNAL - CREATE ROLE <i>role2</i> IDENTIFIED EXTERNALLY;• GLOBAL - CREATE ROLE <i>role3</i> IDENTIFIED GLOBALLY;• APPLICATION - CREATE ROLE <i>role4</i> IDENTIFIED USING <i>schema.package</i>;• PASSWORD - CREATE ROLE <i>role5</i> IDENTIFIED BY <i>role5</i>;
COMMON	VARCHAR2 (3)		Indicates whether a given role is common. Possible values: <ul style="list-style-type: none">• YES if the role is common• NO if the role is local (not common)
ORACLE_MAINTAINED	VARCHAR2 (1)		Denotes whether the role was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). A role for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script.
INHERITED	VARCHAR2 (3)		Indicates whether the role was inherited from another container (YES) or not (NO)
IMPLICIT	VARCHAR2 (3)		Indicates whether the role is a common role created by an implicit application (YES) or not (NO)

Column	Datatype	NULL	Description
EXTERNAL_NAME	VARCHAR2 (4000)		For a global role, the external name refers to the DN of a group from a directory service that is mapped to the global role. This is not applicable to a local role.

5.292 DBA_ROLLBACK_SEGS

DBA_ROLLBACK_SEGS describes rollback segments.

Column	Datatype	NULL	Description
SEGMENT_NAME	VARCHAR2 (30)	NOT NULL	Name of the rollback segment
OWNER	VARCHAR2 (6)		Owner of the rollback segment: <ul style="list-style-type: none">• PUBLIC• SYS
TABLESPACE_NAME	VARCHAR2 (30)	NOT NULL	Name of the tablespace containing the rollback segment
SEGMENT_ID	NUMBER	NOT NULL	ID number of the rollback segment
FILE_ID	NUMBER	NOT NULL	Absolute file number of the data file containing the segment header
BLOCK_ID	NUMBER	NOT NULL	ID number of the block containing the segment header
INITIAL_EXTENT	NUMBER		Initial extent size in bytes
NEXT_EXTENT	NUMBER		Secondary extent size in bytes
MIN_EXTENTS	NUMBER	NOT NULL	Minimum number of extents
MAX_EXTENTS	NUMBER	NOT NULL	Maximum number of extent
PCT_INCREASE	NUMBER		Percent increase for extent size
STATUS	VARCHAR2 (16)		Rollback segment status: <ul style="list-style-type: none">• OFFLINE• ONLINE• NEEDS RECOVERY• PARTLY AVAILABLE• UNDEFINED
INSTANCE_NUM	VARCHAR2 (40)		Rollback segment owning Oracle Real Application Clusters instance number
RELATIVE_FNO	NUMBER	NOT NULL	Relative file number of the segment header

5.293 DBA_ROLLING_DATABASES

DBA_ROLLING_DATABASES lists all the databases eligible for configuration with rolling operations.

Column	Datatype	NULL	Description
RDBID	NUMBER		Rolling operation database identifier
DBID	NUMBER		Oracle database identifier
DBUN	VARCHAR2 (128)		Database unique name
ROLE	VARCHAR2 (8)		Database role
OPEN_MODE	VARCHAR2 (15)		Open mode information

Column	Datatype	NULL	Description
PARTICIPANT	VARCHAR2 (3)		Indicates whether the database is participating in the rolling operation (YES) or not (NO)
VERSION	VARCHAR2 (128)		RDBMS version number
ENGINE_STATUS	VARCHAR2 (14)		Running status of the MRP-recovery or LSP-apply process
RAC	VARCHAR2 (3)		Indicates whether the database is an Oracle Real Application Clusters (Oracle RAC) database
UPDATE_PROGRESS	VARCHAR2 (11)		Upgrade status of the system catalog
PROD_RSCN	VARCHAR (40)		Resetlogs SCN at which redo is currently being produced
PROD RID	VARCHAR (40)		Resetlogs ID at which redo is currently being produced
PROD SCN	VARCHAR (40)		Last SCN at which redo was produced
REDO_SOURCE	VARCHAR2 (128)		Database unique name of the producer of redo being consumed
CONS_RSCN	VARCHAR (40)		Resetlogs SCN at which redo is currently being consumed
CONS RID	VARCHAR (40)		Resetlogs ID at which redo is currently being consumed
CONS SCN	VARCHAR (40)		Last SCN at which redo was consumed
UPDATE_TIME	TIMESTAMP (6)		Time of the last record update

 See Also:

Oracle Data Guard Concepts and Administration for more information about rolling operations.

5.294 DBA_ROLLING_EVENTS

DBA_ROLLING_EVENTS lists all the events reported from the DBMS_ROLLING PL/SQL package.

Column	Datatype	NULL	Description
EVENTID	NUMBER		Event identifier which identifies event order
EVENT_TIME	TIMESTAMP (6)		Time associated with the event
TYPE	VARCHAR2 (7)		Type of event: INFO, NOTICE, WARNING, or ERROR
MESSAGE	VARCHAR2 (256)		Text describing the event details
STATUS	NUMBER		Status code associated with an event
INSTID	NUMBER		Instruction ID associated with an event
REVISION	NUMBER		Plan revision number associated with an event

 **See Also:**

- *Oracle Data Guard Concepts and Administration* for more information about rolling operations.
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_ROLLING` package

5.295 DBA_ROLLING_PARAMETERS

`DBA_ROLLING_PARAMETERS` lists the available parameters of the `DBMS_ROLLING` PL/SQL package.

Column	Datatype	NULL	Description
SCOPE	VARCHAR2(128)		Database unique name associated with a parameter
TYPE	VARCHAR2(7)		Type of parameter
NAME	VARCHAR2(32)		Name of the parameter
DESCRIPTION	VARCHAR2(256)		Description of the parameter
CURVAL	VARCHAR2(256)		Current value of the parameter
LSTVAL	VARCHAR2(256)		Prior value of the parameter
DEFVAL	VARCHAR2(256)		Default value of the parameter
MINVAL	NUMBER		Minimum value of the parameter
MAXVAL	NUMBER		Maximum value of the parameter

 **See Also:**

- *Oracle Data Guard Concepts and Administration* for more information about rolling operations.
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_ROLLING` package

5.296 DBA_ROLLING_PLAN

`DBA_ROLLING_PLAN` displays the instructions which constitute the active upgrade plan.

Each row in `DBA_ROLLING_PLAN` identifies a specific instruction scheduled to execute at a specific database. Instructions are created as a result of successful calls to the `DBMS_ROLLING.BUILD_PLAN` procedure.

During execution, groups of instructions are scheduled in batches to execute at remote databases. Groups of instructions are guaranteed to complete in `BATCHID` order.

Column	Datatype	NULL	Description
REVISION	NUMBER		Plan revision number associated with an instruction

Column	Datatype	NULL	Description
BATCHID	NUMBER		Identifier for a batch of instructions which are requested together
INSTID	NUMBER		Identifier for a single instruction
SOURCE	VARCHAR2 (128)		Database unique name where an instruction executes
TARGET	VARCHAR2 (128)		The site where a given instruction will execute
PHASE	VARCHAR2 (14)		rolling operation phase in which an instruction executes
STATUS	VARCHAR2 (7)		Scheduling status of the instruction
PROGRESS	VARCHAR2 (10)		Execution progress of the instruction
DESCRIPTION	VARCHAR2 (256)		Description of the instruction
EXEC_STATUS	NUMBER		Status code returned from instruction execution
EXEC_INFO	VARCHAR2 (256)		Supplemental information obtained during instruction execution
EXEC_TIME	TIMESTAMP (6)		Time of instruction execution
FINISH_TIME	TIMESTAMP (6)		Time of instruction completion

 **See Also:**

- *Oracle Data Guard Concepts and Administration* for more information about rolling operations.
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_ROLLING` package

5.297 DBA_ROLLING_STATISTICS

`DBA_ROLLING_STATISTICS` provides a list of rolling operation statistics.

Column	Datatype	NULL	Description
NAME	VARCHAR2(256)		Name of the statistic. Possible values: <ul style="list-style-type: none">• DBMS_ROLLING execution time• logical to primary switchover finish time• primary services offline for• primary to logical switchover start time• rolling upgrade finish time• rolling upgrade start time• time for former primary to fully recover upgrade redo• time for former primary to start upgrade redo recovery• total time former primary in physical role• transient logical creation finish time• transient logical creation start time• transient logical protection finish time• transient logical protection start time• user upgrade time
VALUE	VARCHAR2(256)		Value of the statistic
UPDATE_TIME	TIMESTAMP(6)		Time of last update

 **See Also:**

Oracle Data Guard Concepts and Administration for more information about rolling operations.

5.298 DBA_ROLLING_STATUS

`DBA_ROLLING_STATUS` displays the overall status of the rolling operation.

Column	Datatype	NULL	Description
REVISION	NUMBER		Revision number of the current upgrade plan
STATUS	VARCHAR2(12)		Readiness of the facility to begin or resume the rolling operation
PHASE	VARCHAR2(14)		Current phase of the plan
NEXT_INSTRUCTION	NUMBER		Instruction ID of the next pending instruction
REMAINING_INSTRUCTIONS	NUMBER		Number of remaining instructions to execute in the plan
COORDINATOR_INSTANCE	NUMBER		Instance number from which the rolling operation is being coordinated
COORDINATOR_PID	NUMBER		Process PID in which the rolling operation is being coordinated
ORIGINAL_PRIMARY	VARCHAR2(128)		Database unique name of the original primary
FUTURE_PRIMARY	VARCHAR2(128)		Database unique name of the future primary
TOTAL_DATABASES	NUMBER		Number of total databases eligible to participate in the rolling operation

Column	Datatype	NULL	Description
PARTICIPATING_DATABASES	NUMBER		Number of databases configured to participate in the rolling operation
INIT_TIME	TIMESTAMP (6)		Time of the last call to DBMS_ROLLING.INIT_PLAN
BUILD_TIME	TIMESTAMP (6)		Time of the last call to DBMS_ROLLING.BUILD
START_TIME	TIMESTAMP (6)		Time of the last call to DBMS_ROLLING.START_UPGRADE
SWITCH_TIME	TIMESTAMP (6)		Time of the last call to DBMS_ROLLING.SWITCHOVER
FINISH_TIME	TIMESTAMP (6)		Time of the last call to DBMS_ROLLING.FINISH

 **See Also:**

- *Oracle Data Guard Concepts and Administration* for more information about rolling operations.
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_ROLLING package

5.299 DBA_ROLLING_UNSUPPORTED

DBA_ROLLING_UNSUPPORTED displays the schemas, tables, and columns in those tables that contain unsupported data types for a rolling upgrade operation for a logical standby database using the DBMS_ROLLING PL/SQL package.

Use this view before you perform a rolling upgrade using DBMS_ROLLING to determine what is unsupported.

The data pertains to the container in which the view is queried.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Schema name of the unsupported column
TABLE_NAME	VARCHAR2 (128)		Name of the table that the unsupported column belongs to
COLUMN_NAME	VARCHAR2 (128)		Name of the unsupported column
ATTRIBUTES	VARCHAR2 (39)		If not a data type issue, displays the reason why the table is unsupported
DATA_TYPE	VARCHAR2 (106)		Data type of the unsupported column

 **Note:**

A rolling upgrade using DBMS_ROLLING supports more object types than a manual rolling upgrade using transient logical standby databases

 See Also:

- "[DBA_LOGSTDBY_UNSUPPORTED](#)" for more information about determining unsupported data types for a manual rolling upgrade operation using transient logical standby databases
- *Oracle Data Guard Concepts and Administration* for more information about rolling operations
- *Oracle Data Guard Concepts and Administration* for more information about unsupported tables for rolling upgrade operations
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_ROLLING` package

5.300 DBA_RSRC_CATEGORIES

`DBA_RSRC_CATEGORIES` displays all resource consumer group categories.

Column	Datatype	NULL	Description
NAME	VARCHAR2 (128)		Name of the consumer group category
COMMENTS	VARCHAR2 (2000)		Text comment on the consumer group category
STATUS	VARCHAR2 (128)		Indicates whether the consumer group category is part of the pending area (<code>PENDING</code>) or not (<code>NULL</code>)
MANDATORY	VARCHAR2 (3)		Indicates whether the consumer group category is mandatory (<code>YES</code>) or not (<code>NO</code>)

5.301 DBA_RSRC_CONSUMER_GROUP_PRIVS

`DBA_RSRC_CONSUMER_GROUP_PRIVS` displays information about all resource consumer groups and the users and roles assigned to them.

The grant referred to in this view and the related view is the grant of the `SWITCH_CONSUMER_GROUP` object privilege, which is granted using the `DBMS_RESOURCE_MANAGER_PRIVS` package. This privilege is not granted through the `GRANT` SQL statement.

Related View

`USER_RSRC_CONSUMER_GROUP_PRIVS` displays information about the resource consumer groups to which the current user is assigned. This view does not display the `GRANTEE` column.

Column	Datatype	NULL	Description
GRANTEE	VARCHAR2 (128)	NOT NULL	User or role receiving the grant
GRANTED_GROUP	VARCHAR2 (128)		Granted consumer group name
GRANT_OPTION	VARCHAR2 (3)		Indicates whether the grant was with the <code>GRANT</code> option (<code>YES</code>) or not (<code>NO</code>)
INITIAL_GROUP	VARCHAR2 (3)		Indicates whether the consumer group is designated as the default for this user or role (<code>YES</code>) or not (<code>NO</code>)

 See Also:

- "[USER_RSRC_CONSUMER_GROUP_PRIVS](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_RESOURCE_MANAGER_PRIVS` package

5.302 DBA_RSRC_CONSUMER_GROUPS

`DBA_RSRC_CONSUMER_GROUPS` displays information about all resource consumer groups in the database.

Column	Datatype	NULL	Description
CONSUMER_GROUP_ID	NUMBER	NOT NULL	ID of the consumer group
CONSUMER_GROUP	VARCHAR2(128)		Name of the consumer group
CPU_METHOD	VARCHAR2(128)		CPU resource allocation method for the consumer group
MGMT_METHOD	VARCHAR2(128)		Resource allocation method for the consumer group
INTERNAL_USE	VARCHAR2(3)		Indicates whether the consumer group is for internal use only (YES) or not (NO)
COMMENTS	VARCHAR2(2000)		Text comment on the consumer group
CATEGORY	VARCHAR2(128)		Category of the consumer group
STATUS	VARCHAR2(128)		Indicates whether the consumer group is part of the pending area (PENDING) or not (NULL)
MANDATORY	VARCHAR2(3)		Indicates whether the consumer group is mandatory (YES) or not (NO)

5.303 DBA_RSRC_GROUP_MAPPINGS

`DBA_RSRC_GROUP_MAPPINGS` displays the mapping between session attributes and consumer groups in the database.

Column	Datatype	NULL	Description
ATTRIBUTE	VARCHAR2(128)		Session attribute to match
VALUE	VARCHAR2(128)		Attribute value
CONSUMER_GROUP	VARCHAR2(128)		Target consumer group name
STATUS	VARCHAR2(128)		Indicates whether the consumer group is part of the pending area (PENDING) or not (NULL)

5.304 DBA_RSRC_IO_CALIBRATE

`DBA_RSRC_IO_CALIBRATE` displays I/O calibration results for the latest calibration run.

Column	Datatype	NULL	Description
START_TIME	TIMESTAMP (6)		Start time of the most recent I/O calibration
END_TIME	TIMESTAMP (6)		End time of the most recent I/O calibration
MAX_IOPS	NUMBER		Maximum number of data block read requests that can be sustained per second
MAX_MBPS	NUMBER		Maximum megabytes per second of maximum-sized read requests that can be sustained
MAX_PMBPS	NUMBER		Maximum megabytes per second of large I/O requests that can be sustained by a single process
LATENCY	NUMBER		Latency for data block read requests
NUM_PHYSICAL_DISKS	NUMBER		Number of physical disks in the storage subsystem (as specified by the user)
ADDITIONAL_INFO	VARCHAR2 (1024)		Additional information about the most recent calibration run

5.305 DBA_RSRC_MANAGER_SYSTEM_PRIVS

DBA_RSRC_MANAGER_SYSTEM_PRIVS displays information about all the users and roles that have been granted the ADMINISTER_RESOURCE_MANAGER system privilege, which is granted using the DBMS_RESOURCE_MANAGER_PRIVS package.

This privilege is not granted through the GRANT SQL statement.

Related View

USER_RSRC_MANAGER_SYSTEM_PRIVS displays information about the users who are granted system privileges for the DBMS_RESOURCE_MANAGER package. This view does not display the GRANTEE column.

Column	Datatype	NULL	Description
GRANTEE	VARCHAR2 (128)	NOT NULL	User or role receiving the grant
PRIVILEGE	VARCHAR2 (40)	NOT NULL	Name of the system privilege
ADMIN_OPTION	VARCHAR2 (3)		Indicates whether the grant was with the ADMIN option (YES) or not (NO)

See Also:

- "[USER_RSRC_MANAGER_SYSTEM_PRIVS](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_RESOURCE_MANAGER package

5.306 DBA_RSRC_MAPPING_PRIORITY

DBA_RSRC_MAPPING_PRIORITY displays information about all consumer group mapping attribute priorities.

Column	Datatype	NULL	Description
ATTRIBUTE	VARCHAR2 (128)		Session attribute
PRIORITY	NUMBER		Priority (1 is the highest)
STATUS	VARCHAR2 (128)		Indicates whether the consumer group is part of the pending area (<code>PENDING</code>) or not (<code>NULL</code>)

5.307 DBA_RSRC_PLAN_DIRECTIVES

`DBA_RSRC_PLAN_DIRECTIVES` displays information about all resource plan directives in the database.

Column	Datatype	NULL	Description
PLAN	VARCHAR2 (128)		Name of the plan to which the directive belongs
GROUP_OR_SUBPLAN	VARCHAR2 (128)		Name of the consumer group or subplan referred to
TYPE	VARCHAR2 (14)		Indicates whether <code>GROUP_OR_SUBPLAN</code> refers to a consumer group (<code>CONSUMER_GROUP</code>) or a plan (<code>PLAN</code>)
CPU_P1	NUMBER		This column is deprecated. Use the <code>MGMT_P1</code> column instead.
CPU_P2	NUMBER		This column is deprecated. Use the <code>MGMT_P2</code> column instead.
CPU_P3	NUMBER		This column is deprecated. Use the <code>MGMT_P3</code> column instead.
CPU_P4	NUMBER		This column is deprecated. Use the <code>MGMT_P4</code> column instead.
CPU_P5	NUMBER		This column is deprecated. Use the <code>MGMT_P5</code> column instead.
CPU_P6	NUMBER		This column is deprecated. Use the <code>MGMT_P6</code> column instead.
CPU_P7	NUMBER		This column is deprecated. Use the <code>MGMT_P7</code> column instead.
CPU_P8	NUMBER		This column is deprecated. Use the <code>MGMT_P8</code> column instead.
MGMT_P1	NUMBER		Resource allocation at level 1. For share-based plans, indicates the number of shares.
MGMT_P2	NUMBER		Resource allocation at level 2.
MGMT_P3	NUMBER		Resource allocation at level 3.
MGMT_P4	NUMBER		Resource allocation at level 4.
MGMT_P5	NUMBER		Resource allocation at level 5.
MGMT_P6	NUMBER		Resource allocation at level 6.
MGMT_P7	NUMBER		Resource allocation at level 7.
MGMT_P8	NUMBER		Resource allocation at level 8.
ACTIVE_SESS_POOL_P1	NUMBER		Maximum number of calls this consumer group can run concurrently
QUEUEING_P1	NUMBER		Timeout in seconds for waits in the Active Session Limit queue

Column	Datatype	NULL	Description
PARALLEL_TARGET_PERCENTAGE	NUMBER		This column is deprecated. Use the PARALLEL_SERVER_LIMIT column instead.
PARALLEL_DEGREE_LIMIT_P1	NUMBER		Sessions in this consumer group are limited to this maximum degree of parallelism for all parallel operations
SWITCH_GROUP	VARCHAR2(128)		Group to switch to once the switch time is reached
SWITCH_FOR_CALL	VARCHAR2(5)		Indicates whether to switch back to the initial consumer group once the top call has completed (TRUE) or not (FALSE)
SWITCH_TIME	NUMBER		Amount of run time (in seconds) within a group before the session is automatically switched. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the run time is accumulated from the start of a call. Otherwise, the run time is accumulated for the length of the session.
SWITCH_IO_MEGABYTES	NUMBER		The maximum megabytes of I/O within a group that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the maximum megabytes of I/O is accumulated from the start of a call. Otherwise, the maximum megabytes of I/O is accumulated for the length of the session.
SWITCH_IO_REQS	NUMBER		The maximum I/O requests within a group that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the maximum I/O requests is accumulated from the start of a call. Otherwise, the maximum I/O requests is accumulated for the length of the session.
SWITCH_ESTIMATE	VARCHAR2(5)		Indicates whether estimated execution time should be used for switch criteria (TRUE) or not (FALSE)
MAX_EST_EXEC_TIME	NUMBER		Maximum estimated execution time
UNDO_POOL	NUMBER		Undo pool size for the consumer group
MAX_IDLE_TIME	NUMBER		Maximum idle time for the session
MAX_IDLE_BLOCKER_TIME	NUMBER		Maximum idle time for the session when blocking other sessions
MAX_UTILIZATION_LIMIT	NUMBER		This column is deprecated. Use UTILIZATION_LIMIT instead.
PARALLEL_QUEUE_TIMEOUT	NUMBER		Time (in seconds) that a query can remain in the parallel statement queue for the consumer group before it is removed from the queue.
			The PQ_TIMEOUT_ACTION directive in a Resource Manager plan can be used in conjunction with the PARALLEL_QUEUE_TIMEOUT directive to either cancel or run the removed query. If the PQ_TIMEOUT_ACTION directive is not specified, the default behavior is to cancel the query with ORA-07454.
SWITCH_TIME_IN_CALL	NUMBER		This column is deprecated. Specify the time in the SWITCH_TIME directive and set SWITCH_FOR_CALL to TRUE.

Column	Datatype	NULL	Description
SWITCH_IO_LOGICAL	NUMBER		The number of logical I/Os that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the number of logical I/Os is accumulated from the start of a call. Otherwise, the number of logical IOs is accumulated for the length of the session.
SWITCH_ELAPSED_TIME	NUMBER		The elapsed time that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.
PARALLEL_SERVER_LIMIT	NUMBER		Maximum percentage of the parallel target used before queuing subsequent parallel queries
UTILIZATION_LIMIT	NUMBER		Maximum resource utilization allowed, expressed in percentage
PARALLEL_STMT_CRITICAL	VARCHAR2(12)		Indicates whether parallel statements from this consumer group are eligible for queuing in the parallel statement queue: <ul style="list-style-type: none"> • BYPASS_QUEUE - Parallel statements in this consumer group are critical and should never be queued. • QUEUE - All parallel statements in this consumer group, irrespective of the PARALLEL_DEGREE_POLICY initialization parameter value, are eligible for being queued. • FALSE - Certain parallel statements are eligible for queuing, depending on the PARALLEL_DEGREE_POLICY initialization parameter value. This is the default.
SESSION_PGA_LIMIT	NUMBER		The maximum amount of untunable PGA in MB that sessions in this consumer group can allocate before being terminated
PQ_TIMEOUT_ACTION	VARCHAR2(6)		Indicates the action to be taken on a parallel query in the parallel queue when its queue time exceeds the limit set by the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT directive: <ul style="list-style-type: none"> • CANCEL - The statement terminates with error ORA-07454 • RUN - The statement runs immediately, and may get downgraded if parallel servers are unavailable
COMMENTS	VARCHAR2(2000)		Text comment on the plan directive
STATUS	VARCHAR2(128)		Indicates whether the plan directive is part of the pending area (PENDING) or not (NULL).
			Note: PDB resource plans must be single-level, they cannot contain subplans, and they must have 8 or fewer consumer groups. If a resource plan is imported into a PDB and it violates any of these PDB requirements, then the import will automatically convert the resource plan to a compliant version. The original, unmodified resource plan will be stored with a STATUS of LEGACY.

Column	Datatype	NULL	Description
MANDATORY	VARCHAR2 (3)		Indicates whether the plan directive is mandatory (YES) or not (NO). Mandatory plans cannot be deleted.

See Also:

- "[PARALLEL_DEGREE_POLICY](#)"
- *Oracle Database Administrator's Guide* for information on resource plans in general
- *Oracle Database PL/SQL Packages and Types Reference* for information about specifying Resource Manager directive values using the `DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE` procedure

5.308 DBA_RSRC_PLANS

`DBA_RSRC_PLANS` displays information about all resource plans in the database.

For a list of currently active plans, see "[V\\$RSRC_PLAN](#)".

Column	Datatype	NULL	Description
PLAN_ID	NUMBER	NOT NULL	ID number of the resource plan
PLAN	VARCHAR2 (128)		Name of the resource plan
NUM_PLAN_DIRECTIVES	NUMBER		Number of plan directives for the plan
CPU_METHOD	VARCHAR2 (128)		CPU resource allocation method for the plan
MGMT_METHOD	VARCHAR2 (128)		Resource allocation method for the plan
ACTIVE_SESS_POOL_MTH	VARCHAR2 (128)		Active session pool resource allocation method for the plan
PARALLEL_DEGREE_LIMIT_MT_H	VARCHAR2 (128)		Parallel degree limit resource allocation method for the plan
QUEUING_MTH	VARCHAR2 (128)		Queuing resource allocation method for the plan
SUB_PLAN	VARCHAR2 (3)		Indicates whether the plan is a subplan (YES) or not (NO)
COMMENTS	VARCHAR2 (2000)		Text comment on the plan
STATUS	VARCHAR2 (128)		Indicates whether the plan is part of the pending area (PENDING) or not (NULL)
MANDATORY	VARCHAR2 (3)		Indicates whether the plan is mandatory (YES) or not (NO). Mandatory plans cannot be deleted.

 **See Also:**

- *Oracle Database Administrator's Guide* for information on resource plans in general
- *Oracle Database PL/SQL Packages and Types Reference* for more information on creating resource plans with the DBMS_RESOURCE_MANAGER package

5.309 DBA_RULE_SET_RULES

DBA_RULE_SET_RULES describes the rules in all rule sets in the database. Its columns are the same as those in ALL_RULE_SET_RULES.

 **See Also:**

"ALL_RULE_SET_RULES"

5.310 DBA_RULE_SETS

DBA_RULE_SETS describes all rule sets in the database. Its columns are the same as those in ALL_RULE_SETS.

 **See Also:**

"ALL_RULE_SETS"

5.311 DBA_RULES

DBA_RULES describes all rules in the database. Its columns are the same as those in ALL_RULES.

 **See Also:**

"ALL_RULES"

5.312 DBA_SCHEDULER_CHAIN_RULES

DBA_SCHEDULER_CHAIN_RULES displays information about the rules for all chains in the database. Its columns are the same as those in ALL_SCHEDULER_CHAIN_RULES.

 **See Also:**

["ALL_SCHEDULER_CHAIN_RULES"](#)

5.313 DBA_SCHEDULER_CHAIN_STEPS

DBA_SCHEDULER_CHAIN_STEPS displays information about the defined steps of all chains in the database. Its columns are the same as those in ALL_SCHEDULER_CHAIN_STEPS.

 **See Also:**

["ALL_SCHEDULER_CHAIN_STEPS"](#)

5.314 DBA_SCHEDULER_CHAINS

DBA_SCHEDULER_CHAINS displays information about all chains in the database. Its columns are the same as those in ALL_SCHEDULER_CHAINS.

 **See Also:**

["ALL_SCHEDULER_CHAINS"](#)

5.315 DBA_SCHEDULER_CREDENTIALS

DBA_SCHEDULER_CREDENTIALS displays information about all credentials in the database. Its columns are the same as those in ALL_SCHEDULER_CREDENTIALS.

 **Note:**

This view is deprecated in favor of the DBA_CREDENTIALS view. Oracle recommends that you use DBA_CREDENTIALS instead. DBA_SCHEDULER_CREDENTIALS is retained for backward compatibility only.

 **See Also:**

- "[DBA_CREDENTIALS](#)"
- "[ALL_SCHEDULER_CREDENTIALS](#)"

5.316 DBA_SCHEDULER_DB_DESTS

`DBA_SCHEDULER_DB_DESTS` displays information about all destination objects in the database pointing to remote databases. Its columns are the same as those in `ALL_SCHEDULER_DB_DESTS`.

 **See Also:**

- "[ALL_SCHEDULER_DB_DESTS](#)"

5.317 DBA_SCHEDULER_DESTS

`DBA_SCHEDULER_DESTS` displays information about all destination objects for jobs in the database. Its columns are the same as those in `ALL_SCHEDULER_DESTS`.

 **See Also:**

- "[ALL_SCHEDULER_DESTS](#)"

5.318 DBA_SCHEDULER_EXTERNAL_DESTS

`DBA_SCHEDULER_EXTERNAL_DESTS` displays information about all destination objects in the database pointing to remote agents. Its columns are the same as those in `ALL_SCHEDULER_EXTERNAL_DESTS`.

 **See Also:**

- "[ALL_SCHEDULER_EXTERNAL_DESTS](#)"

5.319 DBA_SCHEDULER_FILE_WATCHERS

DBA_SCHEDULER_FILE_WATCHERS displays information about all scheduler file watch requests in the database. Its columns are the same as those in ALL_SCHEDULER_FILE_WATCHERS.

 See Also:

["ALL_SCHEDULER_FILE_WATCHERS"](#)

5.320 DBA_SCHEDULER_GLOBAL_ATTRIBUTE

DBA_SCHEDULER_GLOBAL_ATTRIBUTE displays the values of all scheduler attributes in the database (for example, DEFAULT_TIMEZONE and CURRENT_OPEN_WINDOW). Its columns are the same as those in ALL_SCHEDULER_GLOBAL_ATTRIBUTE.

 See Also:

["ALL_SCHEDULER_GLOBAL_ATTRIBUTE"](#)

5.321 DBA_SCHEDULER_GROUP_MEMBERS

DBA_SCHEDULER_GROUP_MEMBERS displays information about the members of all Scheduler object groups in the database. Its columns are the same as those in ALL_SCHEDULER_GROUP_MEMBERS.

 See Also:

["ALL_SCHEDULER_GROUP_MEMBERS"](#)

5.322 DBA_SCHEDULER_GROUPS

DBA_SCHEDULER_GROUPS displays information about all Scheduler object groups in the database. Its columns are the same as those in ALL_SCHEDULER_GROUPS.

 See Also:

["ALL_SCHEDULER_GROUPS"](#)

5.323 DBA_SCHEDULER_INCOMPAT_MEMBER

DBA_SCHEDULER_INCOMPAT_MEMBER displays all Scheduler incompatibility resource objects members in the database. Its columns are the same as those in ALL_SCHEDULER_INCOMPAT_MEMBER.

 **See Also:**

["ALL_SCHEDULER_INCOMPAT_MEMBER"](#)

5.324 DBA_SCHEDULER_INCOMPATS

DBA_SCHEDULER_INCOMPATS displays all Scheduler incompatibility resource objects in the database. Its columns are the same as those in ALL_SCHEDULER_INCOMPATS.

 **See Also:**

["ALL_SCHEDULER_INCOMPATS"](#)

5.325 DBA_SCHEDULER_JOB_ARGS

DBA_SCHEDULER_JOB_ARGS displays information about the arguments of all Scheduler jobs in the database. Its columns are the same as those in ALL_SCHEDULER_JOB_ARGS.

 **See Also:**

["ALL_SCHEDULER_JOB_ARGS"](#)

5.326 DBA_SCHEDULER_JOB_CLASSES

DBA_SCHEDULER_JOB_CLASSES displays information about all Scheduler job classes in the database. Its columns are the same as those in ALL_SCHEDULER_JOB_CLASSES.

 **See Also:**

["ALL_SCHEDULER_JOB_CLASSES"](#)

5.327 DBA_SCHEDULER_JOB_DESTS

DBA_SCHEDULER_JOB_DESTS displays information about the state of all jobs in the database at each of their destinations. Its columns are the same as those in ALL_SCHEDULER_JOB_DESTS.

 **See Also:**

["ALL_SCHEDULER_JOB_DESTS"](#)

5.328 DBA_SCHEDULER_JOB_LOG

DBA_SCHEDULER_JOB_LOG displays log information for all Scheduler jobs in the database. Its columns are the same as those in ALL_SCHEDULER_JOB_LOG.

 **See Also:**

["ALL_SCHEDULER_JOB_LOG"](#)

5.329 DBA_SCHEDULER_JOB_ROLES

DBA_SCHEDULER_JOB_ROLES displays information about all Scheduler jobs in the database by database role.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)	NOT NULL	Owner of the Scheduler job
JOB_NAME	VARCHAR2 (128)	NOT NULL	Name of the Scheduler job
JOB_SUBNAME	VARCHAR2 (128)		Subname of the Scheduler job (for a job running a chain step)
JOB_CREATOR	VARCHAR2 (128)		Creator of the Scheduler job
DATABASE_ROLE	VARCHAR2 (16)		Name of the database role
PROGRAM_OWNER	VARCHAR2 (4000)		Owner of the program associated with the job
PROGRAM_NAME	VARCHAR2 (4000)		Name of the program associated with the job
JOB_TYPE	VARCHAR2 (16)		Inline job action type: <ul style="list-style-type: none"> • PLSQL_BLOCK • STORED_PROCEDURE • EXECUTABLE • CHAIN
JOB_ACTION	VARCHAR2 (4000)		Inline job action
JOB_CLASS	VARCHAR2 (128)		Name of the job class associated with the job
SCHEDULE_OWNER	VARCHAR2 (4000)		Owner of the schedule that the job uses (can be a window or a window group)
SCHEDULE_NAME	VARCHAR2 (4000)		Name of the schedule that the job uses (can be a window or a window group)

Column	Datatype	NULL	Description
SCHEDULE_TYPE	VARCHAR2(12)		Type of the schedule that the job uses: <ul style="list-style-type: none"> IMMEDIATE - Start date and repeat interval are NULL ONCE - Repeat interval is NULL PLSQL - PL/SQL expression used as schedule CALENDAR - Oracle calendaring expression used as schedule EVENT - Event schedule NAMED - Named schedule WINDOW - Window used as schedule WINDOW_GROUP - Window group used as schedule
START_DATE	TIMESTAMP(6) WITH TIME ZONE		Original scheduled start date of the job (for an inline schedule)
REPEAT_INTERVAL	VARCHAR2(4000)		Inline schedule PL/SQL expression or calendar string
END_DATE	TIMESTAMP(6) WITH TIME ZONE		Date after which the job will no longer run (for an inline schedule)
LAST_START_DATE	TIMESTAMP(6) WITH TIME ZONE		Last date on which the job ran
ENABLED	VARCHAR2(5)		Indicates whether the job is enabled (TRUE) or disabled (FALSE)
STATE	VARCHAR2(15)		Current state of the job: <ul style="list-style-type: none"> DISABLED RETRY_SCHEDULED SCHEDULED RUNNING COMPLETED BROKEN FAILED REMOTE SUCCEEDED CHAIN_STALLED
COMMENTS	VARCHAR2(4000)		Comments on the job

5.330 DBA_SCHEDULER_JOB_RUN_DETAILS

DBA_SCHEDULER_JOB_RUN_DETAILS displays log run details for all Scheduler jobs in the database. Its columns are the same as those in ALL_SCHEDULER_JOB_RUN_DETAILS.

 **See Also:**

["ALL_SCHEDULER_JOB_RUN_DETAILS"](#)

5.331 DBA_SCHEDULER_JOBS

DBA_SCHEDULER_JOBS displays information about all Scheduler jobs in the database. Its columns are the same as those in ALL_SCHEDULER_JOBS.

 **See Also:**

["ALL_SCHEDULER_JOBS"](#)

5.332 DBA_SCHEDULER_NOTIFICATIONS

DBA_SCHEDULER_NOTIFICATIONS displays information about the E-mail notifications for all jobs in the database. Its columns are the same as those in ALL_SCHEDULER_NOTIFICATIONS.

 **See Also:**

["ALL_SCHEDULER_NOTIFICATIONS"](#)

5.333 DBA_SCHEDULER_PROGRAM_ARGS

DBA_SCHEDULER_PROGRAM_ARGS displays information about the arguments of all Scheduler programs in the database. Its columns are the same as those in ALL_SCHEDULER_PROGRAM_ARGS.

 **See Also:**

["ALL_SCHEDULER_PROGRAM_ARGS"](#)

5.334 DBA_SCHEDULER_PROGRAMS

DBA_SCHEDULER_PROGRAMS displays information about all Scheduler programs in the database. Its columns are the same as those in ALL_SCHEDULER_PROGRAMS.

 **See Also:**

["ALL_SCHEDULER_PROGRAMS"](#)

5.335 DBA_SCHEDULER_REMOTE DATABASES

DBA_SCHEDULER_REMOTE_DATABASES displays information about all remote databases that have been registered as sources and destinations for remote database jobs. Its columns are the same as those in ALL_SCHEDULER_REMOTE_DATABASES.

 **See Also:**

["ALL_SCHEDULER_REMOTE_DATABASES"](#)

5.336 DBA_SCHEDULER_REMOTE_JOBSTATE

DBA_SCHEDULER_REMOTE_JOBSTATE displays information about the state of all jobs at remote databases. Its columns are the same as those in ALL_SCHEDULER_REMOTE_JOBSTATE.

 **See Also:**

["ALL_SCHEDULER_REMOTE_JOBSTATE"](#)

5.337 DBA_SCHEDULER_RESOURCES

DBA_SCHEDULER_RESOURCES displays all scheduler resource objects in the database. Its columns are the same as those in ALL_SCHEDULER_RESOURCES.

 **See Also:**

["ALL_SCHEDULER_RESOURCES"](#)

5.338 DBA_SCHEDULER_RSC_CONSTRAINTS

DBA_SCHEDULER_RSC_CONSTRAINTS lists all Oracle Scheduler resource constraint members in the database. Its columns are the same as those in ALL_SCHEDULER_RSC_CONSTRAINTS.

 **See Also:**

["ALL_SCHEDULER_RSC_CONSTRAINTS"](#)

5.339 DBA_SCHEDULER_RUNNING_CHAINS

DBA_SCHEDULER_RUNNING_CHAINS displays information about the chain steps of all running chains in the database. Its columns are the same as those in ALL_SCHEDULER_RUNNING_CHAINS.

 **See Also:**

["ALL_SCHEDULER_RUNNING_CHAINS"](#)

5.340 DBA_SCHEDULER_RUNNING_JOBS

DBA_SCHEDULER_RUNNING_JOBS displays information about all running Scheduler jobs in the database. Its columns are the same as those in ALL_SCHEDULER_RUNNING_JOBS.

 **See Also:**

["ALL_SCHEDULER_RUNNING_JOBS"](#)

5.341 DBA_SCHEDULER_SCHEDULES

DBA_SCHEDULER_SCHEDULES displays information about all Scheduler schedules in the database. Its columns are the same as those in ALL_SCHEDULER_SCHEDULES.

 **See Also:**

["ALL_SCHEDULER_SCHEDULES"](#)

5.342 DBA_SCHEDULER_WINDOW_DETAILS

DBA_SCHEDULER_WINDOW_DETAILS displays log details for all Scheduler windows in the database. Its columns are the same as those in ALL_SCHEDULER_WINDOW_DETAILS.

 **See Also:**

["ALL_SCHEDULER_WINDOW_DETAILS"](#)

5.343 DBA_SCHEDULER_WINDOW_GROUPS

DBA_SCHEDULER_WINDOW_GROUPS displays information about all Scheduler window groups in the database. Its columns are the same as those in ALL_SCHEDULER_WINDOW_GROUPS.

 **See Also:**

["ALL_SCHEDULER_WINDOW_GROUPS"](#)

5.344 DBA_SCHEDULER_WINDOW_LOG

DBA_SCHEDULER_WINDOW_LOG displays log information for all Scheduler windows in the database. Its columns are the same as those in ALL_SCHEDULER_WINDOW_LOG.

 **See Also:**

["ALL_SCHEDULER_WINDOW_LOG"](#)

5.345 DBA_SCHEDULER_WINDOWS

DBA_SCHEDULER_WINDOWS displays information about all Scheduler windows in the database. Its columns are the same as those in ALL_SCHEDULER_WINDOWS.

 **See Also:**

["ALL_SCHEDULER_WINDOWS"](#)

5.346 DBA_SCHEDULER_WINGROUP_MEMBERS

DBA_SCHEDULER_WINGROUP_MEMBERS displays the members of all Scheduler window groups in the database. Its columns are the same as those in ALL_SCHEDULER_WINGROUP_MEMBERS.

 **See Also:**

["ALL_SCHEDULER_WINGROUP_MEMBERS"](#)

5.347 DBA_SEC_RELEVANT_COLS

DBA_SEC_RELEVANT_COLS describes the security relevant columns of all security policies in the database. Its columns are the same as those in ALL_SEC_RELEVANT_COLS.

 **See Also:**

["ALL_SEC_RELEVANT_COLS"](#)

5.348 DBA_SECONDARY_OBJECTS

DBA_SECONDARY_OBJECTS provides information about all secondary objects that are associated with domain indexes in the database.

This view is only relevant in the context of domain indexes. Its columns are the same as those in ["ALL_SECONDARY_OBJECTS"](#).

5.349 DBA_SEGMENTS

DBA_SEGMENTS describes the storage allocated for all segments in the database.

Related View

USER_SEGMENTS describes the storage allocated for the segments owned by the current user's objects. This view does not display the OWNER, HEADER_FILE, HEADER_BLOCK, or RELATIVE_FNO columns.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)		Username of the segment owner
SEGMENT_NAME	VARCHAR2(128)		Name, if any, of the segment
PARTITION_NAME	VARCHAR2(128)		Object Partition Name (Set to NULL for nonpartitioned objects)

Column	Datatype	NULL	Description
SEGMENT_TYPE	VARCHAR2(18)		Type of segment: <ul style="list-style-type: none"> • NESTED TABLE • TABLE • TABLE PARTITION • CLUSTER • LOBINDEX • INDEX • INDEX PARTITION • LOBSEGMENT • TABLE SUBPARTITION • INDEX SUBPARTITION • LOB PARTITION • LOB SUBPARTITION • ROLLBACK • TYPE2 UNDO • DEFERRED ROLLBACK • TEMPORARY • CACHE • SPACE HEADER • UNDEFINED
SEGMENT_SUBTYPE	VARCHAR2(10)		Subtype of LOB segment: SECUREFILE, ASSM, MSSM, and NULL
TABLESPACE_NAME	VARCHAR2(30)		Name of the tablespace containing the segment
HEADER_FILE	NUMBER		Absolute file number of the data file containing the segment header
HEADER_BLOCK	NUMBER		ID of the block containing the segment header
BYTES	NUMBER		Size, in bytes, of the segment
BLOCKS	NUMBER		Size, in Oracle blocks, of the segment
EXTENTS	NUMBER		Number of extents allocated to the segment
INITIAL_EXTENT	NUMBER		Size in bytes requested for the initial extent of the segment at create time. (Oracle rounds the extent size to multiples of 5 blocks if the requested size is greater than 5 blocks.)
NEXT_EXTENT	NUMBER		Size in bytes of the next extent to be allocated to the segment
MIN_EXTENTS	NUMBER		Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER		Maximum number of extents allowed in the segment
MAX_SIZE	NUMBER		Maximum number of blocks allowed in the segment
RETENTION	VARCHAR2(7)		Retention option for SECUREFILE segment
MINRETENTION	NUMBER		Minimum retention duration for SECUREFILE segment
PCT_INCREASE	NUMBER		Percent by which to increase the size of the next extent to be allocated
FREELISTS	NUMBER		Number of process freelists allocated to this segment
FREELIST_GROUPS	NUMBER		Number of freelist groups allocated to this segment
RELATIVE_FNO	NUMBER		Relative file number of the segment header

Column	Datatype	NULL	Description
BUFFER_POOL	VARCHAR2(7)		<p>Buffer pool to be used for segment blocks:</p> <ul style="list-style-type: none"> • DEFAULT • KEEP • RECYCLE
FLASH_CACHE	VARCHAR2(7)		<p>Database Smart Flash Cache hint to be used for segment blocks:</p> <ul style="list-style-type: none"> • DEFAULT • KEEP • NONE <p>Solaris and Oracle Linux functionality only.</p>
CELL_FLASH_CACHE	VARCHAR2(7)		<p>Cell flash cache hint to be used for segment blocks:</p> <ul style="list-style-type: none"> • DEFAULT • KEEP • NONE <p>See Also: Oracle Exadata Storage Server Software documentation for more information</p>
INMEMORY	VARCHAR2(8)		<p>Indicates whether the In-Memory Column Store (IM column store) is enabled (ENABLED) or disabled (DISABLED) for this segment</p>
INMEMORY_PRIORITY	VARCHAR2(8)		<p>Indicates the priority for In-Memory Column Store (IM column store) population:</p> <ul style="list-style-type: none"> • LOW • MEDIUM • HIGH • CRITICAL • NONE • NULL
INMEMORY_DISTRIBUTE	VARCHAR2(15)		<p>Indicates how the IM column store is distributed in an Oracle Real Application Clusters (Oracle RAC) environment:</p> <ul style="list-style-type: none"> • AUTO • BY ROWID RANGE • BY PARTITION • BY SUBPARTITION
INMEMORY_DUPLICATE	VARCHAR2(13)		<p>Indicates the duplicate setting for the IM column store in an Oracle RAC environment:</p> <ul style="list-style-type: none"> • NO DUPLICATE • DUPLICATE • DUPLICATE ALL
INMEMORY_COMPRESSION	VARCHAR2(17)		<p>Indicates the compression level for the IM column store:</p> <ul style="list-style-type: none"> • NO MEMCOMPRESS • FOR DML • FOR QUERY [LOW HIGH] • FOR CAPACITY [LOW HIGH] • NULL

Column	Datatype	NULL	Description
CELLMEMORY ¹¹	VARCHAR2 (24)		<p>The value for columnar compression in the storage cell flash cache. Possible values:</p> <ul style="list-style-type: none"> • ENABLED: Oracle Exadata Storage will decide automatically whether to cache in columnar form • DISABLED: Oracle Exadata Storage is prevented from caching in columnar form • NO CACHECOMPRESS: Oracle Exadata Storage will cache in HCC format (no recompression) • FOR QUERY: Oracle Exadata Storage will recompress and cache in INMEMORY query high format • FOR CAPACITY: Oracle Exadata Storage will recompress and cache in INMEMORY capacity low format

¹ This column is intended for use with Oracle Exadata

See Also:

"USER_SEGMENTS"

5.350 DBA_SEGMENTS_OLD

DBA_SEGMENTS_OLD lists information about storage allocated for all database segments.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Username of the segment owner
SEGMENT_NAME	VARCHAR2 (128)		Name, if any, of the segment
PARTITION_NAME	VARCHAR2 (128)		Name of the partition
SEGMENT_TYPE	VARCHAR2 (18)		Type of segment: INDEX PARTITION, TABLE PARTITION, TABLE, CLUSTER, INDEX, ROLLBACK, DEFERRED ROLLBACK, TEMPORARY, CACHE, LOBSEGMENT and LOBINDEX
TABLESPACE_NAME	VARCHAR2 (30)		Name of the tablespace containing the segment
HEADER_FILE	NUMBER		ID of the file containing the segment header
HEADER_BLOCK	NUMBER		ID of the block containing the segment header
BYTES	NUMBER		Size, in bytes, of the segment
BLOCKS	NUMBER		Size, in Oracle blocks, of the segment
EXTENTS	NUMBER		Number of extents allocated to the segment
INITIAL_EXTENT	NUMBER		Size in bytes requested for the initial extent of the segment at create time. (Oracle rounds the extent size to multiples of 5 blocks if the requested size is greater than 5 blocks.)
NEXT_EXTENT	NUMBER		Size in bytes of the next extent to be allocated to the segment
MIN_EXTENTS	NUMBER		Minimum number of extents allowed in the segment

Column	Datatype	NULL	Description
MAX_EXTENTS	NUMBER		Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER		Percent by which to increase the size of the next extent to be allocated
FREELISTS	NUMBER		Number of process freelists allocated to the segment
FREELIST_GROUPS	NUMBER		Number of freelist groups allocated to this segment
RELATIVE_FNO	NUMBER		Relative file number of the segment header
BUFFER_POOL	VARCHAR2(7)		Buffer pool for the object

5.351 DBA_SENSITIVE_COLUMN_TYPES

DBA_SENSITIVE_COLUMN_TYPES describes sensitive column types in the database.

Column	Datatype	NULL	Description
NAME	VARCHAR2(128)		The name of the sensitive column type
USER_COMMENT	VARCHAR2(4000)		User comment on the sensitive column type
SOURCE_NAME	VARCHAR2(128)		The name of the discovery source for the sensitive column type
SOURCE_TYPE	VARCHAR2(3)		The type of the discovery source: <ul style="list-style-type: none"> • ADM: import from ADM • DB: added within the database

 **See Also:**

Oracle Database Security Guide for more information about transparent sensitive data protection

5.352 DBA_SENSITIVE_DATA

DBA_SENSITIVE_DATA describes the sensitive columns in the database.

Column	Datatype	NULL	Description
SENSITIVE#	NUMBER	NOT NULL	Dictionary ID for the sensitive data
SCHEMA_NAME	VARCHAR2(128)	NOT NULL	The schema containing the sensitive data
TABLE_NAME	VARCHAR2(128)	NOT NULL	The table containing the sensitive data
COLUMN_NAME	VARCHAR2(128)	NOT NULL	The name of the column identified as sensitive
SENSITIVE_TYPE	VARCHAR2(128)		The sensitive column type of the data
SOURCE_NAME	VARCHAR2(128)		The name of the discovery source for the sensitive data
USER_COMMENT	VARCHAR2(4000)		User comment on the sensitive data
TS	TIMESTAMP(6)		The time when the data was identified as sensitive in the database

 See Also:

Oracle Database Security Guide for more information about transparent sensitive data protection

5.353 DBA_SEQUENCES

DBA_SEQUENCES describes all sequences in the database. Its columns are the same as those in ALL_SEQUENCES.

 See Also:

"ALL_SEQUENCES"

5.354 DBA_SERVER_REGISTRY

DBA_SERVER_REGISTRY displays information about all server components in the database that are loaded into the component registry.

Column	Datatype	NULL	Description
COMP_ID	VARCHAR2(30)	NOT NULL	Component identifier
COMP_NAME	VARCHAR2(255)		Component name
VERSION	VARCHAR2(30)		Component version loaded
VERSION_FULL	VARCHAR2(30)		Component full version
STATUS	VARCHAR2(11)		Component status: <ul style="list-style-type: none"> • INVALID • VALID • LOADING • LOADED • UPGRADE • UPGRADED • DOWNGRADING • DOWNGRADED • REMOVING • REMOVED
MODIFIED	VARCHAR2(20)		Time when the component was last modified
CONTROL	VARCHAR2(128)	NOT NULL	User that created the component entry
SCHEMA	VARCHAR2(128)	NOT NULL	User that contains the objects for the component
PROCEDURE	VARCHAR2(61)		Validation procedure
STARTUP	VARCHAR2(8)		Indicates whether the component requires a startup after the upgrade (REQUIRED) or not
PARENT_ID	VARCHAR2(30)		Parent component identifier
OTHER_SCHEMAS	VARCHAR2(4000)		A list of ancillary schema names associated with the component

5.355 DBA_SERVICES

DBA_SERVICES displays all services in the database. The view excludes rows marked for deletion. Its columns are the same as those in ALL_SERVICES.

 **See Also:**

"[ALL_SERVICES](#)"

5.356 DBA_SODA_COLLECTIONS

DBA_SODA_COLLECTIONS describes all Simple Oracle Document Access (SODA) collections in the database.

Related View

USER_SODA_COLLECTIONS describes the SODA collections owned by the current user. This view does not display the OWNER column.

Column	Datatype	NULL	Description
URI_NAME	NVARCHAR2 (255)	NOT NULL	Collection name
OWNER	VARCHAR2 (128)	NOT NULL	Owner of the collection
OBJECT_TYPE	VARCHAR2 (10)	NOT NULL	Indicates whether the collection is table-based (TABLE) or view-based (VIEW)
OBJECT_SCHEMA	VARCHAR2 (128)	NOT NULL	Name of the schema that includes the table or view on which the collection is based
OBJECT_NAME	VARCHAR2 (128)	NOT NULL	Name of the table or view on which the collection is based
CREATED_ON	TIMESTAMP (6)	NOT NULL	Collection creation time
CREATE_MODE	VARCHAR2 (10)	NOT NULL	Creation mode. Possible values: <ul style="list-style-type: none"> • DDL: A new table was created at collection creation time • MAP: The collection was created by mapping a preexisting table or view Note: For view-based collections, the value of this column is always MAP. New views are not created for view-based collections. A view-based collection is always created by mapping a preexisting view.
JSON_DESCRIPTOR	VARCHAR2 (4000)	NOT NULL	Collection metadata, expressed in JavaScript Object Notation (JSON)

 **Note:**

The DBA_SODA_COLLECTIONS view is available only in Oracle Autonomous Database. However, the USER_SODA_COLLECTIONS view is available in on-premises Oracle databases and Oracle Autonomous Database.

 See Also:["USER_SODA_COLLECTIONS"](#)

5.357 DBA_SOURCE

`DBA_SOURCE` describes the text source of all stored objects in the database. Its columns are the same as those in `ALL_SOURCE`.

 See Also:["ALL_SOURCE"](#)

5.358 DBA_SOURCE_AE

`DBA_SOURCE_AE` describes the text source of all stored objects (across all editions) in the database. Its columns are the same as those in `ALL_SOURCE_AE`.

 See Also:["ALL_SOURCE_AE"](#)

5.359 DBA_SQL_MANAGEMENT_CONFIG

`DBA_SQL_MANAGEMENT_CONFIG` displays the configuration parameters of the SQL management base.

You must have the `DBA` role in order to change the configuration parameter values.

Column	Datatype	NULL	Description
PARAMETER_NAME	VARCHAR2(128)	NOT NULL	Name of the configuration parameter: <ul style="list-style-type: none"> • <code>AUTO_CAPTURE_ACTION</code> • <code>AUTO_CAPTURE_MODULE</code> • <code>AUTO_CAPTURE_PARSING_SCHEMA_NAME</code> • <code>AUTO_CAPTURE_SQL_TEXT</code> • <code>PLAN_RETENTION_WEEKS</code> • <code>SPACE_BUDGET_PERCENT</code>
PARAMETER_VALUE	VARCHAR2(4000)		Value of the configuration parameter
LAST_MODIFIED	TIMESTAMP(6)		Time the parameter value was last updated
MODIFIED_BY	VARCHAR2(128)		User who last updated the parameter value

5.360 DBA_SQL_QUARANTINE

`DBA_SQL_QUARANTINE` displays information about SQL Quarantine configurations.

Each row in this view represents a quarantine configuration for a SQL plan.

Column	Datatype	NULL	Description
SIGNATURE	NUMBER	NOT NULL	Unique SQL identifier generated from normalized SQL text
NAME	VARCHAR2 (128)	NOT NULL	Unique plan identifier in string form as a search key
SQL_TEXT	CLOB	NOT NULL	Un-normalized SQL text
PLAN_HASH_VALUE	NUMBER		Unique plan identifier in numeric form as a search key
CPU_TIME	VARCHAR2 (4000)		CPU time threshold (in seconds)
IO_MEGABYTES	VARCHAR2 (4000)		I/O threshold (in megabytes)
IO_REQUESTS	VARCHAR2 (4000)		Physical I/O threshold (number of physical I/O requests)
ELAPSED_TIME	VARCHAR2 (4000)		Elapsed time threshold (in seconds)
IO_LOGICAL	VARCHAR2 (4000)		Logical I/O threshold (number of logical I/O requests)
CREATOR	VARCHAR2 (128)		User who created the quarantine configuration
ORIGIN	VARCHAR2 (16)		Method by which the quarantine configuration was created. The only possible value is <code>RESOURCE-MANAGER</code> , which indicates that the quarantine configuration was created by the Resource Manager.
DESCRIPTION	VARCHAR2 (500)		Text description
CREATED	TIMESTAMP (6)	NOT NULL	Time at which the quarantine configuration was created
LAST_EXECUTED	TIMESTAMP (6)		Time at which the quarantine configuration was last used
ENABLED	VARCHAR2 (3)		Indicates whether the quarantine configuration is enabled (<code>YES</code>) or disabled (<code>NO</code>)
AUTOPURGE	VARCHAR2 (3)		Indicates whether the quarantine configuration is auto-purged (<code>YES</code>) or not (<code>NO</code>)

Note:

This view is available starting with Oracle Database 19c.

See Also:

Oracle Database SQL Tuning Guide for more information about quarantined SQL plans

5.361 DBA_SQL_PATCHES

DBA_SQL_PATCHES displays the set of SQL patches.

Column	Datatype	NULL	Description
NAME	VARCHAR2(128)	NOT NULL	Name of the SQL patch
CATEGORY	VARCHAR2(128)	NOT NULL	Category of the SQL patch
SIGNATURE	NUMBER	NOT NULL	Unique identifier generated from normalized SQL text
SQL_TEXT	CLOB	NOT NULL	Un-normalized SQL text
CREATED	TIMESTAMP(6)	NOT NULL	Timestamp when the SQL patch was created
LAST_MODIFIED	TIMESTAMP(6)		Timestamp when the SQL patch was last modified
DESCRIPTION	VARCHAR2(500)		Text description provided for the SQL patch
STATUS	VARCHAR2(8)		Status of the SQL patch: <ul style="list-style-type: none">• ENABLED• DISABLED
FORCE_MATCHING	VARCHAR2(3)		Indicates whether the signature is force matching (YES) or exact matching (NO)
TASK_ID	NUMBER		Advisor task ID that generated the SQL patch
TASK_EXEC_NAME	VARCHAR2(128)		Advisor execution name for the SQL patch
TASK_OBJ_ID	NUMBER		Advisor object ID for the SQL patch
TASK_FND_ID	NUMBER		Advisor finding ID for the SQL patch
TASK_REC_ID	NUMBER		Advisor recommendation ID for the SQL patch

5.362 DBA_SQL_PLAN_BASELINES

DBA_SQL_PLAN_BASELINES displays information about the SQL plan baselines currently created for specific SQL statements.

Column	Datatype	NULL	Description
SIGNATURE	NUMBER	NOT NULL	Unique SQL identifier generated from normalized SQL text
SQL_HANDLE	VARCHAR2(30)	NOT NULL	Unique SQL identifier in string form as a search key
SQL_TEXT	CLOB	NOT NULL	Un-normalized SQL text
PLAN_NAME	VARCHAR2(128)	NOT NULL	Unique plan identifier in string form as a search key
CREATOR	VARCHAR2(128)		User who created the plan baseline

Column	Datatype	NULL	Description
ORIGIN	VARCHAR2 (29)		<p>How the plan baseline was created:</p> <ul style="list-style-type: none"> • ADDM-SQLTUNE • AUTO-CAPTURE • AUTO-SQLTUNE • EVOLVE-AUTO-INDEX-LOAD • EVOLVE-CREATE-FROM-ADAPTIVE • EVOLVE-LOAD-FROM-AWR • EVOLVE-LOAD-FROM-CURSOR-CACHE • EVOLVE-LOAD-FROM-STS • MANUAL-LOAD • MANUAL-LOAD-FROM-AWR • MANUAL-LOAD-FROM-CURSOR-CACHE • MANUAL-LOAD-FROM-STS • MANUAL-SQLTUNE • STORED-OUTLINE
PARSING_SCHEMA_NAME	VARCHAR2 (128)		Name of the parsing schema
DESCRIPTION	VARCHAR2 (500)		Text description provided for the plan baseline
VERSION	VARCHAR2 (64)		Database version at the time of plan baseline creation
CREATED	TIMESTAMP (6)	NOT NULL	Timestamp when the plan baseline was created
LAST_MODIFIED	TIMESTAMP (6)		Timestamp when the plan baseline was last modified
LAST_EXECUTED	TIMESTAMP (6)		Timestamp when the plan baseline was last executed
			Note: For performance reasons, this column is not updated immediately after each execution of the plan baseline. Therefore, the plan baseline may have been executed more recently than the value of this column indicates.
LAST_VERIFIED	TIMESTAMP (6)		Timestamp when the plan baseline was last verified
ENABLED	VARCHAR2 (3)		Indicates whether the plan baseline is enabled (YES) or disabled (NO)
ACCEPTED	VARCHAR2 (3)		Indicates whether the plan baseline is accepted (YES) or not (NO)
FIXED	VARCHAR2 (3)		Indicates whether the plan baseline is fixed (YES) or not (NO)
REPRODUCED	VARCHAR2 (3)		Indicates whether the optimizer was able to reproduce the plan (YES) or not (NO). The value of this column is set to YES when a plan is initially added to the plan baseline.
AUTOPURGE	VARCHAR2 (3)		Indicates whether the plan baseline is auto-purged (YES) or not (NO)

Column	Datatype	NULL	Description
ADAPTIVE	VARCHAR2 (3)		Indicates whether a plan that is automatically captured by SQL plan management is marked adaptive or not. When a new adaptive plan is found for a SQL statement that has an existing SQL plan baseline, that new plan will be added to the SQL plan baseline as an unaccepted plan, and the ADAPTIVE column will be marked YES. When this new plan is verified (either manually or via the auto evolve task), the plan will be tested and the final plan determined at execution will become an accepted plan if its performance is better than the existing plan baseline. At this point, the value of the ADAPTIVE column is set to NO since the plan is no longer adaptive, but resolved.
OPTIMIZER_COST	NUMBER		Optimizer cost at the time the plan baseline was created
MODULE	VARCHAR2 (64)		Application module name
ACTION	VARCHAR2 (64)		Application action
EXECUTIONS ¹	NUMBER		Number of executions at the time the plan baseline was created
ELAPSED_TIME ¹	NUMBER		Total elapsed time (in microseconds) at the time the plan baseline was created
CPU_TIME ¹	NUMBER		Total CPU time (in microseconds) at the time the plan baseline was created
BUFFER_GETS ¹	NUMBER		Total buffer gets at the time the plan baseline was created
DISK_READS ¹	NUMBER		Total disk reads at the time the plan baseline was created
DIRECT_WRITES ¹	NUMBER		Total direct writes at the time the plan baseline was created
ROWS_PROCESSED ¹	NUMBER		Total rows processed at the time the plan baseline was created
FETCHES ¹	NUMBER		Total number of fetches at the time the plan baseline was created
END_OF_FETCH_COUNT ¹	NUMBER		Total number of full fetches at the time the plan baseline was created

¹ If the value of the ORIGIN column is equal to AUTO-CAPTURE, then data for this column is not populated.

5.363 DBA_SQL_PLAN_DIR_OBJECTS

DBA_SQL_PLAN_DIR_OBJECTS displays the objects created in the SQL plan directive.

Column	Datatype	NULL	Description
DIRECTIVE_ID	NUMBER		The identifier of the SQL plan directive
OWNER	VARCHAR2 (128)		The username of the owner of the object in the SQL plan directive
OBJECT_NAME	VARCHAR2 (128)		The name of the object in the SQL plan directive
SUBOBJECT_NAME	VARCHAR2 (128)		The name of the subobject (for example, column) in the SQL plan directive
OBJECT_TYPE	VARCHAR2 (6)		The type of the subobject in the SQL plan directive
NUM_ROWS	NUMBER		The number of rows in the object when the directive is created
NOTES	XMLTYPE		Other notes about the object

 **See Also:**

- "[DBA_SQL_PLAN_DIRECTIVES](#)"
- *Oracle Database SQL Tuning Guide* for more information about SQL plan directives

5.364 DBA_SQL_PLAN_DIRECTIVES

DBA_SQL_PLAN_DIRECTIVES displays information about the SQL plan directives in the system.

Column	Datatype	NULL	Description
DIRECTIVE_ID	NUMBER	NOT NULL	The identifier of the SQL plan directive
TYPE	VARCHAR2 (16)		<p>The type of the SQL plan directive:</p> <ul style="list-style-type: none"> • DYNAMIC_SAMPLING: SQL plan directive • DYNAMIC_SAMPLING_RESULT: Dynamic sampling query results. This value appears only in Oracle Database 12c Release 2 (12.2.0.1) and later releases. • UNKNOWN: Unknown
ENABLED	VARCHAR2 (3)		<p>Indicates whether the SQL plan directive is enabled. Possible values:</p> <ul style="list-style-type: none"> • YES: The SQL plan directive is enabled. • NO: The SQL plan directive is not enabled.

Column	Datatype	NULL	Description
STATE	VARCHAR2 (10)		The state of the SQL plan directive. Possible values include: <ul style="list-style-type: none"> • SUPERSEDED: This value indicates that the corresponding column or groups have an extension or histogram, or that another SQL plan directive exists that can be used for the directive. • USABLE: This value indicates that the SQL plan directive is usable for the optimizer.
AUTO_DROP	VARCHAR2 (3)		If YES, the SQL plan directive gets dropped when unused beyond <code>SPD_RETENTION_WEEKS</code>
REASON	VARCHAR2 (36)		The reason for creating the SQL plan directive
CREATED	TIMESTAMP (6)		The creation timestamp of the SQL plan directive
LAST_MODIFIED	TIMESTAMP (6)		The timestamp of most recent modification of the SQL plan directive
LAST_USED	TIMESTAMP (9)		The timestamp of most recent usage of the SQL plan directive
NOTES	XMLTYPE		Extra information about the SQL plan directive

 **See Also:**

- "[DBA_SQL_PLAN_DIR_OBJECTS](#)"
- *Oracle Database SQL Tuning Guide* for more information about SQL plan directives

5.365 DBA_SQL_PROFILES

`DBA_SQL_PROFILES` displays information about SQL profiles currently created for specific SQL statements.

Column	Datatype	NULL	Description
NAME	VARCHAR2 (128)	NOT NULL	Name of the SQL profile
CATEGORY	VARCHAR2 (128)	NOT NULL	Category of the SQL profile
SIGNATURE	NUMBER	NOT NULL	Unique identifier generated from normalized SQL text
SQL_TEXT	CLOB	NOT NULL	Un-normalized SQL text
CREATED	TIMESTAMP (6)	NOT NULL	Timestamp when the SQL profile was created
LAST_MODIFIED	TIMESTAMP (6)		Timestamp when the SQL profile was last modified
DESCRIPTION	VARCHAR2 (500)		Text description provided for the SQL profile
TYPE	VARCHAR2 (7)		Type of the SQL profile (how it was created): <ul style="list-style-type: none"> • MANUAL • AUTO

Column	Datatype	NULL	Description
STATUS	VARCHAR2(8)		Status of the SQL profile: <ul style="list-style-type: none">• ENABLED• DISABLED• VOID
FORCE_MATCHING	VARCHAR2(3)		If YES, this causes SQL Profiles to target all SQL statements which have the same text after normalizing all literal values to bind variables. If a combination of literal values and bind variables is used in the same SQL text, then no transformation occurs. This is analogous to the matching algorithm use by the FORCE option of the CURSOR_SHARING parameter. If NO, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter.
TASK_ID	NUMBER		Advisor task ID that generated the SQL profile
TASK_EXEC_NAME	VARCHAR2(128)		Advisor execution name for the SQL profile
TASK_OBJ_ID	NUMBER		Advisor object ID for the SQL profile
TASK_FND_ID	NUMBER		Advisor finding ID for the SQL profile
TASK_REC_ID	NUMBER		Advisor recommendation ID for the SQL profile
TASK_CON_DBID	NUMBER		Database ID for the PDB tuning task generating the SQL profile

 See Also:

The DBMS_SQLTUNE package in *Oracle Database PL/SQL Packages and Types Reference*

5.366 DBA_SQL_TRANSLATION_PROFILES

DBA_SQL_TRANSLATION_PROFILES describes all SQL translation profiles in the database. Its columns are the same as those in ALL_SQL_TRANSLATION_PROFILES.

 See Also:

"ALL_SQL_TRANSLATION_PROFILES"

5.367 DBA_SQL_TRANSLATIONS

DBA_SQL_TRANSLATIONS describes all SQL translations in the database. Its columns are the same as those in ALL_SQL_TRANSLATIONS.

See Also:

"ALL_SQL_TRANSLATIONS"

5.368 DBA_SQLJ_TYPE_ATTRS

DBA_SQLJ_TYPE_ATTRS describes the attributes of all SQLJ object types in the database. Its columns are the same as those in ALL_SQLJ_TYPE_ATTRS.

See Also:

"ALL_SQLJ_TYPE_ATTRS"

5.369 DBA_SQLJ_TYPE_METHODS

DBA_SQLJ_TYPE_METHODS describes the methods of all SQLJ object types in the database. Its columns are the same as those in ALL_SQLJ_TYPE_METHODS.

See Also:

"ALL_SQLJ_TYPE_METHODS"

5.370 DBA_SQLJ_TYPES

DBA_SQLJ_TYPES describes all SQLJ object types in the database. Its columns are the same as those in ALL_SQLJ_TYPES.

See Also:

"ALL_SQLJ_TYPES"

5.371 DBA_SQLSET

DBA_SQLSET displays information about all SQL tuning sets in the database. Its columns are the same as those in ALL_SQLSET.

 **See Also:**

["ALL_SQLSET"](#)

5.372 DBA_SQLSET_BINDS

DBA_SQLSET_BINDS displays the bind values associated with all SQL tuning sets in the database. Its columns are the same as those in ALL_SQLSET_BINDS.

 **See Also:**

["ALL_SQLSET_BINDS"](#)

5.373 DBA_SQLSET_PLANS

DBA_SQLSET_PLANS describes captured plans in the SQL tuning sets in the database. Its columns are the same as those in ALL_SQLSET_PLANS.

 **See Also:**

["ALL_SQLSET_PLANS"](#)

5.374 DBA_SQLSET_REFERENCES

DBA_SQLSET_REFERENCES describes whether or not all SQL tuning sets in the database are active. A SQL tuning set cannot be dropped if it is referenced. Its columns are the same as those in ALL_SQLSET_REFERENCES.

 **See Also:**

["ALL_SQLSET_REFERENCES"](#)

5.375 DBA_SQLSET_STATEMENTS

`DBA_SQLSET_STATEMENTS` displays information about the SQL statements, along with their statistics, that form all SQL tuning sets in the database. Its columns, except for `PARSING_SCHEMA_ID`, are the same as those in `ALL_SQLSET_STATEMENTS`.

Column	Datatype	NULL	Description
<code>SQLSET_NAME</code>	<code>VARCHAR2(128)</code>	NOT NULL	Name of the SQL tuning set for the statement
<code>SQLSET_OWNER</code>	<code>VARCHAR2(128)</code>		User name of the SQL tuning set owner
<code>SQLSET_ID</code>	<code>NUMBER</code>	NOT NULL	ID of the SQL tuning set for the statement
<code>CON_DBID</code>	<code>NUMBER</code>	NOT NULL	The database ID of the PDB
<code>SQL_ID</code>	<code>VARCHAR2(13)</code>	NOT NULL	SQL identifier of the parent cursor in the library cache
<code>FORCE_MATCHING_SIGNATURE</code>	<code>NUMBER</code>	NOT NULL	The signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>FORCE</code>
<code>SQL_TEXT</code>	<code>CLOB</code>		Full text for the SQL statement exposed as a CLOB column.
<code>PARSING_SCHEMA_NAME</code>	<code>VARCHAR2(128)</code>		Name of the user in whose schema the statement was parsed
<code>PARSING_SCHEMA_ID</code>	<code>NUMBER</code>		ID of the schema in which the statement was parsed
<code>PLAN_HASH_VALUE</code>	<code>NUMBER</code>	NOT NULL	Hash value for the plan corresponding to statistics in this record
<code>BIND_DATA</code>	<code>RAW(2000)</code>		Bind data
<code>BINDS_CAPTURED</code>	<code>CHAR(1)</code>		Binds captured
<code>MODULE</code>	<code>VARCHAR2(64)</code>		Contains the name of the module that was executing at the time that the SQL statement was first parsed, which is set by calling <code>DBMS_APPLICATION_INFO.SET_MODULE</code>
<code>ACTION</code>	<code>VARCHAR2(64)</code>		Contains the name of the action that was executing at the time that the SQL statement was first parsed, which is set by calling <code>DBMS_APPLICATION_INFO.SET_ACTION</code>
<code>ELAPSED_TIME</code>	<code>NUMBER</code>		Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching
<code>CPU_TIME</code>	<code>NUMBER</code>		CPU time (in microseconds) used by this cursor for parsing, executing, and fetching
<code>BUFFER_GETS</code>	<code>NUMBER</code>		Number of buffer gets for this child cursor
<code>DISK_READS</code>	<code>NUMBER</code>		Number of disk reads for this child cursor
<code>DIRECT_WRITES</code>	<code>NUMBER</code>		Number of direct writes for this child cursor
<code>ROWS_PROCESSED</code>	<code>NUMBER</code>		Total number of rows that the parsed SQL statement returns
<code>FETCHES</code>	<code>NUMBER</code>		Number of fetches associated with the SQL statement
<code>EXECUTIONS</code>	<code>NUMBER</code>		Number of executions that took place on this object since it was brought into the library cache

Column	Datatype	NULL	Description
END_OF_FETCH_COUNT	NUMBER		Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less than, or equal to, the value of the EXECUTIONS column.
OPTIMIZER_COST	NUMBER		Cost of this query, given by the optimizer
OPTIMIZER_ENV	RAW(2000)		Optimizer environment
PRIORITY	NUMBER		User-defined priority
COMMAND_TYPE	NUMBER		Oracle command type definition
FIRST_LOAD_TIME	VARCHAR2(19)		Timestamp of the parent creation time
STAT_PERIOD	NUMBER		Period of time (in seconds) during which the statistics of the SQL statement were collected
ACTIVE_STAT_PERIOD	NUMBER		Effective period of time (in seconds) during which the SQL statement was active
OTHER	CLOB		Client data, specified by the user, for this statement
PLAN_TIMESTAMP	DATE		Timestamp for the plan corresponding to the statistics in this record
SQL_SEQ	NUMBER	NOT NULL	SQL sequence
LAST_EXEC_START_TIME	VARCHAR2(19)		For SQLs captured from the cursor cache, this is the time when the most recent execution of this SQL started

See Also:

- ["ALL_SQLSET_STATEMENTS"](#)
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_APPLICATION_INFO.SET_MODULE procedure
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_APPLICATION_INFO.SET_ACTION procedure

5.376 DBA_SQLTUNE_BINDS

DBA_SQLTUNE_BINDS displays the bind values associated with all tuned SQL statements in the database.

Related View

USER_SQLTUNE_BINDS displays the bind values associated with the tuned SQL statements owned by the current user.

Column	Datatype	NULL	Description
TASK_ID	NUMBER (38)	NOT NULL	Tuning task identifier
OBJECT_ID	NUMBER (38)	NOT NULL	Advisor framework object identifier
POSITION	NUMBER (38)	NOT NULL	Bind position
VALUE	ANYDATA		Bind value. This column is <code>NULL</code> for PL/SQL bind types.

 See Also:["USER_SQLTUNE_BINDS"](#)

5.377 DBA_SQLTUNE_PLANS

`DBA_SQLTUNE_PLANS` displays information about the execution plans generated for all SQL statements in the database during a SQL tuning session.

Related View

`USER_SQLTUNE_PLANS` displays information about the execution plans generated for the SQL statements owned by the current user during a SQL tuning session.

Column	Datatype	NULL	Description
TASK_ID	NUMBER (38)	NOT NULL	Advisor task ID
EXECUTION_NAME	VARCHAR2 (128)	NOT NULL	Advisor task execution
OBJECT_ID	NUMBER (38)	NOT NULL	Advisor object ID
ATTRIBUTE	VARCHAR2 (34)		Text string identifying the type of the execution plan: <ul style="list-style-type: none"> • Original - Original plan of the query • Original with adjusted cost - Same as Original but with adjusted cost • Using SQL profile - Plan with SQL profile applied • Using new indices - Plan with indexes applied
STATEMENT_ID	VARCHAR2 (30)		Optional statement identifier specified in the EXPLAIN PLAN statement
PLAN_HASH_VALUE	NUMBER	NOT NULL	Numerical representation of the execution plan
PLAN_ID	NUMBER		Plan identifier
TIMESTAMP	DATE		Date and time when the EXPLAIN PLAN statement was issued
REMARKS	VARCHAR2 (4000)		Place for comments that can be added to the steps of the execution plan
OPERATION	VARCHAR2 (30)		Name of the operation performed at this step
OPTIONS	VARCHAR2 (255)		Options used for the operation performed at this step
OBJECT_NODE	VARCHAR2 (128)		Name of the database link used to reference the object
OBJECT_OWNER	VARCHAR2 (128)		Owner of the object

Column	Datatype	NULL	Description
OBJECT_NAME	VARCHAR2(128)		Name of the object
OBJECT_ALIAS	VARCHAR2(261)		Object alias
OBJECT_INSTANCE	NUMBER(38)		Numbered position of the object name in the original SQL statement
OBJECT_TYPE	VARCHAR2(30)		Descriptive modifier that further describes the type of object
OPTIMIZER	VARCHAR2(255)		Current mode of the optimizer
SEARCH_COLUMNS	NUMBER		Number of index columns with start and stop keys (that is, the number of columns with matching predicates)
ID	NUMBER(38)	NOT NULL	Identification number for this step in the execution plan
PARENT_ID	NUMBER(38)		ID of the next step that operates on the results of this step
DEPTH	NUMBER(38)		Depth
POSITION	NUMBER(38)		Order of processing for steps with the same parent ID
COST	NUMBER(38)		Cost of the current operation estimated by the cost-based optimizer (CBO)
CARDINALITY	NUMBER(38)		Number of rows returned by the current operation (estimated by the CBO)
BYTES	NUMBER(38)		Number of bytes returned by the current operation
OTHER_TAG	VARCHAR2(255)		Describes the function of the SQL text in the OTHER column. Values for OTHER_TAG are: <ul style="list-style-type: none"> • SERIAL - SQL is the text of a locally-executed, serial query plan. Currently, SQL is not loaded in OTHER for this case. • SERIAL_FROM_REMOTE - SQL text shown in the OTHER column will be executed at a remote site • PARALLEL_COMBINED_WITH_PARENT - Parent of this operation is a DFO that performs both operations in the parallel execution plan • PARALLEL_COMBINED_WITH_CHILD - Child of this operation is a DFO that performs both operations in the parallel execution plan. • PARALLEL_TO_SERIAL - SQL text shown in the OTHER column is the top-level of the parallel plan. • PARALLEL_TO_PARALLEL - SQL text shown in the OTHER column is executed and output in parallel • PARALLEL_FROM_SERIAL - Operation consumes data from a serial operation and outputs it in parallel
PARTITION_START	VARCHAR2(255)		Start partition of a range of accessed partitions
PARTITION_STOP	VARCHAR2(255)		Stop partition of a range of accessed partitions
PARTITION_ID	NUMBER(38)		Step that has computed the pair of values of the PARTITION_START and PARTITION_STOP columns
OTHER	LONG		Information about parallel execution servers and parallel queries
DISTRIBUTION	VARCHAR2(30)		Distribution method
CPU_COST	NUMBER(38)		User-defined CPU cost

Column	Datatype	NULL	Description
IO_COST	NUMBER (38)		User-defined I/O cost
TEMP_SPACE	NUMBER (38)		Temporary space usage of the operation (sort or hash-join) as estimated by the CBO
ACCESS_PREDICATES	VARCHAR2 (4000)		Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.
FILTER_PREDICATES	VARCHAR2 (4000)		Predicates used to filter rows before producing them
PROJECTION	VARCHAR2 (4000)		Expressions produced by the operation
TIME	NUMBER (38)		Elapsed time (in seconds) of the operation as estimated by the CBO
QBLOCK_NAME	VARCHAR2 (128)		Name of the query block
OTHER_XML	CLOB		Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML because it allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan

 See Also:["USER_SQLTUNE_PLANS"](#)

5.378 DBA_SQLTUNE_RATIONALE_PLAN

DBA_SQLTUNE_RATIONALE_PLAN displays the association between rationales and operations in the execution plan of all SQL statements in the database.

Related View

USER_SQLTUNE_RATIONALE_PLAN displays the association between rationales and operations in the execution plan of the SQL statements owned by the current user.

Column	Datatype	NULL	Description
TASK_ID	NUMBER (38)	NOT NULL	Tuning task identifier
EXECUTION_NAME	VARCHAR2 (128)	NOT NULL	The name of the task execution with which this entry (row) is associated
RATIONALE_ID	NUMBER (38)	NOT NULL	Rationale identifier

Column	Datatype	NULL	Description
OBJECT_ID	NUMBER (38)	NOT NULL	Advisor framework object identifier
OPERATION_ID	NUMBER (38)	NOT NULL	Operation identifier
PLAN_ATTRIBUTE	VARCHAR2 (34)		<p>Type of the execution plan:</p> <ul style="list-style-type: none"> Original - Original plan of the query Original with adjusted cost - Same as Original but with adjusted cost Using SQL profile - Plan with SQL profile applied Using new indices - Plan with indexes applied

 See Also:["USER_SQLTUNE_RATIONALE_PLAN"](#)

5.379 DBA_SQLTUNE_STATISTICS

DBA_SQLTUNE_STATISTICS displays statistics associated with all SQL statements in the database.

Related View

USER_SQLTUNE_STATISTICS displays statistics associated with the SQL statements owned by the current user.

Column	Datatype	NULL	Description
TASK_ID	NUMBER (38)	NOT NULL	Tuning task identifier
OBJECT_ID	NUMBER (38)	NOT NULL	Advisor framework object identifier
PARSING_SCHEMA_ID	NUMBER		Schema under which the SQL is parsed
MODULE	VARCHAR2 (64)		Last application module recorded for the SQL
ACTION	VARCHAR2 (64)		Last application action recorded for the SQL
ELAPSED_TIME	NUMBER		Elapsed time for the SQL statement
CPU_TIME	NUMBER		CPU time for the SQL
BUFFER_GETS	NUMBER		Number of buffer gets
DISK_READS	NUMBER		Number of disk reads
DIRECT_WRITES	NUMBER		Number of disk writes
ROWS_PROCESSED	NUMBER		Number of rows processed by the SQL
FETCHES	NUMBER		Number of fetches
EXECUTIONS	NUMBER		Number of executions
END_OF_FETCH_COUNT	NUMBER		End of fetch count
OPTIMIZER_COST	NUMBER		Optimizer cost for the SQL
OPTIMIZER_ENV	RAW (2000)		Optimizer environment
COMMAND_TYPE	NUMBER		Command type

 See Also:["USER_SQLTUNE_STATISTICS"](#)

5.380 DBA_SR_GRP_STATUS

`DBA_SR_GRP_STATUS` provides information on the current refresh operations for the current synchronous refresh groups in the database. It has the same columns as the `DBA_SR_GRP_STATUS_ALL` view.

Refresh operations are controlled using the `DBMS_SYNC_REFRESH` package.

Related View

`USER_SR_GRP_STATUS` provides information on the current refresh operations for the current synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in `DBA_SR_GRP_STATUS`.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)	NOT NULL	Owner of the refresh operation, which is the user who launched the operation
GROUP_ID	NUMBER	NOT NULL	Group ID of the synchronous refresh group
OPERATION	VARCHAR2 (7)		The phase of the refresh operation performed: <ul style="list-style-type: none"> • PREPARE • EXECUTE
STATUS	VARCHAR2 (10)		The status of the refresh operation: <ul style="list-style-type: none"> • RUNNING • NOT PROCESSED • COMPLETE • ERROR-SOFT • ERROR-HARD • ABORT • PARTIAL
NUM_TBLS	NUMBER	NOT NULL	The number of tables in the synchronous refresh group
NUM_MVS	NUMBER	NOT NULL	The number of materialized views in the synchronous refresh group
BASE_TBLS_REFR_STATUS	VARCHAR2 (13)		Indicates the refresh status of base tables in the synchronous refresh group. The possible values are: <ul style="list-style-type: none"> • NOT PROCESSED • COMPLETE • ABORT
NUM_MVS_COMPLETED	NUMBER		The number of materialized views which have completed refresh in the synchronous refresh group
NUM_MVS_ABORTED	NUMBER		The number of materialized views which have aborted refresh in the synchronous refresh group
ERROR_NUMBER	NUMBER		Error number of the run (if any)
ERROR_MESSAGE	VARCHAR2 (4000)		Error message of the run (if any)

Column	Datatype	NULL	Description
PREPARE_START_TIME	DATE		Time that the PREPARE_REFRESH phase of the run started
PREPARE_END_TIME	DATE		Time that the PREPARE_REFRESH phase of the run ended
EXECUTE_START_TIME	DATE		Time that the EXECUTE_REFRESH phase of the run started
EXECUTE_END_TIME	DATE		Time that the EXECUTE_REFRESH phase of the run ended

 See Also:

- ["USER_SR_GRP_STATUS"](#)
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_SYNC_REFRESH package

5.381 DBA_SR_GRP_STATUS_ALL

DBA_SR_GRP_STATUS_ALL provides information on the refresh operations on the synchronous refresh groups in the database.

A refresh operation is also called a run, and it has two phases: PREPARE_REFRESH and EXECUTE_REFRESH. These phases are controlled using the DBMS_SYNC_REFRESH package.

Each row in this view provides information on a run of a group, identified by its GROUP_ID. The view contains information on the status of the objects of both current and past runs of both current and defunct synchronous refresh groups. Therefore, this view can be used to examine the history of synchronous refresh operations.

The current run of a group is the most recent run of a group; a current group is a currently valid group, which is capable of being refreshed. A group becomes defunct when it is unregistered for any reason, either explicitly by the user or implicitly as a side-effect when the user registers materialized views related to the materialized views in the group.

To view the status of refresh operations for the most recent runs of only the current groups, use the DBA_SR_GRP_STATUS view.

Related View

USER_SR_GRP_STATUS_ALL provides information on the refresh operations on the synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA_SR_GRP_STATUS_ALL.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Owner of the refresh operation, which is the user who launched the operation
GROUP_ID	NUMBER	NOT NULL	Group ID of the synchronous refresh group

Column	Datatype	NULL	Description
OPERATION	VARCHAR2 (7)		The phase of the refresh operation performed: <ul style="list-style-type: none"> • PREPARE • EXECUTE
STATUS	VARCHAR2 (10)		The status of the refresh operation: <ul style="list-style-type: none"> • RUNNING • NOT PROCESSED • COMPLETE • ERROR-SOFT • ERROR-HARD • ABORT • PARTIAL
CURRENT_RUN	VARCHAR2 (1)		Indicates whether the record is for the most recent refresh-operation on the group: <ul style="list-style-type: none"> • Y - Yes • N - No
CURRENT_GROUP	VARCHAR2 (1)		Indicates whether the record is for a current group: <ul style="list-style-type: none"> • Y - Yes • N - No
NUM_TBLS	NUMBER	NOT NULL	The number of tables in the synchronous refresh group
NUM_MVS	NUMBER	NOT NULL	The number of materialized views in the synchronous refresh group
BASE_TBLS_REFR_STATUS	VARCHAR2 (13)		Indicates the refresh status of base tables in the synchronous refresh group. The possible values are: <ul style="list-style-type: none"> • NOT PROCESSED • COMPLETE • ABORT
NUM_MVS_COMPLETED	NUMBER		The number of materialized views which have completed refresh in the synchronous refresh group
NUM_MVS_ABORTED	NUMBER		The number of materialized views which have aborted refresh in the synchronous refresh group
ERROR_NUMBER	NUMBER		Error number of the run (if any)
ERROR_MESSAGE	VARCHAR2 (4000)		Error message of the run (if any)
PREPARE_START_TIME	DATE		Time that the PREPARE_REFRESH phase of the run started
PREPARE_END_TIME	DATE		Time that the PREPARE_REFRESH phase of the run ended
EXECUTE_START_TIME	DATE		Time that the EXECUTE_REFRESH phase of the run started
EXECUTE_END_TIME	DATE		Time that the EXECUTE_REFRESH phase of the run ended

 See Also:

- "[USER_SR_GRP_STATUS_ALL](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_SYNC_REFRESH` package

5.382 DBA_SR_OBJ

`DBA_SR_OBJ` provides information on the objects registered for synchronous refresh for current groups.

Related View

`USER_SR_OBJ` provides information on the objects registered for synchronous refresh for current groups for the current user. Its columns are the same as those in `DBA_SR_OBJ`.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Owner of the synchronous refresh object
NAME	VARCHAR2(128)	NOT NULL	Name of the synchronous refresh object
TYPE	VARCHAR2(5)		Type of synchronous refresh object: <ul style="list-style-type: none"> • MVIEW • TABLE
GROUP_ID	NUMBER	NOT NULL	Group ID of the synchronous refresh group to which this object belongs
STAGING_LOG_NAME	VARCHAR2(128)		Name of the staging log for tables. This column has a value of NULL for materialized views.

 See Also:

- "[USER_SR_OBJ](#)"

5.383 DBA_SR_OBJ_ALL

`DBA_SR_OBJ_ALL` provides information on the objects registered for synchronous refresh for current and defunct groups.

To see information on the objects registered for synchronous refresh for only the current groups, use the `DBA_SR_OBJ` view.

Related View

`USER_SR_OBJ_ALL` provides information on the objects registered for synchronous refresh for current and defunct groups for the current user. Its columns are the same as those in `DBA_SR_OBJ_ALL`.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Owner of the synchronous refresh object
NAME	VARCHAR2(128)	NOT NULL	Name of the synchronous refresh object
TYPE	VARCHAR2(5)		Type of synchronous refresh object: <ul style="list-style-type: none"> • MVIEW • TABLE
GROUP_ID	NUMBER	NOT NULL	Group ID of the synchronous refresh group to which this object belongs
CURRENT_GROUP	VARCHAR2(1)		Indicates whether the record is for a current group: <ul style="list-style-type: none"> • Y - Yes • N - No
STAGING_LOG_NAME	VARCHAR2(128)		Name of the staging log for tables. This column has a value of NULL for materialized views.

 See Also:["USER_SR_OBJ_ALL"](#)

5.384 DBA_SR_OBJ_STATUS

DBA_SR_OBJ_STATUS provides information on the status of objects registered for synchronous refresh for the current refresh operations for the current synchronous refresh groups in the database.

To see information on the status of objects registered for synchronous refresh, use the DBA_SR_OBJ_STATUS_ALL view.

Related View

USER_SR_OBJ_STATUS provides information on the status of objects registered for synchronous refresh for the current refresh operations for the current synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA_SR_OBJ_STATUS.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Owner of the synchronous refresh object
NAME	VARCHAR2(128)	NOT NULL	Name of the synchronous refresh object
TYPE	VARCHAR2(5)		Type of synchronous refresh object: <ul style="list-style-type: none"> • MVIEW • TABLE
GROUP_ID	NUMBER	NOT NULL	Group ID of the synchronous refresh group to which this object belongs
STATUS	VARCHAR2(13)		Status of the synchronous refresh object: <ul style="list-style-type: none"> • NOT PROCESSED • COMPLETE • ABORT

Column	Datatype	NULL	Description
ERROR_NUMBER	NUMBER		Error number of the run (if any)
ERROR_MESSAGE	VARCHAR2 (4000)		Error message of the run (if any)
LAST_MODIFIED_TIME	DATE		Last modification time of the synchronous refresh object

 See Also:["USER_SR_OBJ_STATUS"](#)

5.385 DBA_SR_OBJ_STATUS_ALL

DBA_SR_OBJ_STATUS_ALL provides information on the status of objects registered for synchronous refresh.

The view contains information on the status of the objects of both the current and past runs of both current and defunct groups. Therefore, this view can be used to examine the history of synchronous refresh operations. The current run of a group is the most recent run of a group; a current group is a currently valid group, which is capable of being refreshed. A group becomes defunct when it is unregistered for any reason, either explicitly by the user or implicitly as a side-effect when the user registers materialized views related to the materialized views in the group.

To see information on the status of refresh operations for the most recent runs of only the current groups, use the DBA_SR_OBJ_STATUS view.

Related View

USER_SR_OBJ_STATUS_ALL provides information on the status of objects registered for synchronous refresh in the database which are owned by the current user. Its columns are the same as those in DBA_SR_OBJ_STATUS_ALL.

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)	NOT NULL	Owner of the synchronous refresh object
NAME	VARCHAR2 (128)	NOT NULL	Name of the synchronous refresh object
TYPE	VARCHAR2 (5)		Type of synchronous refresh object: <ul style="list-style-type: none"> • MVIEW • TABLE
GROUP_ID	NUMBER	NOT NULL	Group ID of the synchronous refresh group to which this object belongs
STATUS	VARCHAR2 (13)		Status of the synchronous refresh object: <ul style="list-style-type: none"> • NOT PROCESSED • COMPLETE • ABORT
CURRENT_RUN	VARCHAR2 (1)		Indicates whether the record is for the most recent refresh operation on the group: <ul style="list-style-type: none"> • Y - Yes • N - No

Column	Datatype	NULL	Description
CURRENT_GROUP	VARCHAR2(1)		Indicates whether the record is for a current group: <ul style="list-style-type: none"> • Y - Yes • N - No
ERROR_NUMBER	NUMBER		Error number of the run (if any)
ERROR_MESSAGE	VARCHAR2(4000)		Error message of the run (if any)
LAST_MODIFIED_TIME	DATE		Last modification time of the synchronous refresh object

 See Also:["USER_SR_OBJ_STATUS_ALL"](#)

5.386 DBA_SR_PARTN_OPS

DBA_SR_PARTN_OPS provides information on the partition operations registered on the base tables of the materialized views registered for synchronous refresh.

These rows last only as long as the registrations are active; that is, they disappear after EXECUTE_REFRESH or ABORT_REFRESH of the base table by the DBMS_SYNC_REFRESH package.

Related View

USER_SR_PARTN_OPS provides information on the partition operations registered on the base tables of the materialized views registered for synchronous refresh belonging to the current user. Its columns are the same as those in DBA_SR_PARTN_OPS.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Owner of the base table registered for synchronous refresh
TABLE_NAME	VARCHAR2(128)	NOT NULL	Name of the table
PARTITION_OP	VARCHAR2(128)	NOT NULL	Type of partition operation: <ul style="list-style-type: none"> • DROP • EXCHANGE • TRUNCATE
PARTITION_NAME	VARCHAR2(128)	NOT NULL	Name of the partition to be changed
OUTSIDE_TABLE_SCHEMA	VARCHAR2(128)		Schema in which the outside table (for EXCHANGE PARTITION) was created
OUTSIDE_TABLE_NAME	VARCHAR2(128)		Name of the outside table (for EXCHANGE PARTITION)

 See Also:

- "[USER_SR_PARTN_OPS](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_SYNC_REFRESH` package

5.387 DBA_SR_STLOG_EXCEPTIONS

`DBA_SR_STLOG_EXCEPTIONS` provides information on the exceptions in the staging logs for the tables processed by `DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG`.

Related View

`USER_SR_STLOG_EXCEPTIONS` provides information on the exceptions in the staging logs for the tables belonging to the current user processed by `DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG`. Its columns are the same as those in `DBA_SR_STLOG_EXCEPTIONS`.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Owner of the base table registered for synchronous refresh
TABLE_NAME	VARCHAR2(128)	NOT NULL	Name of the base table registered for synchronous refresh
STAGING_LOG_NAME	VARCHAR2(128)	NOT NULL	Name of the staging log for tables. This column has a value of NULL for materialized views.
BAD_ROWID	ROWID	NOT NULL	Row ID of the staging log row causing the exception for the synchronous refresh
ERROR_NUMBER	NUMBER		Error number of the exception for the synchronous refresh
ERROR_MESSAGE	VARCHAR2(4000)		Error message associated with the <code>ERROR_NUMBER</code> for the synchronous refresh

 See Also:

- "[USER_SR_STLOG_EXCEPTIONS](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_SYNC_REFRESH` package

5.388 DBA_SR_STLOG_STATS

`DBA_SR_STLOG_STATS` provides information on the statistics in the staging logs for the tables processed by `DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG`.

These three statistics columns in the staging log are filled in `PREPARE_STAGING_LOG`:

- The number of inserts (`NUM_INSERTS`)

- The number of deletes (`NUM_DELETES`)
- The number of updates (`NUM_UPDATES`)

After the data in the staging logs of a synchronous refresh group have been processed by `PREPARE_REFRESH` and `EXECUTE_REFRESH`, the statistics columns for the tables in the group are cleared and appear as `NULL`.

Related View

`USER_SR_STLOG_STATS` provides information on the statistics in the staging logs for the tables belonging to the current user processed by `DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG`.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Owner of the base table registered for synchronous refresh
TABLE_NAME	VARCHAR2(128)	NOT NULL	Name of the table
STAGING_LOG_NAME	VARCHAR2(128)	NOT NULL	Name of the staging log for tables. <code>NULL</code> for materialized views
NUM_INSERTS	NUMBER	NOT NULL	The number of inserts in the staging log
NUM_DELETES	NUMBER	NOT NULL	The number of deletes in the staging log
NUM_UPDATES	NUMBER	NOT NULL	The number of updates in the staging log
PSL_MODE	VARCHAR2(33)		The mode specified by the user in running <code>DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG</code> . Possible values: <ul style="list-style-type: none"> • <code>DELETE_TRUSTED</code> • <code>DELETE_TRUSTED</code> and <code>UPDATE_TRUSTED</code> • <code>ENFORCED</code> • <code>INSERT_TRUSTED</code> • <code>INSERT_TRUSTED</code> and <code>DELETE_TRUSTED</code> • <code>TRUSTED</code> • <code>UPDATE_TRUSTED</code> • <code>UPDATE_TRUSTED</code> and <code>INSERT_TRUSTED</code>

See Also:

- "["USER_SR_STLOG_STATS"](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_SYNC_REFRESH` package

5.389 DBA_SSCR_CAPTURE

`DBA_SSCR_CAPTURE` displays session state capture statistics.

Column	Datatype	NULL	Description
DB_NAME	VARCHAR2(4000)		Database name of captured session
INST_NAME	VARCHAR2(4000)		Instance name of captured session
INST_ID	NUMBER		Instance ID of captured session

Column	Datatype	NULL	Description
SESSION_ID	NUMBER		Session ID of captured session
SESSION_SERIAL#	NUMBER		Session serial number of captured session
USER_NAME	VARCHAR2(128)	NOT NULL	User name of captured session
SCHEMA_NAME	VARCHAR2(128)	NOT NULL	Schema name of captured session
SEQUENCE#	NUMBER		Sequence number of captured session
CAPTURE_MODE	VARCHAR2(7)		Mode of capture operation
CAPTURE_SCOPE	VARCHAR2(7)		Scope of capture operation
CAPTURE_FORMAT	VARCHAR2(9)		Format of capture files
CAPTURE_DIR	VARCHAR2(128)		Directory object of capture files
CAPTURE_LOCATOR	RAW(64)		Locator of master capture file
CAPTURE_TIME	TIMESTAMP(6)		Timestamp of capture operation

5.390 DBA_SSCR_RESTORE

DBA_SSCR_RESTORE displays session state restore statistics.

Column	Datatype	NULL	Description
DB_NAME	VARCHAR2(4000)		Database name of restored session
INST_NAME	VARCHAR2(4000)		Instance name of restored session
INST_ID	NUMBER		Instance ID of restored session
SESSION_ID	NUMBER		Session ID of restored session
SESSION_SERIAL#	NUMBER		Session serial number of restored session
USER_NAME	VARCHAR2(128)	NOT NULL	User name of restored session
SCHEMA_NAME	VARCHAR2(128)	NOT NULL	Schema name of restored session
SEQUENCE#	NUMBER		Sequence number of restore operation
RESTORE_MODE	VARCHAR2(7)		Mode of restore operation
RESTORE_SCOPE	VARCHAR2(7)		Scope of restore operation
RESTORE_FORMAT	VARCHAR2(9)		Format of restore files
RESTORE_DIR	VARCHAR2(128)		Directory object of restore files
RESTORE_LOCATOR	RAW(64)		Locator of master restore file
RESTORE_TIME	TIMESTAMP(6)		Timestamp of restore operation

5.391 DBA_STAT_EXTENSIONS

DBA_STAT_EXTENSIONS displays information about all optimizer statistics extensions in the database.

 See Also:

["ALL_STAT_EXTENSIONS"](#)

5.392 DBA_STATEMENTS

DBA_STATEMENTS Statements in stored objects accessible to sys. Its columns are the same as those in **ALL_STATEMENTS**.

 **See Also:**

["ALL_STATEMENTS"](#)

5.393 DBA_STMT_AUDIT_OPTS

DBA_STMT_AUDIT_OPTS describes current system auditing options across the system and by user.

 **Note:**

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from **UNIFIED_AUDIT_TRAIL**.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

Column	Datatype	NULL	Description
USER_NAME	VARCHAR2(128)		User name if by user auditing; ANY_CLIENT if access by a proxy on behalf of a client is being audited; NULL for system-wide auditing
PROXY_NAME	VARCHAR2(128)		Name of the proxy user which is performing an operation for the client; NULL if the client is performing the operation directly
AUDIT_OPTION	VARCHAR2(40)	NOT NULL	Name of the system auditing option
SUCCESS	VARCHAR2(10)		Mode for WHENEVER SUCCESSFUL system auditing
FAILURE	VARCHAR2(10)		Mode for WHENEVER NOT SUCCESSFUL system auditing

5.394 DBA_STORED_SETTINGS

DBA_STORED_SETTINGS lists information about the persistent parameter settings for stored PL/SQL units for which the current user has execute privileges.

It also returns parameter information for all objects in the database and is accessible only to users with the **SELECT_CATALOG_ROLE** privilege. Its columns are the same as those in **ALL_STORED_SETTINGS**.

 **See Also:**

["ALL_STORED_SETTINGS"](#)

Static Data Dictionary Views: DBA_STREAMS_ADD_COLUMN to USER_ZONEMAPS

This chapter contains the static data dictionary views DBA_STREAMS_ADD_COLUMN through USER_ZONEMAPS.

6.1 DBA_STREAMS_ADD_COLUMN

DBA_STREAMS_ADD_COLUMN displays information about declarative rule-based transformations that add a column to a row logical change record (LCR).

Column	Datatype	NULL	Description
RULE_OWNER	VARCHAR2(128)		Owner of the rule
RULE_NAME	VARCHAR2(128)		Name of the rule
SCHEMA_NAME	VARCHAR2(128)		Schema of the column to be added
TABLE_NAME	VARCHAR2(128)		Table of the column to be added
COLUMN_NAME	VARCHAR2(4000)		Name of the column to be added
COLUMN_VALUE	ANYDATA		Value of the column to be added
COLUMN_TYPE	VARCHAR2(4000)		Type of the column to be added
COLUMN_FUNCTION	VARCHAR2(128)		Name of the default function used to add a column
VALUE_TYPE	VARCHAR2(3)		Indicates whether to modify the old (OLD), new (NEW), or both (*) values of the LCR
PRECEDENCE	NUMBER		3 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first)
STEP_NUMBER	NUMBER		Order in which this transformation should be executed

6.2 DBA_STREAMS_DELETE_COLUMN

DBA_STREAMS_DELETE_COLUMN displays information about declarative rule-based transformations that delete a column from a row logical change record (LCR).

Column	Datatype	NULL	Description
RULE_OWNER	VARCHAR2(128)		Owner of the rule
RULE_NAME	VARCHAR2(128)		Name of the rule
SCHEMA_NAME	VARCHAR2(128)		Schema of the column to be deleted
TABLE_NAME	VARCHAR2(128)		Table of the column to be deleted
COLUMN_NAME	VARCHAR2(4000)		Name of the column to delete

Column	Datatype	NULL	Description
VALUE_TYPE	VARCHAR2 (3)		Indicates whether to modify the old (OLD), new (NEW), or both (*) values of the LCR
PRECEDENCE	NUMBER		1 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first)
STEP_NUMBER	NUMBER		Order in which this transformation should be executed

6.3 DBA_STREAMS_GLOBAL_RULES

DBA_STREAMS_GLOBAL_RULES displays information about the global rules created for all capture processes, propagations, and apply processes in the database. Its columns are the same as those in ALL_STREAMS_GLOBAL_RULES.

See Also:

["ALL_STREAMS_GLOBAL_RULES"](#)

6.4 DBA_STREAMS_KEEP_COLUMNS

DBA_STREAMS_KEEP_COLUMNS displays information about declarative rule-based transformations that keep a list of columns in a row logical change record (LCR).

Column	Datatype	NULL	Description
RULE_OWNER	VARCHAR2 (128)		Owner of the rule which has an associated transformation
RULE_NAME	VARCHAR2 (128)		Name of the rule which has an associated transformation
SCHEMA_NAME	VARCHAR2 (128)		Schema of the column to be kept
TABLE_NAME	VARCHAR2 (128)		Table of the column to be kept
COLUMN_NAME	VARCHAR2 (4000)		Column to keep
VALUE_TYPE	VARCHAR2 (3)		Indicates whether to keep the old (OLD), new (NEW), or both (*) value of the LCR
PRECEDENCE	NUMBER		0 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first)
STEP_NUMBER	NUMBER		Order in which this transformation should be executed

6.5 DBA_STREAMS_MESSAGE_CONSUMERS

DBA_STREAMS_MESSAGE_CONSUMERS displays information about all Streams messaging clients in the database. Its columns are the same as those in ALL_STREAMS_MESSAGE_CONSUMERS.

 **See Also:**

["ALL_STREAMS_MESSAGE_CONSUMERS"](#)

6.6 DBA_STREAMS_NEWLY_SUPPORTED

DBA_STREAMS_NEWLY_SUPPORTED displays information about all tables in the database that are newly supported by capture processes. Its columns are the same as those in ALL_STREAMS_NEWLY_SUPPORTED.

 **See Also:**

["ALL_STREAMS_NEWLY_SUPPORTED"](#)

6.7 DBA_STREAMS_RENAME_COLUMN

DBA_STREAMS_RENAME_COLUMN displays information about declarative rule-based transformations that rename a column in a row logical change record (LCR).

Column	Datatype	NULL	Description
RULE_OWNER	VARCHAR2(128)		Owner of the rule
RULE_NAME	VARCHAR2(128)		Name of the rule
SCHEMA_NAME	VARCHAR2(128)		Schema of the column to be renamed
TABLE_NAME	VARCHAR2(128)		Table of the column to be renamed
FROM_COLUMN_NAME	VARCHAR2(4000)		Column to rename
TO_COLUMN_NAME	VARCHAR2(4000)		New column name
VALUE_TYPE	VARCHAR2(3)		Indicates whether to modify the old (OLD), new (NEW), or both (*) values of the LCR
PRECEDENCE	NUMBER		2 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first)
STEP_NUMBER	NUMBER		Order in which this transformation should be executed

6.8 DBA_STREAMS_RENAME_SCHEMA

DBA_STREAMS_RENAME_SCHEMA displays information about declarative rule-based transformations that rename a schema in a row logical change record (LCR).

Column	Datatype	NULL	Description
RULE_OWNER	VARCHAR2(128)		Owner of the rule
RULE_NAME	VARCHAR2(128)		Name of the rule
FROM_SCHEMA_NAME	VARCHAR2(128)		Schema to be renamed
TO_SCHEMA_NAME	VARCHAR2(128)		New schema name
PRECEDENCE	NUMBER		5 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first)
STEP_NUMBER	NUMBER		Order in which this transformation should be executed

6.9 DBA_STREAMS_RENAME_TABLE

DBA_STREAMS_RENAME_TABLE displays information about declarative rule-based transformations that rename a table in a row logical change record (LCR).

Column	Datatype	NULL	Description
RULE_OWNER	VARCHAR2(128)		Owner of the rule
RULE_NAME	VARCHAR2(128)		Name of the rule
FROM_SCHEMA_NAME	VARCHAR2(128)		Schema to be renamed
TO_SCHEMA_NAME	VARCHAR2(128)		New schema name
FROM_TABLE_NAME	VARCHAR2(128)		Table to be renamed
TO_TABLE_NAME	VARCHAR2(128)		New table name
PRECEDENCE	NUMBER		4 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first)
STEP_NUMBER	NUMBER		Order in which this transformation should be executed

6.10 DBA_STREAMS_SCHEMA_RULES

DBA_STREAMS_SCHEMA_RULES displays information about the schema rules created for all capture processes, propagations, and apply processes in the database. Its columns are the same as those in ALL_STREAMS_SCHEMA_RULES.

 **See Also:**

["ALL_STREAMS_SCHEMA_RULES"](#)

6.11 DBA_STREAMS_TABLE_RULES

`DBA_STREAMS_TABLE_RULES` displays information about the table rules created for all capture processes, propagations, and apply processes in the database. Its columns are the same as those in `ALL_STREAMS_TABLE_RULES`.

 **See Also:**

["ALL_STREAMS_TABLE_RULES"](#)

6.12 DBA_STREAMS_TP_COMPONENT

`DBA_STREAMS_TP_COMPONENT` displays information about each Replication component at each database.

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	ID of the Replication component
COMPONENT_NAME	VARCHAR2(4000)		Name of the Replication component
COMPONENT_DB	VARCHAR2(128)		Database where the Replication component resides
COMPONENT_TYPE	VARCHAR2(20)		Type of the Replication component: <ul style="list-style-type: none"> • CAPTURE • PROPAGATION SENDER • PROPAGATION RECEIVER • APPLY • QUEUE
COMPONENT_CHANGED_TIME	DATE		Time that the Replication component was last changed

6.13 DBA_STREAMS_TP_COMPONENT_LINK

`DBA_STREAMS_TP_COMPONENT_LINK` displays information about how messages flow between Replication components.

Column	Datatype	NULL	Description
SOURCE_COMPONENT_ID	NUMBER	NOT NULL	ID of the source Replication component
SOURCE_COMPONENT_NAME	VARCHAR2(4000)		Name of the source Replication component
SOURCE_COMPONENT_DB	VARCHAR2(128)		Database where the source Replication component resides
SOURCE_COMPONENT_TYPE	VARCHAR2(20)		Type of the source Replication component: <ul style="list-style-type: none"> • CAPTURE • PROPAGATION SENDER • PROPAGATION RECEIVER • APPLY • QUEUE

Column	Datatype	NULL	Description
DESTINATION_COMPONENT_ID	NUMBER	NOT NULL	ID of the destination Replication component
DESTINATION_COMPONENT_NA ME	VARCHAR2(4000)		Name of the destination Replication component
DESTINATION_COMPONENT_DB	VARCHAR2(128)		Database where the destination Replication component resides
DESTINATION_COMPONENT_TY PE	VARCHAR2(20)		Type of the destination Replication component: <ul style="list-style-type: none"> • CAPTURE • PROPAGATION SENDER • PROPAGATION RECEIVER • APPLY • QUEUE
PATH_ID	NUMBER	NOT NULL	ID of the stream path
POSITION	NUMBER		Position of the link within the stream path

6.14 DBA_STREAMS_TP_COMPONENT_STAT

DBA_STREAMS_TP_COMPONENT_STAT displays temporary performance statistics and session statistics about each Replication component.

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	ID of the Replication component
COMPONENT_NAME	VARCHAR2(4000)		Name of the Replication component
COMPONENT_DB	VARCHAR2(128)		Database where the Replication component resides
COMPONENT_TYPE	VARCHAR2(20)		Type of the Replication component: <ul style="list-style-type: none"> • CAPTURE • PROPAGATION SENDER • PROPAGATION RECEIVER • APPLY • QUEUE
SUB_COMPONENT_TYPE	VARCHAR2(27)		Type of the Replication subcomponent: <ul style="list-style-type: none"> • LOGMINER READER • LOGMINER PREPARER • LOGMINER BUILDER • CAPTURE SESSION • PROPAGATION SENDER+RECEIVER • APPLY READER • APPLY COORDINATOR • APPLY SERVER
SESSION_ID	NUMBER		ID of the Replication session for the Replication component
SESSION_SERIAL#	NUMBER		Serial number of the Replication session for the Replication component
STATISTIC_TIME	DATE		Time that the statistic was taken
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	VARCHAR2(4000)		Value of the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of the statistic

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Logical number (1-based) of the Advisor run
ADVISOR_RUN_TIME	DATE		Time that the Advisor was run

6.15 DBA_STREAMS_TP_DATABASE

DBA_STREAMS_TP_DATABASE displays information about each database that contains Replication components.

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database
LAST_QUERIED	DATE	NOT NULL	Time that the database was last queried
VERSION	VARCHAR2(128)		Database version of the database
COMPATIBILITY	VARCHAR2(128)		Compatible setting of the database
MANAGEMENT_PACK_ACCESS	VARCHAR2(128)		Management pack access of the database

6.16 DBA_STREAMS_TP_PATH_BOTTLENECK

DBA_STREAMS_TP_PATH_BOTTLENECK displays temporary information about Replication components that might be slowing down the flow of messages in a stream path.

Column	Datatype	NULL	Description
PATH_ID	NUMBER		ID of the stream path
COMPONENT_ID	NUMBER		ID of the bottleneck component
COMPONENT_NAME	VARCHAR2(4000)		Name of the bottleneck component
COMPONENT_DB	VARCHAR2(128)		Database where the bottleneck component resides
COMPONENT_TYPE	VARCHAR2(20)		Type of the bottleneck component: <ul style="list-style-type: none"> • CAPTURE • PROPAGATION SENDER • PROPAGATION RECEIVER • APPLY • QUEUE
TOP_SESSION_ID	NUMBER		ID of the top session for the bottleneck component
TOP_SESSION_SERIAL#	NUMBER		Serial number of the top session for the bottleneck component
ACTION_NAME	VARCHAR2(64)		Action name for the bottleneck process
BOTTLENECK_IDENTIFIED	VARCHAR2(30)		Indicates whether the bottleneck was identified (YES) or not (NO)
ADVISOR_RUN_ID	NUMBER		Logical number (1-based) of the Advisor run
ADVISOR_RUN_TIME	DATE		Time that the Advisor was run

Column	Datatype	NULL	Description
ADVISOR_RUN_REASON	VARCHAR2(4000)		<p>Reason for the bottleneck analysis result.:</p> <ul style="list-style-type: none"> • NULL - Bottleneck is identified • PRE-11.1 DATABASE EXISTS - A pre-release 11.1 database exists in the stream path • DIAGNOSTIC PACK REQUIRED - A database in the stream path does not have the diagnostic package installed • NO BOTTLENECK IDENTIFIED

6.17 DBA_STREAMS_TP_PATH_STAT

`DBA_STREAMS_TP_PATH_STAT` displays temporary performance statistics about each stream path that exists in the Replication topology.

Column	Datatype	NULL	Description
PATH_ID	NUMBER		ID of the stream path
STATISTIC_TIME	DATE		Time that the statistic was taken
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value of the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of the statistic
ADVISOR_RUN_ID	NUMBER		Logical number (1-based) of the Advisor run
ADVISOR_RUN_TIME	DATE		Time that the Advisor was run

6.18 DBA_STREAMS_TRANSFORM_FUNCTION

`DBA_STREAMS_TRANSFORM_FUNCTION` displays information about all rule-based transformation functions in the database. Its columns are the same as those in `ALL_STREAMS_TRANSFORM_FUNCTION`.

 **See Also:**

["ALL_STREAMS_TRANSFORM_FUNCTION"](#)

6.19 DBA_SUBPART_COL_STATISTICS

DBA_SUBPART_COL_STATISTICS provides column statistics and histogram information for all subpartitions in the database. Its columns are the same as those in ALL_SUBPART_COL_STATISTICS.

 **See Also:**

["ALL_SUBPART_COL_STATISTICS"](#)

6.20 DBA_SUBPART_HISTOGRAMS

DBA_SUBPART_HISTOGRAMS lists actual histogram data (end-points per histogram) for histograms on all table subpartitions in the database. Its columns are the same as those in ALL_SUBPART_HISTOGRAMS.

 **See Also:**

["ALL_SUBPART_HISTOGRAMS"](#)

6.21 DBA_SUBPART_KEY_COLUMNS

DBA_SUBPART_KEY_COLUMNS lists subpartitioning key columns for all composite-partitioned tables (and local indexes on composite-partitioned tables) in the database. Its columns are the same as those in ALL_SUBPART_KEY_COLUMNS.

 **See Also:**

["ALL_SUBPART_KEY_COLUMNS"](#)

6.22 DBA_SUBPARTITION_TEMPLATES

DBA_SUBPARTITION_TEMPLATES describes all subpartition templates in the database. Its columns are the same as those in ALL_SUBPARTITION_TEMPLATES.

 **See Also:**

["ALL_SUBPARTITION_TEMPLATES"](#)

6.23 DBA_SUBSCR_REGISTRATIONS

`DBA_SUBSCR_REGISTRATIONS` displays information about all subscription registrations in the database.

Related View

`USER_SUBSCR_REGISTRATIONS` displays information about the subscription registrations owned by the current user.

Column	Datatype	NULL	Description
REG_ID	NUMBER		Registration ID
SUBSCRIPTION_NAME	VARCHAR2(128)	NOT NULL	Name of the subscription registration. The subscription name is of the form <code>schema.queue</code> if the registration is for a single consumer queue or <code>schema.queue:consumer_name</code> if the registration is for a multiconsumer queue.
LOCATION_NAME	VARCHAR2(256)	NOT NULL	Location endpoint of the registration
USER#	NUMBER	NOT NULL	Internally generated user ID
USER_CONTEXT	RAW(128)		Context the user provided during registration of PL/SQL registrations or an internally generated context for OCI registrations
CONTEXT_SIZE	NUMBER		Size of the context
NAMESPACE	VARCHAR2(9)		Namespace of the subscription registration: <ul style="list-style-type: none"> • ANONYMOUS • AQ • DBCHANGE
PRESENTATION	VARCHAR2(7)		Presentation format of notifications: <ul style="list-style-type: none"> • DEFAULT - Binary • XML
VERSION	VARCHAR2(8)		Database version: <ul style="list-style-type: none"> • 8.1.6 • 10.2 • 11.1
STATUS	VARCHAR2(8)		Status of the registration: <ul style="list-style-type: none"> • DB REG - Database registration • LDAP REG - LDAP registration
ANY_CONTEXT	ANYDATA		AnyData user context
CONTEXT_TYPE	NUMBER		Type of the user context
QOSFLAGS	VARCHAR2(64)		Quality of service of the registration: <ul style="list-style-type: none"> • RELIABLE - Reliable notifications persist across instance and database restarts • PAYLOAD - Payload delivery is required. It is only supported for client notification and only for RAW queues. • PURGE_ON_NTFN - Registration is to be purged automatically when the first notification is delivered to this registration location
PAYOUT_CALLBACK	VARCHAR2(4000)		Any callback registered to serialize the notification payload

Column	Datatype	NULL	Description
TIMEOUT	TIMESTAMP (6)		Registration timeout
REG_TIME	TIMESTAMP (6) WITH TIME ZONE		Time of the registration
NTFN_GROUPING_CLASS	VARCHAR2 (4)		Notification grouping class
NTFN_GROUPING_VALUE	NUMBER		Notification grouping value
NTFN_GROUPING_TYPE	VARCHAR2 (7)		Notification grouping type: • SUMMARY • LAST
NTFN_GROUPING_START_TIME	TIMESTAMP (6) WITH TIME ZONE		Notification grouping start time
NTFN_GROUPING_REPEAT_COU NT	VARCHAR2 (40)		Notification grouping repeat count, or FOREVER

 See Also:["USER_SUBSCR_REGISTRATIONS"](#)

6.24 DBA_SUPPLEMENTAL_LOGGING

DBA_SUPPLEMENTAL_LOGGING provides information about supplemental logging for a pluggable database (PDB) in a multitenant container database (CDB).

Column	Datatype	NULL	Description
MINIMAL	VARCHAR2 (3)		Identifies whether minimal supplemental logging is on (YES or NO)
PRIMARY_KEY	VARCHAR2 (3)		Identifies whether primary key supplemental logging is on (YES or NO)
UNIQUE_INDEX	VARCHAR2 (3)		Identifies whether unique column supplemental logging is on (YES or NO)
FOREIGN_KEY	VARCHAR2 (3)		Identifies whether foreign key supplemental logging is on (YES or NO)
ALL_COLUMN	VARCHAR2 (3)		Identifies whether all column supplemental logging is on (YES or NO)
PROCEDURAL	VARCHAR2 (3)		Identifies whether supplemental logging for procedural replication is on (YES or NO)
SUBSET_REP ¹	VARCHAR2 (3)		Indicates whether subset database replication is on (YES or NO)

¹ This column is available starting with Oracle Database 19c.

 **See Also:**

- *Oracle Database Utilities* for more information about supplemental logging
- "V\$DATABASE" for information about supplemental logging in a CDB

6.25 DBA_SYNC_CAPTURE

DBA_SYNC_CAPTURE displays information about all synchronous capture processes in the database. Its columns are the same as those in ALL_SYNC_CAPTURE.

 **See Also:**

"[ALL_SYNC_CAPTURE](#)"

6.26 DBA_SYNC_CAPTURE_PREPARED_TABS

DBA_SYNC_CAPTURE_PREPARED_TABS displays information about all tables in the database that are prepared for synchronous capture instantiation. Its columns are the same as those in ALL_SYNC_CAPTURE_PREPARED_TABS.

 **See Also:**

"[ALL_SYNC_CAPTURE_PREPARED_TABS](#)"

6.27 DBA_SYNC_CAPTURE_TABLES

DBA_SYNC_CAPTURE_TABLES displays information about all tables in the database that are captured by synchronous captures. Its columns are the same as those in ALL_SYNC_CAPTURE_TABLES.

 **See Also:**

"[ALL_SYNC_CAPTURE_TABLES](#)"

6.28 DBA_SYNONYMS

DBA_SYNONYMS describes all synonyms in the database. Its columns are the same as those in ALL_SYNONYMS.

 **See Also:**

["ALL_SYNONYMS"](#)

6.29 DBA_SYS_PRIVS

DBA_SYS_PRIVS describes system privileges granted to users and roles.

Column	Datatype	NULL	Description
GRANTEE	VARCHAR2 (128)		Grantee name, user, or role receiving the grant
PRIVILEGE	VARCHAR2 (40)		System privilege
ADMIN_OPTION	VARCHAR2 (3)		Indicates whether the grant was with the ADMIN option (YES) or not (NO)
COMMON	VARCHAR2 (3)		Indicates how the grant was made. Possible values: <ul style="list-style-type: none">• YES if the privilege was granted commonly (CONTAINER=ALL was used)• NO if the privilege was granted locally (CONTAINER=ALL was not used)
INHERITED	VARCHAR2 (3)		Indicates whether the grant was inherited from another container (YES) or not (NO)

 **See Also:**

["USER_SYS_PRIVS"](#)

6.30 DBA_TAB_COL_STATISTICS

DBA_TAB_COL_STATISTICS contains column statistics and histogram information extracted from DBA_TAB_COLUMNS. Its columns are the same as those in ALL_TAB_COL_STATISTICS.

 **See Also:**

- ["DBA_TAB_COLUMNS"](#)
- ["ALL_TAB_COL_STATISTICS"](#)

6.31 DBA_TAB_COLS

DBA_TAB_COLS describes the columns of all tables, views, and clusters in the database.

Its columns (except for SENSITIVE_COLUMN) are the same as those in ALL_TAB_COLS.

To gather statistics for this view, use the DBMS_STATS package.

This view differs from DBA_TAB_COLUMNS in that system-generated hidden columns are not filtered out.

Columns marked with an asterisk (*) in the table below remain for backward compatibility with Oracle7. This information is now in the [TAB|PART]_COL_STATISTICS views.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Owner of the table, view, or cluster
TABLE_NAME	VARCHAR2(128)	NOT NULL	Name of the table, view, or cluster
COLUMN_NAME	VARCHAR2(128)	NOT NULL	Column name
DATA_TYPE	VARCHAR2(128)		Data type of the column
DATA_TYPE_MOD	VARCHAR2(3)		Data type modifier of the column
DATA_TYPE_OWNER	VARCHAR2(128)		Owner of the data type of the column
DATA_LENGTH	NUMBER	NOT NULL	Length of the column (in bytes)
DATA_PRECISION	NUMBER		Decimal precision for NUMBER data type; binary precision for FLOAT data type; NULL for all other data types
DATA_SCALE	NUMBER		Digits to the right of the decimal point in a number
NULLABLE	VARCHAR2(1)		Indicates whether a column allows NULLs. The value is N if there is a NOT NULL constraint on the column or if the column is part of a PRIMARY KEY.
COLUMN_ID	NUMBER		Sequence number of the column as created
DEFAULT_LENGTH	NUMBER		Length of the default value for the column
DATA_DEFAULT	LONG		Default value for the column
NUM_DISTINCT*	NUMBER		Number of distinct values in the column
LOW_VALUE*	RAW(1000)		Low value in the column
HIGH_VALUE*	RAW(1000)		High value in the column
DENSITY*	NUMBER		If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram. It does not represent the selectivity of values that span 2 or more endpoints. If a histogram is not available on COLUMN_NAME, then the value of this column is 1/NUM_DISTINCT.
NUM_NULLS	NUMBER		Number of NULLs in the column

Column	Datatype	NULL	Description
NUM_BUCKETS	NUMBER		<p>Number of buckets in the histogram for the column</p> <p>Note: The number of buckets in a histogram is specified in the SIZE parameter of the ANALYZE SQL statement. However, Oracle Database does not create a histogram with more buckets than the number of rows in the sample. Also, if the sample contains any values that are very repetitious, Oracle Database creates the specified number of buckets, but the value indicated by this column may be smaller because of an internal compression algorithm.</p>
LAST_ANALYZED	DATE		Date on which this column was most recently analyzed
SAMPLE_SIZE	NUMBER		Sample size used in analyzing this column
CHARACTER_SET_NAME	VARCHAR2(44)		<p>Name of the character set:</p> <ul style="list-style-type: none"> • CHAR_CS • NCHAR_CS
CHAR_COL_DECL_LENGTH	NUMBER		Declaration length of the character type column
GLOBAL_STATS	VARCHAR2(3)		GLOBAL_STATS will be YES if statistics are gathered or incrementally maintained, otherwise it will be NO
USER_STATS	VARCHAR2(3)		Indicates whether statistics were entered directly by the user (YES) or not (NO)
AVG_COL_LEN	NUMBER		Average length of the column (in bytes)
CHAR_LENGTH	NUMBER		Displays the length of the column in characters. This value only applies to the following data types: <ul style="list-style-type: none"> • CHAR • VARCHAR2 • NCHAR • NVARCHAR2
CHAR_USED	VARCHAR2(1)		Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C), or whether the data type is not any of the following (NULL): <ul style="list-style-type: none"> • CHAR • VARCHAR2 • NCHAR • NVARCHAR2
V80_FMT_IMAGE	VARCHAR2(3)		Indicates whether the column data is in release 8.0 image format (YES) or not (NO)
DATA_UPGRADED	VARCHAR2(3)		Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)
HIDDEN_COLUMN	VARCHAR2(3)		Indicates whether the column is a hidden column (YES) or not (NO)
VIRTUAL_COLUMN	VARCHAR2(3)		Indicates whether the column is a virtual column (YES) or not (NO)
SEGMENT_COLUMN_ID	NUMBER		Sequence number of the column in the segment
INTERNAL_COLUMN_ID	NUMBER	NOT NULL	Internal sequence number of the column

Column	Datatype	NULL	Description
HISTOGRAM	VARCHAR2(15)		Indicates existence/type of histogram: <ul style="list-style-type: none"> • NONE • FREQUENCY • TOP-FREQUENCY • HEIGHT BALANCED • HYBRID
QUALIFIED_COL_NAME	VARCHAR2(4000)		Qualified column name
USER_GENERATED	VARCHAR2(3)		Indicates whether the column is a user-generated column (YES) or a system-generated column (NO)
DEFAULT_ON_NULL	VARCHAR2(3)		Indicates whether the column has DEFAULT ON NULL semantics (YES) or not (NO)
IDENTITY_COLUMN	VARCHAR2(3)		Indicates whether this is an identity column (YES) or not (NO)
SENSITIVE_COLUMN	VARCHAR2(3)		Indicates whether this is a sensitive column (YES) or not (NO)
EVALUATION_EDITION	VARCHAR2(128)		Name of the edition in which editioned objects referenced in an expression column are resolved
UNUSABLE_BEFORE	VARCHAR2(128)		Name of the oldest edition in which the index may be used as part of a query plan
UNUSABLE_BEGINNING	VARCHAR2(128)		Name of the edition for which the index may not be used as part of a query plan in this edition or any of its descendants
COLLATION	VARCHAR2(100)		Collation for the column. Only applies to columns with character data types.
COLLATED_COLUMN_ID	NUMBER		Internal sequence number of a column, for which this virtual column generates a collation key

6.32 DBA_TAB_COLUMNS

`DBA_TAB_COLUMNS` describes the columns of all tables, views, and clusters in the database.

Its columns (except for `SENSITIVE_COLUMN`) are the same as those in `ALL_TAB_COLUMNS`.

To gather statistics for this view, use the `DBMS_STATS` package.

This view filters out system-generated hidden columns. The `DBA_TAB_COLS` view does not filter out system-generated hidden columns.

Columns marked with an asterisk (*) in the table below remain for backward compatibility with Oracle7. This information is now in the [TAB|PART]_COL_STATISTICS views.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	Owner of the table, view, or cluster
TABLE_NAME	VARCHAR2(128)	NOT NULL	Name of the table, view, or cluster
COLUMN_NAME	VARCHAR2(128)	NOT NULL	Column name
DATA_TYPE	VARCHAR2(128)		Data type of the column
DATA_TYPE_MOD	VARCHAR2(3)		Data type modifier of the column
DATA_TYPE_OWNER	VARCHAR2(128)		Owner of the data type of the column
DATA_LENGTH	NUMBER	NOT NULL	Length of the column (in bytes)
DATA_PRECISION	NUMBER		Decimal precision for NUMBER data type; binary precision for FLOAT data type; NULL for all other data types
DATA_SCALE	NUMBER		Digits to the right of the decimal point in a number
NULLABLE	VARCHAR2(1)		Indicates whether a column allows NULLs. The value is N if there is a NOT NULL constraint on the column or if the column is part of a PRIMARY KEY. The constraint should be in an ENABLE VALIDATE state.
COLUMN_ID	NUMBER		Sequence number of the column as created
DEFAULT_LENGTH	NUMBER		Length of the default value for the column
DATA_DEFAULT	LONG		Default value for the column
NUM_DISTINCT*	NUMBER		Number of distinct values in the column
LOW_VALUE*	RAW(1000)		Low value in the column
HIGH_VALUE*	RAW(1000)		High value in the column
DENSITY*	NUMBER		If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram. It does not represent the selectivity of values that span 2 or more endpoints. If a histogram is not available on COLUMN_NAME, then the value of this column is 1/NUM_DISTINCT.
NUM_NULLS	NUMBER		Number of NULLs in the column
NUM_BUCKETS	NUMBER		Number of buckets in the histogram for the column Note: The number of buckets in a histogram is specified in the SIZE parameter of the ANALYZE SQL statement. However, Oracle Database does not create a histogram with more buckets than the number of rows in the sample. Also, if the sample contains any values that are very repetitious, Oracle Database creates the specified number of buckets, but the value indicated by this column may be smaller because of an internal compression algorithm.
LAST_ANALYZED	DATE		Date on which this column was most recently analyzed
SAMPLE_SIZE	NUMBER		Sample size used in analyzing this column
CHARACTER_SET_NAME	VARCHAR2(44)		Name of the character set: <ul style="list-style-type: none"> • CHAR_CS • NCHAR_CS
CHAR_COL_DECL_LENGTH	NUMBER		Declaration length of the character type column

Column	Datatype	NULL	Description
GLOBAL_STATS	VARCHAR2 (3)		GLOBAL_STATS will be YES if statistics are gathered or incrementally maintained, otherwise it will be NO
USER_STATS	VARCHAR2 (3)		Indicates whether statistics were entered directly by the user (YES) or not (NO)
AVG_COL_LEN	NUMBER		Average length of the column (in bytes)
CHAR_LENGTH	NUMBER		Displays the length of the column in characters. This value only applies to the following data types: <ul style="list-style-type: none">• CHAR• VARCHAR2• NCHAR• NVARCHAR2
CHAR_USED	VARCHAR2 (1)		Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C), or whether the data type is not any of the following (NULL): <ul style="list-style-type: none">• CHAR• VARCHAR2• NCHAR• NVARCHAR2
V80_FMT_IMAGE	VARCHAR2 (3)		Indicates whether the column data is in release 8.0 image format (YES) or not (NO)
DATA_UPGRADED	VARCHAR2 (3)		Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)
HISTOGRAM	VARCHAR2 (15)		Indicates existence/type of histogram: <ul style="list-style-type: none">• NONE• FREQUENCY• TOP-FREQUENCY• HEIGHT BALANCED• HYBRID
DEFAULT_ON_NULL	VARCHAR2 (3)		Indicates whether the column has DEFAULT ON NULL semantics (YES) or not (NO)
IDENTITY_COLUMN	VARCHAR2 (3)		Indicates whether this is an identity column (YES) or not (NO)
SENSITIVE_COLUMN	VARCHAR2 (3)		Indicates whether this is a sensitive column (YES) or not (NO)
EVALUATION_EDITION	VARCHAR2 (128)		Name of the edition in which editioned objects referenced in an expression column are resolved
UNUSABLE_BEFORE	VARCHAR2 (128)		Name of the oldest edition in which the index may be used as part of a query plan
UNUSABLE_BEGINNING	VARCHAR2 (128)		Name of the edition for which the index may not be used as part of a query plan in this edition or any of its descendants
COLLATION	VARCHAR2 (100)		Collation for the column. Only applies to columns with character data types.

 **See Also:**

- "[ALL_TAB_COLUMNS](#)"
- "[DBA_TAB_COLS](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_STATS` package

6.33 DBA_TAB_COMMENTS

`DBA_TAB_COMMENTS` displays comments on all tables and views in the database. Its columns are the same as those in `ALL_TAB_COMMENTS`.

 **See Also:**

- "[ALL_TAB_COMMENTS](#)"

6.34 DBA_TAB_HISTGRM_PENDING_STATS

`DBA_TAB_HISTGRM_PENDING_STATS` describes pending statistics for tables, partitions, and subpartitions in the database. Its columns are the same as those in `ALL_TAB_HISTGRM_PENDING_STATS`.

 **See Also:**

- "[ALL_TAB_HISTGRM_PENDING_STATS](#)"

6.35 DBA_TAB_HISTOGRAMS

`DBA_TAB_HISTOGRAMS` describes histograms on columns of all tables in the database. Its columns are the same as those in `ALL_TAB_HISTOGRAMS`.

 **See Also:**

- "[ALL_TAB_HISTOGRAMS](#)"

6.36 DBA_TAB_IDENTITY_COLS

DBA_TAB_IDENTITY_COLS describes all table identity columns. Its columns are the same as those in ALL_TAB_IDENTITY_COLS.

 See Also:

"[ALL_TAB_IDENTITY_COLS](#)"

6.37 DBA_TAB_MODIFICATIONS

DBA_TAB_MODIFICATIONS describes modifications to all tables in the database that have been modified since the last time statistics were gathered on the tables. Its columns are the same as those in ALL_TAB_MODIFICATIONS.

 See Also:

"[ALL_TAB_MODIFICATIONS](#)"

6.38 DBA_TAB_PARTITIONS

DBA_TAB_PARTITIONS displays partition-level partitioning information, partition storage parameters, and partition statistics generated by the DBMS_STATS package for all partitions in the database.

Its columns are the same as those in "[ALL_TAB_PARTITIONS](#)".

6.39 DBA_TAB_PENDING_STATS

DBA_TAB_PENDING_STATS describes pending statistics for tables, partitions, and subpartitions in the database. Its columns are the same as those in ALL_TAB_PENDING_STATS.

 See Also:

"[ALL_TAB_PENDING_STATS](#)"

6.40 DBA_TAB_PRIVS

DBA_TAB_PRIVS describes all object grants in the database.

Related View

USER_TAB_PRIVS describes the object grants for which the current user is the object owner, grantor, or grantee.

Column	Datatype	NULL	Description
GRANTEE	VARCHAR2(128)		Name of the user or role to whom access was granted
OWNER	VARCHAR2(128)		Owner of the object
TABLE_NAME	VARCHAR2(128)		Name of the object. The object can be any object, including tables, packages, indexes, sequences, and so on.
GRANTOR	VARCHAR2(128)		Name of the user who performed the grant
PRIVILEGE	VARCHAR2(40)		Privilege on the object
GRANTABLE	VARCHAR2(3)		Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
HIERARCHY	VARCHAR2(3)		Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)
COMMON	VARCHAR2(3)		Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> • YES if the privilege was granted commonly (CONTAINER=ALL was used) • NO if the privilege was granted locally (CONTAINER=ALL was not used)
TYPE	VARCHAR2(24)		Type of the object
INHERITED	VARCHAR2(3)		Indicates whether the grant was inherited from another container (YES) or not (NO)

See Also:

"USER_TAB_PRIVS"

6.41 DBA_TAB_STATISTICS

DBA_TAB_STATISTICS displays optimizer statistics for all tables in the database. Its columns are the same as those in ALL_TAB_STATISTICS.

See Also:

"ALL_TAB_STATISTICS"

6.42 DBA_TAB_STAT_PREFS

DBA_TAB_STAT_PREFS displays information about statistics preferences for all tables in the database. Its columns are the same as those in ALL_TAB_STAT_PREFS.

 **See Also:**

"[ALL_TAB_STAT_PREFS](#)".

6.43 DBA_TAB_STATS_HISTORY

DBA_TAB_STATS_HISTORY provides a history of table statistics modifications for all tables in the database. Its columns are the same as those in ALL_TAB_STATS_HISTORY.

 **See Also:**

"[ALL_TAB_STATS_HISTORY](#)"

6.44 DBA_TAB_SUBPARTITIONS

DBA_TAB_SUBPARTITIONS displays, for each table subpartition, the subpartition name, name of the table and partition to which it belongs, its storage attributes, and statistics generated by the DBMS_STATS package.

Its columns are the same as those in "[ALL_TAB_SUBPARTITIONS](#)".

6.45 DBA_TABLES

DBA_TABLES describes all relational tables in the database. Its columns are the same as those in ALL_TABLES.

To gather statistics for this view, use the DBMS_STATS package.

 **See Also:**

"[ALL_TABLES](#)"

6.46 DBA_TABLESPACE_GROUPS

DBA_TABLESPACE_GROUPS describes all tablespace groups in the database.

Column	Datatype	NULL	Description
GROUP_NAME	VARCHAR2(30)	NOT NULL	Name of the tablespace group
TABLESPACE_NAME	VARCHAR2(30)	NOT NULL	Name of the tablespace

6.47 DBA_TABLESPACE_THRESHOLDS

DBA_TABLESPACE_THRESHOLDS describes space utilization threshold settings for all tablespaces in the database.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2(30)		Tablespace name
CONTENTS	VARCHAR2(9)		Tablespace contents: <ul style="list-style-type: none"> • UNDO • PERMANENT • TEMPORARY
EXTENT_MANAGEMENT	VARCHAR2(10)		Indicates whether the extents in the tablespace are dictionary managed (DICTIONARY) or locally managed (LOCAL)
THRESHOLD_TYPE	VARCHAR2(8)		Indicates whether the threshold value is derived from a DEFAULT threshold or an EXPLICIT threshold
METRICS_NAME	VARCHAR2(64)		Name of the metric for which the threshold is set
WARNING_OPERATOR	VARCHAR2(12)		Relational operator for warning thresholds: <ul style="list-style-type: none"> • GT • EQ • LT • LE • GE • CONTAINS • NE • DO_NOT_CHECK
WARNING_VALUE	VARCHAR2(256)		Warning threshold value
CRITICAL_OPERATOR	VARCHAR2(12)		Relational operator for critical thresholds: <ul style="list-style-type: none"> • GT • EQ • LT • LE • GE • CONTAINS • NE • DO_NOT_CHECK
CRITICAL_VALUE	VARCHAR2(256)		Critical threshold value

6.48 DBA_TABLESPACE_USAGE_METRICS

DBA_TABLESPACE_USAGE_METRICS describes tablespace usage metrics for all types of tablespaces, including permanent, temporary, and undo tablespaces.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2(30)		Tablespace name
USED_SPACE	NUMBER		Total space consumed by all objects created in the tablespace, expressed as number of data blocks For undo tablespaces, the value of this column includes space consumed by both expired and unexpired undo segments.
TABLESPACE_SIZE	NUMBER		The maximum size of the tablespace, expressed as number of data blocks <ul style="list-style-type: none"> If the tablespace contains any datafiles with autoextend enabled, then this column displays the maximum size to which the tablespace can grow. Underlying storage free space, such as Oracle ASM or file system storage, is also taken into account when computing this value. For example: <ul style="list-style-type: none"> If a tablespace has a current size of 5 GB, the combined maximum size of its datafiles is 32 GB, and its underlying storage has 20 GB of free space, then this column will have a value of approximately 25 GB. If a tablespace has a current size of 10 GB, the combined maximum size of its datafiles is 20 GB, and its underlying storage has 25 GB of free space, then this column will have a value of approximately 20 GB. If the tablespace contains only datafiles with autoextend disabled, then this column displays the combined size of all datafiles in the tablespace.
USED_PERCENT	NUMBER		Percentage of used space, as a function of the maximum possible tablespace size

6.49 DBA_TABLESPACES

DBA_TABLESPACES describes all tablespaces in the database.

Related View

USER_TABLESPACES describes the tablespaces accessible to the current user. This view does not display the PLUGGED_IN column.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2(30)	NOT NULL	Name of the tablespace
BLOCK_SIZE	NUMBER	NOT NULL	Tablespace block size (in bytes)
INITIAL_EXTENT	NUMBER		Default initial extent size (in bytes)
NEXT_EXTENT	NUMBER		Default incremental extent size (in bytes)
MIN_EXTENTS	NUMBER	NOT NULL	Default minimum number of extents
MAX_EXTENTS	NUMBER		Default maximum number of extents
MAX_SIZE	NUMBER		Default maximum size of segments (in Oracle blocks)
PCT_INCREASE	NUMBER		Default percent increase for extent size

Column	Datatype	NULL	Description
MIN_EXTLEN	NUMBER		Minimum extent size for this tablespace (in bytes)
STATUS	VARCHAR2 (9)		Tablespace status: <ul style="list-style-type: none">• ONLINE• OFFLINE• READ ONLY
CONTENTS	VARCHAR2 (9)		Tablespace contents: <ul style="list-style-type: none">• UNDO• LOST WRITE PROTECTION• PERMANENT• TEMPORARY
LOGGING	VARCHAR2 (9)		Default logging attribute: <ul style="list-style-type: none">• LOGGING• NOLOGGING
FORCE_LOGGING	VARCHAR2 (3)		Indicates whether the tablespace is under force logging mode (YES) or not (NO)
EXTENT_MANAGEMENT	VARCHAR2 (10)		Indicates whether the extents in the tablespace are dictionary managed (DICTIONARY) or locally managed (LOCAL)
ALLOCATION_TYPE	VARCHAR2 (9)		Type of extent allocation in effect for the tablespace: <ul style="list-style-type: none">• SYSTEM• UNIFORM• USER
PLUGGED_IN	VARCHAR2 (3)		Indicates whether the tablespace is plugged in (YES) or not (NO)
SEGMENT_SPACE_MANAGEMENT	VARCHAR2 (6)		Indicates whether the free and used segment space in the tablespace is managed using free lists (MANUAL) or bitmaps (AUTO)
DEF_TAB_COMPRESSION	VARCHAR2 (8)		Indicates whether default table compression is enabled (ENABLED) or not (DISABLED) Note: Enabling default table compression indicates that all tables in the tablespace will be created with table compression enabled unless otherwise specified.
RETENTION	VARCHAR2 (11)		Undo tablespace retention: <ul style="list-style-type: none">• GUARANTEE - Tablespace is an undo tablespace with RETENTION specified as GUARANTEE A RETENTION value of GUARANTEE indicates that unexpired undo in all undo segments in the undo tablespace should be retained even if it means that forward going operations that need to generate undo in those segments fail.• NOGUARANTEE - Tablespace is an undo tablespace with RETENTION specified as NOGUARANTEE• NOT APPLY - Tablespace is not an undo tablespace
BIGFILE	VARCHAR2 (3)		Indicates whether the tablespace is a bigfile tablespace (YES) or a smallfile tablespace (NO)
PREDICATE_EVALUATION	VARCHAR2 (7)		Indicates whether predicates are evaluated by host (HOST) or by storage (STORAGE)
ENCRYPTED	VARCHAR2 (3)		Indicates whether the tablespace is encrypted (YES) or not (NO)

Column	Datatype	NULL	Description
COMPRESS_FOR	VARCHAR2(30)		<p>Default compression for what kind of operations:</p> <ul style="list-style-type: none"> • BASIC • ADVANCED • QUERY LOW • QUERY HIGH • ARCHIVE LOW • ARCHIVE HIGH • NULL <p>The QUERY LOW, QUERY HIGH, ARCHIVE LOW, and ARCHIVE HIGH values are associated with Hybrid Columnar Compression, a feature of the Enterprise Edition of Oracle Database that is dependent on the underlying storage system. See <i>Oracle Database Concepts</i> for more information.</p>
DEF_INMEMORY	VARCHAR2(8)		Indicates whether the In-Memory Column Store (IM column store) is by default enabled (ENABLED) or disabled (DISABLED) for tables in this tablespace
DEF_INMEMORY_PRIORITY	VARCHAR2(8)		<p>Indicates the default priority for In-Memory Column Store (IM column store) population for this tablespace. Possible values:</p> <ul style="list-style-type: none"> • LOW • MEDIUM • HIGH • CRITICAL • NONE • NULL
DEF_INMEMORY_DISTRIBUTE	VARCHAR2(15)		<p>Indicates how the IM column store is distributed by default for this tablespace in an Oracle Real Application Clusters (Oracle RAC) environment:</p> <ul style="list-style-type: none"> • AUTO • BY ROWID RANGE • BY PARTITION • BY SUBPARTITION
DEF_INMEMORY_COMPRESSION	VARCHAR2(17)		<p>Indicates the default compression level for the IM column store for this tablespace:</p> <ul style="list-style-type: none"> • NO MEMCOMPRESS • FOR DML • FOR QUERY [LOW HIGH] • FOR CAPACITY [LOW HIGH] • NULL
DEF_INMEMORY_DUPLICATE	VARCHAR2(13)		<p>Indicates the duplicate setting for the IM column store in an Oracle RAC environment:</p> <ul style="list-style-type: none"> • NO DUPLICATE • DUPLICATE • DUPLICATE ALL
SHARED	VARCHAR2(12)		<p>Tablespace type:</p> <ul style="list-style-type: none"> • SHARED: For shared tablespace • LOCAL_ON_LEAF: For local temporary tablespace for leaf (read-only) instances • LOCAL_ON_ALL: For local temporary tablespace for all instance types

Column	Datatype	NULL	Description
DEF_INDEX_COMPRESSION	VARCHAR2(8)		<p>Indicates whether default index compression is enabled (<code>ENABLED</code>) or not (<code>DISABLED</code>)</p> <p>Note: Enabling default index compression indicates that all indexes in the tablespace will be created with index compression enabled unless otherwise specified.</p>
INDEX_COMPRESS_FOR	VARCHAR2(13)		<p>Valid values are:</p> <ul style="list-style-type: none"> • ADVANCED LOW • ADVANCED HIGH • NULL <p>No other values are allowed.</p>
DEF_CELLMEMORY	VARCHAR2(14)		<p>This specifies the default value for the <code>CELLMEMORY</code> attribute that tables created in the tablespace will inherit unless the behavior is overridden explicitly</p> <p>This column is intended for use with Oracle Exadata.</p>
DEF_INMEMORY_SERVICE	VARCHAR2(12)		<p>Indicates how the IM column store is populated on various instances by default for this tablespace. The possible values are:</p> <ul style="list-style-type: none"> • <code>DEFAULT</code>: Data is populated on all instances specified with the <code>PARALLEL_INSTANCE_GROUP</code> initialization parameter. If that parameter is not set, then the data is populated on all instances. This is the default. • <code>NONE</code>: Data is not populated on any instance. • <code>ALL</code>: Data is populated on all instances, regardless of the value of the <code>PARALLEL_INSTANCE_GROUP</code> initialization parameter. • <code>USER_DEFINED</code>: Data is populated only on the instances on which the user-specified service is active. The service name corresponding to this is stored in the <code>DEF_INMEMORY_SERVICE_NAME</code> column.
DEF_INMEMORY_SERVICE_NAME	VARCHAR2(1000)	E	<p>Indicates the service name for the service on which the IM column store should be populated by default for this tablespace. This column has a value only when the corresponding <code>DEF_INMEMORY_SERVICE</code> is <code>USER_DEFINED</code>. In all other cases, this column is null.</p>

Column	Datatype	NULL	Description
LOST_WRITE_PROTECT	VARCHAR2(7)		<p>The lost write protection setting for the tablespace. Possible values:</p> <ul style="list-style-type: none"> • ENABLED: Indicates that lost write data is being collected • OFF: Indicates that lost write data is not being collected • SUSPEND: Indicates that lost write data is not currently being collected, but it can be enabled at a later date. The lost write data collected when the file was ENABLED remains in the lost write database, but it is not being checked or updated. <p>If lost write protection is enabled for a tablespace, it is enabled for all data files for that tablespace, including data files added later.</p> <p>If lost write protection is enabled for a single data file, it does not have to be enabled for another data file in the same tablespace.</p> <p>You can check the lost write protection status for a data file by querying the <code>LOST_WRITE_PROTECT</code> column in the <code>DBA_DATA_FILES</code> view.</p>
CHUNK_TABLESPACE	VARCHAR2(1)		Indicates whether this is a chunk tablespace (Y) or not (N)

- "[USER_TABLESPACES](#)"
- "[PARALLEL_INSTANCE_GROUP](#)"
- "[DBA_DATA_FILES](#)"

6.50 DBA_TEMP_FILES

`DBA_TEMP_FILES` describes all temporary files (tempfiles) in the database.

Column	Datatype	NULL	Description
FILE_NAME	VARCHAR2(513)		Name of the database temp file
FILE_ID	NUMBER		File identifier number of the database temp file
TABLESPACE_NAME	VARCHAR2(30)	NOT NULL	Name of the tablespace to which the file belongs
BYTES	NUMBER		Size of the file (in bytes)
BLOCKS	NUMBER		Size of the file (in Oracle blocks)
STATUS	VARCHAR2(7)		<p>File status:</p> <ul style="list-style-type: none"> • OFFLINE • ONLINE • UNKNOWN
RELATIVE_FNO	NUMBER		Tablespace-relative file number

Column	Datatype	NULL	Description
AUTOEXTENSIBLE	VARCHAR2 (3)		Indicates whether the file is autoextensible (YES) or not (NO)
MAXBYTES	NUMBER		maximum size of the file (in bytes)
MAXBLOCKS	NUMBER		Maximum size of the file (in Oracle blocks)
INCREMENT_BY	NUMBER		Default increment for autoextension (in Oracle blocks)
USER_BYTES	NUMBER		Size of the useful portion of the file (in bytes)
USER_BLOCKS	NUMBER		Size of the useful portion of the file (in Oracle blocks)
SHARED	VARCHAR2 (12)		Type of tablespace this file belongs to: <ul style="list-style-type: none"> • SHARED: For shared tablespace • LOCAL_FOR_RIM: Local temporary tablespace for RIM (read-only) instances • LOCAL_FOR_ALL: Local temporary tablespace for all instance types
INST_ID	NUMBER		Instance ID of the instance to which the temp file belongs. This column has a NULL value for temp files that belong to shared tablespaces.

6.51 DBA_TEMP_FREE_SPACE

DBA_TEMP_FREE_SPACE displays temporary space usage information at tablespace level.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2 (30)	NOT NULL	Name of the tablespace
TABLESPACE_SIZE	NUMBER		Total size of the tablespace, in bytes
ALLOCATED_SPACE	NUMBER		Total allocated space, in bytes, including space that is currently allocated and used and space that is currently allocated and available for reuse
FREE_SPACE	NUMBER		Total free space available, in bytes, including space that is currently allocated and available for reuse and space that is currently unallocated
SHARED	VARCHAR2 (12)		Type of tablespace this file belongs to: <ul style="list-style-type: none"> • SHARED: For shared tablespace • LOCAL_FOR_RIM: Local temporary tablespace for RIM (read-only) instances • LOCAL_FOR_ALL: Local temporary tablespace for all instance types
INST_ID	NUMBER		Instance ID of the instance to which the tempfile belongs

6.52 DBA_THRESHOLDS

DBA_THRESHOLDS describes all thresholds.

Column	Datatype	NULL	Description
METRICS_NAME	VARCHAR2 (64)		Metrics name

Column	Datatype	NULL	Description
WARNING_OPERATOR	VARCHAR2(12)		Relational operator for warning thresholds: <ul style="list-style-type: none"> • GT • EQ • LT • LE • GE • CONTAINS • NE • DO NOT CHECK • DO_NOT_CHECK
WARNING_VALUE	VARCHAR2(256)		Warning threshold value
CRITICAL_OPERATOR	VARCHAR2(12)		Relational operator for critical thresholds: <ul style="list-style-type: none"> • GT • EQ • LT • LE • GE • CONTAINS • NE • DO NOT CHECK • DO_NOT_CHECK
CRITICAL_VALUE	VARCHAR2(256)		Critical threshold value
OBSERVATION_PERIOD	NUMBER		Observation period length (in minutes)
CONSECUTIVE_OCCURRENCES	NUMBER		Number of occurrences before an alert is issued
INSTANCE_NAME	VARCHAR2(16)		Instance name; NULL for database-wide alerts
OBJECT_TYPE	VARCHAR2(64)		Object type: <ul style="list-style-type: none"> • SYSTEM • SERVICE • EVENT_CLASS • TABLESPACE • FILE
OBJECT_NAME	VARCHAR2(513)		Name of the object for which the threshold is set
STATUS	VARCHAR2(7)		Indicates whether the threshold is applicable on a valid object (VALID) or not (INVALID)
			Thresholds for non-tablespace metrics can only be set in ROOT and apply to a CDB as a whole. Any pre-existing non-tablespace thresholds that may exist in a PDB have a status of INVALID in the DBA_THRESHOLDS view. You can remove these threshold settings using the DBMS_SERVER_ALERT.SET_THRESHOLD API . See <i>Oracle Database PL/SQL Packages and Types Reference</i> for more information about the DBMS_SERVER_ALERT.SET_THRESHOLD API .

6.53 DBA_TRANSFORMATIONS

DBA_TRANSFORMATIONS displays information about all transformations in the database. These transformations can be specified with Advanced Queuing operations such as `enqueue`,

dequeue, and subscribe to automatically integrate transformations in AQ messaging. Its columns are the same as those in `ALL_TRANSFORMATIONS`.

 **See Also:**

["ALL_TRANSFORMATIONS"](#)

6.54 DBA_TRIGGER_COLS

`DBA_TRIGGER_COLS` describes the use of columns in all triggers in the database. Its columns are the same as those in `ALL_TRIGGER_COLS`.

 **See Also:**

["ALL_TRIGGER_COLS"](#)

6.55 DBA_TRIGGER_ORDERING

`DBA_TRIGGER_ORDERING` describes all triggers in the database that have `FOLLOWS` or `PRECEDES` ordering. Its columns are the same as those in `ALL_TRIGGER_ORDERING`.

 **See Also:**

["ALL_TRIGGER_ORDERING"](#)

6.56 DBA_TRIGGERS

`DBA_TRIGGERS` describes all triggers in the database. Its columns are the same as those in `ALL_TRIGGERS`.

 **See Also:**

["ALL_TRIGGERS"](#)

6.57 DBA_TRIGGER_AE

DBA_TRIGGER_AE describes all triggers (across all editions) in the database. Its columns are the same as those in ALL_TRIGGER_AE.

 **Note:**

This view is available starting with Oracle Database 19c.

 **See Also:**

["ALL_TRIGGER_AE"](#)

6.58 DBA_TS_QUOTAS

DBA_TS_QUOTAS describes tablespace quotas for all users.

Related View

USER_TS_QUOTAS describes tablespace quotas for the current user. This view does not display the USERNAME column.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2(30)	NOT NULL	Tablespace name
USERNAME	VARCHAR2(128)	NOT NULL	User with resource rights on the tablespace
BYTES	NUMBER		Number of bytes charged to the user
MAX_BYTES	NUMBER		User's quota in bytes, or -1 if no limit
BLOCKS	NUMBER		Number of Oracle blocks charged to the user
MAX_BLOCKS	NUMBER		User's quota in Oracle blocks, or -1 if no limit
DROPPED	VARCHAR2(3)		Whether the tablespace has been dropped

 **See Also:**

["USER_TS_QUOTAS"](#)

6.59 DBA_TSDP_IMPORT_ERRORS

DBA_TSDP_IMPORT_ERRORS shows information about the errors encountered during import of the Transparent Sensitive Data Protection discovery result.

This error information corresponds to the last import of the discovery result done using the DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT API.

Column	Datatype	NULL	Description
ERROR_CODE	NUMBER	NOT NULL	The ORA error code of the error encountered
SCHEMA_NAME	VARCHAR2(128)		The schema corresponding to the error
TABLE_NAME	VARCHAR2(128)		The table corresponding to the error
COLUMN_NAME	VARCHAR2(128)		The column corresponding to the error
SENSITIVE_TYPE	VARCHAR2(128)		The sensitive type corresponding to the error

 **See Also:**

- *Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT` procedure

6.60 DBA_TSDP_POLICY_CONDITION

`DBA_TSDP_POLICY_CONDITION` describes the Transparent Sensitive Data Protection policy and condition mapping. It also lists the property-value pairs for the condition.

Column	Datatype	NULL	Description
POLICY_NAME	VARCHAR2(128)		The name of the Transparent Sensitive Data Protection policy
SUB_POLICY	NUMBER	NOT NULL	The sub policy of the Transparent Sensitive Data Protection policy
PROPERTY	VARCHAR2(11)		The condition property. Possible values: <ul style="list-style-type: none"> • DATATYPE • LENGTH • SCHEMA_NAME • TABLE_NAME
VALUE	VARCHAR2(128)		The value of the condition property

 **See Also:**

- Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection

6.61 DBA_TSDP_POLICY_FEATURE

`DBA_TSDP_POLICY_FEATURE` shows the Transparent Sensitive Data Protection policy security feature mapping for all the TSDP policies in the database.

At this time, only Oracle Data Redaction is supported.

Column	Datatype	NULL	Description
POLICY_NAME	VARCHAR2 (128)		The name of the Transparent Sensitive Data Protection policy
SECURITY_FEATURE	VARCHAR2 (12)		The Oracle security feature with which the Transparent Sensitive Data Protection policy is associated

 **See Also:**

Oracle Database Security Guide for more information about using Transparent Sensitive Data Protection

6.62 DBA_TSDP_POLICY_PARAMETER

`DBA_TSDP_POLICY_PARAMETER` shows the parameter-value pairs for the condition of the Transparent Sensitive Data Protection policy.

Column	Datatype	NULL	Description
POLICY_NAME	VARCHAR2 (128)		The name of the Transparent Sensitive Data Protection policy
SUB_POLICY	NUMBER	NOT NULL	The sub policy of the Transparent Sensitive Data Protection policy
PARAMETER	VARCHAR2 (128)		The parameter for the Transparent Sensitive Data Protection sub policy
VALUE	VARCHAR2 (4000)		The value of the parameter
DEFAULT_OPTION	VARCHAR2 (5)		Indicates whether this is the default option for the policy: <ul style="list-style-type: none"> • TRUE: This is the default option for the policy • FALSE: This is not the default option for the policy

 **See Also:**

Oracle Database Security Guide for more information about using Transparent Sensitive Data Protection

6.63 DBA_TSDP_POLICY_PROTECTION

`DBA_TSDP_POLICY_PROTECTION` shows the list of columns that have been protected through Transparent Sensitive Data Protection.

Column	Datatype	NULL	Description
SCHEMA_NAME	VARCHAR2 (128)	NOT NULL	The schema containing the sensitive data
TABLE_NAME	VARCHAR2 (128)	NOT NULL	The table containing the sensitive column
COLUMN_NAME	VARCHAR2 (128)	NOT NULL	The name of the sensitive column

Column	Datatype	NULL	Description
TSDP_POLICY	VARCHAR2(128)		The TSDP policy name based on which the column protection was enabled
SECURITY_FEATURE	VARCHAR2(12)		The security feature enabled on the sensitive column
SECURITY_FEATURE_POLICY	VARCHAR2(128)	NOT NULL	Name of the underlying Oracle security feature policy
SUBPOLICY#	NUMBER	NOT NULL	The subpolicy of the Transparent Sensitive Data Protection policy based on which protection has been enabled

 **See Also:**

Oracle Database Security Guide for more information about using Transparent Sensitive Data Protection

6.64 DBA_TSDP_POLICY_TYPE

DBA_TSDP_POLICY_TYPE shows the Transparent Sensitive Data Protection policy to sensitive column type mapping.

Column	Datatype	NULL	Description
POLICY_NAME	VARCHAR2(128)		The Transparent Sensitive Data Protection policy name
SENSITIVE_TYPE	VARCHAR2(128)		The sensitive column type name

 **See Also:**

Oracle Database Security Guide for more information about using Transparent Sensitive Data Protection

6.65 DBA_TSM_DESTINATION

DBA_TSM_DESTINATION lists transparent session migration (TSM) destination session statistics.

Column	Datatype	NULL	Description
SOURCE_DATABASE_NAME	VARCHAR2(4000)		Database name of source session
DESTINATION_DATABASE_NAME	VARCHAR2(4000)		Database name of destination session
DESTINATION_INSTANCE_NAME	VARCHAR2(4000)		Instance name of destination session
DESTINATION_INSTANCE_ID	VARCHAR2(4000)		Instance ID of destination session
DESTINATION_INST_START_TIME	TIMESTAMP(6) WITH TIME ZONE		Instance start time of destination session
SEQUENCE#	NUMBER		Migration sequence number

Column	Datatype	NULL	Description
DESTINATION_SID	NUMBER		Session ID of destination session
DESTINATION_SERIAL#	NUMBER		Session serial number of destination session
DESTINATION_START_TIME	TIMESTAMP(6) WITH TIME ZONE		Start time for migration on destination session
DESTINATION_END_TIME	TIMESTAMP(6) WITH TIME ZONE		End time for migration on destination session
DESTINATION_USER_NAME	VARCHAR2(128)	NOT NULL	User associated with the destination session
DESTINATION_SCHEMA_NAME	VARCHAR2(128)	NOT NULL	Schema associated with the destination session
DESTINATION_STATE	VARCHAR2(24)		Migration state of destination session

6.66 DBA_TSM_SOURCE

DBA_TSM_SOURCE lists transparent session migration (TSM) source session statistics.

Column	Datatype	NULL	Description
SOURCE_DATABASE_NAME	VARCHAR2(4000)		Database name of source session
SOURCE_INSTANCE_NAME	VARCHAR2(4000)		Instance name of source session
SOURCE_INSTANCE_ID	VARCHAR2(4000)		Instance ID of source session
SOURCE_INSTANCE_START_TIME	TIMESTAMP(6) WITH TIME ZONE		Instance start time of source session
SEQUENCE#	NUMBER		Migration sequence number
SOURCE_SID	NUMBER		Session ID of source session
SOURCE_SERIAL#	NUMBER		Source serial number of source session
SOURCE_STATE	VARCHAR2(24)		Migration state of source session
CONNECT_STRING	VARCHAR2(4000)		Connect string specified for migration
SOURCE_START_TIME	TIMESTAMP(6) WITH TIME ZONE		Start time for migration on source session
COST	NUMBER		Estimate of migration cost
FAILURE_REASON	VARCHAR2(34)		Reason for migration failure, if any
SOURCE_END_TIME	TIMESTAMP(6) WITH TIME ZONE		End time for migration on source session
ROUNDTrips	NUMBER		Number of client/server round trips during migration
SOURCE_USER_NAME	VARCHAR2(128)	NOT NULL	User associated with the source session
SOURCE_SCHEMA_NAME	VARCHAR2(128)	NOT NULL	Schema associated with the source session
DESTINATION_DATABASE_NAME	VARCHAR2(4000)		Database name of the destination session

6.67 DBA_TSTZ_TAB_COLS

DBA_TSTZ_TAB_COLS displays information about the columns of all tables in the database, which have columns defined on TIMESTAMP WITH TIME ZONE data types or object types containing attributes of TIMESTAMP WITH TIME ZONE data types.

Its columns (except for COLUMN_NAME, NESTED, VIRTUAL_COLUMN, SCALAR_COLUMN, and UNUSED_COLUMN) are the same as those in ALL_TSTZ_TAB_COLS.

 **See Also:**

["ALL_TSTZ_TAB_COLS"](#)

6.68 DBA_TSTZ_TABLES

DBA_TSTZ_TABLES displays information about all tables in the database, which have columns defined on TIMESTAMP WITH TIME ZONE data types or object types containing attributes of TIMESTAMP WITH TIME ZONE data types.

Its columns are the same as those in ALL_TSTZ_TABLES.

 **See Also:**

["ALL_TSTZ_TABLES"](#)

6.69 DBA_TUNE_MVIEW

DBA_TUNE_MVIEW displays the result of executing the DBMS_ADVISOR.TUNE_MVIEW procedure.

Related View

USER_TUNE_MVIEW displays the result of executing the DBMS_ADVISOR.TUNE_MVIEW procedure. This view does not display the OWNER column.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)		Owner of the task
TASK_NAME	VARCHAR2(128)		Name of the task
ACTION_ID	NUMBER	NOT NULL	Identifier of the action
SCRIPT_TYPE	VARCHAR2(14)		Type of the script: <ul style="list-style-type: none">• IMPLEMENTATION• UNDO
STATEMENT	CLOB		Action statement

 **See Also:**

- "[USER_TUNE_MVIEW](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_ADVISOR.TUNE_MVIEW` procedure

6.70 DBA_TYPE_ATTRS

`DBA_TYPE_ATTRS` describes the attributes of all object types in the database. Its columns (except for `CHAR_USED`) are the same as those in `ALL_TYPE_ATTRS`.

 **See Also:**

- "[ALL_TYPE_ATTRS](#)"

6.71 DBA_TYPE_METHODS

`DBA_TYPE_METHODS` describes the methods of all object types in the database. Its columns are the same as those in `ALL_TYPE_METHODS`.

 **See Also:**

- "[ALL_TYPE_METHODS](#)"

6.72 DBA_TYPE VERSIONS

`DBA_TYPE_VERSIONS` describes the versions of all object types in the database. Its columns are the same as those in `ALL_TYPE_VERSIONS`.

 **See Also:**

- "[ALL_TYPE_VERSIONS](#)"

6.73 DBA_TYPES

DBA_TYPES describes all object types in the database. Its columns are the same as those in ALL_TYPES.

 **See Also:**

"[ALL_TYPES](#)"

6.74 DBA_UMF_LINK

DBA_UMF_LINK displays information about the registered database links in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns all the registered database links in the topology if you are querying on a target node.

Column	Datatype	NULL	Description
TOPOLOGY_NAME	VARCHAR2 (128)	NOT NULL	Topology name for the link
FROM_NODE_ID	NUMBER	NOT NULL	Node ID of the local node
TO_NODE_ID	NUMBER	NOT NULL	Node ID of the remote node
LINK_NAME	VARCHAR2 (128)	NOT NULL	Fully qualified database link name

 **See Also:**

Oracle Database Performance Tuning Guide for information about configuring the Remote Management Framework (RMF) architecture

6.75 DBA_UMF_REGISTRATION

DBA_UMF_REGISTRATION displays information about the registered nodes in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns all the registered nodes in the topology if you are querying on a target node.

Column	Datatype	NULL	Description
TOPOLOGY_NAME	VARCHAR2 (128)	NOT NULL	Topology name for the node
NODE_NAME	VARCHAR2 (128)	NOT NULL	Unique node name in the topology
NODE_ID	NUMBER	NOT NULL	Unique node ID in the topology
NODE_TYPE	NUMBER	NOT NULL	Node type. Possible value: <ul style="list-style-type: none"> • 0: RDBMS node

Column	Datatype	NULL	Description
AS_SOURCE	VARCHAR2 (5)		Indicates whether the node is a source node. Possible values: <ul style="list-style-type: none">• TRUE: The node is a source node, and it can provide remote services• FALSE: The node is not a source node, and it cannot provide remote services
AS_CANDIDATE_TARGET	VARCHAR2 (5)		Node is a candidate target. Possible values: <ul style="list-style-type: none">• TRUE: Node can be promoted to target role• FALSE: Node cannot be promoted to target role
STATE	VARCHAR2 (20)		Current state of the node. Possible values: <ul style="list-style-type: none">• OK: Node is registered• REGISTRATION_PENDING: Node registration has started, but has not been completed• SYNC_FAILED: Unable to synchronize the topology with the node

 **See Also:**

Oracle Database Performance Tuning Guide for information about configuring the Remote Management Framework (RMF) architecture

6.76 DBA_UMF_SERVICE

DBA_UMF_SERVICE displays information about the registered services in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns all the registered services in the topology if you are querying on a target node

Column	Datatype	NULL	Description
TOPOLOGY_NAME	VARCHAR2 (128)	NOT NULL	Topology name for the service
NODE_ID	NUMBER	NOT NULL	Node ID of the node providing the service
SERVICE_ID	VARCHAR2 (7)		Service Identifier. Possible values: <ul style="list-style-type: none">• 1: Automatic Workload Repository• 2: SQL Tuning

 **See Also:**

Oracle Database Performance Tuning Guide for information about configuring the Remote Management Framework (RMF) architecture

6.77 DBA_UFM_TOPOLOGY

`DBA_UFM_TOPOLOGY` displays information about the registered topologies in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns one row per registered topology if you are querying on a target node.

Column	Datatype	NULL	Description
TOPOLOGY_NAME	VARCHAR2 (128)	NOT NULL	Unique topology name
TARGET_ID	NUMBER		Node ID of the target node
TOPOLOGY_VERSION	NUMBER	NOT NULL	Topology version number
TOPOLOGY_STATE	VARCHAR2 (8)		Possible values: <ul style="list-style-type: none"> • ACTIVE: Topology can be used for RMF operations • INACTIVE: Topology cannot be used for RMF operations

 **See Also:**

Oracle Database Performance Tuning Guide for information about configuring the Remote Management Framework (RMF) architecture

6.78 DBA_UNDO_EXTENTS

`DBA_UNDO_EXTENTS` describes the extents comprising the segments in all undo tablespaces in the database.

 **Note:**

The status of the undo space distribution reported by `DBA_UNDO_EXTENTS` is correct for the undo tablespace that is active on the instance on which `DBA_UNDO_EXTENTS` is queried. However, due to the use of in-memory information that is different on each instance, there can be a discrepancy in the status of the undo space distribution of undo tablespaces active on other instances when queried from one instance. This does not affect undo functionality and is only a reporting discrepancy for other instances' undo tablespace space distribution status. As a best practice, query the space distribution for an undo tablespace from the instance on which it is active.

Column	Datatype	NULL	Description
OWNER	CHAR (3)		Owner of the undo tablespace
SEGMENT_NAME	VARCHAR2 (128)	NOT NULL	Name of the undo segment
TABLESPACE_NAME	VARCHAR2 (128)	NOT NULL	Name of the undo tablespace
EXTENT_ID	NUMBER		ID of the extent

Column	Datatype	NULL	Description
FILE_ID	NUMBER	NOT NULL	Absolute file number of the data file containing the extent
BLOCK_ID	NUMBER		Start block number of the extent
BYTES	NUMBER		Size of the extent (in bytes)
BLOCKS	NUMBER		Size of the extent (in blocks)
RELATIVE_FNO	NUMBER		Relative number of the file containing the segment header
COMMIT_JTIME	NUMBER		Commit time of the undo in the extent expressed as Julian time. This column is deprecated, but retained for backward compatibility reasons.
COMMIT_WTIME	VARCHAR2 (20)		Commit time of the undo in the extent expressed as Wallclock time. This column is deprecated, but retained for backward compatibility reasons.
STATUS	VARCHAR2 (9)		Transaction Status of the undo in the extent: <ul style="list-style-type: none"> • ACTIVE • EXPIRED • UNEXPIRED

6.79 DBA_UNUSED_COL_TABS

DBA_UNUSED_COL_TABS describes all tables in the database containing unused columns. Its columns are the same as those in ALL_UNUSED_COL_TABS.

 **See Also:**

["ALL_UNUSED_COL_TABS"](#)

6.80 DBA_UNUSED_GRANTS

DBA_UNUSED_GRANTS shows all the grants that are not used during the privilege capture.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)		Name of the privilege analysis policy
RUN_NAME	VARCHAR2 (128)		Name of the run of the privilege analysis policy
GRANTEE	VARCHAR2 (128)		Name of the user who is granted with the privilege or role
ROLENAME	VARCHAR2 (128)		Name of the role that is granted to the grantee
SYS_PRIV	VARCHAR2 (40)		Name of the system privilege that is granted to the grantee
OBJ_PRIV	VARCHAR2 (40)		Name of the object privilege that is granted to the grantee
USER_PRIV	VARCHAR2 (25)		Name of the user privilege that is granted to the grantee

Column	Datatype	NULL	Description
OBJECT_OWNER	VARCHAR2(128)		Name of the owner of the object for which the object privilege is granted
OBJECT_NAME	VARCHAR2(128)		Name of the object for which the object privilege is granted
OBJECT_TYPE	VARCHAR2(23)		Type of the object for which the object privilege is granted
COLUMN_NAME	VARCHAR2(128)		Name of the column in the table for which the object privilege is granted
OPTIONS	NUMBER		Whether the grant option of the privilege is granted

 See Also:

Oracle Database Security Guide for more information about privilege analysis

6.81 DBA_UNUSED_OBJPRIVS

DBA_UNUSED_OBJPRIVS lists the object privileges (without privilege grant paths) that are not used for the privilege analysis policies reported by the DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE_ADMIN role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2(128)	NOT NULL	Name of the privilege analysis policy
USERNAME	VARCHAR2(128)		Name of the user whose privileges are reported
ROLENAME	VARCHAR2(128)		Name of the role whose unused privileges are reported (for ROLE type privilege analysis or ROLE AND CONTEXT privilege analysis)
OBJ_PRIV	VARCHAR2(40)		Unused object privilege
OBJECT_OWNER	VARCHAR2(128)		Object owner
OBJECT_NAME	VARCHAR2(128)		Name of the object that USERNAME has OBJ_PRIV on
OBJECT_TYPE	VARCHAR2(23)		Type of the object USERNAME has OBJ_PRIV on
COLUMN_NAME	VARCHAR2(128)		Name of the column that USERNAME has OBJ_PRIV on
GRANT_OPTION	NUMBER		Indicates whether the privilege is granted with the GRANT option: <ul style="list-style-type: none"> • 0 - Indicates that the privilege is granted without the GRANT option • 1 - Indicates that the privilege is granted with the GRANT option
RUN_NAME	VARCHAR2(128)		The name of the run during which the privilege was reported

 See Also:

- "[DBA_UNUSED_OBJPRIVS_PATH](#)" for privilege grant path information for unused object privileges
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.82 DBA_UNUSED_OBJPRIVS_PATH

`DBA_UNUSED_OBJPRIVS_PATH` lists the object privileges that are not used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)	NOT NULL	Name of the privilege analysis policy
USERNAME	VARCHAR2 (128)		Name of the user whose privileges are reported
ROLENAME	VARCHAR2 (128)		Name of the role whose unused privileges are reported (for <code>ROLE</code> type privilege analysis or <code>ROLE AND CONTEXT</code> privilege analysis)
OBJ_PRIV	VARCHAR2 (40)		Unused object privilege
OBJECT_OWNER	VARCHAR2 (128)		Object owner
OBJECT_NAME	VARCHAR2 (128)		Name of the object that <code>USERNAME</code> has <code>OBJ_PRIV</code> on
OBJECT_TYPE	VARCHAR2 (23)		Type of the object that <code>USERNAME</code> has <code>OBJ_PRIV</code> on
COLUMN_NAME	VARCHAR2 (128)		Name of the column that <code>USERNAME</code> has <code>OBJ_PRIV</code> on
GRANT_OPTION	NUMBER		Indicates whether the privilege is granted with the <code>GRANT</code> option: <ul style="list-style-type: none"> • 0 - Indicates that the privilege is granted without the <code>GRANT</code> option • 1 - Indicates that the privilege is granted with the <code>GRANT</code> option
PATH	GRANT_PATH		Object privilege grant paths
RUN_NAME	VARCHAR2 (128)		The name of the run during which the privilege was reported

 See Also:

- "[DBA_USED_OBJPRIVS_PATH](#)"
- "[DBA_UNUSED_OBJPRIVS](#)"
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.83 DBA_UNUSED_PRIVS

`DBA_UNUSED_PRIVS` lists the privileges that are not used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2(128)	NOT NULL	Name of the privilege analysis policy
USERNAME	VARCHAR2(128)		Name of the user whose unused privileges are reported
ROLENAME	VARCHAR2(128)		Name of the role whose unused privileges are reported (for <code>ROLE</code> type privilege analysis or <code>ROLE AND CONTEXT</code> privilege analysis)
SYS_PRIV	VARCHAR2(40)		Unused system privilege
OBJ_PRIV	VARCHAR2(40)		Unused object privilege
USER_PRIV	VARCHAR2(25)		Unused user privilege
OBJECT_OWNER	VARCHAR2(128)		Object owner
OBJECT_NAME	VARCHAR2(128)		Name of the object that <code>USERNAME</code> has <code>OBJ_PRIV</code> or <code>USER_PRIV</code> on
OBJECT_TYPE	VARCHAR2(23)		Type of the object that <code>OBJ_PRIV</code> has accessed or <code>USER_PRIV</code> if <code>USER_PRIV</code> was used
COLUMN_NAME	VARCHAR2(128)		Name of the column that <code>OBJ_PRIV</code> has access on
OPTION\$	NUMBER		Indicates whether the privilege is granted with the <code>GRANT</code> option or the <code>ADMIN</code> option: <ul style="list-style-type: none"> • 0 - Indicates that the privilege is granted without the <code>GRANT</code> option or <code>ADMIN</code> option • 1 - Indicates that the privilege is granted with the <code>GRANT</code> option or <code>ADMIN</code> option
PATH	GRANT_PATH		Privilege grant paths
RUN_NAME	VARCHAR2(128)		The name of the run during which the privilege was reported

 **See Also:**

- "[DBA_USED_PRIVS](#)"
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.84 DBA_UNUSED_SYSPRIVS

`DBA_UNUSED_SYSPRIVS` lists the system privileges (without privilege grant paths) that are not used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)	NOT NULL	Name of a privilege analysis policy
USERNAME	VARCHAR2 (128)		Name of the user whose privileges are reported
ROLENAME	VARCHAR2 (128)		Name of the role whose unused privileges are reported (for <code>ROLE</code> type privilege analysis or <code>ROLE AND CONTEXT</code> privilege analysis)
SYS_PRIV	VARCHAR2 (40)		Unused system privilege
ADMIN_OPTION	NUMBER		Indicates whether the privilege is granted with the <code>ADMIN</code> option: <ul style="list-style-type: none"> • 0 - Indicates that the privilege is granted without the <code>ADMIN</code> option • 1 - Indicates that the privilege is granted with the <code>ADMIN</code> option
RUN_NAME	VARCHAR2 (128)		The name of the run during which the privilege was reported

 **See Also:**

- "[DBA_UNUSED_SYSPRIVS_PATH](#)" for privilege grant path information for unused system privileges
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.85 DBA_UNUSED_SYSPRIVS_PATH

`DBA_UNUSED_SYSPRIVS_PATH` lists the system privileges that are not used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)	NOT NULL	Name of a privilege analysis policy
USERNAME	VARCHAR2 (128)		Name of the user whose privileges are reported
ROLENAME	VARCHAR2 (128)		Name of the role whose unused privileges are reported (for <code>ROLE</code> type privilege analysis or <code>ROLE AND CONTEXT</code> privilege analysis)
SYS_PRIV	VARCHAR2 (40)		Unused system privilege
ADMIN_OPTION	NUMBER		Indicates whether the privilege is granted with the <code>ADMIN</code> option: <ul style="list-style-type: none"> • 0 - Indicates that the privilege is granted without the <code>ADMIN</code> option • 1 - Indicates that the privilege is granted with the <code>ADMIN</code> option
PATH	GRANT_PATH		System privilege grant paths
RUN_NAME	VARCHAR2 (128)		The name of the run during which the privilege was reported

See Also:

- "[DBA_USED_SYSPRIVS_PATH](#)"
- "[DBA_UNUSED_SYSPRIVS](#)"
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.86 DBA_UNUSED_USERPRIVS

`DBA_UNUSED_USERPRIVS` lists the user privileges (without privilege grant paths) that are not used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)	NOT NULL	Name of a privilege analysis policy

Column	Datatype	NULL	Description
USERNAME	VARCHAR2 (128)		Name of the user whose privileges are reported
ROLENAME	VARCHAR2 (128)		Name of the role whose unused privileges are reported (for ROLE type privilege analysis or ROLE AND CONTEXT privilege analysis)
USER_PRIV	VARCHAR2 (25)		Unused user privilege
ONUSER	VARCHAR2 (128)		The user whose user privileges the grantee can exercise
GRANT_OPTION	NUMBER		Indicates whether the privilege is granted with the GRANT option: <ul style="list-style-type: none">• 0 - Indicates that the privilege is granted without the GRANT option• 1 - Indicates that the privilege is granted with the GRANT option
RUN_NAME	VARCHAR2 (128)		The name of the run during which the privilege was reported

 See Also:

- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT procedure

6.87 DBA_UNUSED_USERPRIVS_PATH

DBA_UNUSED_USERPRIVS_PATH lists the user privileges that are not used for the privilege analysis policies reported by the DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE_ADMIN role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)	NOT NULL	Name of a privilege analysis policy
USERNAME	VARCHAR2 (128)		Name of the user whose privileges are reported
ROLENAME	VARCHAR2 (128)		Name of the role whose unused privileges are reported (for ROLE type privilege analysis or ROLE AND CONTEXT privilege analysis)
USER_PRIV	VARCHAR2 (25)		Unused user privilege
ONUSER	VARCHAR2 (128)		The user whose user privileges the grantee can exercise

Column	Datatype	NULL	Description
GRANT_OPTION	NUMBER		Indicates whether the privilege is granted with the GRANT option: <ul style="list-style-type: none">• 0 - Indicates that the privilege is granted without the GRANT option• 1 - Indicates that the privilege is granted with the GRANT option
PATH	GRANT_PATH		User privilege grant paths
RUN_NAME	VARCHAR2 (128)		The name of the run during which the privilege was reported

 See Also:

- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.88 DBA_UPDATABLE_COLUMNS

`DBA_UPDATABLE_COLUMNS` describes all columns in a join view that can be updated by the database administrator, subject to appropriate privileges. Its columns are the same as those in `ALL_UPDATABLE_COLUMNS`.

 See Also:

- "[ALL_UPDATABLE_COLUMNS](#)"
- *Oracle Database Concepts* for information on updatable join views

6.89 DBA_USED_OBJPRIVS

`DBA_USED_OBJPRIVS` lists the object privileges (without privilege grant paths) that are used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)	NOT NULL	Name of the privilege analysis policy
SEQUENCE	NUMBER	NOT NULL	The sequence number of the privilege analysis run during which the privilege was reported
OS_USER	VARCHAR2 (128)		Operating system login username

Column	Datatype	NULL	Description
USERHOST	VARCHAR2 (128)		Client host machine name
MODULE	VARCHAR2 (64)		Module name
USERNAME	VARCHAR2 (128)	NOT NULL	Name of the user whose privilege was reported
USED_ROLE	VARCHAR2 (128)		Used role
OBJ_PRIV	VARCHAR2 (40)		Used object privilege
OBJECT_OWNER	VARCHAR2 (128)		Object owner
OBJECT_NAME	VARCHAR2 (128)		Name of the object that OBJ_PRIV was used to access
OBJECT_TYPE	VARCHAR2 (23)		Type of the object that OBJ_PRIV was used to access
COLUMN_NAME	VARCHAR2 (128)		Name of the column that OBJ_PRIV was used to access
GRANT_OPTION	NUMBER		Indicates whether the GRANT option was used: <ul style="list-style-type: none"> • 0 - Indicates that the GRANT option was not used • 1 - Indicates that the GRANT option was used
RUN_NAME	VARCHAR2 (128)		The name of the run during which the privilege was reported

 See Also:

- "[DBA_USED_OBJPRIVS_PATH](#)" for privilege grant path information for used object privileges
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT procedure

6.90 DBA_USED_OBJPRIVS_PATH

DBA_USED_OBJPRIVS_PATH lists the object privileges that are used for the privilege analysis policies reported by the DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE_ADMIN role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)	NOT NULL	Name of the privilege analysis policy
SEQUENCE	NUMBER	NOT NULL	The sequence number of the privilege analysis run during which the privilege was reported
OS_USER	VARCHAR2 (128)		Operating system login username
USERHOST	VARCHAR2 (128)		Client host machine name
MODULE	VARCHAR2 (64)		Module name
USERNAME	VARCHAR2 (128)	NOT NULL	Name of the user whose privilege was reported
USED_ROLE	VARCHAR2 (128)		Used role

Column	Datatype	NULL	Description
OBJ_PRIV	VARCHAR2(40)		Used object privilege
OBJECT_OWNER	VARCHAR2(128)		Object owner
OBJECT_NAME	VARCHAR2(128)		Name of the object that OBJ_PRIV is used to access
OBJECT_TYPE	VARCHAR2(23)		Type of the object that OBJ_PRIV is used to access
COLUMN_NAME	VARCHAR2(128)		Name of the column that OBJ_PRIV is used to access
GRANT_OPTION	NUMBER		Indicates whether the GRANT option was used: <ul style="list-style-type: none"> • 0 - Indicates that the GRANT option was not used • 1 - Indicates that the GRANT option was used
PATH	GRANT_PATH		Object privilege grant paths
RUN_NAME	VARCHAR2(128)		The name of the run during which the privilege was reported

 **See Also:**

- "[DBA_UNUSED_OBJPRIVS_PATH](#)"
- "[DBA_USED_OBJPRIVS](#)"
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.91 DBA_USED_PRIVS

DBA_USED_PRIVS lists the privileges that are used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2(128)	NOT NULL	Name of a privilege analysis policy
SEQUENCE	NUMBER	NOT NULL	The sequence number of the privilege analysis run during which the privilege was reported
OS_USER	VARCHAR2(128)		Operating system login username
USERHOST	VARCHAR2(128)		Client host machine name
MODULE	VARCHAR2(64)		Module name
USERNAME	VARCHAR2(128)	NOT NULL	Name of the user whose privilege was reported
USED_ROLE	VARCHAR2(128)		Used role
SYS_PRIV	VARCHAR2(40)		Used system privilege
OBJ_PRIV	VARCHAR2(40)		Used object privilege
USER_PRIV	VARCHAR2(25)		Used user privilege

Column	Datatype	NULL	Description
OBJECT_OWNER	VARCHAR2(128)		Object owner
OBJECT_NAME	VARCHAR2(128)		Name of the object or user that <code>OBJ_PRIV</code> or <code>USER_PRIV</code> is used to access
OBJECT_TYPE	VARCHAR2(23)		Type of the object or user that <code>OBJ_PRIV</code> or <code>USER_PRIV</code> is used to access
COLUMN_NAME	VARCHAR2(128)		Name of the column that <code>OBJ_PRIV</code> is used to access
OPTION\$	NUMBER		Indicates whether the <code>GRANT</code> option or the <code>ADMIN</code> option was used: <ul style="list-style-type: none"> • 0 - Indicates that the <code>GRANT</code> option or <code>ADMIN</code> option was not used • 1 - Indicates that the <code>GRANT</code> option or <code>ADMIN</code> option was used
PATH	GRANT_PATH		Used privilege grant paths
RUN_NAME	VARCHAR2(128)		The name of the run during which the privilege was reported

See Also:

- "[DBA_UNUSED_PRIVS](#)"
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.92 DBA_USED_PUBPRIVS

`DBA_USED_PUBPRIVS` lists the privileges that are used from the `PUBLIC` role for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2(128)	NOT NULL	Name of a privilege analysis policy
SEQUENCE	NUMBER	NOT NULL	The sequence number of the privilege analysis run during which the privilege was reported
OS_USER	VARCHAR2(128)		Operating system login username
USERHOST	VARCHAR2(128)		Client host machine name
MODULE	VARCHAR2(64)		Module name
USERNAME	VARCHAR2(128)	NOT NULL	Name of the user who used the privilege from the <code>PUBLIC</code> role
SYS_PRIV	VARCHAR2(40)		Used system privilege
OBJ_PRIV	VARCHAR2(40)		Used object privilege

Column	Datatype	NULL	Description
OBJECT_OWNER	VARCHAR2(128)		Object owner
OBJECT_NAME	VARCHAR2(128)		Name of the object that OBJ_PRIV is used to access
OBJECT_TYPE	VARCHAR2(23)		Type of the object that OBJ_PRIV is used to access
OPTIONS\$	NUMBER		Indicates whether the GRANT option or the ADMIN option was used: <ul style="list-style-type: none"> • 0 - Indicates that the GRANT option or ADMIN option was not used • 1 - Indicates that the GRANT option or ADMIN option was used
RUN_NAME	VARCHAR2(128)		The name of the run during which the privilege was reported

 **See Also:**

- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT procedure

6.93 DBA_USED_SYSPRIVS

DBA_USED_SYSPRIVS lists the system privileges (without privilege grant paths) that are used for the privilege analysis policies reported by the DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE_ADMIN role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2(128)	NOT NULL	Name of a privilege analysis policy
SEQUENCE	NUMBER	NOT NULL	The sequence number of the privilege analysis run during which the privilege was used
OS_USER	VARCHAR2(128)		Operating system login username
USERHOST	VARCHAR2(128)		Client host machine name
MODULE	VARCHAR2(64)		Module name
USERNAME	VARCHAR2(128)	NOT NULL	Name of the user whose privilege was reported
USED_ROLE	VARCHAR2(128)		Used role
SYS_PRIV	VARCHAR2(40)		Used system privilege
ADMIN_OPTION	NUMBER		Indicates whether the ADMIN option was used: <ul style="list-style-type: none"> • 0 - Indicates that the ADMIN option was not used • 1 - Indicates that the ADMIN option was used
RUN_NAME	VARCHAR2(128)		The name of the run during which the privilege was reported

 **See Also:**

- "[DBA_USED_SYSPRIVS_PATH](#)" for privilege grant path information for used system privileges
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.94 DBA_USED_SYSPRIVS_PATH

`DBA_USED_SYSPRIVS_PATH` lists the system privileges that are used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2(128)	NOT NULL	Name of a privilege analysis policy
SEQUENCE	NUMBER	NOT NULL	The sequence number of the privilege analysis run during which the privilege was reported
OS_USER	VARCHAR2(128)		Operating system login username
USERHOST	VARCHAR2(128)		Client host machine name
MODULE	VARCHAR2(64)		Module name
USERNAME	VARCHAR2(128)	NOT NULL	Name of the user whose privilege was reported
USED_ROLE	VARCHAR2(128)		Used role
SYS_PRIV	VARCHAR2(40)		Used system privilege
ADMIN_OPTION	NUMBER		Indicates whether the <code>ADMIN</code> option was used: <ul style="list-style-type: none"> • 0 - Indicates that the <code>ADMIN</code> option was not used • 1 - Indicates that the <code>ADMIN</code> option was used
PATH	GRANT_PATH		System privilege grant paths
RUN_NAME	VARCHAR2(128)		The name of the run during which the privilege was reported

 **See Also:**

- "[DBA_UNUSED_SYSPRIVS_PATH](#)"
- "[DBA_USED_SYSPRIVS](#)"
- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.95 DBA_USED_USERPRIVS

`DBA_USED_USERPRIVS` lists the user privileges (without privilege grant paths) that are used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)	NOT NULL	Name of a privilege analysis policy
SEQUENCE	NUMBER	NOT NULL	The sequence number of the privilege analysis run during which the privilege was reported
OS_USER	VARCHAR2 (128)		Operating system login username
USERHOST	VARCHAR2 (128)		Client host machine name
MODULE	VARCHAR2 (64)		Module name
USERNAME	VARCHAR2 (128)	NOT NULL	Name of the user whose privilege was reported
USED_ROLE	VARCHAR2 (128)		Used role
USER_PRIV	VARCHAR2 (25)		Used user privilege
ONUSER	VARCHAR2 (128)		The user whose user privileges the grantee can exercise
GRANT_OPTION	NUMBER		Indicates whether the privilege is granted with the <code>GRANT</code> option: <ul style="list-style-type: none"> • 0 - Indicates that the privilege is granted without the <code>GRANT</code> option • 1 - Indicates that the privilege is granted with the <code>GRANT</code> option
RUN_NAME	VARCHAR2 (128)		The name of the run during which the privilege was reported

See Also:

- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.96 DBA_USED_USERPRIVS_PATH

`DBA_USED_USERPRIVS_PATH` lists the user privileges that are used for the privilege analysis policies reported by the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure.

This view provides access to analyzed privilege records in `SYS` tables.

You must have the `CAPTURE_ADMIN` role to access this view.

Column	Datatype	NULL	Description
CAPTURE	VARCHAR2 (128)	NOT NULL	Name of a privilege analysis policy
SEQUENCE	NUMBER	NOT NULL	The sequence number of the privilege analysis run during which the privilege was reported
OS_USER	VARCHAR2 (128)		Operating system login username
USERHOST	VARCHAR2 (128)		Client host machine name
MODULE	VARCHAR2 (64)		Module name
USERNAME	VARCHAR2 (128)	NOT NULL	Name of the user whose privilege was reported
USED_ROLE	VARCHAR2 (128)		Used role
USER_PRIV	VARCHAR2 (25)		Used user privilege
ONUSER	VARCHAR2 (128)		The user whose user privileges the grantee can exercise
GRANT_OPTION	NUMBER		Indicates whether the privilege is granted with the GRANT option: <ul style="list-style-type: none"> • 0 - Indicates that the privilege is granted without the GRANT option • 1 - Indicates that the privilege is granted with the GRANT option
PATH	GRANT_PATH		User privilege grant paths
RUN_NAME	VARCHAR2 (128)		The name of the run during which the privilege was reported

See Also:

- *Oracle Database Security Guide* for more information about privilege analysis
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT` procedure

6.97 DBA_USERS

`DBA_USERS` describes all users of the database.

Related View

`USER_USERS` describes the current user. This view does not display the `PASSWORD`, `PROFILE`, `PASSWORD_VERSIONS`, `EDITIONS_ENABLED`, `AUTHENTICATION_TYPE`, and `LAST_LOGIN` columns.

Column	Datatype	NULL	Description
USERNAME	VARCHAR2 (128)	NOT NULL	Name of the user
USER_ID	NUMBER	NOT NULL	ID number of the user
PASSWORD	VARCHAR2 (4000)		This column is deprecated in favor of the <code>AUTHENTICATION_TYPE</code> column

Column	Datatype	NULL	Description
ACCOUNT_STATUS	VARCHAR2 (32)	NOT NULL	<p>Account status:</p> <ul style="list-style-type: none"> • OPEN The account is open. • EXPIRED The password for the account is expired, either because the <code>PASSWORD_LIFE_TIME</code> limit was reached or because the password was expired by the <code>ALTER USER ... PASSWORD EXPIRE</code> command. The user can log in with the expired password, then change the password. • EXPIRED (GRACE) The password for the account is expired because the <code>PASSWORD_LIFE_TIME</code> limit was reached, but the password change grace period (<code>PASSWORD_GRACE_TIME</code>) has not yet elapsed. The user can log in with the expired password, but will receive an <code>ORA-28002</code> warning as a reminder that the password must soon be changed. If the <code>PASSWORD_GRACE_TIME</code> elapses, the user can log in with the expired password, then change the password. • LOCKED The account is locked, either by the <code>ALTER USER ... ACCOUNT LOCK</code> command, or because the number of consecutive failed login attempts exceeded the <code>FAILED_LOGIN_ATTEMPTS</code> limit and the value of <code>PASSWORD_LOCK_TIME</code> is <code>UNLIMITED</code>. The account can be unlocked by the <code>ALTER USER ... ACCOUNT UNLOCK</code> command. • LOCKED (TIMED) The account is locked because the number of consecutive failed login attempts exceeded the <code>FAILED_LOGIN_ATTEMPTS</code> limit and the <code>PASSWORD_LOCK_TIME</code> has not yet elapsed. The account can be unlocked either by the <code>ALTER USER ... ACCOUNT UNLOCK</code> command or by waiting until the <code>PASSWORD_LOCK_TIME</code> has elapsed. • EXPIRED & LOCKED The password for the account is expired, as described for the <code>EXPIRED</code> account status, and the account is locked as described for the <code>LOCKED</code> account status. The account can first be unlocked as described for the <code>LOCKED</code> account status, then the password can be changed as described for the <code>EXPIRED</code> account status. • EXPIRED (GRACE) & LOCKED The password for the account is expired, as described for the <code>EXPIRED (GRACE)</code> account status, and the account is locked as described for the <code>LOCKED</code> account status. The account can first be unlocked as described for the <code>LOCKED</code> account status, then the password can be changed as described for the <code>EXPIRED (GRACE)</code> account status. • EXPIRED & LOCKED (TIMED) The password for the account is expired, as described for the <code>EXPIRED</code> account status, and the

Column	Datatype	NULL	Description
			account is locked as described for the LOCKED(TIMED) account status. The account can first be unlocked as described for the LOCKED(TIMED) account status, then the password can be changed as described for the EXPIRED account status.
			<ul style="list-style-type: none"> • EXPIRED(GRACE) & LOCKED(TIMED)
			The password for the account is expired, as described for the EXPIRED(GRACE) account status, and the account is locked as described for the LOCKED(TIMED) account status. The account can first be unlocked as described for the LOCKED(TIMED) account status, then the password can be changed as described for the EXPIRED(GRACE) account status.
			<ul style="list-style-type: none"> • OPEN & IN ROLLOVER
			The account is in the password rollover period. The user can log in with either the earlier password or the new password. However, at the time the user logs in, the server recalculates whether the account is still in its password rollover period. If the password rollover period has elapsed, then the login will succeed only if the new password was specified, and the account status will change to OPEN.
			<ul style="list-style-type: none"> • EXPIRED & IN ROLLOVER
			The account is in the password rollover period and the password is expired as described for the EXPIRED account status. The user can log in with either the earlier password or the new password. However, at the time the user logs in, the server recalculates whether the account is still in its password rollover period. If the password rollover period has elapsed, then the login will succeed only if the new password was specified, and the account status will change to EXPIRED. After logging in, the user will be prompted to change the password.
			<ul style="list-style-type: none"> • LOCKED & IN ROLLOVER
			The account is in the password rollover period and is also locked as described for the LOCKED account status. The account can be unlocked as described for the LOCKED account status, after which the user can log in as described for the OPEN & IN ROLLOVER account status.
			<ul style="list-style-type: none"> • EXPIRED & LOCKED & IN ROLLOVER
			The account is in the password rollover period, its password is expired as described for the EXPIRED account status, and the account is locked as described for the LOCKED account status. The account can be unlocked as described for the LOCKED account status, after which the user can log in as described for the EXPIRED & IN ROLLOVER account status.
			<ul style="list-style-type: none"> • LOCKED(TIMED) & IN ROLLOVER
			The account is in the password rollover period and is also locked as described for the

Column	Datatype	NULL	Description
			<p>LOCKED (TIMED) account status. The account can be unlocked as described for the LOCKED (TIMED) account status, after which the user can log in with either the earlier password or the new password. However, at the time the user logs in, the server recalculates whether the account is still in its password rollover period. If the password rollover period has elapsed, then the login will succeed only if the new password was specified.</p> <ul style="list-style-type: none"> EXPIRED & LOCKED (TIMED) & IN ROL <p>The account is in the password rollover period, its password is expired as described for the EXPIRED account status, and the account is locked as described for the LOCKED (TIMED) account status. The account can be unlocked as described for the LOCKED (TIMED) account status, after which the user can log in as described for the EXPIRED & IN ROLLOVER account status.</p>
LOCK_DATE	DATE		Date the account was locked if account status was LOCKED
EXPIRY_DATE	DATE		Date of expiration of the account
DEFAULT_TABLESPACE	VARCHAR2(30)	NOT NULL	Default tablespace for data
TEMPORARY_TABLESPACE	VARCHAR2(30)	NOT NULL	Name of the default tablespace for temporary tables or the name of a tablespace group
LOCAL_TEMP_TABLESPACE	VARCHAR2(30)		Default local temporary tablespace for the user
CREATED	DATE	NOT NULL	User creation date
PROFILE	VARCHAR2(128)	NOT NULL	User resource profile name
INITIAL_RSRC_CONSUMER_GRP	VARCHAR2(128)		Initial resource consumer group for the user
EXTERNAL_NAME	VARCHAR2(4000)		<p>User external name. For centrally managed users, if the database user mapping is an exclusive mapping, then this will be the directory service DN for the user. If this database user is a shared schema, it will be the DN of a group.</p>
PASSWORD VERSIONS	VARCHAR2(12)		<p>Shows the list of versions of the password hashes (also known as "verifiers") existing for the account. The values for this column can include:</p> <ul style="list-style-type: none"> 10G: If an old case-insensitive ORCL hash exists 11G: If a SHA-1 hash exists 12C: If a de-optimized PBKDF2-based hash exists HTTP: If an MD5 hash (for HTTP Digest authentication) exists <p>For more information about the 12C verifier, see <i>Oracle Database Concepts</i>.</p> <p>Note that any combination of these verifiers can exist for any given account.</p>
EDITIONS_ENABLED	VARCHAR2(1)		Indicates whether editions have been enabled for the corresponding user (Y) or not (N)

Column	Datatype	NULL	Description
AUTHENTICATION_TYPE	VARCHAR2 (8)		<p>Indicates the authentication mechanism for the user:</p> <ul style="list-style-type: none"> • NONE - The user has not been configured for an authentication method • EXTERNAL - CREATE USER <i>user1</i> IDENTIFIED EXTERNALLY; • GLOBAL - CREATE USER <i>user2</i> IDENTIFIED GLOBALLY; • PASSWORD - CREATE USER <i>user3</i> IDENTIFIED BY <i>password</i>;
PROXY_ONLY_CONNECT	VARCHAR2 (1)		<p>Indicates whether a user can connect directly (N) or whether the account can only be proxied (Y) by users who have proxy privileges for this account (that is, by users who have been granted the "connect through" privilege for this account).</p> <p>For more information about creating proxy user accounts and authorizing users to connect through them, see <i>Oracle Database Security Guide</i>.</p>
COMMON	VARCHAR2 (3)		<p>Indicates whether a given user is common. Possible values</p> <ul style="list-style-type: none"> • YES if a user is common • NO if a user is local (not common)
LAST_LOGIN	TIMESTAMP (9) WITH TIME ZONE		<p>The time of the last user login</p> <p>This column is not populated when a user connects to the database with administrative privileges, that is, AS { SYSASM SYSBACKUP SYSDBA SYSDG SYSOPER SYSRAC SYSKM }.</p>
ORACLE_MAINTAINED	VARCHAR2 (1)		<p>Denotes whether the user was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). A user for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script.</p>
INHERITED	VARCHAR2 (3)		<p>Indicates whether the user definition was inherited from another container (YES) or not (NO)</p>
DEFAULT_COLLATION	VARCHAR2 (100)		<p>Default collation for the user's schema</p>
IMPLICIT	VARCHAR2 (3)		<p>Indicates whether this user is a common user created by an implicit application (YES) or not (NO)</p>
ALL_SHARD	VARCHAR2 (3)		<p>In a sharded database, the value in this column indicates whether the user was created with shard DDL enabled. The possible values are:</p> <ul style="list-style-type: none"> • YES: The user was created with shard DDL enabled. The user exists on all shards and the shard catalog. • NO: The user was created without shard DDL enabled. The user exists only in the database in which the user was created. <p>In a non-sharded database, the value in this column is always NO.</p>
PASSWORD_CHANGE_DATE ¹	DATE		<p>Date on which the user's password was last set</p> <p>This column is populated only when the value of the AUTHENTICATION_TYPE column is PASSWORD. Otherwise, this column is null.</p>

¹ This column is available starting with Oracle Database 19c.

6.98 DBA_USERS_WITH_DEFPWD

`DBA_USERS_WITH_DEFPWD` displays all users in the database that are still using their default passwords.

Column	Datatype	NULL	Description
USERNAME	VARCHAR2 (128)	NOT NULL	Name of the user
PRODUCT	VARCHAR2 (4000)		Name of the product the user belongs to

Note:

In a CDB, when `DBA_USERS_WITH_DEFPWD` is queried from a PDB, information about local users who are using their default passwords is displayed. To display information about common users, query `DBA_USERS_WITH_DEFPWD` from the root.

See Also:

Oracle Multitenant Administrator's Guide for an introduction to local and common users in a CDB

6.99 DBA_USTATS

`DBA_USTATS` describes the user-defined statistics collected on all tables and indexes in the database. Its columns are the same as those in `ALL_USTATS`.

See Also:

["ALL_USTATS"](#)

6.100 DBA_VARRAYS

DBA_VARRAYS describes all varrays in the database. Its columns are the same as those in ALL_VARRAYS.

 **See Also:**

["ALL_VARRAYS"](#)

6.101 DBA_VIEWS

DBA_VIEWS describes all views in the database. Its columns are the same as those in ALL_VIEWS.

 **See Also:**

["ALL_VIEWS"](#)

6.102 DBA_VIEWS_AE

DBA_VIEWS_AE describes all views (across all editions) in the database. Its columns are the same as those in ALL_VIEWS_AE.

 **See Also:**

["ALL_VIEWS_AE"](#)

6.103 DBA_WAITERS

DBA_WAITERS shows all the sessions that are waiting for a lock. In an Oracle RAC environment, this only applies if the waiter is on the same instance.

Column	Datatype	NULL	Description
WAITING_SESSION	NUMBER		The waiting session
WAITING_CON_ID	NUMBER		The container ID (CON_ID) of the waiting session
HOLDING_SESSION	NUMBER		The holding session
HOLDING_CON_ID	NUMBER		The container ID (CON_ID) of the holding session.
LOCK_TYPE	VARCHAR2(26)		The lock type
MODE_HELD	VARCHAR2(40)		The mode held
MODE_REQUESTED	VARCHAR2(40)		The mode requested

Column	Datatype	NULL	Description
LOCK_ID1	NUMBER		Lock ID 1
LOCK_ID2	NUMBER		Lock ID 2

6.104 DBA_WALLET_ACES

DBA_WALLET_ACES describes access control entries defined in wallet access control lists.

Related View

USER_WALLET_ACES describes the status of access control entries for the current user to access wallets through PL/SQL network utility packages. This view does not display the ACE_ORDER, START_DATE, END_DATE, GRANT_TYPE, INVERTED_PRINCIPAL, PRINCIPAL, or PRINCIPAL_TYPE columns.

Column	Datatype	NULL	Description
WALLET_PATH	VARCHAR2(1000)	NOT NULL	Wallet path
ACE_ORDER	NUMBER	NOT NULL	Order number of the access control entry
START_DATE	TIMESTAMP(6)		Start date of the access control entry
END_DATE	TIMESTAMP(6)		End date of the access control entry
GRANT_TYPE	VARCHAR2(5)		Indicates whether the access control entry grants or denies the privilege
INVERTED_PRINCIPAL	VARCHAR2(3)		Indicates whether the principal is inverted or not
PRINCIPAL	VARCHAR2(128)		Principal the privilege is applied to
PRINCIPAL_TYPE	VARCHAR2(16)		Type of the principal
PRIVILEGE	VARCHAR2(128)		Privilege

See Also:

"USER_WALLET_ACES"

6.105 DBA_WALLET_ACLS

DBA_WALLET_ACLS displays the access control lists assigned to restrict access to wallets through PL/SQL network utility packages.

Column	Datatype	NULL	Description
WALLET_PATH	VARCHAR2(1000)	NOT NULL	Wallet path
ACL	VARCHAR2(4000)		Path of the access control list
ACOLID	RAW(8)		Object ID of the access control list
ACL_OWNER	VARCHAR2(128)		Owner of the access control list

6.106 DBA_WARNING_SETTINGS

DBA_WARNING_SETTINGS displays information about the warning parameter settings for all objects in the database. Its columns are the same as those in ALL_WARNING_SETTINGS.

 **See Also:**

["ALL_WARNING_SETTINGS"](#)

6.107 DBA_WI_CAPTURE_FILES

Each row in DBA_WI_CAPTURE_FILES represents a capture file that belongs to the workload analyzed in the current Workload Intelligence job.

Column	Datatype	NULL	Description
JOB_ID	NUMBER	NOT NULL	The identifier of the job in the workload to which the given capture file belongs
FILE_ID	NUMBER	NOT NULL	The identifier of the current capture file
FILE_PATH	VARCHAR2 (4000)	NOT NULL	The path of the current capture file

6.108 DBA_WI_JOBS

Each row in DBA_WI_JOBS describes a Workload Intelligence job, that is, a task that applies the algorithms of Workload Intelligence on a given capture directory.

Column	Datatype	NULL	Description
JOB_ID	NUMBER	NOT NULL	The job identifier
JOB_NAME	VARCHAR2 (128)	NOT NULL	A name that uniquely identifies the given job
CAPTURE_DIRECTORY	VARCHAR2 (4000)	NOT NULL	Path to the capture directory on which the given job has been applied
MODEL_ORDER	NUMBER		The order of the markov model that describes the workload associated with the current job. If NULL, the corresponding order has not been calculated yet.
THRESHOLD	NUMBER		A number in the range [0, 1] that represents the threshold that the user has given as an input parameter to the current job of Workload Intelligence for the identification of significant patterns. If NULL, the process of pattern identification has not been initiated yet.

6.109 DBA_WI_OBJECTS

Each row in DBA_WI_OBJECTS represents a database object (table) that is accessed by the given template in the given Workload Intelligence job.

Column	Datatype	NULL	Description
JOB_ID	NUMBER	NOT NULL	The identifier of the job in the workload of which the given object has been accessed
TEMPLATE_ID	NUMBER	NOT NULL	The identifier of the template in the given job by which the current object has been accessed
OBJECT_ID	NUMBER	NOT NULL	The identifier of the current object
ACCESS_TYPE	VARCHAR2(2)	NOT NULL	Possible values: <ul style="list-style-type: none"> • R - Indicates that the current object has been accessed for reading by the given template • W - Indicates that the current object has been accessed for writing by the given template • RW - Indicates that the current object has been accessed for both reading and writing by the given template

6.110 DBA_WI_PATTERN_ITEMS

Each row in DBA_WI_PATTERN_ITEMS represents a template that participates in a significant pattern that has been found by the given Workload Intelligence job.

Column	Datatype	NULL	Description
JOB_ID	NUMBER	NOT NULL	The identifier of the job in the workload of which the current pattern has been found
PATTERN_ID	NUMBER	NOT NULL	The identifier of the pattern to which the current item (template) belongs
SEQUENCE_NUMBER	NUMBER	NOT NULL	Number that indicates the position of the current item in the given pattern
TEMPLATE_ID	NUMBER	NOT NULL	The identifier of the template that participates in the given position of the current pattern
IS_FIRST_IN_LOOP	CHAR(1)	NOT NULL	A flag that indicates whether or not the current item marks the beginning of a loop in the given pattern. The possible values are Y and N.
IS_LAST_IN_LOOP	CHAR(1)	NOT NULL	A flag that indicates whether or not the current item marks the end of a loop in the given pattern. The possible values are Y and N.

6.111 DBA_WI_PATTERNS

Each row in DBA_WI_PATTERNS represents a pattern that has been identified by Workload Intelligence as significant in the workload associated with the given job. Such a pattern consists of one or more templates.

These templates that comprise the given pattern are described in the related view DBA_WI_PATTERN_ITEMS.

Column	Datatype	NULL	Description
JOB_ID	NUMBER	NOT NULL	The identifier of the job in the workload of which the current pattern has been found

Column	Datatype	NULL	Description
PATTERN_ID	NUMBER	NOT NULL	The identifier of the current pattern
LENGTH	NUMBER	NOT NULL	The length of the pattern, that is, the number of items (templates) it consists of
NUMBER_OF_EXECUTIONS	NUMBER	NOT NULL	The number of times the current pattern has been executed in the given workload
DB_TIME	NUMBER	NOT NULL	The total time consumed in the database server by all the executions of the current pattern in the given workload

 **See Also:**

["DBA_WI_PATTERN_ITEMS"](#)

6.112 DBA_WI_STATEMENTS

Each row in `DBA_WI_STATEMENTS` describes a statement (SQL or PL/SQL) that is part of the template with identifier `TEMPLATE_ID`, which has been found in the workload that is related to the Workload Intelligence job whose identifier is equal to `JOB_ID`.

A template may consist of multiple statements, for example, if it represents a transaction. In this case, there is one row in this view for every one of these statements. These statements are ordered, based on the order defined by the corresponding transaction. Column `SEQUENCE_NUMBER` is used to describe this order.

Column	Datatype	NULL	Description
<code>JOB_ID</code>	NUMBER	NOT NULL	The identifier of the job in the workload of which the given statement has been found
<code>TEMPLATE_ID</code>	NUMBER	NOT NULL	The identifier of the template in the given job to which the current statement belongs
<code>SEQUENCE_NUMBER</code>	NUMBER	NOT NULL	A number that indicates the order of the current statement in the given template
<code>SQL_TEXT</code>	CLOB	NOT NULL	The SQL text associated with the current statement. Note that although multiple SQL statements can be classified to the same template, only one row is stored that represents them all. This row corresponds to the first instance of the given template that is found during parsing of the workload.

6.113 DBA_WI_TEMPLATE_EXECUTIONS

Each row in `DBA_WI_TEMPLATE_EXECUTIONS` represents an execution of a template in a capture that belongs to the workload that is associated with the current Workload Intelligence job.

Column	Datatype	NULL	Description
<code>JOB_ID</code>	NUMBER	NOT NULL	The identifier of the job in the workload of which the current execution of the given template belongs

Column	Datatype	NULL	Description
CAPTURE_FILE_ID	NUMBER	NOT NULL	The identifier of the capture file in which the current execution of the given template was found
SEQUENCE_NUMBER	NUMBER	NOT NULL	A number that indicates the order of the current execution in the given capture file
TEMPLATE_ID	NUMBER	NOT NULL	The identifier of the template that was executed in the execution represented by the current row
DB_TIME	NUMBER	NOT NULL	The time that the current execution consumed on the database server

6.114 DBA_WI_TEMPLATES

Each row in `DBA_WI_TEMPLATES` describes a template that has been found in the workload that is related to the Workload Intelligence job whose identifier is equal to `JOB_ID`.

A template can represent either a simple query, or an entire transaction. Two queries in the given workload belong to the same template, if they exhibit trivial differences, for example, if they contain different literal values, different bind variable names, different comments, or different white spaces.

Column	Datatype	NULL	Description
JOB_ID	NUMBER	NOT NULL	The identifier of the job in the workload of which the given template has been found
TEMPLATE_ID	NUMBER	NOT NULL	The identifier of a template in a given job
IS_TRANSACTION	CHAR(1)	NOT NULL	Flag that indicates whether the given template represents a transaction: <ul style="list-style-type: none"> • Y - indicates that the given template represents a transaction • N - indicates that the given template does not represent a transaction

6.115 DBA_WORKLOAD_ACTIVE_USER_MAP

`DBA_WORKLOAD_ACTIVE_USER_MAP` contains the mappings that are going to be valid for the next replay or are valid for the current replay.

Column	Datatype	NULL	Description
SCHEDULE_CAP_ID	NUMBER		The ID of a capture in the schedule
CAPTURE_USER	VARCHAR2(4000)	NOT NULL	The user name during the time of the workload capture
REPLAY_USER	VARCHAR2(4000)		The user name to which captured user should be remapped during replay

6.116 DBA_WORKLOAD_CAPTURE_SQLTEXT

`DBA_WORKLOAD_CAPTURE_SQLTEXT` displays all the SQL statements that have been recorded in a workload capture. For those SQL statements whose length exceeds 1000 characters, the full

statements can be loaded to the DBA_WORKLOAD_LONG_SQLTEXT view using the DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT procedure.

Column	Datatype	NULL	Description
CAPTURE_ID	NUMBER (38)	NOT NULL	Internal key for the workload capture
SQL_ID	VARCHAR2 (13)	NOT NULL	SQL identifier of the parent cursor in the library cache
SQL_TYPE	VARCHAR2 (64)		Type of the SQL statement, which can include values such as INSERT, SELECT, and CREATE INDEX
SQL_TEXT	VARCHAR2 (1000)		First thousand characters of the SQL text for the current cursor
SQL_LENGTH	NUMBER (38)		The length of the SQL statement
SQL_TEXT_COMPLETE	CHAR (1)		Indicates whether the SQL_TEXT column includes the full text of the SQL statement. Possible values: <ul style="list-style-type: none"> • Y: The column SQL_TEXT includes the full text of the SQL statement • N: The column SQL_TEXT contains only the first thousand characters of the SQL text

See Also:

- "[DBA_WORKLOAD_LONG_SQLTEXT](#)"
- "[DBA_RAT_CAPTURE_SCHEMA_INFO](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for information about the DBMS_WORKLOAD_REPLAY package

6.117 DBA_WORKLOAD_CAPTURES

DBA_WORKLOAD_CAPTURES displays all the workload captures that have been performed in the current database.

It also lists captures on which DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO() or DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO() have been called. Each row contains information about one workload capture.

Column	Datatype	NULL	Description
ID	NUMBER	NOT NULL	Internal key for the workload capture
NAME	VARCHAR2 (128)	NOT NULL	Name for the workload capture
DBID	NUMBER	NOT NULL	ID of the database in which the workload was captured
DBNAME	VARCHAR2 (10)	NOT NULL	Name of the database in which the workload was captured
DBVERSION	VARCHAR2 (17)	NOT NULL	Version of the database in which the workload was captured
PARALLEL	VARCHAR2 (3)		Indicates whether the database in which the workload was captured is an Oracle RAC database (YES) or a single instance database (NO)

Column	Datatype	NULL	Description
DIRECTORY	VARCHAR2(128)	NOT NULL	Name of the directory object for workload capture
STATUS	VARCHAR2(40)	NOT NULL	Current status of the workload capture: <ul style="list-style-type: none">• IN_PROGRESS - Workload capture is in progress• COMPLETED - Workload capture has completed successfully• FAILED - Workload capture was aborted due to errors encountered
START_TIME	DATE	NOT NULL	Datetime when the capture began
END_TIME	DATE		Datetime when the capture completed or failed; NULL if the capture is still in progress
DURATION_SECS	NUMBER		Duration of the workload capture (in seconds)
START_SCN	NUMBER	NOT NULL	Start SCN value for this capture
END_SCN	NUMBER		End SCN value for this capture; NULL if the capture is still in progress
DEFAULT_ACTION	VARCHAR2(30)	NOT NULL	Mode in which to apply workload capture filters: <ul style="list-style-type: none">• INCLUDE - All the capture filters are treated as EXCLUSION filters, determining the workload that will not be captured.• EXCLUDE - All the capture filters are treated as INCLUSION FILTERS, determining the workload that will be captured.
FILTERS_USED	NUMBER		Number of filters that were used for this capture
CAPTURE_SIZE	NUMBER		Total size of workload capture
DBTIME	NUMBER		Total amount of database time (in microseconds) that has been recorded in this workload capture
DBTIME_TOTAL	NUMBER		Total amount of database time (in microseconds) across the entire database during the workload capture, including the part of the workload that was not captured.
USER_CALLS	NUMBER		Total number of user calls that have been recorded in this workload capture
USER_CALLS_TOTAL	NUMBER		Total number of user calls across the entire database during the workload capture, including the part of the workload that was not captured.
USER_CALLS_UNREPLAYABLE	NUMBER		Total number of user calls that will not be replayed in a subsequent replay of this workload capture
PLSQL_SUBCALL_SIZE	NUMBER		Total size of workload capture for SQL executed from PL/SQL
PLSQL_CALLS	NUMBER		Total number of PL/SQL calls recorded in the workload capture
PLSQL_SUBCALLS	NUMBER		Total number of calls recorded in the workload capture for SQL executed from PL/SQL
PLSQL_DBTIME	NUMBER		Total amount of database time (in microseconds) from PL/SQL calls that have been recorded in the workload capture
TRANSACTIONS	NUMBER		Total number of transactions that have been recorded in this workload capture

Column	Datatype	NULL	Description
TRANSACTIONS_TOTAL	NUMBER		Total number of transactions across the entire database during the workload capture, including the part of the workload that was not captured.
CONNECTS	NUMBER		Total number of session connects that have been recorded in this workload capture
CONNECTS_TOTAL	NUMBER		Total number of session connects across the entire database during the workload capture, including the part of the workload that was not captured
ERRORS	NUMBER		Total number of errors that have been recorded in this workload capture
AWR_DBID	NUMBER		Database ID of the AWR snapshots that correspond to this workload capture. For captures that were performed in the current database, this value is equal to the current database's DBID. For captures that were performed in other databases, this value will either be NULL or will be populated by <code>DBMS_WORKLOAD_CAPTURE.IMPORT_AWR()</code> .
AWR_BEGIN_SNAP	NUMBER		Begin snapshot ID of the AWR snapshots that correspond to this workload capture
AWR_END_SNAP	NUMBER		End snapshot ID of the AWR snapshots that correspond to this workload capture
AWR_EXPORTED	VARCHAR2(12)		Indicates whether the AWR snapshots that correspond to this workload capture have been exported using <code>DBMS_WORKLOAD_CAPTURE.EXPORT_AWR()</code> (YES) or not (NO), or whether AWR snapshots cannot be exported because the capture is still in progress, has run to completion successfully, or was done in a different database from which it was not exported (NOT POSSIBLE)
ERROR_CODE	NUMBER		Error code for this workload capture
ERROR_MESSAGE	VARCHAR2(512)		Error message for this workload capture
DIR_PATH	VARCHAR2(4000)	NOT NULL	Full directory path for the workload capture directory object
DIR_PATH_SHARED	VARCHAR2(10)	NOT NULL	Indicates whether the workload capture directory is shared by all the instances of the recording database (applicable only for Oracle RAC databases)
LAST_PROCESSED_VERSION	VARCHAR2(128)		Database version in which this capture was preprocessed using <code>DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE()</code> last; NULL if the capture has never been preprocessed
SQLSET_OWNER	VARCHAR2(128)		User name of the SQL tuning set owner
SQLSET_NAME	VARCHAR2(128)		Name of the SQL tuning set for this workload capture
PLSQL_MODE	VARCHAR2(12)		Capture options for PL/SQL calls. Possible values: <ul style="list-style-type: none"> • TOP_LEVEL: Top-level PL/SQL only • EXTENDED: Both top-level PL/SQL and SQL executed from PL/SQL

Column	Datatype	NULL	Description
ENCRYPTION	VARCHAR2 (128)		Indicates the encryption standard used for the given capture: <ul style="list-style-type: none">• NULL - Capture files are not encrypted• AES128 – Capture files are encrypted using AES128• AES192 – Capture files are encrypted using AES192• AES256 – Capture files are encrypted using AES256
ENCRYPTION_VERIFIER ¹	RAW (512)		Data used internally for creating an encrypted capture

¹ This column is available starting with Oracle Database 19c, Release Update 19.7.

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_WORKLOAD_REPLAY package

6.118 DBA_WORKLOAD_CONNECTION_MAP

DBA_WORKLOAD_CONNECTION_MAP displays the connection mapping information for workload replay. Each row defines one connection mapping for a particular workload replay.

Column	Datatype	NULL	Description
REPLAY_ID	NUMBER	NOT NULL	ID of the replay (corresponds to DBA_WORKLOAD_REPLAYS.ID)
CONN_ID	NUMBER	NOT NULL	Key (ID) of the connection mapping table
SCHEDULE_CAP_ID	NUMBER		Schedule capture ID (corresponds to DBA_WORKLOAD_SCHEDULE_CAPTURES.SCHEDULE_CAP_ID)
CAPTURE_CONN	VARCHAR2 (4000)	NOT NULL	Connection string that was used during capture
REPLAY_CONN	VARCHAR2 (4000)		Connection string that should be used during replay

6.119 DBA_WORKLOAD_DIV_SUMMARY

DBA_WORKLOAD_DIV_SUMMARY displays a summary of the replay divergence information in the DBA_WORKLOAD_REPLAY_DIVERGENCE view. DBA_WORKLOAD_REPLAY_DIVERGENCE may have duplicate entries, while DBA_WORKLOAD_DIV_SUMMARY keeps only one entry and tracks the number of occurrences of each duplicate entry.

Starting with Oracle Database 12.2.0.1, the replay report is generated from DBA_WORKLOAD_DIV_SUMMARY instead of from DBA_WORKLOAD_REPLAY_DIVERGENCE, which results in faster generation of the replay report.

Column	Datatype	NULL	Description
REPLAY_ID	NUMBER	NOT NULL	ID (key) for the workload replay
DIVERGENCE_TYPE	NUMBER	NOT NULL	Reserved for future use
IS_QUERY_DATA_DIVERGENCE	VARCHAR2(1)		Indicates whether the data divergence is from the number of rows fetched by SELECT queries (Y) or not (N)
IS_DML_DATA_DIVERGENCE	VARCHAR2(1)		Indicates whether the divergence is from the number of rows affected by INSERT, UPDATE, or DELETE SQL statements (Y) or not (N)
IS_ERROR_DIVERGENCE	VARCHAR2(1)		Indicates whether the divergence is from errors seen during capture or replay (Y) or not (N)
IS_THREAD_FAILURE	VARCHAR2(1)		Indicates whether the divergence is from sessions that failed during replay (Y) or not (N)
IS_DATA_MASKED	VARCHAR2(1)		Indicates whether the SQL call contains masked bind data (Y) or not (N).
			If data masking technology is used at the replay database, the workload capture files need to be masked. Otherwise, SQL statements generated from capture files that contain sensitive bind data will not match the database. When the replay client sends masked bind data to the server, it turns on the IS_DATA_MASKED flag for the current SQL call.
STREAM_ID	NUMBER	NOT NULL	Stream ID of the session that reported the divergence
SQL_ID	VARCHAR2(13)		SQL ID of the SQL that reported the divergence
EXPECTED_ERROR#	NUMBER		Error number that was seen during capture (0 if the capture ran successfully)
EXPECTED_ERROR_MESSAGE	VARCHAR2(4000)		Text of the error message whose number appears in the EXPECTED_ERROR# column
OBSERVED_ERROR#	NUMBER		Actual error number seen during replay (0 if the replay ran successfully, 15566 (corresponding to ORA-15566) if the captured call could not be replayed)
OBSERVED_ERROR_MESSAGE	VARCHAR2(4000)		Text of the error message whose number appears in the OBSERVED_ERROR# column
SERVICE	VARCHAR2(64)		Service name of the session that reported the divergence
MODULE	VARCHAR2(64)		Module name of the session that reported the divergence
OCCURRENCES	NUMBER		Number of times the divergence occurred during replay

Example

The following query prints the top 3 SQL statements that got error divergence during replay. This query shows the captured error number and the actual error number seen during replay.

```
SQL> SELECT * FROM
  (SELECT occurrences, sql_id, expected_error#, observed_error#
   FROM dba_workload_div_summary
  WHERE replay_id = 123
    AND is_error_divergence = 'Y'
 ORDER BY occurrences DESC)
 WHERE ROWNUM <= 3;
```

```
OCCURRENCES SQL_ID EXPECTED_ERROR# OBSERVED_ERROR#
----- ----- -----
8 0xrm2wjdqv17m 0 1
4 8bzwdnnznspj 1422 0
3 6d8rwrac8dsk7 1 1400
```

6.120 DBA_WORKLOAD_FILTERS

`DBA_WORKLOAD_FILTERS` displays all the workload filters that have been defined in the current database.

In Oracle Database 11g, only workload filters of type `CAPTURE` are supported. Starting with Oracle Database 11gR2, filters of type `REPLAY` are supported.

Column	Datatype	NULL	Description
TYPE	VARCHAR2(30)		Type of the workload filter (<code>CAPTURE</code> or <code>REPLAY</code>)
ID	VARCHAR2(40)		Sequence number of the workload filter
STATUS	VARCHAR2(6)		Status of the workload filter: <ul style="list-style-type: none"> • NEW - This filter will be used by the next subsequent operation such as the next workload capture. • IN USE - This filter is currently being used by an operation that is in progress such as an active workload capture. • USED - This filter was used in the past by some operation such as a past workload capture.
SET_NAME	VARCHAR2(1000)		Name of the filter set to which the filter belongs
NAME	VARCHAR2(128)		Name of the workload filter
ATTRIBUTE	VARCHAR2(128)		Name of the attribute on which the filter is defined
VALUE	VARCHAR2(4000)		Value of the attribute on which the filter is defined. Wildcards such as % and _ are supported if the attribute is of string type.

6.121 DBA_WORKLOAD_GROUP_ASSIGNMENTS

`DBA_WORKLOAD_GROUP_ASSIGNMENTS` displays all the workload capture groups and their assigned instances. A workload capture group is a subset of the captured workload. Each group accesses its own set of recorded database objects.

Column	Datatype	NULL	Description
REPLAY_DIR_NUMBER	NUMBER (38)	NOT NULL	The value that is associated with the subdirectory under the replay directory. See REPLAY_DIR_NUMBER in DBA_WORKLOAD_REPLAYS.
GROUP_ID	NUMBER (38)	NOT NULL	The identifier of a workload capture group
INSTANCE_NUMBER	NUMBER (38)	NOT NULL	The instance a given group is assigned to

 **See Also:**["DBA_WORKLOAD_REPLAYS"](#)

6.122 DBA_WORKLOAD_LONG_SQLTEXT

DBA_WORKLOAD_LONG_SQLTEXT displays the captured SQL statements that are longer than 1000 characters. You can load SQL statements longer than 1000 characters to the DBA_WORKLOAD_LONG_SQLTEXT view using the DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT procedure.

Column	Datatype	NULL	Description
CAPTURE_ID	NUMBER (38)	NOT NULL	Internal key for the workload capture
SQL_ID	VARCHAR2 (13)	NOT NULL	SQL identifier of the parent cursor in the library cache
SQL_FULLTEXT	CLOB		Full text for the SQL statement exposed as a CLOB column

 **See Also:**

- ["DBA_WORKLOAD_CAPTURE_SQLTEXT"](#)
- Oracle Database PL/SQL Packages and Types Reference* for information about the DBMS_WORKLOAD_REPLAY package

6.123 DBA_WORKLOAD_REPLY_CLIENTS

DBA_WORKLOAD_REPLY_CLIENTS displays all workload replay clients and their assigned instances.

Column	Datatype	NULL	Description
WRC_ID	NUMBER (38)	NOT NULL	The identifier of a workload replay client
SCHEDULE_CAP_ID	NUMBER (38)	NOT NULL	A unique identifier for a workload capture added to a replay schedule. 0 for a non-consolidated replay
INSTANCE_NUMBER	NUMBER (38)	NOT NULL	The instance that the replay client connects to

6.124 DBA_WORKLOAD_REPLAY_DIVERGENCE

`DBA_WORKLOAD_REPLAY_DIVERGENCE` displays information about data/error divergence for a user call that has been replayed.

`DBA_WORKLOAD_DIV_SUMMARY` displays a summary of the replay divergence information in the `DBA_WORKLOAD_REPLAY_DIVERGENCE` view. `DBA_WORKLOAD_REPLAY_DIVERGENCE` may have duplicate entries, while `DBA_WORKLOAD_DIV_SUMMARY` keeps only one entry and tracks the number of occurrences of each duplicate entry.

Column	Datatype	NULL	Description
REPLAY_ID	NUMBER	NOT NULL	ID (key) for the workload replay
TIMESTAMP	TIMESTAMP(6) WITH TIME ZONE		Time that the divergence occurred
DIVERGENCE_TYPE	NUMBER	NOT NULL	Reserved for future use
IS_QUERY_DATA_DIVERGENCE	VARCHAR2(1)		Indicates whether the data divergence is from the number of rows fetched by <code>SELECT</code> queries (Y) or not (N)
IS_DML_DATA_DIVERGENCE	VARCHAR2(1)		Indicates whether the divergence is from the number of rows affected by <code>INSERT</code> , <code>UPDATE</code> , or <code>DELETE</code> SQL statements (Y) or not (N)
IS_ERROR_DIVERGENCE	VARCHAR2(1)		Indicates whether the divergence is from errors seen during capture or replay (Y) or not (N)
IS_THREAD_FAILURE	VARCHAR2(1)		Indicates whether the divergence is from sessions that failed during replay (Y) or not (N)
IS_DATA_MASKED	VARCHAR2(1)		Indicates whether the SQL call contains masked bind data (Y) or not (N).
EXPECTED_ROW_COUNT	NUMBER		If data masking technology is used at the replay database, the workload capture files need to be masked. Otherwise, SQL statements generated from capture files that contain sensitive bind data will not match the database. When the replay client sends masked bind data to the server, it turns on the <code>IS_DATA_MASKED</code> flag for the current SQL call.
OBSERVED_ROW_COUNT	NUMBER		Number of rows fetched for <code>SELECT</code> queries or rows affected for <code>INSERT</code> , <code>UPDATE</code> , or <code>DELETE</code> SQL statements during capture
EXPECTED_ERROR#	NUMBER		Actual number of rows fetched for <code>SELECT</code> queries or rows affected for <code>INSERT</code> , <code>UPDATE</code> , or <code>DELETE</code> SQL statements during replay
EXPECTED_ERROR_MESSAGE	VARCHAR2(4000)		Error number that was seen during capture (0 if the capture ran successfully)
OBSERVED_ERROR#	NUMBER		Text of the error message whose number appears in the <code>EXPECTED_ERROR#</code> column
OBSERVED_ERROR_MESSAGE	VARCHAR2(4000)		Actual error number seen during replay (0 if the replay ran successfully, 15566 (corresponding to ORA-15566) if the captured call could not be replayed)
STREAM_ID	NUMBER	NOT NULL	Text of the error message whose number appears in the <code>OBSERVED_ERROR#</code> column
			Stream ID of the session that reported the divergence

Column	Datatype	NULL	Description
CALL_COUNTER	NUMBER	NOT NULL	Call counter of the user call that reported the divergence
CAPTURE_STREAM_ID	NUMBER		Internal ID of the capture file whose replay produced the divergence
SQL_ID	VARCHAR2(13)		SQL ID of the SQL that reported the divergence
SESSION_ID	NUMBER	NOT NULL	Session ID of the session that reported the divergence
SESSION_SERIAL#	NUMBER	NOT NULL	Captured session serial number of the session that reported the divergence
SERVICE	VARCHAR2(64)		Service name of the session that reported the divergence
MODULE	VARCHAR2(64)		Module name of the session that reported the divergence
ACTION	VARCHAR2(64)		Action name of the session that reported the divergence

 See Also:["DBA_WORKLOAD_DIV_SUMMARY"](#)

6.125 DBA_WORKLOAD_REPLAY_SCHEDULES

DBA_WORKLOAD_REPLAY_SCHEDULES displays the names of replay schedules for the current replay directory.

A replay schedule defines one or multiple workload captures, and the order to start their replays. The current replay directory is set by

`DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY('replay_dir')`. Each row in the view contains information about one replay schedule.

Column	Datatype	NULL	Description
SCHEDULE_NAME	VARCHAR2(128)	NOT NULL	The name of a schedule to be replayed. It defines one or multiple workload captures, and the order to start their replays.
DIRECTORY	VARCHAR2(128)	NOT NULL	Directory object name for the replay schedule name
STATUS	VARCHAR2(128)		NEW if the schedule is being created, CURRENT if the schedule is currently being used by a replay, otherwise NULL

 See Also:

- "[DBA_WORKLOAD_SCHEDULE_CAPTURES](#)" displays the workload captures in a replay schedule.
- "[DBA_WORKLOAD_SCHEDULE_ORDERING](#)" displays the order to start captures in a replay schedule.
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_WORKLOAD_REPLAY` package

6.126 DBA_WORKLOAD_REPLAYS

`DBA_WORKLOAD_REPLAYS` displays all the workload replays that have been performed in the current database.

It also lists replays on which `DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO()` has been called. Each row contains information about one workload replay.

Column	Datatype	NULL	Description
ID	NUMBER	NOT NULL	Internal key for the workload replay
NAME	VARCHAR2(128)	NOT NULL	Name of the workload replay
DBID	NUMBER	NOT NULL	ID of the database in which the workload was replayed
DBNAME	VARCHAR2(10)	NOT NULL	Name of the database in which the workload was replayed
DBVERSION	VARCHAR2(17)	NOT NULL	Version of the database in which the workload was replayed
PARALLEL	VARCHAR2(3)		Indicates whether the database in which the workload was replayed was an Oracle RAC database (<code>YES</code>) or a single instance database (<code>NO</code>)
DIRECTORY	VARCHAR2(128)	NOT NULL	Name of the directory object for the workload replay
CAPTURE_ID	NUMBER		ID of the capture (<code>DBA_WORKLOAD_CAPTURES.ID</code>) that was replayed. If the replay involves a replay schedule, the <code>CAPTURE_ID</code> will be null.
STATUS	VARCHAR2(40)	NOT NULL	Current status of the workload replay: <ul style="list-style-type: none"> • <code>PREPARE</code> - Workload prepare has been started and is waiting for clients to join • <code>IN PROGRESS</code> - Workload replay is in progress • <code>COMPLETED</code> - Workload replay has successfully completed • <code>CANCELLED</code> - Workload replay or the workload prepare has been cancelled • <code>FAILED</code> - Workload replay was aborted due to errors encountered. See the <code>COMMENTS</code> column for further information.
PREPARE_TIME	DATE		Datetime at which the workload prepare started
START_TIME	DATE		Datetime when the replay began
END_TIME	DATE		Datetime when the replay completed or cancelled; <code>NULL</code> if the replay is still in progress

Column	Datatype	NULL	Description
DURATION_SECS	NUMBER		Duration of the workload replay (in seconds)
NUM_CLIENTS	NUMBER	NOT NULL	Number of workload replay client processes that were used in this workload replay
NUM_CLIENTS_DONE	NUMBER	NOT NULL	Number of workload replay client processes that have finished replay
FILTER_SET_NAME	VARCHAR2(128)		Name of the filter set used for the replay
DEFAULT_ACTION	VARCHAR2(30)	NOT NULL	Reserved for future use
SYNCHRONIZATION	VARCHAR2(9)		Indicates whether recorded transaction semantics should be maintained (TRUE) or not (FALSE) When synchronization is on, the commit order observed during the original workload capture will be preserved. Every action that is replayed will be executed only after all of its dependent commits have been executed. Dependent commits are commits that were issued before the given action in the original workload capture.
			See Also: DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY() in <i>Oracle Database PL/SQL Packages and Types Reference</i> for a detailed explanation of this replay parameter
CONNECT_TIME_SCALE	NUMBER	NOT NULL	Connection time scaling factor for captured streams during replay. The value is interpreted as a percentage. The default value of 100 means 100 percent. See Also: DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY() in <i>Oracle Database PL/SQL Packages and Types Reference</i> for a detailed explanation of this replay parameter
THINK_TIME_SCALE	NUMBER	NOT NULL	Think time scaling factor for captured streams during replay. It scales the thinking time elapsed between two successive user calls from the same captured stream. The input is interpreted as a percentage. The default value of 100 means 100 percent. See Also: DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY() in <i>Oracle Database PL/SQL Packages and Types Reference</i> for a detailed explanation of this replay parameter
THINK_TIME_AUTO_CORRECT	VARCHAR2(5)		Indicates whether the think time should be automatically corrected between calls (TRUE) or not (FALSE). A value of TRUE reduces think time if replay goes slower than capture. A value of FALSE results in no action. See Also: DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY() in <i>Oracle Database PL/SQL Packages and Types Reference</i> for a detailed explanation of this replay parameter
SCALE_UP_MULTIPLIER	NUMBER	NOT NULL	Before the multiple-capture replay, SCALE_UP_MULTIPLIER is used to scale up the query part of a workload capture. The queries from each captured session are replayed concurrently as many times as the value of SCALE_UP_MULTIPLIER.

Column	Datatype	NULL	Description
USER_CALLS	NUMBER		Total number of user calls replayed
DBTIME	NUMBER		Accumulated database time (in microseconds) for the replay
NETWORK_TIME	NUMBER		Accumulated network time for the replay (in microseconds)
THINK_TIME	NUMBER		Accumulated think time (in microseconds) for the replay
PAUSE_TIME	NUMBER		The total time (in seconds) that the replay has been paused (by calling the PAUSE_REPLAY procedure)
PLSQL_CALLS	NUMBER		Total number of replayed top-level PL/SQL calls
PLSQL_SUBCALLS	NUMBER		Total number of replayed calls for SQL executed from PL/SQL
PLSQL_DBTIME	NUMBER		Total amount of database time (in microseconds) from PL/SQL calls
ELAPSED_TIME_DIFF	NUMBER		Reserved for future use
REPLAY_DEADLOCKS	NUMBER		A workload replay uses either the timing information from the capture files or the commit-based synchronization. With commit-based synchronization, the capture-time commit order is preserved during replay, and sessions normally wait on the session that is to do the next commit; such waits are classified as "WCR: replay clock" waits. A replay deadlock occurs if the session that is to do the next commit is itself blocked by a session that is waiting on "WCR: replay clock." Replay deadlocks are resolved by allowing the blocker to go ahead and commit out of order. Replay deadlocks are not detected as database deadlocks since "WCR: replay clock" is an idle wait, introduced specifically for DB Replay.
			See Also: " WCR: replay clock "
AWR_DBID	NUMBER		Database ID of the AWR snapshots that correspond to this workload replay. For replays that were performed in the current database, this value is equal to the current database's DBID. For replays that were performed in other databases, this value will either be NULL or will be populated by <code>DBMS_WORKLOAD_REPLAY.IMPORT_AWR()</code> .
			See Also: <code>DBMS_WORKLOAD_REPLAY.IMPORT_AWR()</code> in <i>Oracle Database PL/SQL Packages and Types Reference</i>
AWR_BEGIN_SNAP	NUMBER		Begin snapshot ID of the AWR snapshots that correspond to this workload replay
AWR_END_SNAP	NUMBER		End snapshot ID of the AWR snapshots that correspond to this workload replay

Column	Datatype	NULL	Description
AWR_EXPORTED	VARCHAR2(12)		<p>Indicates whether the AWR snapshots that correspond to this workload replay have been exported using DBMS_WORKLOAD_REPLAY.EXPORT_AWR() (YES) or not (NO), or whether AWR snapshots cannot be exported because the replay is still in progress, has run to completion successfully, or was done in a different database from which it was not exported (NOT POSSIBLE)</p> <p>See Also: DBMS_WORKLOAD_REPLAY.EXPORT_AWR() in <i>Oracle Database PL/SQL Packages and Types Reference</i></p>
ERROR_CODE	NUMBER		Error code for this workload replay
ERROR_MESSAGE	VARCHAR2(512)		Error message for this workload replay
DIR_PATH	VARCHAR2(4000)	NOT NULL	Full directory path for the replay directory object
REPLAY_DIR_NUMBER	NUMBER		A hash value computed based on the values of other columns in this view, such as the NAME, DBID, DBNAME, PREPARE_TIME, START_TIME, and END_TIME columns. It should be fairly unique for any replay. The value is used to create a subdirectory under the replay directory.
SQLSET_OWNER	VARCHAR2(128)		User name of the SQL tuning set owner
SQLSET_NAME	VARCHAR2(128)		Name of the SQL tuning set for this workload replay
SCHEDULE_NAME	VARCHAR2(128)		The name of a schedule to be replayed. It defines one or multiple workload captures, and the order to start their replays.
			If SCHEDULE_NAME is NULL, the replay is a regular replay introduced since Oracle Database 11g, done with existing APIs from DBMS_WORKLOAD_REPLAY: INITIALIZE_REPLAY, PREPARE_REPLAY, and START_REPLAY.
			If SCHEDULE_NAME is not NULL, the replay is a new consolidated replay introduced in Oracle Database 12c. That is, it is a replay of one or more workload captures done with new APIs at DBMS_WORKLOAD_REPLAY: INITIALIZE_CONSOLIDATED_REPLAY, PREPARE_CONSOLIDATED_REPLAY, and START_CONSOLIDATED_REPLAY.
			See Also: DBMS_WORKLOAD_REPLAY in <i>Oracle Database PL/SQL Packages and Types Reference</i>
DIVERGENCE_LOAD_STATUS	VARCHAR2(5)		Indicates whether replay divergence data have been loaded (TRUE) or not (FALSE)
PLSQL_MODE	VARCHAR2(12)		Replay options for PL/SQL calls. Possible values: <ul style="list-style-type: none"> • TOP_LEVEL: Top-level PL/SQL only • EXTENDED: SQL executed from PL/SQL or top-level PL/SQL if there is no SQL recorded inside the PL/SQL

Column	Datatype	NULL	Description
CONNECT_TIME_AUTO_CORREC T	VARCHAR2(12)		Indicates whether the waiting time for a new session to be connected is automatically reduced when the replay proceeds faster than its capture. The reduced amount is determined by the elapsed-time difference between the replay and the capture of the slowest session. The default value is true. There is no impact when the replay proceeds slower than the capture.
RAC_MODE	VARCHAR2(19)		Replay options in an Oracle RAC environment: <ul style="list-style-type: none">• GLOBAL_SYNC: Synchronization is across all instances. This is the default. Database connections from workload replay client (wrc) are done based on connection remapping.• PER_INSTANCE_CLIENT: Synchronization is across all instances. All database connections from one wrc are connected to only one instance.• PER_INSTANCE_SYNC: Synchronization is within one instance. All database connections from one wrc are connected to only one instance.
QUERY_ONLY	VARCHAR2(1)		Indicates whether only the query-only workload from the current workload capture will be replayed, skipping all the DML/DDL that might update the database (Y) or not (N)

 See Also:

Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_WORKLOAD_REPLAY package

6.127 DBA_WORKLOAD_SCHEDULE_CAPTURES

DBA_WORKLOAD_SCHEDULE_CAPTURES displays the workload captures used by replay schedules.

Each row in the view contains information about one workload capture.

Column	Datatype	NULL	Description
SCHEDULE_NAME	VARCHAR2(128)	NOT NULL	The name of a schedule to be replayed
SCHEDULE_CAP_ID	NUMBER	NOT NULL	Identifies a workload capture added to a replay schedule. It starts with 1. If the same capture is added multiple times to a schedule, there will be multiple rows with different SCHEDULE_CAP_ID columns and identical CAPTURE_ID columns.
CAPTURE_ID	NUMBER	NOT NULL	Points to the capture ID from DBA_WORKLOAD_CAPTURES.
CAPTURE_DIR	VARCHAR2(128)	NOT NULL	Name of the directory object for workload capture

Column	Datatype	NULL	Description
OS_SUBDIR	VARCHAR2(4000)	NOT NULL	Name of the subdirectory under the replay directory for this workload capture
MAX_CONCURRENT_SESSIONS	NUMBER		The maximal number of concurrent sessions that was seen in this workload capture
NUM_CLIENTS_ASSIGNED	NUMBER		Number of clients assigned to this workload capture before replay starts
NUM_CLIENTS	NUMBER		Number of clients that are running for this workload capture during replay
NUM_CLIENTS_DONE	NUMBER		Number of clients that have finished the replay of this workload capture
STOP_REPLAY	VARCHAR2(1)	NOT NULL	Indicates whether the whole replay will stop once the replay of this workload capture is done (Y) or not (N)
TAKE_BEGIN_SNAPSHOT	VARCHAR2(1)	NOT NULL	Indicates whether an AWR snapshot will be taken when the replay of this capture starts (Y) or not (N)
TAKE_END_SNAPSHOT	VARCHAR2(1)	NOT NULL	Indicates whether an AWR snapshot will be taken when the replay of this capture finishes (Y) or not (N)
QUERY_ONLY	VARCHAR2(1)	NOT NULL	Indicates whether only the query-only workload from the current workload capture will be replayed, skipping all the DML/DDL that might update the database (Y) or not (N)
START_DELAY_SECS	NUMBER		Displays the wait time (in seconds) when the replay of a workload capture is ready to start. "Ready to start" means the capture does not wait for any other capture, or all the captures for which it should wait have already been replayed. The default value is 0.
START_TIME	DATE		Start time for the replay of this capture
END_TIME	DATE		Finish time for the replay of this capture
AWR_DBID	NUMBER		AWR database ID of the replay
AWR_BEGIN_SNAP	NUMBER		AWR snapshot ID when the replay starts
AWR_END_SNAP	NUMBER		AWR snapshot ID when the replay finishes

6.128 DBA_WORKLOAD_SCHEDULE_ORDERING

DBA_WORKLOAD_SCHEDULE_ORDERING displays the start ordering between workload captures in the replay schedule.

Each row in the view defines one start ordering between two workload captures in the same replay schedule.

Column	Datatype	NULL	Description
SCHEDULE_NAME	VARCHAR2(128)	NOT NULL	Name of a schedule to be replayed
SCHEDULE_CAP_ID	NUMBER	NOT NULL	Identifies the workload capture that will wait

Column	Datatype	NULL	Description
WAITFOR_CAP_ID	NUMBER	NOT NULL	<p>Identifies the workload capture for which the workload capture identified by SCHEDULE_CAP_ID needs to wait. The replay of capture SCHEDULE_CAP_ID will not start until capture WAITFOR_CAP_ID finishes its replay.</p> <p>If the view has multiple rows with the same SCHEDULE_CAP_ID but different WAITFOR_CAP_ID, it defines a schedule so that the replay of a capture specified by SCHEDULE_CAP_ID will not start unless all the replays of the waited captures run into completion.</p> <p>If the view has multiple rows with the same WAITFOR_CAP_ID but different SCHEDULE_CAP_ID, it defines a schedule so that the replay of multiple captures will not start unless the replay of the capture specified by WAITFOR_CAP_ID finishes.</p>

6.129 DBA_WORKLOAD_SQL_MAP

DBA_WORKLOAD_SQL_MAP contains the mapping information for skipping or replacing a SQL statement based on its sql_id during workload replay.

Column	Datatype	NULL	Description
REPLAY_ID	NUMBER (38)	NOT NULL	A foreign key to the ID column in the DBA_WORKLOAD_REPLAYS view
SCHEDULE_CAP_ID	NUMBER (38)	NOT NULL	The ID of a capture in the schedule
SQL_ID	VARCHAR2 (13)	NOT NULL	SQL identifier of the SQL statement at the time of capture
OPERATION	VARCHAR2 (7)		SKIP or REPLACE
SQL_ID_NUMBER	NUMBER		Internal representation of SQL_ID
REPLACEMENT_SQL_TEXT	VARCHAR2 (4000)		<p>When the value in the OPERATION column is SKIP, this column is NULL.</p> <p>When the value in the OPERATION column is REPLACE, this column shows the SQL statement to be used.</p>

6.130 DBA_WORKLOAD_TRACKED_COMMITS

DBA_WORKLOAD_TRACKED_COMMITS displays the commits tracked every second during a database replay.

Column	Datatype	NULL	Description
REPLAY_DIR_NUMBER	NUMBER	NOT NULL	<p>The numerical value that is associated with the subdirectory under the replay directory.</p> <p>See REPLAY_DIR_NUMBER in DBA_WORKLOAD_REPLAYS</p>
INSTANCE_NUMBER	NUMBER (38)		The instance where the commit is executed
FILE_ID	NUMBER (38)	NOT NULL	The file ID
CALL_CTR	NUMBER (38)	NOT NULL	The call counter of the commit
COMMIT_SCN	NUMBER (38)		The recorded commit SCN value

Column	Datatype	NULL	Description
PREV_GLOBAL_COMMIT_FILE_ID	NUMBER (38)		The file ID of the latest commit across all sessions
PREV_GLOBAL_COMMIT_SCN	NUMBER (38)		The recorded SCN of the latest commit across all sessions
PREV_LOCAL_COMMIT_CALL_CNT	NUMBER (38)		The call counter of the latest commit in the same session
CAPTURE_COMMIT_TIME	NUMBER (38)		The time in seconds since the capture started
CAPTURE_COMMIT_TIME_DELTA	NUMBER (38)	A	The elapsed time in seconds since the previous commit across all sessions during capture
REPLAY_COMMIT_TIME	NUMBER (38)		The time in seconds since the replay started
REPLAY_COMMIT_TIME_DELTA	NUMBER (38)		The elapsed time in seconds since the previous commit across all sessions during the replay

 **See Also:**

[DBA_WORKLOAD_REPLAYS](#)

6.131 DBA_WORKLOAD_USER_MAP

DBA_WORKLOAD_USER_MAP contains all the mappings ever done until they are removed at some point.

The mappings are stored in a table made public through this view.

To remove old mappings, execute this statement:

```
SQL> delete * from DBA_WORKLOAD_USER_MAP;
```

Column	Datatype	NULL	Description
REPLAY_ID	NUMBER		This is a foreign key to the ID column in the DBA_WORKLOAD_REPLAYS view
SCHEDULE_CAP_ID	NUMBER		The ID of a capture in the schedule
CAPTURE_USER	VARCHAR2 (4000)	NOT NULL	The user name during the time of the workload capture
REPLAY_USER	VARCHAR2 (4000)		The user name to which the captured user should be remapped during replay. If the REPLAY_USER is null, the CAPTURE_USER is used during replay. In other words, the original user is used.

 **See Also:**

["DBA_WORKLOAD_REPLAYS"](#)

6.132 DBA_XML_INDEXES

DBA_XML_INDEXES describes all XML indexes in the database. Its columns are the same as those in ALL_XML_INDEXES.

See Also:

["ALL_XML_INDEXES"](#)

6.133 DBA_XML_NESTED_TABLES

DBA_XML_NESTED_TABLES describes all the tables and their corresponding nested tables. Its columns are the same as those in ALL_XML_NESTED_TABLES.

See Also:

["ALL_XML_NESTED_TABLES"](#)

6.134 DBA_XML_OUT_OF_LINE_TABLES

DBA_XML_OUT_OF_LINE_TABLES describes all the out of line tables connected to a given root table for the same schema. Its columns are the same as those in ALL_XML_OUT_OF_LINE_TABLES.

See Also:

["ALL_XML_OUT_OF_LINE_TABLES"](#)

6.135 DBA_XML_SCHEMA_ATTRIBUTES

DBA_XML_SCHEMA_ATTRIBUTES describes all the attributes and their properties. Its columns are the same as those in ALL_XML_SCHEMA_ATTRIBUTES.

See Also:

["ALL_XML_SCHEMA_ATTRIBUTES"](#)

6.136 DBA_XML_SCHEMA_COMPLEX_TYPES

DBA_XML_SCHEMA_COMPLEX_TYPES describes all complex types in the database. Its columns are the same as those in ALL_XML_SCHEMA_COMPLEX_TYPES.

 **See Also:**

["ALL_XML_SCHEMA_COMPLEX_TYPES"](#)

6.137 DBA_XML_SCHEMA_ELEMENTS

DBA_XML_SCHEMA_ELEMENTS describes all the elements and their properties. Its columns are the same as those in ALL_XML_SCHEMA_ELEMENTS.

 **See Also:**

["ALL_XML_SCHEMA_ELEMENTS"](#)

6.138 DBA_XML_SCHEMA_NAMESPACES

DBA_XML_SCHEMA_NAMESPACES describes all the available namespaces. Its columns are the same as those in ALL_XML_SCHEMA_NAMESPACES.

 **See Also:**

["ALL_XML_SCHEMA_NAMESPACES"](#)

6.139 DBA_XML_SCHEMA_SIMPLE_TYPES

DBA_XML_SCHEMA_SIMPLE_TYPES describes all simple types. Its columns are the same as those in ALL_XML_SCHEMA_SIMPLE_TYPES.

 **See Also:**

["ALL_XML_SCHEMA_SIMPLE_TYPES"](#)

6.140 DBA_XML_SCHEMA_SUBSTGRP_HEAD

DBA_XML_SCHEMA_SUBSTGRP_HEAD describes the heads of substitution groups. Its columns are the same as those in ALL_XML_SCHEMA_SUBSTGRP_HEAD.

 **See Also:**

["ALL_XML_SCHEMA_SUBSTGRP_HEAD"](#)

6.141 DBA_XML_SCHEMA_SUBSTGRP_MBRs

DBA_XML_SCHEMA_SUBSTGRP_MBRs describes all members of substitution groups. Its columns are the same as those in ALL_XML_SCHEMA_SUBSTGRP_MBRs.

 **See Also:**

["ALL_XML_SCHEMA_SUBSTGRP_MBRs"](#)

6.142 DBA_XML_SCHEMAS

DBA_XML_SCHEMAS describes all registered XML schemas in the database. Its columns are the same as those in ALL_XML_SCHEMAS.

 **See Also:**

["ALL_XML_SCHEMAS"](#)

6.143 DBA_XML_TAB_COLS

DBA_XML_TAB_COLS describes the columns of all XML tables in the database. Its columns are the same as those in ALL_XML_TAB_COLS.

 **See Also:**

["ALL_XML_TAB_COLS"](#)

6.144 DBA_XML_TABLES

DBA_XML_TABLES describes all XML tables in the database. Its columns are the same as those in ALL_XML_TABLES.

 **See Also:**

"ALL_XML_TABLES"

6.145 DBA_XML_VIEW_COLS

DBA_XML_VIEW_COLS describes the columns of all XML views in the database. Its columns are the same as those in ALL_XML_VIEW_COLS.

 **See Also:**

"ALL_XML_VIEW_COLS"

6.146 DBA_XML_VIEWS

DBA_XML_VIEWS describes all XML views in the database. Its columns are the same as those in ALL_XML_VIEWS.

 **See Also:**

"ALL_XML_VIEWS"

6.147 DBA_XS_AUDIT_POLICY_OPTIONS

DBA_XS_AUDIT_POLICY_OPTIONS describes auditing options defined under all audit policies specific to Oracle Database Real Application Security.

Column	Datatype	NULL	Description
POLICY_NAME	VARCHAR2(128)		Name of the audit policy
AUDIT_CONDITION	VARCHAR2(4000)		Condition associated with the audit policy
AUDIT_OPTION	VARCHAR2(128)		Auditing option defined in the audit policy
CONDITION_EVAL_OPT	VARCHAR2(9)		Evaluation option associated with the audit policy's condition. The possible values are STATEMENT, SESSION, INSTANCE, NONE.

Column	Datatype	NULL	Description
COMMON	VARCHAR2 (3)		Indicates whether the audit policy is a common audit policy (YES) or local (NO). The value is NULL in non-CDBs.

See Also:

Oracle Database Security Guide for more information about auditing

6.148 DBA_XS_AUDIT_TRAIL

DBA_XS_AUDIT_TRAIL describes all audit records specific to Oracle Database Real Application Security.

Column	Datatype	NULL	Description
USERID	VARCHAR2 (128)		Name of the database user whose actions were audited
ACTION	NUMBER		Numeric audit trail action type code. The corresponding name of the action type is in the ACTION_NAME column.
ACTION_NAME	VARCHAR2 (64)		Name of the action type corresponding to the numeric code in the ACTION column
OBJ_OWNER	VARCHAR2 (128)		Owner of the object affected by the action
OBJ_NAME	VARCHAR2 (128)		Name of the object affected by the action
RETURN_CODE	NUMBER		Oracle error code generated by the action
XS_USER_NAME	VARCHAR2 (128)		Name of the Real Application Security user
XS_SESSIONID	RAW (33)		Identifier of the Real Application Security session
XS_INACTIVITY_TIMEOUT	NUMBER		Inactivity timeout of the Real Application Security session
XS_ENTITY_TYPE	VARCHAR2 (32)		Type of the Real Application Security entity. Possible values are USER, ROLE, ROLESET, SECURITYCLASS, ACL, DATASECURITY, and NSTEMPLATE.
XS_TARGET_PRINCIPAL_NAME	VARCHAR2 (128)		Target principal name in Real Application Security operations. Possible operations are set verifier, set password, add proxy, remove proxy, switch user, assign user, create session, grant roles.
XS_PROXY_USER_NAME	VARCHAR2 (128)		Name of the Real Application Security proxy user.
XS_DATASEC_POLICY_NAME	VARCHAR2 (128)		Name of the Real Application Security data security policy enabled or disabled
XS_SCHEMA_NAME	VARCHAR2 (128)		Name of the schema in enable, disable data security policy and global callback operation
XS_CALLBACK_EVENT_TYPE	VARCHAR2 (32)		Real Application Security global callback event type
XS_PACKAGE_NAME	VARCHAR2 (128)		Real Application Security callback package name for the global callback

Column	Datatype	NULL	Description
XS_PROCEDURE_NAME	VARCHAR2(128)		Real Application Security callback procedure name for the global callback
XS_ENABLED_ROLE	VARCHAR2(128)		The role that is enabled
XS_COOKIE	VARCHAR2(1024)		Real Application Security session cookie
XS_NS_NAME	VARCHAR2(128)		Name of the Real Application Security session namespace
XS_NS_ATTRIBUTE	VARCHAR2(4000)		Name of the Real Application Security session namespace attribute
XS_NS_ATTRIBUTE_OLD_VAL	VARCHAR2(4000)		The old value of the Real Application Security session namespace attribute
XS_NS_ATTRIBUTE_NEW_VAL	VARCHAR2(4000)		The new value of the Real Application Security session namespace attribute
EVENT_TIMESTAMP	TIMESTAMP(6) WITH TIME ZONE		Timestamp of audit record

 **See Also:**

Oracle Database Security Guide for more information about auditing

6.149 DBA_XS_ENABLED_AUDIT_POLICIES

DBA_XS_ENABLED_AUDIT_POLICIES describes all the audit policies specific to Oracle Database Real Application Security that are enabled to users.

 **Note:**

This view was known as DBA_XS_ENB_AUDIT_POLICIES in Oracle Database 12c Release 1. It was renamed to DBA_XS_ENABLED_AUDIT_POLICIES in Oracle Database 12c Release 2 (12.2.0.1).

Column	Datatype	NULL	Description
POLICY_NAME	VARCHAR2(128)		Name of the audit policy
ENABLED_OPTION	VARCHAR2(15)		Enabled option of the audit policy. Possible values: <ul style="list-style-type: none"> • BY USER: For policies that are enabled on users • EXCEPT USERS: For policies that are enabled on users • BY GRANTED ROLE: For policies that are enabled on roles • INVALID: For policies that are enabled on roles
ENTITY_NAME	VARCHAR2(128)		Database entity (user name or role name) on which the audit policy is enabled

Column	Datatype	NULL	Description
ENTITY_TYPE	VARCHAR2(7)		Database entity type. Possible values: <ul style="list-style-type: none">• USER: Indicates that the policy is enabled on a user or users.• ROLE: Indicates that the policy is enabled on a role or roles.
SUCCESS	VARCHAR2(3)		Indicates whether the audit policy is enabled for auditing successful events (YES) or not (NO)
FAILURE	VARCHAR2(3)		Indicates whether the audit policy is enabled for auditing unsuccessful events (YES) or not (NO)

 **See Also:**

Oracle Database Security Guide for more information about auditing

6.150 DBA_XS_ENB_AUDIT_POLICIES

DBA_XS_ENB_AUDIT_POLICIES is a synonym for the DBA_XS_ENABLED_AUDIT_POLICIES view.

 **See Also:**

- "[DBA_XS_ENABLED_AUDIT_POLICIES](#)"
- *Oracle Database Security Guide* for more information about auditing
- *Oracle Database Security Guide* for more information about auditing

6.151 DBA_XSTREAM_ADMINISTRATOR

DBA_XSTREAM_ADMINISTRATOR displays information about the users who have been granted privileges to be XStream administrators by procedures in the DBMS_XSTREAM_AUTH package. Its columns are the same as those in ALL_XSTREAM_ADMINISTRATOR.

 **See Also:**

["ALL_XSTREAM_ADMINISTRATOR"](#)

6.152 DBA_XSTREAM_INBOUND

DBA_XSTREAM_INBOUND displays information about all XStream inbound servers in the database. Its columns are the same as those in ALL_XSTREAM_INBOUND.

 **See Also:**

["ALL_XSTREAM_INBOUND"](#)

6.153 DBA_XSTREAM_INBOUND_PROGRESS

DBA_XSTREAM_INBOUND_PROGRESS displays information about the progress made by all XStream inbound servers in the database. Its columns are the same as those in ALL_XSTREAM_INBOUND_PROGRESS.

 **See Also:**

["ALL_XSTREAM_INBOUND_PROGRESS"](#)

6.154 DBA_XSTREAM_OUT_SUPPORT_MODE

DBA_XSTREAM_OUT_SUPPORT_MODE displays information about the level of XStream capture process support for the tables in the database. Its columns are the same as those in ALL_XSTREAM_OUT_SUPPORT_MODE.

 **See Also:**

["ALL_XSTREAM_OUT_SUPPORT_MODE"](#)

6.155 DBA_XSTREAM_OUTBOUND

DBA_XSTREAM_OUTBOUND displays information about all XStream outbound servers in the database. Its columns are the same as those in ALL_XSTREAM_OUTBOUND.

 **See Also:**

["ALL_XSTREAM_OUTBOUND"](#)

6.156 DBA_XSTREAM_OUTBOUND_PROGRESS

DBA_XSTREAM_OUTBOUND_PROGRESS displays information about the progress made by all XStream outbound servers in the database. Its columns are the same as those in ALL_XSTREAM_OUTBOUND_PROGRESS.

 **See Also:**

["ALL_XSTREAM_OUTBOUND_PROGRESS"](#)

6.157 DBA_XSTREAM_RULES

DBA_XSTREAM_RULES displays information about all XStream rules in the database. Its columns are the same as those in ALL_XSTREAM_RULES.

 **See Also:**

["ALL_XSTREAM_RULES"](#)

6.158 DBA_XSTREAM_SPLIT_MERGE

DBA_XSTREAM_SPLIT_MERGE displays information about XStream current automatic split and merge operations.

Column	Datatype	NULL	Description
ORIGINAL_CAPTURE_NAME	VARCHAR2(128)	NOT NULL	Name of the original capture process
CLONED_CAPTURE_NAME	VARCHAR2(128)		Name of the cloned capture process
ORIGINAL_CAPTURE_STATUS	VARCHAR2(8)		Status of the original capture process: <ul style="list-style-type: none"> • DISABLED • ENABLED • ABORTED
CLONED_CAPTURE_STATUS	VARCHAR2(8)		Status of the cloned capture process: <ul style="list-style-type: none"> • DISABLED • ENABLED • ABORTED
ORIGINAL_XSTREAM_NAME	VARCHAR2(128)		Name of the original XStream component that receives database changes directly from the original capture process. The component is either a propagation or a local apply process.
CLONED_XSTREAM_NAME	VARCHAR2(128)		Name of the cloned XStream component that receives database changes directly from the cloned capture process. The component is either a propagation or a local apply process.

Column	Datatype	NULL	Description
XSTREAM_TYPE	VARCHAR2(11)		Type of the component in ORIGINAL_XSTREAM_NAME and CLONED_XSTREAM_NAME: <ul style="list-style-type: none"> • PROPAGATION • APPLY
RECOVERABLE_SCRIPT_ID	RAW(16)		Unique ID of the script to split or merge operation
SCRIPT_STATUS	VARCHAR2(12)		Status of the recoverable script: <ul style="list-style-type: none"> • GENERATING • NOT EXECUTING • EXECUTING • EXECUTED • ERROR
ACTION_TYPE	VARCHAR2(7)		type of action performed by the script: <ul style="list-style-type: none"> • SPLIT • MERGE • MONITOR
ACTION_THRESHOLD	VARCHAR2(40)		For SPLIT actions, the threshold set by the split_threshold capture process parameter. For MERGE actions, the threshold set by the merge_threshold capture process parameter.
STATUS	VARCHAR2(16)		Status of the action: <ul style="list-style-type: none"> • NOTHING TO SPLIT - Not ready to split or does not need to split • ABOUT TO SPLIT • SPLITTING - A split is in progress • SPLIT DONE - A split is done • NOTHING TO MERGE - Not ready to merge • ABOUT TO MERGE • MERGING - A merge is in progress • MERGE DONE - A merge is done • ERROR - An error was returned during a split or merge • NONSPLITTABLE - The original capture is not splittable either because it is disabled, it has more than one publisher to its queue, or it has only one destination for captured messages
STATUS_UPDATE_TIME	TIMESTAMP(6)		Time when status was last updated
CREATION_TIME	TIMESTAMP(6)		Time when the action started
LAG	NUMBER		Time (in seconds) that the cloned capture process lags behind the original capture process
JOB_OWNER	VARCHAR2(128)		Owner of the job that performs the split or merge operation
JOB_NAME	VARCHAR2(128)		Name of the job that performs the split or merge operation

Column	Datatype	NULL	Description
JOB_STATE	VARCHAR2(15)		<p>Current state of the job:</p> <ul style="list-style-type: none"> • DISABLED • RETRY SCHEDULED • SCHEDULED • RUNNING • COMPLETED • BROKEN • FAILED • REMOTE • SUCCEEDED • CHAIN_STALLED
JOB_NEXT_RUN_DATE	VARCHAR2(64)		Next time the job will run
ERROR_NUMBER	NUMBER		Error number if the capture process was aborted
ERROR_MESSAGE	VARCHAR2(4000)		Error message if the capture process was aborted

6.159 DBA_XSTREAM_SPLIT_MERGE_HIST

DBA_XSTREAM_SPLIT_MERGE_HIST displays information about past XStream automatic split and merge operations.

Column	Datatype	NULL	Description
ORIGINAL_CAPTURE_NAME	VARCHAR2(128)	NOT NULL	Name of the original capture process
CLONED_CAPTURE_NAME	VARCHAR2(128)		Name of the cloned capture process
ORIGINAL_QUEUE_OWNER	VARCHAR2(128)		Owner of the queue used by the original capture process
ORIGINAL_QUEUE_NAME	VARCHAR2(128)		Name of the queue used by the original capture process
CLONED_QUEUE_OWNER	VARCHAR2(128)		Owner of the queue used by the cloned capture process
CLONED_QUEUE_NAME	VARCHAR2(128)		Name of the queue used by the cloned capture process
ORIGINAL_CAPTURE_STATUS	VARCHAR2(8)		<p>Status of the original capture process:</p> <ul style="list-style-type: none"> • DISABLED • ENABLED • ABORTED
CLONED_CAPTURE_STATUS	VARCHAR2(8)		<p>Status of the cloned capture process:</p> <ul style="list-style-type: none"> • DISABLED • ENABLED • ABORTED
ORIGINAL_XSTREAM_NAME	VARCHAR2(128)		Name of the original XStream component that receives database changes directly from the original capture process. The component is either a propagation or a local apply process.
CLONED_XSTREAM_NAME	VARCHAR2(128)		Name of the cloned XStream component that receives database changes directly from the cloned capture process. The component is either a propagation or a local apply process.

Column	Datatype	NULL	Description
XSTREAM_TYPE	VARCHAR2(11)		Type of the component in ORIGINAL_XSTREAM_NAME and CLONED_XSTREAM_NAME: <ul style="list-style-type: none"> • PROPAGATION • APPLY
RECOVERABLE_SCRIPT_ID	RAW(16)		Unique ID of the script to split or merge operation
SCRIPT_STATUS	VARCHAR2(12)		Status of the recoverable script: <ul style="list-style-type: none"> • GENERATING • NOT EXECUTING • EXECUTING • EXECUTED • ERROR
ACTION_TYPE	VARCHAR2(7)		type of action performed by the script: <ul style="list-style-type: none"> • SPLIT • MERGE • MONITOR
ACTION_THRESHOLD	VARCHAR2(40)		For SPLIT actions, the threshold set by the split_threshold capture process parameter. For MERGE actions, the threshold set by the merge_threshold capture process parameter.
STATUS	VARCHAR2(16)		Status of the action: <ul style="list-style-type: none"> • NOTHING TO SPLIT - Not ready to split or does not need to split • ABOUT TO SPLIT • SPLITTING - A split is in progress • SPLIT DONE - A split is done • NOTHING TO MERGE - Not ready to merge • ABOUT TO MERGE • MERGING - A merge is in progress • MERGE DONE - A merge is done • ERROR - An error was returned during a split or merge • NONSPLITTABLE - The original capture is not splittable either because it is disabled, it has more than one publisher to its queue, or it has only one destination for captured messages
STATUS_UPDATE_TIME	TIMESTAMP(6)		Time when status was last updated
CREATION_TIME	TIMESTAMP(6)		Time when the action started
LAG	NUMBER		Time (in seconds) that the cloned capture process lags behind the original capture process
JOB_OWNER	VARCHAR2(128)		Owner of the job that performs the split or merge operation
JOB_NAME	VARCHAR2(128)		Name of the job that performs the split or merge operation
ERROR_NUMBER	NUMBER		Error number if the capture process was aborted
ERROR_MESSAGE	VARCHAR2(4000)		Error message if the capture process was aborted

6.160 DBA_XSTREAM_STMT_HANDLERS

DBA_XSTREAM_STMT_HANDLERS displays information about all XStream statement DML handlers in the database.

Column	Datatype	NULL	Description
HANDLER_NAME	VARCHAR2(128)	NOT NULL	Name of the statement handler
HANDLER_COMMENT	VARCHAR2(4000)		Comment of the statement handler
CREATION_TIME	TIMESTAMP(6)		Timestamp for script creation
MODIFICATION_TIME	TIMESTAMP(6)		Timestamp for script modification

6.161 DBA_XSTREAM_STMTS

DBA_XSTREAM_STMTS displays information about the statements in all XStream statement DML handlers in the database.

Column	Datatype	NULL	Description
HANDLER_NAME	VARCHAR2(128)	NOT NULL	Name of the statement handler
EXECUTION_SEQUENCE	NUMBER	NOT NULL	Execution sequence of the statement
STATEMENT	CLOB		Text of the SQL statement
CREATION_TIME	TIMESTAMP(6)		Timestamp for statement creation
MODIFICATION_TIME	TIMESTAMP(6)		Timestamp for statement modification

6.162 DBA_XSTREAM_TRANSFORMATIONS

DBA_XSTREAM_TRANSFORMATIONS displays information about all XStream transformations available on a system, in order of execution. Its columns are the same as those in ALL_XSTREAM_TRANSFORMATIONS.

 **See Also:**

"ALL_XSTREAM_TRANSFORMATIONS"

6.163 DBA_XTERNAL_LOC_PARTITIONS

DBA_XTERNAL_LOC_PARTITIONS describes partition-level locations in the database. Its columns are the same as those in ALL_XTERNAL_LOC_PARTITIONS.

 **See Also:**

"ALL_XTERNAL_LOC_PARTITIONS"

6.164 DBA_XTERNAL_LOC_SUBPARTITIONS

DBA_XTERNAL_LOC_SUBPARTITIONS describes subpartition-level locations in the database. Its columns are the same as those in ALL_XTERNAL_LOC_SUBPARTITIONS.

 **See Also:**

["ALL_XTERNAL_LOC_SUBPARTITIONS"](#)

6.165 DBA_XTERNAL_PART_TABLES

DBA_XTERNAL_PART_TABLES describes object-level information for partitioned external tables in the database. Its columns are the same as those in ALL_XTERNAL_PART_TABLES.

 **See Also:**

["ALL_XTERNAL_PART_TABLES"](#)

6.166 DBA_XTERNAL_TAB_PARTITIONS

DBA_XTERNAL_TAB_PARTITIONS describes partition-level information for partitioned external tables in the database. Its columns are the same as those in ALL_XTERNAL_TAB_PARTITIONS.

 **See Also:**

["ALL_XTERNAL_TAB_PARTITIONS"](#)

6.167 DBA_XTERNAL_TAB_SUBPARTITIONS

DBA_XTERNAL_TAB_SUBPARTITIONS describes subpartition-level information for partitioned external tables in the database. Its columns are the same as those in ALL_XTERNAL_TAB_SUBPARTITIONS.

 **See Also:**

["ALL_XTERNAL_TAB_SUBPARTITIONS"](#)

6.168 DBA_ZONEMAP_MEASURES

DBA_ZONEMAP_MEASURES describes the measures for all the zone maps in the database. Its columns are the same as those in ALL_ZONEMAP_MEASURES.

 **Note:**

This view is intended for use with Oracle Exadata release 12.1.2.1.1 or later.

 **See Also:**

- "[ALL_ZONEMAP_MEASURES](#)"
- *Oracle Database Data Warehousing Guide* for more information about zone maps

6.169 DBA_ZONEMAPS

DBA_ZONEMAPS describes all the zone maps in the database. Its columns are the same as those in ALL_ZONEMAPS.

 **Note:**

This view is intended for use with Oracle Exadata release 12.1.2.1.1 or later.

 **See Also:**

- "[ALL_ZONEMAPS](#)"
- *Oracle Database Data Warehousing Guide* for more information about zone maps

6.170 DBFS_CONTENT

DBFS_CONTENT displays all the path items from all available content stores in the system.

Column	Datatype	NULL	Description
STORE	VARCHAR2 (256)		Name of store
MOUNT	VARCHAR2 (256)		Location at which instance of store is mounted
PATHNAME	VARCHAR2 (1024)		Name of path to item

Column	Datatype	NULL	Description
PATHTYPE	VARCHAR2 (32)		Type of path item (see DBMS_DBFS_CONTENT Constants - Path Name Types)
FILEDATA	BLOB		BLOB locator that can be used to access data in the path item
STD_ACCESS_TIME	TIMESTAMP (6)		Time of last access of a path name's contents
STD_ACL	VARCHAR2 (1024)		Access Control List (in standard ACL syntax)
STD_CHANGE_TIME	TIMESTAMP (6)		Time of last change to the path name
STD_CHILDREN	NUMBER		Number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)
STD_CONTENT_TYPE	VARCHAR2 (1024)		One or more client-supplied mime-types (in standard RFC syntax) describing the path name which is typically of TYPE_FILE. The content type is not necessarily interpreted by the store.
STD_CREATION_TIME	TIMESTAMP (6)		Time at which the item was created. Once set, this value remains the same for the lifetime of the path name.
STD_DELETED	NUMBER		Set to a nonzero number if the path name has been soft-deleted but not yet purged (see DBMS_DBFS_CONTENT Constants - Store Features)
STD_GUID	NUMBER		Store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given (store-name, store-specific-path name) has a stable and unique GUID for its lifetime.
STD_MODIFICATION_TIME	TIMESTAMP (6)		Time of last change to the data associated with a path name. Changes to the content of a TYPE_FILE or TYPE_REFERENCE path, the referent of the TYPE_LINK path, and addition or deletion of immediate children in a TYPE_DIRECTORY path, all constitute data changes.
STD_OWNER	VARCHAR2 (32)		Client-supplied (or implicit) owner name for the path name
STD_PARENT_GUID	NUMBER		Store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given (store-name, store-specific-path name) has a stable and unique GUID for its lifetime.
STD_REFERENT	VARCHAR2 (1024)		The GUID of the parent of this path name (that is that std_parent_guid(pathname) == std_guid(parent(pathname))).
OPT_HASH_TYPE	VARCHAR2 (32)		Content of the symbolic link of a TYPE_LINK path, otherwise NULL. The STD_REFERENT can be an arbitrary string and must not necessarily be interpreted as path name by clients (or such interpretation should be done with great care).
OPT_HASH_VALUE	VARCHAR2 (128)		Type of hash provided in the OPT_HASH_VALUE property (see DBMS_CRYPTO for possible options)
			Hash value of type OPT_HASH_TYPE describing the content of the path name

Column	Datatype	NULL	Description
OPT_LOCK_COUNT	NUMBER		Number of compatible locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the OPT_LOCKER must specify all lockers with repeats so that lock counts can be correctly maintained.
OPT_LOCK_DATA	VARCHAR2(128)		Client-supplied user-data associated with a user-lock, uninterpreted by the store
OPT_LOCKER	VARCHAR2(128)		One or more implicit or client-specified principals that applied a user-lock on a path name
OPT_LOCK_STATUS	NUMBER		One of the (LOCK_READ_ONLY, LOCK_WRITE_ONLY, LOCK_READ_WRITE) values describing the type of lock currently applied on a path name
OPT_VERSION	NUMBER		Sequence number for linear versioning of a path name
OPT_VERSION_PATH	VARCHAR2(1024)		Version path name for hierarchical versioning of a path name
OPT_CONTENT_ID	RAW(128)		A provider-generated store-specific unique contentID in the form of a string for a file element (that may optionally not be associated with a path (see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH in DBMS_DBFS_CONTENT Constants - Store Features))

 **See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for more information about DBMS_DBFS_CONTENT Constants - Path Name Types and DBMS_DBFS_CONTENT Constants - Store Features
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_CRYPTO package

6.171 DBFS_CONTENT_PROPERTIES

DBFS_CONTENT_PROPERTIES displays all the property/value pairs for all path items in all content stores in the system.

Column	Datatype	NULL	Description
STORE	VARCHAR2(256)		Name of store
MOUNT	VARCHAR2(256)		Location at which instance of store is mounted
PATHNAME	VARCHAR2(1024)		Name of path to item
PROPERTY_NAME	VARCHAR2(32)		Name of the property
PROPERTY_VALUE	VARCHAR2(1024)		Value of the property
PROPERTY_TYPE	NUMBER		PL/SQL typecode for the property value

6.172 DBMS_ALERT_INFO

DBMS_ALERT_INFO describes registered alerts.

Column	Datatype	NULL	Description
NAME	VARCHAR2(30)	NOT NULL	Name of the alert
SID	VARCHAR2(30)	NOT NULL	Session ID of a session waiting for this alert
CHANGED	VARCHAR2(1)		Boolean flag to indicate that an alert has been signaled. Y: alert signaled, N: no alert.
MESSAGE	VARCHAR2(1800)		Optional message passed by signaler

6.173 DBMS_LOCK_ALLOCATED

DBMS_LOCK_ALLOCATED describes user-allocated locks.

Column	Datatype	NULL	Description
NAME	VARCHAR2(128)	NOT NULL	Name of the lock
LOCKID	NUMBER(38)		Lock identifier number
EXPIRATION	DATE		Planned lock expiration date (updates whenever the allocation procedure is run)

6.174 DBMS_METADATA_PARSE_ITEMS

DBMS_METADATA_PARSE_ITEMS documents the valid parse items.

Column	Datatype	NULL	Description
OBJECT_TYPE	VARCHAR2(128)	NOT NULL	Object type name
PARSE_ITEM	VARCHAR2(124)		Parse item name
ALTER_XML	VARCHAR2(1)		Y: Can be used when generating ALTER_XML document
FETCH_XML_CLOB	VARCHAR2(1)		Y: Can be returned by FETCH_XML_CLOB
CONVERT	VARCHAR2(1)		Y: Can be returned by CONVERT or FETCH_DDL
DESCRIPTION	VARCHAR2(4000)		Description of the parse item

See Also:

- "DBMS_METADATA_TRANSFORM_PARAMS"
- "DBMS_METADATA_TRANSFORMS"

6.175 DBMS_METADATA_TRANSFORM_PARAMS

DBMS_METADATA_TRANSFORM_PARAMS documents the valid transform parameters for each transform.

Column	Datatype	NULL	Description
OBJECT_TYPE	VARCHAR2(128)	NOT NULL	Object type name
TRANSFORM	VARCHAR2(128)	NOT NULL	Transform name
PARAM	VARCHAR2(128)	NOT NULL	Parameter name
DATATYPE	VARCHAR2(11)		BOOLEAN, TEXT, NUMBER or UNSPECIFIED
DEFAULT_VAL	VARCHAR2(2000)		Default value of transform parameter
DESCRIPTION	VARCHAR2(4000)		Description of the transform parameter

 **See Also:**

- "[DBMS_METADATA_PARSE_ITEMS](#)"
- "[DBMS_METADATA_TRANSFORMS](#)"

6.176 DBMS_METADATA_TRANSFORMS

DBMS_METADATA_TRANSFORMS documents the valid Oracle-supplied transforms.

Column	Datatype	NULL	Description
OBJECT_TYPE	VARCHAR2(128)	NOT NULL	Object type name
TRANSFORM	VARCHAR2(128)	NOT NULL	Transform name
INPUT_TYPE	VARCHAR2(24)		Type of input document
OUTPUT_TYPE	VARCHAR2(24)		Type of output document
DESCRIPTION	VARCHAR2(71)		Description of the transform

 **See Also:**

- "[DBMS_METADATA_PARSE_ITEMS](#)"
- "[DBMS_METADATA_TRANSFORM_PARAMS](#)"

6.177 DEPTREE

This view, created by `utldtree.sql`, contains information on the object dependency tree.

For user `SYS`, this view displays shared cursors (and only shared cursors) that depend on the object. For all other users, it displays objects other than shared cursors. Other users can access `SYS.DEPTREE` for information on shared cursors.

Column	Datatype	NULL	Description
NESTED_LEVEL	NUMBER		Nesting level in the dependency tree
TYPE	VARCHAR2(23)		Object type
SCHEMA	VARCHAR2(128)		Object schema
NAME	VARCHAR2(1002)		Object name
SEQ#	NUMBER		Sequence number in the dependency tree. Used for ordering queries. See Also: " IDEPTREE "

6.178 DICT

`DICT` is a synonym for `DICTIONARY`.

 **See Also:**

["DICTIONARY"](#)

6.179 DICT_COLUMNS

`DICT_COLUMNS` contains descriptions of columns in data dictionary tables and views.

Column	Datatype	NULL	Description
TABLE_NAME	VARCHAR2(128)		Name of the object that contains the column
COLUMN_NAME	VARCHAR2(128)		Name of the column
COMMENTS	VARCHAR2(4000)		Text comment on the column

6.180 DICTIONARY

`DICTIONARY` contains descriptions of data dictionary tables and views.

Column	Datatype	NULL	Description
TABLE_NAME	VARCHAR2(128)		Name of the object
COMMENTS	VARCHAR2(4000)		Text comment on the object

6.181 DICTIONARY_CREDENTIALS_ENCRYPT

DICTIONARY_CREDENTIALS_ENCRYPT indicates whether encryption of dictionary credentials is enforced or not. You can encrypt sensitive credential information, such as passwords that are stored in the data dictionary.

Column	Datatype	NULL	Description
ENFORCEMENT	VARCHAR2 (8)		<p>Enforcement status for encryption of dictionary credentials. Possible values:</p> <ul style="list-style-type: none">• ENABLED: Encryption of dictionary credentials is enforced• DISABLED: Encryption of dictionary credentials is not enforced

See Also:

Oracle Database Security Guide for information about encrypting sensitive credential information in the data dictionary

6.182 DM_USER_MODELS

DM_USER_MODELS displays information about the models in the user's schema.

Column	Datatype	NULL	Description
NAME	VARCHAR2 (128)	NOT NULL	Name of the model

Column	Datatype	NULL	Description
FUNCTION_NAME	VARCHAR2(30)		<p>Model function:</p> <ul style="list-style-type: none"> association - Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set. attribute_importance - Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome. classification - Classification is a predictive mining function. A classification model uses historical data to predict new discrete or categorical data. <p>The classification function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).</p> <ul style="list-style-type: none"> clustering - Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set. feature_extraction - Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model. regression - Regression is a predictive mining function. A regression model uses historical data to predict new continuous, numeric data.
ALGORITHM_NAME	VARCHAR2(30)		<p>Algorithm used by the model:</p> <ul style="list-style-type: none"> algo_name - Setting that specifies the algorithm used by the model. asso_max_rule_length - Setting that specifies the maximum length of a rule used by an association model. asso_min_confidence - Setting that specifies the minimum confidence for an association model. asso_min_support - Setting that specifies the minimum support for an association model. clas_cost_table_name - Setting that specifies the name of the cost matrix table for a classification model. clas_priors_table_name - Setting that specifies the name of the prior probability table for NB and ABN models. Decision Tree is the only classification algorithm that does not use priors. <p>For SVM classification models, this setting specifies the name of a table of weights.</p> <ul style="list-style-type: none"> clus_num_clusters - Setting that specifies the number of clusters for a clustering model. feat_num_features - Setting that specifies the number of features for a feature selection model.
CREATION_DATE	DATE	NOT NULL	Date on which the model was created
BUILD_DURATION	NUMBER		Duration of the model build process
TARGET_ATTRIBUTE	VARCHAR2(128)		Attribute designated as the target of a classification model

Column	Datatype	NULL	Description
MODEL_SIZE	NUMBER		Size of the model (in megabytes)

6.183 DOCUMENT_LINKS

DOCUMENT_LINKS provides system information about Oracle XML DB document links in Oracle XML DB Repository documents.

When an XML document that includes XLink or XInclude links is added to the repository, these links can be mapped to document links, which are tracked using view DOCUMENT_LINKS.

Column	Datatype	NULL	Description
SOURCE_ID	RAW(16)		The source resource OID
TARGET_ID	RAW(16)		The target resource OID
TARGET_PATH	VARCHAR2(4000)		This column is always NULL. It is reserved for future use.
LINK_TYPE	VARCHAR2(8)		The document link type: Hard or Weak
LINK_FORM	VARCHAR2(8)		Whether the original link was of form XLink or XInclude
SOURCE_TYPE	VARCHAR2(17)		Whether the link is contained in Resource Content or Resource Metadata

 **See Also:**

Oracle XML DB Developer's Guide for information about using this view

6.184 ERROR_SIZE

ERROR_SIZE is accessed to create DBA_OBJECT_SIZE and USER_OBJECT_SIZE.

 **See Also:**

- "[DBA_OBJECT_SIZE](#)"
- "[USER_OBJECT_SIZE](#)"

6.185 EXCEPTIONS

EXCEPTIONS contains information on violations of integrity constraints. This table is created by the utlexcpt.sql script.

Column	Datatype	NULL	Description
ROW_ID	ROWID		Row that caused the violation

Column	Datatype	NULL	Description
OWNER	VARCHAR2 (128)		Owner of the table
TABLE_NAME	VARCHAR2 (128)		Name of the table
CONSTRAINT	VARCHAR2 (128)		Integrity constraint that was violated

6.186 FLASHBACK_TRANSACTION_QUERY

FLASHBACK_TRANSACTION_QUERY displays information about all flashback transaction queries in the database.

The database must have at least minimal supplemental logging enabled to avoid unpredictable behavior.

Column	Datatype	NULL	Description
XID	RAW (8)		Transaction identifier
START_SCN	NUMBER		Transaction start system change number (SCN)
START_TIMESTAMP	DATE		Transaction start timestamp
COMMIT_SCN	NUMBER		Transaction commit system change number; NULL for active transactions
COMMIT_TIMESTAMP	DATE		Transaction commit timestamp; NULL for active transactions
LOGON_USER	VARCHAR2 (128)		Logon user for the transaction
UNDO_CHANGE#	NUMBER		Undo system change number (1 or higher)
OPERATION	VARCHAR2 (32)		Forward-going DML operation performed by the transaction: <ul style="list-style-type: none"> • D - Delete • I - Insert • U - Update • B • UNKNOWN
TABLE_NAME	VARCHAR2 (256)		Name of the table to which the DML applies
TABLE_OWNER	VARCHAR2 (386)		Owner of the table to which the DML applies
ROW_ID	VARCHAR2 (19)		Rowid of the row that was modified by the DML
UNDO_SQL	VARCHAR2 (4000)		SQL to undo the DML indicated by OPERATION

See Also:

Oracle Database Utilities for information on how to enable minimal supplemental logging

6.187 GLOBAL_CONTEXT

`GLOBAL_CONTEXT` displays the values of global context attributes, which are accessible for the current session, based on the `CLIENT_IDENTIFIER` value.

`GLOBAL_CONTEXT` is similar to `SESSION_CONTEXT`, which lists the values of session (or local) context attributes set under the current session.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2 (31)		Namespace of the globally accessible context
ATTRIBUTE	VARCHAR2 (31)		Attribute of the globally accessible context
VALUE	VARCHAR2 (4000)		Value of the attribute of the globally accessible context
USERNAME	VARCHAR2 (31)		Username for which globally accessible context value is applicable
CLIENT_IDENTIFIER	VARCHAR2 (65)		Client identifier of the globally accessible context

 **See Also:**

- "[SESSION_CONTEXT](#)"
- *Oracle Database Security Guide* for more information about using global application contexts

6.188 GLOBAL_NAME

`GLOBAL_NAME` contains one row that displays the global name of the current database.

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2 (4000)		Global name of the database

6.189 HS_ALL_CAPS

`HS_ALL_CAPS` contains information about all of the capabilities (that is, features) associated with non-Oracle (FDS) data stores.

Column	Datatype	NULL	Description
CAP_NUMBER	NUMBER		Capability number
CONTEXT	NUMBER		Context in which this capability is applicable
TRANSLATION	VARCHAR2 (255)		Valid for functions; contains translation to FDS dialect
ADDITIONAL_INFO	NUMBER		Flag for internal use
FDS_CLASS_NAME	VARCHAR2 (30)		Name of the FDS Class
FDS_INST_NAME	VARCHAR2 (30)		Name of the FDS instance

6.190 HS_ALL_DD

HS_ALL_DD contains data dictionary information about non-Oracle (FDS) data stores.

Column	Datatype	NULL	Description
DD_TABLE_NAME	VARCHAR2(128)		Data dictionary table name
TRANSLATION_TYPE	CHAR(1)		T = Translation, M = Mimic
TRANSLATION_TEXT	VARCHAR2(4000)		SQL statement containing the mapping
FDS_CLASS_NAME	VARCHAR2(30)		Name of the FDS Class
FDS_INST_NAME	VARCHAR2(30)		Name of the FDS instance
DD_TABLE_DESC	VARCHAR2(255)		Description of the Oracle data dictionary table

6.191 HS_ALL_INITS

HS_ALL_INITS contains initialization parameter information about non-Oracle (FDS) data stores.

Column	Datatype	NULL	Description
INIT_VALUE_NAME	VARCHAR2(64)		Name of the initialization parameter
INIT_VALUE	VARCHAR2(255)		Value of the initialization parameter
INIT_VALUE_TYPE	VARCHAR2(1)		Environment variable (T or F). T means this is an environment variable; F means do not set as an environment variable
FDS_CLASS_NAME	VARCHAR2(30)		Name of the FDS Class
FDS_INST_NAME	VARCHAR2(30)		Name of the FDS instance

6.192 HS_BASE_CAPS

HS_BASE_CAPS contains information about base capability (that is, base features) of the non-Oracle (FDS) data store.

Column	Datatype	NULL	Description
CAP_NUMBER	NUMBER	NOT NULL	Capability number
CAP_DESCRIPTION	VARCHAR2(255)		Description of the capability

6.193 HS_BASE_DD

HS_BASE_DD displays information from the base data dictionary translation table.

Column	Datatype	NULL	Description
DD_TABLE_NAME	VARCHAR2(128)	NOT NULL	Name of the Oracle data dictionary table
DD_TABLE_DESC	VARCHAR2(255)		Description of the Oracle data dictionary table

Column	Datatype	NULL	Description
DD_TABLE_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)

6.194 HS_CLASS_CAPS

HS_CLASS_CAPS contains information about the class-specific (driver) capabilities belonging to the non-Oracle (FDS) data store.

Column	Datatype	NULL	Description
CAP_NUMBER	NUMBER	NOT NULL	Capability number
CAP_DESCRIPTION	VARCHAR2 (255)		Capability description
CONTEXT	NUMBER		Flag indicating the context in which the capability is enabled
TRANSLATION	VARCHAR2 (255)		Valid for functions; contains translation to FDS dialect
ADDITIONAL_INFO	NUMBER		Additional flags for internal use
FDS_CLASS_NAME	VARCHAR2 (30)	NOT NULL	Name of the FDS Class
FDS_CLASS_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)

6.195 HS_CLASS_DD

HS_CLASS_DD displays information from the non-Oracle data store (FDS) class-specific data dictionary translations.

Column	Datatype	NULL	Description
DD_TABLE_NAME	VARCHAR2 (128)	NOT NULL	Name of the Oracle data dictionary table
DD_TABLE_DESC	VARCHAR2 (255)		Description of the Oracle data dictionary table
TRANSLATION_TYPE	CHAR (1)	NOT NULL	T = Translation, M = Mimic
TRANSLATION_TEXT	VARCHAR2 (4000)		SQL statement containing the mapping
FDS_CLASS_NAME	VARCHAR2 (30)	NOT NULL	Name of the FDS Class
DD_TABLE_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)
FDS_CLASS_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)

6.196 HS_CLASS_INIT

HS_CLASS_INIT displays information about the non-Oracle (FDS) class-specific initialization parameters.

Column	Datatype	NULL	Description
INIT_VALUE_NAME	VARCHAR2 (64)	NOT NULL	Name of the initialization parameter
INIT_VALUE	VARCHAR2 (255)	NOT NULL	Value of the initialization parameter

Column	Datatype	NULL	Description
INIT_VALUE_TYPE	VARCHAR2(1)	NOT NULL	Environment variable (T or F). T means this is an environment variable; F means do not set as an environment variable
FDS_CLASS_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS Class
FDS_CLASS_INIT_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)
FDS_CLASS_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)

6.197 HS_FDS_CLASS

HS_FDS_CLASS contains information about legal non-Oracle (FDS) classes.

Column	Datatype	NULL	Description
FDS_CLASS_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS class (for example, ODBC, DB2)
FDS_CLASS_COMMENTS	VARCHAR2(255)		Text description of the non-Oracle class
FDS_CLASS_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)

6.198 HS_FDS_INST

HS_FDS_INST contains information about non-Oracle (FDS) instances.

Column	Datatype	NULL	Description
FDS_INST_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS instance
FDS_INST_COMMENTS	VARCHAR2(255)		Text description of the non-Oracle instance
FDS_CLASS_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS class
FDS_INST_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)
FDS_CLASS_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)

6.199 HS_INST_CAPS

HS_INST_CAPS contains information about instance-specific capabilities (that is, features).

Column	Datatype	NULL	Description
CAP_NUMBER	NUMBER	NOT NULL	Capability number
CAP_DESCRIPTION	VARCHAR2(255)		Capability description
CONTEXT	NUMBER		Context in which this capability is applicable
TRANSLATION	VARCHAR2(255)		Valid for functions; contains translation to FDS dialect
ADDITIONAL_INFO	NUMBER		Additional flags for internal use
FDS_CLASS_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS class (for example, ODBC, DB2)

Column	Datatype	NULL	Description
FDS_INST_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS instance
FDS_CLASS_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)
FDS_INST_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)

6.200 HS_INST_DD

HS_INST_DD displays information from the non-Oracle (FDS) instance-specific data dictionary translations.

Column	Datatype	NULL	Description
DD_TABLE_NAME	VARCHAR2(128)	NOT NULL	Name of the Oracle data dictionary table
DD_TABLE_DESC	VARCHAR2(255)		Description of the Oracle data dictionary table
TRANSLATION_TYPE	CHAR(1)	NOT NULL	T = Translation, M = Mimic
TRANSLATION_TEXT	VARCHAR2(4000)		SQL statement containing the mapping
FDS_CLASS_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS class (for example, ODBC, DB2)
FDS_INST_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS instance
DD_TABLE_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)
FDS_CLASS_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)
FDS_INST_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)

6.201 HS_INST_INIT

HS_INST_INIT contains information about the non-Oracle (FDS) instance-specific initialization parameters.

Column	Datatype	NULL	Description
INIT_VALUE_NAME	VARCHAR2(64)	NOT NULL	Name of the initialization parameter
INIT_VALUE	VARCHAR2(255)	NOT NULL	Value of the initialization parameter
INIT_VALUE_TYPE	VARCHAR2(1)	NOT NULL	Environment variable (T or F). T means this is an environment variable; F means do not set as an environment variable
FDS_CLASS_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS class (for example: ODBC, DB2)
FDS_INST_NAME	VARCHAR2(30)	NOT NULL	Name of the FDS instance
FDS_INST_INIT_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)
FDS_CLASS_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)
FDS_INST_ID	NUMBER	NOT NULL	Sequence: a counter that is incremented for every row inserted (used internally)

6.202 IDEPTREE

This view, created by `utldtree.sql`, lists the indented dependency tree. It is a pre-sorted, pretty-print version of DEPTREE.

Column	Datatype	NULL	Description
NESTED_LEVEL	NUMBER		Nesting level in the dependency tree
TYPE	VARCHAR2(23)		Object type
OWNER	VARCHAR2(28)		Object schema
NAME	VARCHAR2(1002)		Object name

6.203 IND

IND is a synonym for USER_INDEXES.

 **See Also:**

["USER_INDEXES"](#)

6.204 INDEX_HISTOGRAM

INDEX_HISTOGRAM contains information from the ANALYZE INDEX ... VALIDATE STRUCTURE statement.

 **Note:**

The ANALYZE INDEX ... VALIDATE STRUCTURE OFFLINE statement must be used to collect statistics.

Column	Datatype	NULL	Description
REPEAT_COUNT	NUMBER		Number of times that one or more index keys is repeated in the table
KEYS_WITH_REPEAT_COUNT	NUMBER		Number of index keys that are repeated that many times

6.205 INDEX_STATS

INDEX_STATS stores information from the last ANALYZE INDEX ... VALIDATE STRUCTURE statement.

 **Note:**

The ANALYZE INDEX ... VALIDATE STRUCTURE OFFLINE statement must be used in order to collect statistics

Column	Datatype	NULL	Description
HEIGHT	NUMBER		Height of the B-Tree
BLOCKS	NUMBER	NOT NULL	Blocks allocated to the segment
NAME	VARCHAR2(128)	NOT NULL	Name of the index
PARTITION_NAME	VARCHAR2(128)		Name of the partition of the index which was analyzed. If the index is not partitioned, NULL is returned.
LF_ROWS	NUMBER		Number of leaf rows (values in the index)
LF_BLKS	NUMBER		Number of leaf blocks in the B-Tree
LF_ROWS_LEN	NUMBER		Sum of the lengths of all the leaf rows
LF_BLK_LEN	NUMBER		Usable space in a leaf block
BR_ROWS	NUMBER		Number of branch rows in the B-Tree
BR_BLKS	NUMBER		Number of branch blocks in the B-Tree
BR_ROWS_LEN	NUMBER		Sum of the lengths of all the branch blocks in the B-Tree
BR_BLK_LEN	NUMBER		Usable space in a branch block
DEL_LF_ROWS	NUMBER		Number of deleted leaf rows in the index
DEL_LF_ROWS_LEN	NUMBER		Total length of all deleted rows in the index
DISTINCT_KEYS	NUMBER		Number of distinct keys in the index (may include rows that have been deleted)
MOST_REPEATED_KEY	NUMBER		How many times the most repeated key is repeated (may include rows that have been deleted)
BTREE_SPACE	NUMBER		Total space currently allocated in the B-Tree
USED_SPACE	NUMBER		Total space that is currently being used in the B-Tree
PCT_USED	NUMBER		Percent of space allocated in the B-Tree that is being used
ROWS_PER_KEY	NUMBER		Average number of rows per distinct key (this figure is calculated without consideration of deleted rows)
BLKS_GETS_PER_ACCESS	NUMBER		Expected number of consistent mode block reads per row, assuming that a randomly chosen row is accessed using the index. Used to calculate the number of consistent reads that will occur during an index scan.
PRE_ROWS	NUMBER		Number of prefix rows (values in the index)
PRE_ROWS_LEN	NUMBER		Sum of lengths of all prefix rows

Column	Datatype	NULL	Description
OPT_CMPR_COUNT	NUMBER		Optimal index compression length
OPT_CMPR_PCTSAVE	NUMBER		Corresponding space savings after an ANALYZE
DEL_LF_CMP_ROWS	NUMBER		Number of deleted rows that are within a compression unit (CU)
PRG_LF_CMP_ROWS	NUMBER		Number of purged rows that are within a CU
LF_CMP_ROWS	NUMBER		Number of rows that are in a CU or prefix compressed
LF_CMP_ROWS_LEN	NUMBER		Sum of lengths of all prefix rows and CUs
LF_UNCMP_ROWS	NUMBER		Number of rows that are neither in a CU nor prefix compressed
LF_UNCMP_ROWS_LEN	NUMBER		Sum of lengths of rows that are neither in a CU nor prefix compressed
LF_SUF_ROWS_LEN	NUMBER		Sum of lengths of suffix rows
LF_CMP_ROWS_UNCMP_LEN	NUMBER		Sum of the uncompressed lengths of rows that are in a CU or prefix compressed
LF_CMP_RECMP_COUNT	NUMBER		Sum of CU recompression counts
LF_CMP_LOCK_VEC_LEN	NUMBER		Sum of CU lock vector lengths
LF_CMP_BLKS	NUMBER		Number of blocks that have a CU or nonzero prefix column count
LF_UNCMP_BLKS	NUMBER		Number of blocks that do not have a CU and have a zero prefix column count

6.206 LOGSTDBY_UNSUPPORTED_TABLES

LOGSTDBY_UNSUPPORTED_TABLES is a synonym for DBA_LOGSTDBY_UNSUPPORTED_TABLE.

 **See Also:**

["DBA_LOGSTDBY_UNSUPPORTED_TABLE"](#)

6.207 MAP_OBJECT

MAP_OBJECT is a global temporary table that displays the hierarchical arrangement of storage containers for objects. Each row in the table represents a level in the hierarchy.

Column	Datatype	NULL	Description
OBJECT_NAME	VARCHAR2(2000)		Name of the object
OBJECT_OWNER	VARCHAR2(2000)		Owner of the object
OBJECT_TYPE	VARCHAR2(2000)		Object type
FILE_MAP_IDX	NUMBER		File index (corresponds to FILE_MAP_IDX in V\$MAP_FILE)
DEPTH	NUMBER		Element depth within the I/O stack
ELEM_IDX	NUMBER		Index corresponding to the element

Column	Datatype	NULL	Description
CU_SIZE	NUMBER		Contiguous set of logical blocks of the file (in HKB units) that is resident contiguously on the element
STRIDE	NUMBER		Number of HKB between contiguous units (CU) in the file that are contiguous on this element. Used in RAID5 and striped files.
NUM CU	NUMBER		Number of contiguous units that are adjacent to each other on this element that are separated by STRIDE HKB in the file. In RAID5, the number of contiguous units also include the parity stripes.
ELEM_OFFSET	NUMBER		Element offset (in HKB units)
FILE_OFFSET	NUMBER		Offset (in HKB units) from the start of the file to the first byte of the contiguous units
DATA_TYPE	VARCHAR2 (2000)		Data type (DATA, PARITY, or DATA AND PARITY)
PARITY_POS	NUMBER		Position of the parity. Only for RAID5. This field is needed to distinguish the parity from the data part.
PARITY_PERIOD	NUMBER		Parity period. Only for RAID5.

6.208 NLS_DATABASE_PARAMETERS

NLS_DATABASE_PARAMETERS lists permanent NLS parameters of the database.

Column	Datatype	NULL	Description
PARAMETER	VARCHAR2 (128)		Parameter name
VALUE	VARCHAR2 (64)		Parameter value

6.209 NLS_INSTANCE_PARAMETERS

NLS_INSTANCE_PARAMETERS lists NLS parameters of the instance.

Column	Datatype	NULL	Description
PARAMETER	VARCHAR2 (30)		Parameter name
VALUE	VARCHAR2 (64)		Parameter value

6.210 NLS_SESSION_PARAMETERS

NLS_SESSION_PARAMETERS lists NLS parameters of the user session.

Column	Datatype	NULL	Description
PARAMETER	VARCHAR2 (30)		Parameter name
VALUE	VARCHAR2 (64)		Parameter value

6.211 OBJ

OBJ is a synonym for USER_OBJECTS.

 **See Also:**

"USER_OBJECTS"

6.212 PATH_VIEW

PATH_VIEW contains one row for each unique path to access a resource in the Oracle XML DB repository.

Column	Datatype	NULL	Description
PATH	VARCHAR2 (1024)		An (absolute) path to repository resource RES
RES	XMLTYPE(XMLSchema "http://xmlns.oracle.com/xdb/b/XDBResource.xsd" Element "Resource")		The resource referred to by the PATH column
LINK	XMLTYPE		Link property
RESID	RAW(16)		Resource OID

 **See Also:**

Oracle XML DB Developer's Guide for information about using this view

6.213 PDB_ALERTS

PDB_ALERTS contains descriptions of reasons for PDB alerts.

Column	Datatype	NULL	Description
TIME	TIMESTAMP (6)	NOT NULL	Time when the violation happened
NAME	VARCHAR2 (128)	NOT NULL	A name of a PDB or non-CDB to which this record applies
CAUSE_NO	NUMBER	NOT NULL	Number identifying a specific reason for a PDB alert
TYPE_NO	NUMBER	NOT NULL	Type of the violation
ERROR	NUMBER		Oracle error, if any, for this violation
LINE	NUMBER	NOT NULL	Line number for the violation message
MESSAGE	VARCHAR2 (4000)	NOT NULL	Description of the violation

Column	Datatype	NULL	Description
STATUS	NUMBER		Status of the violation
ACTION	VARCHAR2 (4000)		Actions to take to resolve the violations

6.214 PDB_PLUG_IN_VIOLATIONS

PDB_PLUG_IN_VIOLATIONS displays information about incompatibilities between a PDB and the CDB to which it belongs.

This view is also used to display information generated by executing DBMS_PDB.CHECK_PLUG_COMPATIBILITY.

Column	Datatype	NULL	Description
TIME	TIMESTAMP (6)	NOT NULL	Time when a violation described by this row was discovered
NAME	VARCHAR2 (128)	NOT NULL	The name of an existing PDB or a PDB intended to be created (if a row was entered as a result of running DBMS_PDB.CHECK_PLUG_COMPATIBILITY)
CAUSE	VARCHAR2 (64)	NOT NULL	Attribute which was being checked
TYPE	VARCHAR2 (9)	NOT NULL	ERROR or WARNING
ERROR_NUMBER	NUMBER		Oracle error number, if any, encountered during a check
LINE	NUMBER	NOT NULL	Used to differentiate between violations which share a cause
MESSAGE	VARCHAR2 (4000)	NOT NULL	Description of a violation
STATUS	VARCHAR2 (9)		PENDING, RESOLVED, or IGNORE
ACTION	VARCHAR2 (4000)		Description of an action to take to correct the violation
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_PDB package, which provides an interface for examining and manipulating data about PDBs

6.215 PLAN_TABLE

`PLAN_TABLE` is automatically created as a global temporary table to hold the output of an `EXPLAIN PLAN` statement for all users.

`PLAN_TABLE` is the default sample output table into which the `EXPLAIN PLAN` statement inserts rows describing execution plans.

While a `PLAN_TABLE` table is automatically set up for each user, you can use the SQL script `utlxplan.sql` to manually create a local `PLAN_TABLE` in your schema.

Column	Datatype	NULL	Description
STATEMENT_ID	VARCHAR2(30)		Value of the optional <code>STATEMENT_ID</code> parameter specified in the <code>EXPLAIN PLAN</code> statement
PLAN_ID	NUMBER		Unique identifier of a plan in the database
TIMESTAMP	DATE		Date and time when the <code>EXPLAIN PLAN</code> statement was generated
REMARKS	VARCHAR2(4000)		Any comment (of up to 4000 bytes) you want to associate with each step of the explained plan. This column is used to indicate whether an outline or SQL Profile was used for the query. If you need to add or change a remark on any row of the <code>PLAN_TABLE</code> , then use the <code>UPDATE</code> statement to modify the rows of the <code>PLAN_TABLE</code> .
OPERATION	VARCHAR2(30)		Name of the internal operation performed in this step. In the first row generated for a statement, the column contains one of the following values: <ul style="list-style-type: none">• DELETE STATEMENT• INSERT STATEMENT• SELECT STATEMENT• UPDATE STATEMENT
OPTIONS	VARCHAR2(255)		A variation on the operation described in the <code>OPERATION</code> column
OBJECT_NODE	VARCHAR2(128)		Name of the database link used to reference the object (a table name or view name). For local queries using parallel execution, this column describes the order in which output from operations is consumed.
OBJECT_OWNER	VARCHAR2(128)		Owner of the table or index
OBJECT_NAME	VARCHAR2(128)		Name of the table or index
OBJECT_ALIAS	VARCHAR2(261)		Unique alias of a table or view in a SQL statement. For indexes, it is the object alias of the underlying table.
OBJECT_INSTANCE	NUMBER(38)		Number corresponding to the ordinal position of the object as it appears in the original statement. The numbering proceeds from left to right, outer to inner with respect to the original statement text. View expansion results in unpredictable numbers.
OBJECT_TYPE	VARCHAR2(30)		Modifier that provides descriptive information about the object; for example, <code>NON-UNIQUE</code> for indexes
OPTIMIZER	VARCHAR2(255)		Current mode of the optimizer
SEARCH_COLUMNS	NUMBER		Not currently used

Column	Datatype	NULL	Description
ID	NUMBER (38)		A number assigned to each step in the execution plan
PARENT_ID	NUMBER (38)		ID of the next execution step that operates on the output of the ID step
DEPTH	NUMBER (38)		Depth of the operation in the row source tree that the plan represents. The value can be used for indenting the rows in a plan table report.
POSITION	NUMBER (38)		For the first row of output, this indicates the optimizer's estimated cost of executing the statement. For the other rows, it indicates the position relative to the other children of the same parent.
COST	NUMBER (38)		Cost of the operation as estimated by the optimizer's query approach. Cost is not determined for table access operations. The value of this column does not have any particular unit of measurement; it is merely a weighted value used to compare costs of execution plans. The value of this column is a function of the CPU_COST and IO_COST columns.
CARDINALITY	NUMBER (38)		Estimate by the query optimization approach of the number of rows accessed by the operation
BYTES	NUMBER (38)		Estimate by the query optimization approach of the number of bytes accessed by the operation
OTHER_TAG	VARCHAR2 (255)		<p>Describes the contents of the OTHER column:</p> <ul style="list-style-type: none"> • SERIAL - Serial execution. Currently, SQL is not loaded in the OTHER column for this case. • SERIAL_FROM_REMOTE - Serial execution at a remote site. • PARALLEL_FROM_SERIAL - Serial execution. Output of step is partitioned or broadcast to parallel execution servers. • PARALLEL_TO_SERIAL - Parallel execution. Output of step is returned to serial query coordinator (QC) process. • PARALLEL_TO_PARALLEL - Parallel execution. Output of step is repartitioned to second set of parallel execution servers. • PARALLEL_COMBINED_WITH_PARENT - Parallel execution; Output of step goes to next step in same parallel process. No interprocess communication to parent. • PARALLEL_COMBINED_WITH_CHILD - Parallel execution. Input of step comes from prior step in same parallel process. No interprocess communication from child.

Column	Datatype	NULL	Description
PARTITION_START	VARCHAR2 (255)		<p>Start partition of a range of accessed partitions:</p> <ul style="list-style-type: none"> • <i>number</i> - Start partition has been identified by the SQL compiler, and its partition number is given by <i>number</i> • KEY - Start partition will be identified at run time from partitioning key values • ROW LOCATION - Start partition (same as the stop partition) will be computed at run time from the location of each record being retrieved. The record location is obtained from a user-specified ROWID or from a global index. • INVALID - Range of accessed partitions is empty
PARTITION_STOP	VARCHAR2 (255)		<p>Stop partition of a range of accessed partitions:</p> <ul style="list-style-type: none"> • <i>number</i> - Stop partition has been identified by the SQL compiler, and its partition number is given by <i>number</i> • KEY - Stop partition will be identified at run time from partitioning key values • ROW LOCATION - Stop partition (same as the start partition) will be computed at run time from the location of each record being retrieved. The record location is obtained from a user-specified ROWID or from a global index. • INVALID - Range of accessed partitions is empty
PARTITION_ID	NUMBER (38)		Step that has computed the pair of values of the PARTITION_START and PARTITION_STOP columns
OTHER	LONG		Other information that is specific to the execution step that a user might find useful (see the OTHER_TAG column)
OTHER_XML	CLOB		<p>Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML since multiple pieces of information can be stored there. This includes:</p> <ul style="list-style-type: none"> • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan
DISTRIBUTION	VARCHAR2 (30)		Method used to distribute rows from producer query servers to consumer query servers
CPU_COST	NUMBER (38)		CPU cost of the operation as estimated by the query optimizer's approach. The value of this column is proportional to the number of machine cycles required for the operation. For statements that use the rule-based approach, this column is NULL.

Column	Datatype	NULL	Description
IO_COST	NUMBER (38)		I/O cost of the operation as estimated by the query optimizer's approach. The value of this column is proportional to the number of data blocks read by the operation. For statements that use the rule-based approach, this column is NULL.
TEMP_SPACE	NUMBER (38)		Temporary space (in bytes) used by the operation as estimated by the query optimizer's approach. For statements that use the rule-based approach, or for operations that do not use any temporary space, this column is NULL.
ACCESS_PREDICATES	VARCHAR2 (4000)		Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.
FILTER_PREDICATES	VARCHAR2 (4000)		Predicates used to filter rows before producing them
PROJECTION	VARCHAR2 (4000)		Expressions produced by the operation
TIME	NUMBER (38)		Elapsed time (in seconds) of the operation as estimated by query optimization. For statements that use the rule-based approach, this column is NULL.
QBLOCK_NAME	VARCHAR2 (128)		Name of the query block (either system-generated or defined by the user with the QB_NAME hint)

6.216 PLUGGABLE_SET_CHECK

PLUGGABLE_SET_CHECK contains pluggable set checks.

Column	Datatype	NULL	Description
OBJ1_OWNER	VARCHAR2 (128)		Owner of the object
OBJ1_NAME	VARCHAR2 (128)		Object 1
OBJ1_SUBNAME	VARCHAR2 (128)		SubObject1Name
OBJ1_TYPE	VARCHAR2 (18)		Object Type
TS1_NAME	VARCHAR2 (30)		Tablespace containing Object 1
OBJ2_NAME	VARCHAR2 (128)		Object Name
OBJ2_SUBNAME	VARCHAR2 (128)		SubObject2Name
OBJ2_TYPE	VARCHAR2 (18)		Object Type
OBJ2_OWNER	VARCHAR2 (128)		Object owner of second object
TS2_NAME	VARCHAR2 (30)		Tablespace containing Object 1
CONSTRAINT_NAME	VARCHAR2 (128)		Name of dependent constraint
REASON	VARCHAR2 (86)		Reason for Pluggable check violation
MESG_ID	NUMBER		The message ID

6.217 PRODUCT_COMPONENT_VERSION

PRODUCT_COMPONENT_VERSION contains version and status information for component products.

Column	Datatype	NULL	Description
PRODUCT	VARCHAR2 (80)		Product name
VERSION	VARCHAR2 (80)		Version number
VERSION_FULL	VARCHAR2 (160)		The version number with the new Oracle Database version scheme introduced in Oracle Database 18c. The version number is displayed only for the database component. All other components return a null value for this column.
STATUS	VARCHAR2 (80)		Status of release

6.218 PROXY_USERS

PROXY_USERS describes the list of proxy users and the clients on whose behalf they can act.

Column	Datatype	NULL	Description
PROXY	VARCHAR2 (128)	NOT NULL	Name of a proxy user
CLIENT	VARCHAR2 (128)	NOT NULL	Name of the client user who the proxy user can act as
AUTHENTICATION	VARCHAR2 (3)		Indicates whether the proxy is required to supply the client's authentication credentials (YES) or not (NO)
FLAGS	VARCHAR2 (35)		Flags associated with the proxy/client pair: <ul style="list-style-type: none"> • PROXY MAY ACTIVATE ALL CLIENT ROLES • NO CLIENT ROLES MAY BE ACTIVATED • PROXY MAY ACTIVATE ROLE • PROXY MAY ACTIVATE ALL CLIENT ROLES • PROXY MAY NOT ACTIVATE ROLE

6.219 PSTUBTBL

This table contains information on stubs generated by the PSTUB utility so that an Oracle Forms 3.0 client can call stored procedures in Oracle Database.

 **Note:**

The contents of this table are intended only for use by the PSTUB utility.

Column	Datatype	NULL	Description
USERNAME	VARCHAR2 (128)		Schema part of the identifier of a stored procedure
DBNAME	VARCHAR2 (128)		Database link part of the identifier of a stored procedure
LUN	VARCHAR2 (128)		Library unit name part of the identifier of a stored procedure
LUTYPE	VARCHAR2 (3)		Type of the stored procedure
LINENO	NUMBER		Line number of the stub
LINE	VARCHAR2 (1800)		Text of the stub

6.220 PUBLIC_DEPENDENCY

`PUBLIC_DEPENDENCY` lists dependencies to and from objects, by object number.

Column	Datatype	NULL	Description
OBJECT_ID	NUMBER	NOT NULL	Object number
REFERENCED_OBJECT_ID	NUMBER	NOT NULL	Referenced object (the parent object)

6.221 PUBLICSYN

`PUBLICSYN` contains information on public synonyms.

Column	Datatype	NULL	Description
SNAME	VARCHAR2(128)		Name of the synonym
CREATOR	VARCHAR2(128)		Owner of the synonym
TNAME	VARCHAR2(128)		Table of which this is a synonym
DATABASE	VARCHAR2(128)		Database in which the table resides
TABTYPE	VARCHAR2(10)		Type of table

6.222 QUEUE_PRIVILEGES

`QUEUE_PRIVILEGES` shows all Advanced Queuing object privileges granted to the session.

Column	Datatype	NULL	Description
GRANTEE	VARCHAR2(128)	NOT NULL	Name of the user or role to whom access was granted
OWNER	VARCHAR2(128)	NOT NULL	Owner of the object
NAME	VARCHAR2(128)	NOT NULL	Name of the object
GRANTOR	VARCHAR2(128)	NOT NULL	Name of the user who performed the grant
ENQUEUE_PRIVILEGE	NUMBER		Permission to ENQUEUE to the queue
DEQUEUE_PRIVILEGE	NUMBER		Permission to DEQUEUE from the queue

6.223 RECYCLEBIN

`RECYCLEBIN` is a synonym for `USER_RECYCLEBIN`.

 **See Also:**

["USER_RECYCLEBIN"](#)

6.224 REDACTION_COLUMNS

`REDACTION_COLUMNS` describes all redacted columns in the database, giving the owner of the table or view within which the column resides, the object name, the column name, the type of redaction function, the parameters to the redaction function (if any), and an optional user-provided description of the redaction function that is performed on the column.

Column	Datatype	NULL	ullDescription
OBJECT_OWNER	VARCHAR2(128)	NOT NULL	Owner of the object that is redacted
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of the object that is redacted
COLUMN_NAME	VARCHAR2(128)	NOT NULL	Name of the column that is redacted
FUNCTION_TYPE	VARCHAR2(27)		Redaction function for this column
FUNCTION_PARAMETERS	VARCHAR2(1000)		Redaction function_parameters for this column
REGEXP_PATTERN	VARCHAR2(512)		Regular expression pattern to search for
REGEXP_REPLACE_STRING	VARCHAR2(4000)		Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form \n, (where n is a number from 1 to 9)
REGEXP_POSITION	NUMBER		Integer counting from 1, giving the position where the search should begin
REGEXP_OCCURRENCE	NUMBER		Either 0 (to replace all occurrences of the match), or a positive integer n (to replace the nth occurrence of the match)
REGEXP_MATCH_PARAMETER	VARCHAR2(10)		To change the default matching behavior, possible values are a combination of i, c, n, m, and x. See the documentation of the <code>match_parameter</code> in the <code>REGEXP_REPLACE</code> section of the <i>Oracle Database SQL Language Reference</i> .
COLUMN_DESCRIPTION	VARCHAR2(4000)		User-provided description of the redaction function that is performed on the column. For example, for a Social Security Number column, the description might be: "redact SSN to XXX-XX-(last 4 digits)".

 **See Also:**

Oracle Database Advanced Security Guide for more information about Oracle Data Redaction

6.225 REDACTION_EXPRESSIONS

`REDACTION_EXPRESSIONS` shows all the Data Redaction named Policy Expressions in the database.

Column	Datatype	NULL	Description
POLICY_EXPRESSION_NAME	VARCHAR2(256)		Customer-specified name of the named Policy Expression

Column	Datatype	NULL	Description
EXPRESSION	VARCHAR2(4000)		The SQL expression defined for this Data Redaction named Policy Expression
OBJECT_OWNER	VARCHAR2(128)		Owner of the table or view which this named Policy Expression is associated with
OBJECT_NAME	VARCHAR2(128)		Name of the table or view which this named Policy Expression is associated with
COLUMN_NAME	VARCHAR2(128)		Name of the column which this named Policy Expression is associated with
POLICY_EXPRESSION_DESCRIPTION	VARCHAR2(4000)		Description of this named Policy Expression

 **See Also:**

Oracle Database Advanced Security Guide for more information about Oracle Data Redaction

6.226 REDACTION_POLICIES

`REDACTION_POLICIES` displays all redaction policies in the database.

Column	Datatype	NULL	Description
OBJECT_OWNER	VARCHAR2(128)	NOT NULL	Owner of the object with the policy
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of the object with the policy
POLICY_NAME	VARCHAR2(128)	NOT NULL	Name of the policy
EXPRESSION	VARCHAR2(4000)	NOT NULL	Expression for this policy
ENABLE	VARCHAR2(7)		Indicates whether the policy is enabled (YES) or not (NO)
POLICY_DESCRIPTION	VARCHAR2(4000)		Description of the policy

 **See Also:**

Oracle Database Advanced Security Guide for more information about Oracle Data Redaction

6.227 REDACTION_VALUES_FOR_TYPE_FULL

`REDACTION_VALUES_FOR_TYPE_FULL` shows all of the current values for full redaction.

For example, if a redaction policy is applied to a column of type `BINARY_DOUBLE` and the redaction type is full redaction, that column will be redacted with the value shown in the `BINARY_DOUBLE_VALUE` column of this view.

Column	Datatype	NULL	Description
NUMBER_VALUE	NUMBER	NOT NULL	Redaction result for full redaction on NUMBER columns
BINARY_FLOAT_VALUE	BINARY_FLOAT	NOT NULL	Redaction result for full redaction on BINARY_FLOAT columns
BINARY_DOUBLE_VALUE	BINARY_DOUBLE	NOT NULL	Redaction result for full redaction on BINARY_DOUBLE columns
CHAR_VALUE	VARCHAR2(1)		Redaction result for full redaction on CHAR columns
VARCHAR_VALUE	VARCHAR2(1)		Redaction result for full redaction on VARCHAR2 columns
NCHAR_VALUE	NCHAR(1)		Redaction result for full redaction on NCHAR columns
NVARCHAR_VALUE	NVARCHAR2(1)		Redaction result for full redaction on NVARCHAR2 columns
DATE_VALUE	DATE	NOT NULL	Redaction result for full redaction on DATE columns
TIMESTAMP_VALUE	TIMESTAMP(6)	NOT NULL	Redaction result for full redaction on TIMESTAMP columns
TIMESTAMP_WITH_TIME_ZONE_VALUE	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Redaction result for full redaction on TIMESTAMP WITH TIME ZONE columns
BLOB_VALUE	BLOB		Redaction result for full redaction on BLOB columns
CLOB_VALUE	CLOB		Redaction result for full redaction on CLOB columns
NCLOB_VALUE	NCLOB		Redaction result for full redaction on NCLOB columns

 **See Also:**

Oracle Database Advanced Security Guide for more information about Oracle Data Redaction

6.228 REPORT_COMPONENTS

REPORT_COMPONENTS displays metadata about different database components offering reports in XML, HTML, or Text formats.

Reports are first generated in XML and can then be translated into HTML or Text formats, for supported report types. Each component generates one or more reports containing different types of content. You can request reports using the component's own PL/SQL interface (for example, DBMS_SQLTUNE for SQL Tuning Advisor).

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	ID number of the database component building the report
COMPONENT_NAME	VARCHAR2(128)	NOT NULL	Name of the database component building the report (for example, sqltune for SQL Tuning Advisor)
COMPONENT_DESCRIPTION	VARCHAR2(256)		Component description
REPORT_ID	NUMBER	NOT NULL	ID number of the report type
REPORT_NAME	VARCHAR2(128)	NOT NULL	Name of the report type

Column	Datatype	NULL	Description
REPORT_DESCRIPTION	VARCHAR2(256)		Description of the report type
SCHEMA_FILENAME	VARCHAR2(500)		Filename of the XML schema for the report (optional)
SCHEMA_DATA	XMLTYPE		XML schema for this report (optional)

 **See Also:**

Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_SQLTUNE package

6.229 REPORT_FILES

REPORT_FILES displays data for all of the XML schema and XSLT files associated with reports for a given component.

Column	Datatype	NULL	Description
FILENAME	VARCHAR2(500)	NOT NULL	Name of the XSLT/XML schema file
DATA	XMLTYPE		XSLT/XML schema data

6.230 REPORT_FORMATS

REPORT_FORMATS displays metadata about the different output formats supported for reports.

Some reports are generated in XML only, in which case no data will appear in this view. When reports support HTML or Text formats (for example, the SQL Performance Analyzer reports), metadata about the format will appear in this view.

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	ID number of the database component building the report
COMPONENT_NAME	VARCHAR2(128)	NOT NULL	Name of the database component building the report (for example, sqltune for SQL Tuning Advisor)
REPORT_ID	NUMBER	NOT NULL	ID number of the report type
REPORT_NAME	VARCHAR2(128)	NOT NULL	Name of the report type
FORMAT_NAME	VARCHAR2(128)	NOT NULL	Name of the report format
DESCRIPTION	VARCHAR2(256)		Description of the report format

Column	Datatype	NULL	Description
TYPE	VARCHAR2 (6)		Format type: <ul style="list-style-type: none"> • XSLT - Reports generated by applying an XSLT style sheet to XML data (for example, HTML reports) • Text - Reports generated by first applying an XSLT style sheet to convert XML data to HTML, and then converting the HTML to formatted Text using the internal report HTML-to-text translation engine. • Custom - Custom formats implemented natively by report clients
XSLT_FILENAME	VARCHAR2 (500)		Name of the XSLT used for this format (XSLT and Text format types only)
XSLT_DATA	XMLTYPE		XSLT data (XSLT and Text format types only)
TEXT_LINESIZE	NUMBER		Maximum line size of the formatted text report (Text format types only)

6.231 RESOURCE_COST

RESOURCE_COST lists the cost for each resource.

Column	Datatype	NULL	Description
RESOURCE_NAME	VARCHAR2 (32)	NOT NULL	Name of the resource
UNIT_COST	NUMBER	NOT NULL	Cost of the resource

6.232 RESOURCE_MAP

RESOURCE_MAP describes resources. This table can be used to map resource names to resource numbers.

Column	Datatype	NULL	Description
RESOURCE#	NUMBER	NOT NULL	Numeric resource code
TYPE#	NUMBER	NOT NULL	Numeric type code
NAME	VARCHAR2 (32)	NOT NULL	Name of the resource

6.233 RESOURCE_VIEW

RESOURCE_VIEW contains one row for each resource in the Oracle XML DB repository.

Column	Datatype	NULL	Description
RES	XMLTYPE(XMLSchema "http://xmlns.oracle.com/xdb/b/XDBResource.xsd" Element "Resource")		A resource in the repository
ANY_PATH	VARCHAR2 (4000)		An (absolute) path to the resource
RESID	RAW(16)		Resource OID, which is a unique handle to the resource

 **See Also:**

Oracle XML DB Developer's Guide for information about using this view

6.234 ROLE_ROLE_PRIVS

ROLE_ROLE_PRIVS describes the roles granted to other roles.

Information is provided only about roles to which the user has access.

Column	Datatype	NULL	Description
ROLE	VARCHAR2 (128)		Name of the role
GRANTED_ROLE	VARCHAR2 (128)		Role that was granted
ADMIN_OPTION	VARCHAR2 (3)		Signifies that the role was granted with ADMIN option
COMMON	VARCHAR2 (3)		Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> • YES if the role was granted commonly (CONTAINER=ALL was used) • NO if the role was granted locally (CONTAINER=ALL was not used)
INHERITED	VARCHAR2 (3)		Indicates whether the role grant was inherited from another container (YES) or not (NO)

6.235 ROLE_SYS_PRIVS

ROLE_SYS_PRIVS describes system privileges granted to roles.

Information is provided only about roles to which the user has access.

Column	Datatype	NULL	Description
ROLE	VARCHAR2 (128)		Name of the role
PRIVILEGE	VARCHAR2 (40)		System privilege granted to the role
ADMIN_OPTION	VARCHAR2 (3)		Indicates whether the grant was with the ADMIN option (YES) or not (NO)

Column	Datatype	NULL	Description
COMMON	VARCHAR2 (3)		Indicates how the grant was made. Possible values: <ul style="list-style-type: none">• YES if the privilege was granted commonly (CONTAINER=ALL was used)• NO if the privilege was granted locally (CONTAINER=ALL was not used)
INHERITED	VARCHAR2 (3)		Indicates whether the role grant was inherited from another container (YES) or not (NO)

6.236 ROLE_TAB_PRIVS

ROLE_TAB_PRIVS describes table privileges granted to roles. Information is provided only about roles to which the user has access.

Column	Datatype	NULL	Description
ROLE	VARCHAR2 (128)		Name of the role
OWNER	VARCHAR2 (128)		Owner of the object
TABLE_NAME	VARCHAR2 (128)		Name of the object
COLUMN_NAME	VARCHAR2 (128)		Name of the column, if applicable
PRIVILEGE	VARCHAR2 (40)		Object privilege granted to the role
GRANTABLE	VARCHAR2 (3)		YES if the role was granted with ADMIN OPTION; otherwise NO
COMMON	VARCHAR2 (3)		Indicates how the grant was made. Possible values: <ul style="list-style-type: none">• YES if the privilege was granted commonly (CONTAINER=ALL was used)• NO if the privilege was granted locally (CONTAINER=ALL was not used)
INHERITED	VARCHAR2 (3)		Indicates whether the role grant was inherited from another container (YES) or not (NO)

6.237 SCHEDULER_BATCH_ERRORS

SCHEDULER_BATCH_ERRORS displays the errors caused by each call in the batch after a Scheduler batch call (when the COMMIT_SEMANTICS argument has been set to ABSORB_ERRORS).

Column	Datatype	NULL	Description
ARRAY_INDEX	NUMBER		Index of the job in the batch
OBJECT_TYPE	VARCHAR2 (30)		Object type: <ul style="list-style-type: none">• JOB• LIGHTWEIGHT JOB• UNKNOWN
OBJECT_NAME	VARCHAR2 (100)		Full name of the object (including schema)
ATTR_NAME	VARCHAR2 (30)		Name of the attribute being set (if this is a batch set attribute call); NULL otherwise
ERROR_CODE	NUMBER		Top level error code
ERROR_MESSAGE	VARCHAR2 (4000)		Complete error stack

Column	Datatype	NULL	Description
ADDITIONAL_INFO	VARCHAR2(4000)		Additional information (currently unused)

6.238 SCHEMA_EXPORT_OBJECTS

SCHEMA_EXPORT_OBJECTS lists simple path names for some of the object types belonging to a Data Pump schema export, which is invoked using the SCHEMAS parameter on the expdp command.

Users of the Data Pump Export and Import utilities can query this view to determine valid values for the EXCLUDE and INCLUDE parameters.

Column	Datatype	NULL	Description
OBJECT_PATH	VARCHAR2(200)	NOT NULL	Simple path name for the object type
COMMENTS	VARCHAR2(2000)		Comment on the object type
NAMED	CHAR(1)		Do objects of this type have names? If yes (Y), then the name can be specified in the optional name_clause on the EXCLUDE and INCLUDE parameters.

 **See Also:**

- "[DATABASE_EXPORT_OBJECTS](#)"
- "[TABLE_EXPORT_OBJECTS](#)"
- *Oracle Database Utilities* for more information on performing a full Data Pump export using the expdp command

6.239 SEQ

SEQ is a synonym for USER_SEQUENCES.

 **See Also:**

- ["USER_SEQUENCES"](#)

6.240 SESSION_CONTEXT

SESSION_CONTEXT describes the context attributes and their values set for the current session.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)		Namespace that the active attribute is in

Column	Datatype	NULL	Description
ATTRIBUTE	VARCHAR2(128)		Name of the active attribute
VALUE	VARCHAR2(4000)		Value of the active attribute

6.241 SESSION_PRIVS

SESSION_PRIVS describes the system privileges that are currently available to the user.

Column	Datatype	NULL	Description
PRIVILEGE	VARCHAR2(40)	NOT NULL	Name of the privilege

6.242 SESSION_ROLES

SESSION_ROLES describes the roles that are currently enabled to the user.

Column	Datatype	NULL	Description
ROLE	VARCHAR2(128)	NOT NULL	Name of the role

6.243 SOURCE_SIZE

Oracle accesses this view to create views about object size.

 **See Also:**

["DBA_OBJECT_SIZE"](#) and ["USER_OBJECT_SIZE"](#)

6.244 STMT_AUDIT_OPTION_MAP

STMT_AUDIT_OPTION_MAP describes auditing option type codes. This table can be used to map auditing option type numbers to type names.

 **Note:**

This view is populated in any Oracle Database where auditing is enabled, regardless of whether pre-Oracle Database 12c auditing or unified auditing is enabled for the database.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

Note:

The mapping explained in this view is valid for audit configuration from the DBA_STMT_AUDIT_OPTS view only, and such audit configurations can be made when unified auditing is not enabled.

Column	Datatype	NULL	Description
OPTION#	NUMBER	NOT NULL	Numeric auditing option type code
NAME	VARCHAR2 (40)	NOT NULL	Name of the type of auditing option
PROPERTY	NUMBER	NOT NULL	Property flag of the auditing option

See Also:

["DBA_STMT_AUDIT_OPTS"](#)

6.245 SYN

SYN is a synonym for USER_SYNONYMS.

See Also:

["ALL_SYNONYMS"](#)

6.246 SYNONYMS

SYNONYMS is included for compatibility. Oracle recommends that you do not use this view.

6.247 SYS_OBJECTS

SYS_OBJECTS maps object IDs to object types and segment data block addresses.

Column	Datatype	NULL	Description
OBJECT_TYPE	VARCHAR2 (18)		Type of the object
OBJECT_TYPE_ID	NUMBER		Type ID of the object
SEGMENT_TYPE_ID	NUMBER		Type of segment: TABLE, CLUSTER, INDEX, ROLLBACK, DEFERRED ROLLBACK, TEMPORARY, CACHE
OBJECT_ID	NUMBER		Object identifier
HEADER_FILE	NUMBER		ID of the file containing the segment header
HEADER_BLOCK	NUMBER		ID of the block containing the segment header
TS_NUMBER	NUMBER		The tablespace number

6.248 SYSCATALOG

SYSCATALOG is included for compatibility.

Oracle recommends that you do not use this view.

6.249 SYSFILES

SYSFILES is included for compatibility.

Oracle recommends that you do not use this view.

6.250 SYSSEGOBJ

SYSSEGOBJ is included for compatibility.

Oracle recommends that you do not use this view.

6.251 SYSTEM_PRIVILEGE_MAP

SYSTEM_PRIVILEGE_MAP describes privilege (auditing option) type codes.

This table can be used to map privilege (auditing option) type numbers to type names.

Column	Datatype	NULL	Description
PRIVILEGE	NUMBER	NOT NULL	Numeric privilege (auditing option) type code
NAME	VARCHAR2 (40)	NOT NULL	Name of the type of privilege (auditing option). See <i>Oracle Database SQL Language Reference</i> for a list of valid system privileges.
PROPERTY	NUMBER	NOT NULL	Property flag of the privilege (auditing option): <ul style="list-style-type: none">• 0 - Indicates a privilege that can be granted with a SQL GRANT statement• 1 - Indicates a privilege that can only be granted using a PL/SQL package

6.252 TAB

TAB is included for compatibility.

Oracle recommends that you do not use this view.

6.253 TABLE_EXPORT_OBJECTS

TABLE_EXPORT_OBJECTS lists simple path names for some of the object types belonging to a Data Pump schema export, which is invoked using the TABLES parameter on the expdp command.

Users of the Data Pump Export and Import utilities can query this view to determine valid values for the EXCLUDE and INCLUDE parameters.

Column	Datatype	NULL	Description
OBJECT_PATH	VARCHAR2(200)	NOT NULL	Simple path name for the object type
COMMENTS	VARCHAR2(2000)		Comment on the object type
NAMED	CHAR(1)		Do objects of this type have names? If yes (Y), then the name can be specified in the optional name_clause on the EXCLUDE and INCLUDE parameters.

See Also:

- ["DATABASE_EXPORT_OBJECTS"](#)
- ["SCHEMA_EXPORT_OBJECTS"](#)
- *Oracle Database Utilities* for more information on performing a full Data Pump export using the expdp command

6.254 TABLE_PRIVILEGE_MAP

TABLE_PRIVILEGE_MAP describes privilege (auditing option) type codes.

This table can be used to map privilege (auditing option) type numbers to type names.

Column	Datatype	NULL	Description
PRIVILEGE	NUMBER	NOT NULL	Numeric privilege (auditing option) type code
NAME	VARCHAR2(40)	NOT NULL	Name of the type of privilege (auditing option)

6.255 TABQUOTAS

TABQUOTAS is included for compatibility.

Oracle recommends that you do not use this view.

6.256 TABS

TABS is a synonym for USER_TABLES.

See Also:

- ["USER_TABLES"](#)

6.257 TRUSTED_SERVERS

TRUSTED_SERVERS displays whether a server is trusted or untrusted.

Column	Datatype	NULL	Description
TRUST	VARCHAR2 (9)		Trustedness of the server listed. Values can be TRUSTED or UNTRUSTED servers which are not listed in the NAME column have opposite trustedness.
NAME	VARCHAR2 (128)		Server name. Can be a specific server name or ALL for all servers.

Table 6-1 shows examples of the values returned depending on the status of the servers.

Table 6-1 TRUSTED_SERVERS Values

Condition (If . . .)	TRUSTED column	NAME column
... all servers are trusted	Trusted	ALL
... no servers are trusted	Untrusted	ALL
... all servers except DB1 are trusted	Untrusted	DB1
... all servers except DB1 are untrusted	Trusted	DB1

See Also:

- *Oracle Database PL/SQL Packages and Types Reference*
- *Oracle Database Enterprise User Security Administrator's Guide*

6.258 TS_PITR_CHECK

This view, created by `catpitrc.sql`, provides information on any dependencies or restrictions that might prevent tablespace point-in-time recovery from proceeding.

This view applies only to the tablespace point-in-time recovery feature.

Column	Datatype	NULL	Description
OBJ1_OWNER	VARCHAR2 (128)		The owner of the object preventing tablespace point-in-time recovery. See the REASON column for details.
OBJ1_NAME	VARCHAR2 (128)		The name of the object preventing tablespace point-in-time recovery
OBJ1_SUBNAME	VARCHAR2 (128)		Subordinate to OBJ1_NAME
OBJ1_TYPE	VARCHAR2 (16)		The object type for the object preventing tablespace point-in-time recovery
TS1_NAME	VARCHAR2 (30)		Name of the tablespace containing the object preventing tablespace point-in-time recovery
OBJ2_NAME	VARCHAR2 (128)		The name of a second object which may be preventing tablespace point-in-time recovery. If NULL, object 1 is the only object preventing recovery.
OBJ2_SUBNAME	VARCHAR2 (128)		Subordinate to OBJ2_NAME

Column	Datatype	NULL	Description
OBJ2_TYPE	VARCHAR2(15)		The object type for the second object (will be NULL if OBJ2_NAME is NULL)
OBJ2_OWNER	VARCHAR2(128)		The owner of the second object (will be NULL if OBJ2_NAME is NULL)
TS2_NAME	VARCHAR2(30)		Name of the tablespace containing second object which may be preventing tablespace point-in-time recovery (-1 indicates not applicable)
CONSTRAINT_NAME	VARCHAR2(128)		Name of the constraint
REASON	VARCHAR2(81)		Reason why tablespace point-in-time recovery cannot proceed

 See Also:

Oracle Database Backup and Recovery User's Guide for more information about tablespace point-in-time recovery

6.259 TS_PITR_OBJECTS_TO_BE_DROPPED

TS_PITR_OBJECTS_TO_BE_DROPPED lists all objects lost as a result of performing tablespace point-in-time recovery.

This view applies only to the tablespace point-in-time recovery feature.

Column	Datatype	NULL	Description
OWNER	VARCHAR2(128)	NOT NULL	The owner of the object
NAME	VARCHAR2(128)	NOT NULL	The name of the object that will be lost as a result of undergoing tablespace point-in-time recovery
CREATION_TIME	DATE	NOT NULL	Creation timestamp of the object
TABLESPACE_NAME	VARCHAR2(30)		Name of the tablespace containing the object

 See Also:

Oracle Database Backup and Recovery User's Guide for more information about tablespace point-in-time recovery

6.260 UNI_PLUGGABLE_SET_CHECK

UNI_PLUGGABLE_SET_CHECK contains pluggable check information.

Column	Datatype	NULL	Description
OBJ1_OWNER	VARCHAR2(128)		Owner of object
OBJ1_NAME	VARCHAR2(128)		Object 1

Column	Datatype	NULL	Description
OBJ1_SUBNAME	VARCHAR2 (128)		SubObject1Name
OBJ1_TYPE	VARCHAR2 (18)		Object Type
TS1_NAME	VARCHAR2 (30)		Tablespace containing Object 1
OBJ2_NAME	VARCHAR2 (128)		Object Name
OBJ2_SUBNAME	VARCHAR2 (128)		SubObject2Name
OBJ2_TYPE	VARCHAR2 (18)		Object Type
OBJ2_OWNER	VARCHAR2 (128)		Object owner of second object
TS2_NAME	VARCHAR2 (30)		Tablespace containing Object 1
CONSTRAINT_NAME	VARCHAR2 (128)		Name of dependent constraint
REASON	VARCHAR2 (86)		Reason for Pluggable check violation
MESG_ID	NUMBER		The message ID

6.261 UNIFIED_AUDIT_TRAIL

When unified auditing is enabled in Oracle Database, the audit records are populated in this new audit trail.

This view displays audit records in tabular form by retrieving the audit records from the audit trail.

 **Note:**

This view is populated only in an Oracle Database where unified auditing is enabled.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

Column	Datatype	NULL	Description
AUDIT_TYPE	VARCHAR2 (64)		Type of auditing: <ul style="list-style-type: none"> • Database Vault • Datapump • Direct path API • FineGrainedAudit • KACL_AUDIT • Label Security • Protocol • RMAN_AUDIT • Standard • XS
SESSIONID	NUMBER		Audit session identifier
PROXY_SESSIONID	NUMBER		Audit session identifier of proxying session
OS_USERNAME	VARCHAR2 (128)		Name of the operating system user for the database session

Column	Datatype	NULL	Description
USERHOST	VARCHAR2 (128)		Name of the host machine from which the session was spawned
TERMINAL	VARCHAR2 (30)		The operating system terminal of the user session
INSTANCE_ID	NUMBER		Instance number as specified in the initialization parameter file, init.ora
DBID	NUMBER		Database identifier of the audited database
AUTHENTICATION_TYPE	VARCHAR2 (1024)		Authentication information for the session user See: " AUTHENTICATION_TYPE Description "
DBUSERNAME	VARCHAR2 (128)		Database user name of the user whose actions were audited
DBPROXY_USERNAME	VARCHAR2 (128)		Proxying user name, in the case of proxy authentication
EXTERNAL_USERID	VARCHAR2 (1024)		External user name, in the case of network or external authentication For OCI IAM users, the user OCID (Oracle Cloud Identifier)
GLOBAL_USERID	VARCHAR2 (32)		For a user logged in as an enterprise user, the global user identifier for the user For OCI IAM users, the value of this column is null
CLIENT_PROGRAM_NAME	VARCHAR2 (48)		Name of the program used for the database session
DBLINK_INFO	VARCHAR2 (4000)		Value of <code>SYS_CONTEXT('USERENV', 'DBLINK_INFO')</code> . Valid if the connection was via a database link.
XS_USER_NAME	VARCHAR2 (128)		Name of the Real Application Security user
XS_SESSIONID	RAW (33)		Identifier of the Real Application Security session
ENTRY_ID	NUMBER		Numeric ID for each audit trail entry in the session
STATEMENT_ID	NUMBER		Numeric ID for each statement run (a statement may cause many actions)
EVENT_TIMESTAMP	TIMESTAMP (6)		Timestamp of the creation of the audit trail entry in the local time zone
EVENT_TIMESTAMP_UTC	TIMESTAMP (6)		Timestamp of the creation of the audit trail entry in UTC (Coordinated Universal Time)
ACTION_NAME	VARCHAR2 (64)		Name of the action executed by the user. The name should be read in conjunction with the <code>AUDIT_TYPE</code> to understand the real action.
RETURN_CODE	NUMBER		Oracle error code generated by the action. Zero if the action succeeded
OS_PROCESS	VARCHAR2 (16)		Operating system process identifier of the Oracle database process
TRANSACTION_ID	RAW (8)		Transaction identifier of the transaction in which the object is modified
SCN	NUMBER		System change number (SCN) of the creation of the audit trail entry
EXECUTION_ID	VARCHAR2 (64)		Execution context identifier for each action
OBJECT_SCHEMA	VARCHAR2 (128)		Schema name of object affected by the action
OBJECT_NAME	VARCHAR2 (128)		Name of the object affected by the action
SQL_TEXT	CLOB		SQL associated with the event

Column	Datatype	NULL	Description
SQL_BINDS	CLOB		List of bind variables, if any, associated with SQL_TEXT
APPLICATION_CONTEXTS	VARCHAR2(4000)		Semicolon-separated list of Application Context Namespace, Attribute, Value information in (APPCTX_NSPACE,APPCTX_ATTRIBUTE=<value>) format
CLIENT_IDENTIFIER	VARCHAR2(64)		Client identifier in each Oracle session
NEW_SCHEMA	VARCHAR2(128)		The schema of the object named in the NEW_NAME column
NEW_NAME	VARCHAR2(128)		New name of object after RENAME, or name of underlying object (for example, CREATE INDEX owner.obj_name ON new_owner.new_name)
OBJECT_EDITION	VARCHAR2(128)		Name of the edition containing the audited object
SYSTEM_PRIVILEGE_USED	VARCHAR2(1024)		Comma-separated list of system privileges used to execute the action
SYSTEM_PRIVILEGE	VARCHAR2(40)		System privilege granted/revoke by a GRANT/REVOKE statement
AUDIT_OPTION	VARCHAR2(40)		AUDIT/NOAUDIT SQL command
OBJECT_PRIVILEGES	VARCHAR2(35)		Object privileges granted/revoke by a GRANT/REVOKE statement
ROLE	VARCHAR2(128)		Roles granted or revoked or set by GRANT/REVOKE/SET ROLE command
TARGET_USER	VARCHAR2(128)		User on whom the GRANT/REVOKE/AUDIT/NOAUDIT statement was executed
EXCLUDED_USER	VARCHAR2(128)		User who was excluded when the AUDIT/NOAUDIT statement was executed
EXCLUDED_SCHEMA	VARCHAR2(128)		Displays the schema of the excluded objects
EXCLUDED_OBJECT	VARCHAR2(128)		Displays object excluded from the action
CURRENT_USER	VARCHAR2(128)		Effective user for the statement execution
ADDITIONAL_INFO	VARCHAR2(4000)		Text comment on the audit trail entry, if any
UNIFIED_AUDIT_POLICIES	VARCHAR2(4000)		<p>Lists the audit policies that caused the current audit record. For example, if SELECT ON SCOTT.EMP was configured from policy SCOTT_EMP_POL, for the SELECT event this column will display SCOTT_EMP_POL.</p> <p>If more than one policy was configured, the list of policies that caused the event to be recorded in the audit trail are displayed in a comma-separated list.</p> <p>This column has a NULL value for mandatory audit records. See <i>Oracle Database Security Guide</i> for information on activities that are mandatorily audited.</p>
FGA_POLICY_NAME	VARCHAR2(128)		Fine-grained auditing (FGA) policy name that generated this FGA audit record
XS_INACTIVITY_TIMEOUT	NUMBER		Inactivity timeout of the Real Application Security session
XS_ENTITY_TYPE	VARCHAR2(32)		Type of the Real Application Security entity. Possible values are USER, ROLE, ROLESET, SECURITYCLASS, ACL, DATASECURITY, and NSTEMPLATE.

Column	Datatype	NULL	Description
XS_TARGET_PRINCIPAL_NAME	VARCHAR2(128)		Target principal name in Real Application Security operations. Possible operations are set verifier, set password, add proxy, remove proxy, switch user, assign user, create session, and grant roles.
XS_PROXY_USER_NAME	VARCHAR2(128)		Name of the Real Application Security proxy user
XS_DATASEC_POLICY_NAME	VARCHAR2(128)		Name of the Real Application Security data security policy enabled or disabled
XS_SCHEMA_NAME	VARCHAR2(128)		Name of the schema in enable, disable data security policy and global callback operation
XS_CALLBACK_EVENT_TYPE	VARCHAR2(32)		Real Application Security global callback event type
XS_PACKAGE_NAME	VARCHAR2(128)		Real Application Security callback package name for the global callback
XS_PROCEDURE_NAME	VARCHAR2(128)		Real Application Security callback procedure name for the global callback
XS_ENABLED_ROLE	VARCHAR2(128)		The role that is enabled
XS_COOKIE	VARCHAR2(1024)		Real Application Security session cookie
XS_NS_NAME	VARCHAR2(128)		Name of the Real Application Security session namespace
XS_NS_ATTRIBUTE	VARCHAR2(4000)		Name of the Real Application Security session namespace attribute
XS_NS_ATTRIBUTE_OLD_VAL	VARCHAR2(4000)		The old value of the Real Application Security session namespace attribute
XS_NS_ATTRIBUTE_NEW_VAL	VARCHAR2(4000)		The new value of the Real Application Security session namespace
DV_ACTION_CODE	NUMBER		Numeric action type code for Database Vault
DV_ACTION_NAME	VARCHAR2(30)		Name of the action whose numeric code appears in the DV_ACTION_CODE column
DV_EXTENDED_ACTION_CODE	NUMBER		Numeric action type code for Database Vault administration
DV_GRANTEE	VARCHAR2(128)		Name of the user whose Database Vault authorization was modified
DV_RETURN_CODE	NUMBER		Database Vault specific error code
DV_ACTION_OBJECT_NAME	VARCHAR2(128)		The unique name of the Database Vault object that was modified
DV_RULE_SET_NAME	VARCHAR2(128)		The unique name of the rule set that was executing and caused the audit event to trigger
DV_COMMENT	VARCHAR2(4000)		Text comment on the audit trail entry, providing more information about the statement audited
DV_FACTOR_CONTEXT	VARCHAR2(4000)		An XML document that contains all of the factor identifiers for the current session at the point when the audit event was triggered

Column	Datatype	NULL	Description
DV_OBJECT_STATUS	VARCHAR2(1)		Indicates whether a particular Database Vault object is enabled or disabled. For example, if a Database Vault administrator enables or disables a realm, then this event will be audited and the DV_OBJECT_STATUS value will show the status of the realm after the event occurred. Possible values for this column are: <ul style="list-style-type: none"> • Y - The object is enabled • N - The object is disabled
OLS_POLICY_NAME	VARCHAR2(128)		Name of the Oracle Label Security (OLS) policy for which this audit record is generated
OLS_GRANTEE	VARCHAR2(1024)		Name of the user whose OLS authorization was modified
OLS_MAX_READ_LABEL	VARCHAR2(4000)		Maximum read label assigned to a user
OLS_MAX_WRITE_LABEL	VARCHAR2(4000)		Maximum write label assigned to a user
OLS_MIN_WRITE_LABEL	VARCHAR2(4000)		Minimum write label assigned to a user
OLS_PRIVILEGES_GRANTED	VARCHAR2(128)		OLS privileges assigned to a user or a trusted stored procedure
OLS_PROGRAM_UNIT_NAME	VARCHAR2(128)		Name of the trusted stored procedure whose authorization was modified or was executed
OLS_PRIVILEGES_USED	VARCHAR2(128)		OLS privileges used for an event
OLS_STRING_LABEL	VARCHAR2(4000)		String representation of the OLS label
OLS_LABEL_COMPONENT_TYPE	VARCHAR2(12)		Type of the OLS label component
OLS_LABEL_COMPONENT_NAME	VARCHAR2(30)		Name of the OLS label component
OLS_PARENT_GROUP_NAME	VARCHAR2(30)		Name of the parent of the OLS group
OLS_OLD_VALUE	VARCHAR2(4000)		Old value for OLS ALTER events
OLS_NEW_VALUE	VARCHAR2(4000)		New value for OLS ALTER events
RMAN_SESSION_RECID	NUMBER		RMAN session identifier. Together with RMAN_SESSION_STAMP uniquely identifies an RMAN job (note that this is not same as user session ID; the value is a recid in controlfile that identifies RMAN job)
RMAN_SESSION_STAMP	NUMBER		Timestamp for the session
RMAN_OPERATION	VARCHAR2(20)		The RMAN operation executed by the job. One row will be added for each distinct operation within an RMAN session. For example, a backup job would contain BACKUP in the RMAN_OPERATION column.

Column	Datatype	NULL	Description
RMAN_OBJECT_TYPE	VARCHAR2(20)		<p>Type of objects involved for backup or restore/recover or change/delete/crosscheck commands.</p> <p>It contains one of the following values. If RMAN command does not satisfy one of them, then preference is given in order, from top to bottom of the list:</p> <ul style="list-style-type: none"> • DB FULL • RECVR AREA • DB INCR • DATAFILE FULL • DATAFILE INCR • ARCHIVELOG • CONTROLFILE • SPFILE
RMAN_DEVICE_TYPE	VARCHAR2(5)		<p>Device involved in the RMAN job. It may be DISK or SBT_TAPE or * (An * indicates that more than one location is involved).</p> <p>For a backup job, it will be the output device type. For other commands (such as restore or crosscheck), it will be the input device type.</p>
DP_TEXT_PARAMETERS1	VARCHAR2(512)		<p>Parameters during a Data Pump operation that have a text/string value. This may contain the values for:</p> <ul style="list-style-type: none"> • ACCESS METHODS • DATA OPTIONS • DUMPER DIRECTORY • JOB_TYPE • JOB VERSION • MASTER TABLE • METADATA_JOB_MODE • PARTITION OPTIONS • REMOTE LINK • TABLE EXISTS <p>For descriptions and more information about the settings that can appear for these Data Pump text parameters, see Table 6-2.</p>
DP_BOOLEAN_PARAMETERS1	VARCHAR2(512)		<p>Parameters during a Data Pump operation that have a boolean value. This may contain the values for:</p> <ul style="list-style-type: none"> • DATA_ONLY - Boolean value for whether or not the operation processed data only (as opposed to metadata only, or metadata and data combined) • DUMPFILE_PRESENT - Denotes whether a dump file exists. Typically, it indicates whether a network export in which no dumpfile is required. • JOB_RESTARTED - Boolean that indicates if the export or import job had to be restarted • MASTER_ONLY - Indicates whether the import job imported just the master table and then stopped the job so that the contents of the master table can be examined • METADATA_ONLY - Boolean value for whether or not the operation processed metadata only (as opposed to data only, or metadata and data combined)

Column	Datatype	NULL	Description
DIRECT_PATH_NUM_COLUMNS_LOADED	NUMBER		Shows the number of columns that were loaded using the SQL*Loader direct path load method
RLS_INFO	CLOB		Stores virtual private database (VPD) policy names and predicates separated by delimiter. To format the output into individual rows, use the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_UNI function.
KSACL_USER_NAME	VARCHAR2(128)		The connecting user name The value in this column is meaningful only when the UNIFIED_AUDIT_TRAIL.RETURN_CODE is 46981, which is the denial-of-service (DoS) error code.
KSACL_SERVICE_NAME	VARCHAR2(512)		The target database service name The value in this column is meaningful only when the UNIFIED_AUDIT_TRAIL.RETURN_CODE is 46981, which is the denial-of-service (DoS) error code.
KSACL_SOURCE_LOCATION	VARCHAR2(48)		The source location of the initiating connection The value in this column is meaningful only when the UNIFIED_AUDIT_TRAIL.RETURN_CODE is 46981, which is the denial-of-service (DoS) error code.
PROTOCOL_SESSION_ID	NUMBER		Oracle XML DB session ID The PROTOCOL_* columns in this view are meaningful when auditing Oracle XML DB protocol (HTTP or FTP) messages. You can use this column to identify audit records from the same Oracle XML DB session.
PROTOCOL_RETURN_CODE	NUMBER		Return code for the Oracle XML DB protocol request This value is logged in the audit records for both the reply message containing the return code and its corresponding request message. For HTTP requests, a return code of 200 (OKAY) or 304 (NOT-MODIFIED) is considered successful, and a return code of 207 means the reply may have multiple components with separate return codes. All other HTTP return codes are considered unsuccessful.
PROTOCOL_ACTION_NAME	VARCHAR2(32)		Indicates the protocol and method for the Oracle XML DB protocol message This value is of the form <i>protocol-method</i> . Possible values for <i>protocol</i> are HTTP or FTP. Examples: HTTP-GET and FTP-RETR. Note that the HTTP GET and HEAD methods are both logged as HTTP-GET. Unrecognized methods are logged as HTTP-UNKNOWN or FTP-UNKNOWN.
PROTOCOL_USERHOST	VARCHAR2(128)		IP address of the client
PROTOCOL_MESSAGE	VARCHAR2(4000)		Text of the Oracle XML DB protocol message

Column	Datatype	NULL	Description
SOURCE ¹	VARCHAR2 (8)		<p>Source of the audit record:</p> <ul style="list-style-type: none"> • FILE - Refers to records from the operating system spillover files in each database instance • DATABASE - Refers to records from the AUDSYS.AUD\$UNIFIED table

¹ This column is available starting with Oracle Database 19c, Release Update 19.21.

Table 6-2 Data Pump Text Parameter Descriptions

Parameter	Description
ACCESS_METHOD	The method used to load the data. Settings can be: <ul style="list-style-type: none"> • AUTOMATIC: Enables Oracle Data Pump to determine the optimal load method • DIRECT_PATH : Uses the direct path API to pass the data to be loaded. • EXTERNAL_TABLE: Loads data using the external tables option. • CONVENTIONAL: Loads the data using SQL INSERT statements
DATA_OPTIONS	Indicates how certain types of data were handled during import operations. Settings are in bit-mask format, which are as follows: <ul style="list-style-type: none"> • 1 (SKIP_CONSTRAINT_ERRORS): Specifies that the import operation proceeded even if non-deferred constraint violations were encountered. • 8 (DISABLE_APPEND_HINT): The import operation did not use the APPEND hint while loading a data object. • 16 (REJECT_ROWS_WITH_REPLACE_CHAR): Warnings are issued when the replacement character may be used and an option was added to reject data rows where the replacement character was used during a Data Pump import. This situation can occur if different character sets are used for the export/import process
DUMPER DIRECTORY	Not in use
JOB_TYPE	Is either EXPORT or IMPORT
JOB VERSION	Specifies the version of database objects that were imported
MASTER_TABLE	Indicates the name of the master table. By default, it appears as follows for export operations: <i>schema_name.SYS_EXPORT_TABLE_n</i> For import operations, it appears as follows: <i>schema_name.SYS_IMPORT_TABLE_n</i> The <i>n</i> represents a numeric value of 01. If 01 is in use, the number is incremented with 02, 03, and so on.
METADATA_JOB_MODE	Type of export or import operation. For example a table export would be TABLE_EXPORT
PARTITION OPTIONS	Indicates how table partitions were created during an import operation. Settings can be: <ul style="list-style-type: none"> • NONE: The tables were created as they existed on the system from which the export operation was performed. • DEPARTITION: Each partition or subpartition was promoted to a new individual table. • MERGE: All partitions and subpartitions were merged into one table

Table 6-2 (Cont.) Data Pump Text Parameter Descriptions

Parameter	Description
REMOTE_LINK	Indicates that the export was performed from a (source) database identified by a valid database link. The data from the source database instance was written to a dump file set on the connected database instance.
TABLE_EXISTS_ACTION	Indicates the action that was taken on an import operation when the target table already existed. The values are as follows: <ul style="list-style-type: none"> • REPLACE • TRUNCATE • SKIP • APPEND

AUTHENTICATION_TYPE Description

The AUTHENTICATION_TYPE column of UNIFIED_AUDIT_TRAIL displays authentication information for the session user.

The value of this column is a string with the following syntax:

```
(TYPE=(auth_string));(CLIENT_ADDRESS=((PROTOCOL=protocol)
(HOST=client_ip_address)(PORT=client_port_number)));
[(LOGON_INFO=((VERIFIER=%s-%s)(CLIENT_CAPABILITIES=%s));]
```

- (TYPE=(auth_string));

Indicates the type of authentication for the session user.

Possible values for *auth_string*:

- DATABASE - Username/password authentication
- DIRECTORY_PASSWORD - Directory-based user authentication
- NETWORK_SERVICE - Authentication was performed by Oracle Net Services or strong authentication
- OS - Operating system external user authentication
- PROXY - OCI proxy connection authentication

- (CLIENT_ADDRESS=((PROTOCOL=protocol)(HOST=client_ip_address)(PORT=client_port_number)));

Displays the protocol used by the client, such as ipc, sdp, tcp, or tcps, the client IP address, and the client port number.

- (LOGON_INFO=((VERIFIER=version-rollover_state)(CLIENT_CAPABILITIES=capability_list)));

This syntax is displayed only if authentication was completed during gradual database password rollover.

The value of VERIFIER comprises the following two values, separated by a hyphen:

- *version* - Indicates the password version (11G or 12C)
- *rollover_state* - Indicates whether the user was authenticated with the OLD password or the NEW password

For `CLIENT_CAPABILITIES`, the value of `capability_list` is a comma-separated list of one or more of the following client capabilities: `O5L_NP`, `O7L_MR`, or `O8L_LI`. See *Oracle Database Net Services Reference* for more information about client capabilities.

 **See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_AUDIT_MGMT` package
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_UNI` function

6.262 USABLE_EDITIONS

`USABLE_EDITIONS` describes the usable editions of the current user.

Column	Datatype	NULL	Description
<code>EDITION_NAME</code>	<code>VARCHAR2(128)</code>	NOT NULL	Name of the edition
<code>PARENT_EDITION_NAME</code>	<code>VARCHAR2(128)</code>		Name of the parent edition for this edition

 **See Also:**

Oracle Database Development Guide for more information about editions

6.263 USER_ADDM_FDG_BREAKDOWN

`USER_ADDM_FDG_BREAKDOWN` describes the contribution for each finding from the different instances owned by the current user. Its columns are the same as those in `DBA_ADDM_FDG_BREAKDOWN`.

 **See Also:**

["DBA_ADDM_FDG_BREAKDOWN"](#)

6.264 USER_ADDM_FINDINGS

`USER_ADDM_FINDINGS` displays the ADDM findings discovered by the advisors owned by the current user.

Each row for ADDM tasks in the related `USER_ADVISOR_FINDINGS` view has a corresponding row in this view. Its columns (except for `OWNER`) are the same as those in `DBA_ADDM_FINDINGS`.

 **See Also:**

["DBA_ADDM_FINDINGS"](#)

6.265 USER_ADDM_INSTANCES

USER_ADDM_INSTANCES provides instance-level information for ADDM tasks that finished executing in all instances owned by the current user. Its columns are the same as those in DBA_ADDM_INSTANCES.

 **See Also:**

["DBA_ADDM_INSTANCES"](#)

6.266 USER_ADDM_TASK_DIRECTIVES

USER_ADDM_TASK_DIRECTIVES displays information about ADDM task directives owned by the current user. Its columns (except for USERNAME and SEQ_ID) are the same as those in DBA_ADDM_TASK_DIRECTIVES.

 **See Also:**

["DBA_ADDM_TASK_DIRECTIVES"](#)

6.267 USER_ADDM_TASKS

USER_ADDM_TASKS displays information about the ADDM tasks owned by the current user.

The view contains one row for each row in the related USER_ADVISOR_TASKS view that has ADVISOR_NAME=ADDM and STATUS=COMPLETED. Its columns (except for OWNER) are the same as those in DBA_ADDM_TASKS.

 **See Also:**

["DBA_ADDM_TASKS"](#)

6.268 USER_ADVISOR_ACTIONS

USER_ADVISOR_ACTIONS displays information about the actions associated with the recommendations owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_ACTIONS.

 **See Also:**

["DBA_ADVISOR_ACTIONS"](#)

6.269 USER_ADVISOR_DIR_TASK_INST

USER_ADVISOR_DIR_TASK_INST displays information about all task directive instances owned by the current user. Its columns (except for SEQ_ID and USERNAME) are the same as those in DBA_ADVISOR_DIR_TASK_INST.

 **See Also:**

["DBA_ADVISOR_DIR_TASK_INST"](#)

6.270 USER_ADVISOR_EXEC_PARAMETERS

USER_ADVISOR_EXEC_PARAMETERS displays the parameter values used for past executions of tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_EXEC_PARAMETERS.

 **See Also:**

["DBA_ADVISOR_EXEC_PARAMETERS"](#)

6.271 USER_ADVISOR_EXECUTIONS

USER_ADVISOR_EXECUTIONS displays metadata information for tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_EXECUTIONS.

 **See Also:**

["DBA_ADVISOR_EXECUTIONS"](#)

6.272 USER_ADVISOR_FDG_BREAKDOWN

USER_ADVISOR_FDG_BREAKDOWN describes the contribution from the different instances to the findings for each ADDM task owned by the current user. Its columns are the same as those in DBA_ADVISOR_FDG_BREAKDOWN.

 **See Also:**

"[DBA_ADVISOR_FDG_BREAKDOWN](#)"

6.273 USER_ADVISOR_FINDINGS

USER_ADVISOR_FINDINGS displays the findings discovered by the advisors owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_FINDINGS.

 **See Also:**

"[DBA_ADVISOR_FINDINGS](#)"

6.274 USER_ADVISOR_JOURNAL

USER_ADVISOR_JOURNAL displays the journal entries for the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_JOURNAL.

 **See Also:**

"[DBA_ADVISOR_JOURNAL](#)"

6.275 USER_ADVISOR_LOG

USER_ADVISOR_LOG displays information about the current state of the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_LOG.

 **See Also:**

"[DBA_ADVISOR_LOG](#)"

6.276 USER_ADVISOR_OBJECTS

USER_ADVISOR_OBJECTS displays information about the objects currently referenced by the advisors owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_OBJECTS.

 **See Also:**

["DBA_ADVISOR_OBJECTS"](#)

6.277 USER_ADVISOR_PARAMETERS

USER_ADVISOR_PARAMETERS displays the task parameters and their current values for the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_PARAMETERS.

 **See Also:**

["DBA_ADVISOR_PARAMETERS"](#)

6.278 USER_ADVISOR_RATIONALE

USER_ADVISOR_RATIONALE displays information about the rationales for the recommendations owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_RATIONALE.

 **See Also:**

["DBA_ADVISOR_RATIONALE"](#)

6.279 USER_ADVISOR_RECOMMENDATIONS

USER_ADVISOR_RECOMMENDATIONS displays the results of an analysis of the recommendations owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_RECOMMENDATIONS.

 **See Also:**

["DBA_ADVISOR_RECOMMENDATIONS"](#)

6.280 USER_ADVISOR_SQLA_REC_SUM

USER_ADVISOR_SQLA_REC_SUM displays recommendation rollup information for the workload objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLA_REC_SUM.

 **See Also:**

["DBA_ADVISOR_SQLA_REC_SUM"](#)

6.281 USER_ADVISOR_SQLA_TABLES

USER_ADVISOR_SQLA_TABLES displays cross references between the workload statements and the tables referenced in the statement for the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLA_TABLES.

 **See Also:**

["DBA_ADVISOR_SQLA_TABLES"](#)

6.282 USER_ADVISOR_SQLA_WK_MAP

USER_ADVISOR_SQLA_WK_MAP displays the workload references for the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLA_WK_MAP.

 **See Also:**

["DBA_ADVISOR_SQLA_WK_MAP"](#)

6.283 USER_ADVISOR_SQLA_WK_STMTS

USER_ADVISOR_SQLA_WK_STMTS displays information about the workload objects owned by the current user after an Access Advisor analysis operation. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLA_WK_STMTS.

 **See Also:**

["DBA_ADVISOR_SQLA_WK_STMTS"](#)

6.284 USER_ADVISOR_SQLPLANS

USER_ADVISOR_SQLPLANS displays the different SQL execution plans owned by the current user generated as part of an advisor analysis. Its columns are the same as those in DBA_ADVISOR_SQLPLANS.

 **See Also:**

["DBA_ADVISOR_SQLPLANS"](#)

6.285 USER_ADVISOR_SQLSTATS

USER_ADVISOR_SQLSTATS displays execution statistics owned by the current user for the test-execution of different SQL plans during the advisor analysis. Its columns are the same as those in DBA_ADVISOR_SQLSTATS.

 **See Also:**

["DBA_ADVISOR_SQLSTATS"](#)

6.286 USER_ADVISOR_SQLW_JOURNAL

USER_ADVISOR_SQLW_JOURNAL displays the journal entries for the workload objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLW_JOURNAL.

 **See Also:**

["DBA_ADVISOR_SQLW_JOURNAL"](#)

6.287 USER_ADVISOR_SQLW_PARAMETERS

USER_ADVISOR_SQLW_PARAMETERS displays the workload parameters and their current values owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLW_PARAMETERS.

 **See Also:**

["DBA_ADVISOR_SQLW_PARAMETERS"](#)

6.288 USER_ADVISOR_SQLW_STMTS

USER_ADVISOR_SQLW_STMTS displays rows that correspond to the statements in the workload owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLW_STMTS.

 **See Also:**

["DBA_ADVISOR_SQLW_STMTS"](#)

6.289 USER_ADVISOR_SQLW_SUM

USER_ADVISOR_SQLW_SUM displays an aggregated picture of the SQLWkld workload objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLW_SUM.

 **See Also:**

["DBA_ADVISOR_SQLW_SUM"](#)

6.290 USER_ADVISOR_SQLW_TABLES

USER_ADVISOR_SQLW_TABLES displays cross references between the workload statements and the tables referenced in the statement. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLW_TABLES.

 **See Also:**

["DBA_ADVISOR_SQLW_TABLES"](#)

6.291 USER_ADVISOR_SQLW_TEMPLATES

USER_ADVISOR_SQLW_TEMPLATES displays an aggregated picture of the SQLWkld template objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_SQLW_TEMPLATES.

 **See Also:**

["DBA_ADVISOR_SQLW_TEMPLATES"](#)

6.292 USER_ADVISOR_TASKS

USER_ADVISOR_TASKS displays information about the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_TASKS.

 See Also:

["DBA_ADVISOR_TASKS"](#)

6.293 USER_ADVISOR_TEMPLATES

USER_ADVISOR_TEMPLATES displays information about the templates owned by the current user. Its columns (except for OWNER) are the same as those in DBA_ADVISOR_TEMPLATES.

 See Also:

["DBA_ADVISOR_TEMPLATES"](#)

6.294 USER_ALL_TABLES

USER_ALL_TABLES describes the object tables and relational tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ALL_TABLES.

 See Also:

["ALL_ALL_TABLES"](#)

6.295 USER_ANALYTIC_VIEW_ATTR_CLASS

USER_ANALYTIC_VIEW_ATTR_CLASS describes the attribute classifications of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ANALYTIC_VIEW_ATTR_CLASS.

 See Also:

["ALL_ANALYTIC_VIEW_ATTR_CLASS"](#)

6.358 USER_ATTRIBUTE_DIM_ORD_ATRS

USER_ATTRIBUTE_DIM_ORD_ATRS is identical to USER_ATTRIBUTE_DIM_ORDER_ATTRS.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

"[USER_ATTRIBUTE_DIM_ORDER_ATTRS](#)"

6.359 USER_ATTRIBUTE_DIM_ORD_ATRS_AE

USER_ATTRIBUTE_DIM_ORD_ATRS_AE describes the order attributes of the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ATTRIBUTE_DIM_ORD_ATRS_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

["ALL_ATTRIBUTE_DIM_ORD_ATTRS_AE"](#)

6.360 USER_ATTRIBUTE_DIM_ORDER_ATTRS

USER_ATTRIBUTE_DIM_ORDER_ATTRS describes the order attributes of the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ATTRIBUTE_DIM_ORDER_ATTRS.

 **See Also:**

["ALL_ATTRIBUTE_DIM_ORDER_ATTRS"](#)

6.361 USER_ATTRIBUTE_DIM_TABLES

USER_ATTRIBUTE_DIM_TABLES describes the tables used by the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ATTRIBUTE_DIM_TABLES.

 **See Also:**

["ALL_ATTRIBUTE_DIM_TABLES"](#)

6.362 USER_ATTRIBUTE_DIM_TABLES_AE

USER_ATTRIBUTE_DIM_TABLES_AE describes the tables used by the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ATTRIBUTE_DIM_TABLES_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

["ALL_ATTRIBUTE_DIM_TABLES_AE"](#)

6.363 USER_ATTRIBUTE_DIMENSIONS

USER_ATTRIBUTE_DIMENSIONS describes the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ATTRIBUTE_DIMENSIONS.

 **See Also:**

["ALL_ATTRIBUTE_DIMENSIONS"](#)

6.364 USER_ATTRIBUTE_DIMENSIONS_AE

USER_ATTRIBUTE_DIMENSIONS_AE describes the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ATTRIBUTE_DIMENSIONS_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

["ALL_ATTRIBUTE_DIMENSIONS_AE"](#)

6.365 USER_ATTRIBUTE_TRANSFORMATIONS

USER_ATTRIBUTE_TRANSFORMATIONS describes the transformation functions for the transformations owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ATTRIBUTE_TRANSFORMATIONS.

 **See Also:**

["ALL_ATTRIBUTE_TRANSFORMATIONS"](#)

6.366 USER_AUDIT_OBJECT

USER_AUDIT_OBJECT displays audit trail records for the objects accessible to the current user. Its columns are the same as those in DBA_AUDIT_OBJECT.

 **Note:**

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED_AUDIT_TRAIL.

- "[DBA_AUDIT_OBJECT](#)"
- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

6.367 USER_AUDIT_POLICIES

USER_AUDIT_POLICIES describes the fine-grained auditing policies on the tables and views owned by the current user. Its columns (except for OBJECT_SCHEMA) are the same as those in ALL_AUDIT_POLICIES.

 **Note:**

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED_AUDIT_TRAIL.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

 **See Also:**

["ALL_AUDIT_POLICIES"](#)

6.368 USER_AUDIT_POLICY_COLUMNS

USER_AUDIT_POLICY_COLUMNS describes the fine-grained auditing policy columns on the tables and views owned by the current user. Its columns are the same as those in ALL_AUDIT_POLICY_COLUMNS.

Note:

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED_AUDIT_TRAIL.

- See *Oracle Database Security Guide* for more information about unified auditing.

See Also:

"[ALL_AUDIT_POLICY_COLUMNS](#)"

6.369 USER_AUDIT_SESSION

USER_AUDIT_SESSION displays the audit trail records concerning connections and disconnections of the current user. Its columns are the same as those in DBA_AUDIT_SESSION.

Note:

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED_AUDIT_TRAIL.

- "[DBA_AUDIT_SESSION](#)"
- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

6.370 USER_AUDIT_STATEMENT

USER_AUDIT_STATEMENT displays audit trail entries for the GRANT, REVOKE, AUDIT, NOAUDIT, and ALTER SYSTEM statements issued by the current user.

Its columns are the same as those in "[DBA_AUDIT_STATEMENT](#)".

 **Note:**

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from `UNIFIED_AUDIT_TRAIL`.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

6.371 USER_AUDIT_TRAIL

`USER_AUDIT_TRAIL` displays the standard audit trail entries related to the current user.

Its columns are the same as those in "[DBA_AUDIT_TRAIL](#)".

The view displays audit records generated by actions performed by the user and audit records generated by actions performed on the user's schema objects.

 **Note:**

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from `UNIFIED_AUDIT_TRAIL`.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

6.372 USER_AW_PS

`USER_AW_PS` describes the page spaces in the analytic workspaces owned by the current user. Its columns (except for `OWNER`) are the same as those in `ALL_AW_PS`.

 **See Also:**

"[ALL_AW_PS](#)"

6.373 USER_AWS

USER_AWS describes the analytic workspaces owned by the current user. Its columns (except for OWNER) are the same as those in ALL_AWS.

 **See Also:**

"[ALL_AWS](#)"

6.374 USER_BASE_TABLE_MVIEWS

USER_BASE_TABLE_MVIEWS describes the materialized views using materialized view logs owned by the current user. Its columns are the same as those in ALL_BASE_TABLE_MVIEWS.

 **See Also:**

"[ALL_BASE_TABLE_MVIEWS](#)"

6.375 USER_BLOCKCHAIN_TABLES

USER_BLOCKCHAIN_TABLES describes the blockchain tables owned by the current user. Its columns (except for SCHEMA_NAME) are the same as those in ALL_BLOCKCHAIN_TABLES.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.10.

 **See Also:**

"[ALL_BLOCKCHAIN_TABLES](#)"

6.376 USER_CATALOG

USER_CATALOG lists tables, views, clusters, synonyms, and sequences owned by the current user. Its columns are the same as those in ALL_CATALOG.

 **See Also:**

"[ALL_CATALOG](#)"

6.377 USER_CERTIFICATES

`USER_CERTIFICATES` displays the certificates added by the current user which are used for signature verification for blockchain tables. Its columns (except `USER_NAME`) are the same as those in `ALL_CERTIFICATES`.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.10.

 **See Also:**

"`ALL_CERTIFICATES`"

6.378 USER_CHANGE_NOTIFICATION_REGS

`USER_CHANGE_NOTIFICATION_REGS` describes the change notification registrations owned by the current user. Its columns (except for `USERNAME`) are the same as those in `DBA_CHANGE_NOTIFICATION_REGS`.

 **See Also:**

"`DBA_CHANGE_NOTIFICATION_REGS`"

6.379 USER_CLU_COLUMNS

`USER_CLU_COLUMNS` maps columns in the current user's tables to cluster columns. Its columns are the same as those in `DBA_CLU_COLUMNS`.

 **See Also:**

"`DBA_CLU_COLUMNS`"

6.380 USER_CLUSTER_HASH_EXPRESSIONS

USER_CLUSTER_HASH_EXPRESSIONS lists hash functions for the hash clusters owned by the current user. Its columns are the same as those in ALL_CLUSTER_HASH_EXPRESSIONS.

 **See Also:**

["ALL_CLUSTER_HASH_EXPRESSIONS"](#)

6.381 USER_CLUSTERING_DIMENSIONS

USER_CLUSTERING_DIMENSIONS describes dimension tables associated with tables with an attribute clustering clause owned by the user. Its columns (except for OWNER) are the same as those in ALL_CLUSTERING_DIMENSIONS.

 **See Also:**

- ["ALL_CLUSTERING_DIMENSIONS"](#)
- *Oracle Database Data Warehousing Guide* for information about attribute clustering with zone maps

6.382 USER_CLUSTERING_JOINS

USER_CLUSTERING_JOINS describes joins to the dimension tables associated with tables with an attribute clustering clause owned by the user. Its columns (except for OWNER) are the same as those in ALL_CLUSTERING_JOINS.

 **See Also:**

- ["ALL_CLUSTERING_JOINS"](#)
- *Oracle Database Data Warehousing Guide* for information about attribute clustering with zone maps

6.383 USER_CLUSTERING_KEYS

USER_CLUSTERING_KEYS describes clustering keys for tables with an attribute clustering clause owned by the user. Its columns are the same as those in ALL_CLUSTERING_KEYS.

 **See Also:**

- "[ALL_CLUSTERING_KEYS](#)"
- *Oracle Database Data Warehousing Guide* for information about attribute clustering with zone maps

6.384 USER_CLUSTERING_TABLES

USER_CLUSTERING_TABLES describes the tables with an attribute clustering clause owned by the user. Its columns are the same as those in ALL_CLUSTERING_TABLES.

 **See Also:**

- "[ALL_CLUSTERING_TABLES](#)"
- *Oracle Database Data Warehousing Guide* for information about attribute clustering with zone maps

6.385 USER_CLUSTERS

USER_CLUSTERS describes all the clusters owned by the current user. Its columns are the same as those in ALL_CLUSTERS.

 **See Also:**

- "[ALL_CLUSTERS](#)"

6.386 USER_CODE_ROLE_PRIVS

USER_CODE_ROLE_PRIVS describes all the roles that are associated with program units owned by current user. Its columns (except for OWNER) are the same as those in ALL_CODE_ROLE_PRIVS.

 **See Also:**

- "[ALL_CODE_ROLE_PRIVS](#)"

6.387 USER_COL_COMMENTS

USER_COL_COMMENTS displays comments on the columns of the tables and views owned by the current user. Its columns (except for OWNER) are the same as those in ALL_COL_COMMENTS.

 **See Also:**

"[ALL_COL_COMMENTS](#)"

6.388 USER_COL_PENDING_STATS

USER_COL_PENDING_STATS describes the pending statistics of the columns owned by the current user. Its columns (except for OWNER) are the same as those in ALL_COL_PENDING_STATS.

 **See Also:**

"[ALL_COL_PENDING_STATS](#)"

6.389 USER_COL_PRIVS

USER_COL_PRIVS describes the column object grants for which the current user is the object owner, grantor, or grantee. Its columns are the same as those in DBA_COL_PRIVS.

 **See Also:**

"[DBA_COL_PRIVS](#)"

6.390 USER_COL_PRIVS_MADE

USER_COL_PRIVS_MADE describes the column object grants for which the current user is the object owner. Its columns (except for OWNER) are the same as those in ALL_COL_PRIVS_MADE.

 **See Also:**

"[ALL_COL_PRIVS_MADE](#)"

6.391 USER_COL_PRIVS_REC

USER_COL_PRIVS_REC describes the column object grants for which the current user is the grantee. Its columns (except for GRANTEE) are the same as those in ALL_COL_PRIVS_REC.

 **See Also:**

["ALL_COL_PRIVS_REC"](#)

6.392 USER_COLL_TYPES

USER_COLL_TYPES describes named collection types (VARRAYs, nested tables, object tables, and so on) in the current user's schema. Its columns are the same as those in ALL_COLL_TYPES.

 **See Also:**

["ALL_COLL_TYPES"](#)

6.393 USER_COMPARISON

USER_COMPARISON displays information about the comparison objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA_COMPARISON.

 **See Also:**

["DBA_COMPARISON"](#)

6.394 USER_COMPARISON_COLUMNS

USER_COMPARISON_COLUMNS displays information about the columns for the comparison objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA_COMPARISON_COLUMNS.

 **See Also:**

["DBA_COMPARISON_COLUMNS"](#)

6.395 USER_COMPARISON_ROW_DIF

USER_COMPARISON_ROW_DIF displays information about the differing rows in the comparison scans owned by the current user. Its columns are the same as those in DBA_COMPARISON_ROW_DIF.

 **See Also:**

["DBA_COMPARISON_ROW_DIF"](#)

6.396 USER_COMPARISON_SCAN

USER_COMPARISON_SCAN displays information about the comparison scans owned by the current user. Its columns (except for OWNER) are the same as those in DBA_COMPARISON_SCAN.

 **See Also:**

["DBA_COMPARISON_SCAN"](#)

6.397 USER_COMPARISON_SCAN_VALUES

USER_COMPARISON_SCAN_VALUES displays information about the values for the comparison scans owned by the current user. Its columns (except for OWNER) are the same as those in DBA_COMPARISON_SCAN_VALUES.

 **See Also:**

["DBA_COMPARISON_SCAN_VALUES"](#)

6.398 USER_CONS_COLUMNS

USER_CONS_COLUMNS describes columns that are owned by the current user and that are specified in constraint definitions. Its columns are the same as those in ALL_CONS_COLUMNS.

 **See Also:**

["ALL_CONS_COLUMNS"](#)

6.399 USER_CONS_OBJ_COLUMNS

USER_CONS_OBJ_COLUMNS displays information about the types that object columns (or attributes) or collection elements have been constrained to, in the tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CONS_OBJ_COLUMNS.

 **See Also:**

["ALL_CONS_OBJ_COLUMNS"](#)

6.400 USER_CONSTRAINTS

USER_CONSTRAINTS describes all constraint definitions on tables owned by the current user. Its columns are the same as those in ALL_CONSTRAINTS.

 **See Also:**

["ALL_CONSTRAINTS"](#)

6.401 USER_CQ_NOTIFICATION_QUERIES

USER_CQ_NOTIFICATION_QUERIES describes the registered queries for the CQ notifications owned by the current user. Its columns (except for USERNAME) are the same as those in DBA_CQ_NOTIFICATION_QUERIES.

 **See Also:**

["DBA_CQ_NOTIFICATION_QUERIES"](#)

6.402 USER_CREDENTIALS

USER_CREDENTIALS displays credentials owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CREDENTIALS.

 **See Also:**

["ALL_CREDENTIALS"](#)

6.403 USER_CUBE_ATTR_VISIBILITY

USER_CUBE_ATTR_VISIBILITY describes the OLAP attributes visible for the dimensions, hierarchies, and levels owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_ATTR_VISIBILITY.

 **See Also:**

["ALL_CUBE_ATTR_VISIBILITY"](#)

6.404 USER_CUBE_ATTRIBUTES

USER_CUBE_ATTRIBUTES describes the attributes for the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_ATTRIBUTES.

 **See Also:**

["ALL_CUBE_ATTRIBUTES"](#)

6.405 USER_CUBE_BUILD_PROCESSES

USER_CUBE_BUILD_PROCESSES describes the OLAP build processes and maintenance scripts owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_BUILD_PROCESSES.

 **See Also:**

["ALL_CUBE_BUILD_PROCESSES"](#)

6.406 USER_CUBE_CALCULATED_MEMBERS

USER_CUBE_CALCULATED_MEMBERS describes the calculated members for the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_CALCULATED_MEMBERS.

 **See Also:**

["ALL_CUBE_CALCULATED_MEMBERS"](#)

6.407 USER_CUBE_DIM_LEVELS

USER_CUBE_DIM_LEVELS describes the OLAP dimension levels owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_DIM_LEVELS.

 **See Also:**

["ALL_CUBE_DIM_LEVELS"](#)

6.408 USER_CUBE_DIM_MODELS

USER_CUBE_DIM_MODELS describes the models for the OLAP dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_DIM_MODELS.

 **See Also:**

["ALL_CUBE_DIM_MODELS"](#)

6.409 USER_CUBE_DIM_VIEW_COLUMNS

USER_CUBE_DIM_VIEW_COLUMNS describes the columns of the relational views of the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_DIM_VIEW_COLUMNS.

 **See Also:**

["ALL_CUBE_DIM_VIEW_COLUMNS"](#)

6.410 USER_CUBE_DIM_VIEWS

USER_CUBE_DIM_VIEWS describes the relational views of the OLAP dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_DIM_VIEWS.

 **See Also:**

["ALL_CUBE_DIM_VIEWS"](#)

6.411 USER_CUBE_DIMENSIONALITY

USER_CUBE_DIMENSIONALITY describes the dimension order for the OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_DIMENSIONALITY.

 **See Also:**

["ALL_CUBE_DIMENSIONALITY"](#)

6.412 USER_CUBE_DIMENSIONS

USER_CUBE_DIMENSIONS describes the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_DIMENSIONS.

 **See Also:**

["ALL_CUBE_DIMENSIONS"](#)

6.413 USER_CUBE_HIER_LEVELS

USER_CUBE_HIER_LEVELS describes the hierarchy levels for the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_HIER_LEVELS.

 **See Also:**

["ALL_CUBE_HIER_LEVELS"](#)

6.414 USER_CUBE_HIER_VIEW_COLUMNS

USER_CUBE_HIER_VIEW_COLUMNS describes the columns of the relational hierarchy views of the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_HIER_VIEW_COLUMNS.

 **See Also:**

["ALL_CUBE_HIER_VIEW_COLUMNS"](#)

6.415 USER_CUBE_HIER_VIEWS

USER_CUBE_HIER_VIEWS describes the hierarchies for the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_HIER_VIEWS.

See Also:

["ALL_CUBE_HIER_VIEWS"](#)

6.416 USER_CUBE_HIERARCHIES

USER_CUBE_HIERARCHIES describes the OLAP dimension hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_HIERARCHIES.

See Also:

["ALL_CUBE_HIERARCHIES"](#)

6.417 USER_CUBE_MEASURES

USER_CUBE_MEASURES describes the measures for the OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_MEASURES.

See Also:

["ALL_CUBE_MEASURES"](#)

6.418 USER_CUBE_NAMED_BUILD_SPECS

USER_CUBE_NAMED_BUILD_SPECS describes the OLAP cube named build specifications in the database that are owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_NAMED_BUILD_SPECS.

See Also:

["ALL_CUBE_NAMED_BUILD_SPECS"](#)

6.419 USER_CUBE_SUB_PARTITION_LEVELS

USER_CUBE_SUB_PARTITION_LEVELS describes the OLAP secondary partition levels in the database that are owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_SUB_PARTITION_LEVELS.

 **See Also:**

["ALL_CUBE_SUB_PARTITION_LEVELS"](#)

6.420 USER_CUBE_VIEW_COLUMNS

USER_CUBE_VIEW_COLUMNS describes the columns of relational views of OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_VIEW_COLUMNS.

 **See Also:**

["ALL_CUBE_VIEW_COLUMNS"](#)

6.421 USER_CUBE_VIEWS

USER_CUBE_VIEWS describes the relational views of the OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBE_VIEWS.

 **See Also:**

["ALL_CUBE_VIEWS"](#)

6.422 USER_CUBES

USER_CUBES describes the OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_CUBES.

 **See Also:**

["ALL_CUBES"](#)

6.423 USER_DATAPUMP_JOBS

USER_DATAPUMP_JOBS displays the Data Pump jobs owned by the current user. Its columns (except for OWNER_NAME) are the same as those in DBA_DATAPUMP_JOBS.

 **See Also:**

["DBA_DATAPUMP_JOBS"](#)

6.424 USER_DB_LINKS

USER_DB_LINKS describes the database links owned by the current user. Its columns are the same as those in ALL_DB_LINKS except that it does not have the OWNER column.

It also displays an additional column, PASSWORD, which is no longer used and for which nothing is returned. The PASSWORD column is maintained for backward compatibility only.

 **See Also:**

["ALL_DB_LINKS"](#)

6.425 USER_DBFS_HS

USER_DBFS_HS shows all Database File System (DBFS) hierarchical stores owned by the current user. Its columns (except for STOREOWNER) are the same as those in DBA_DBFS_HS.

 **See Also:**

["DBA_DBFS_HS"](#)

6.426 USER_DBFS_HS_COMMANDS

USER_DBFS_HS_COMMANDS shows all the registered store commands for all Database File system (DBFS) hierarchical stores owned by current user. Its columns (except for STOREOWNER) are the same as those in DBA_DBFS_HS_COMMANDS.

 **See Also:**

["DBA_DBFS_HS_COMMANDS"](#)

6.427 USER_DBFS_HS_FILES

USER_DBFS_HS_FILES displays files in the Database File System (DBFS) hierarchical store owned by the current user and their location on the back-end device.

Column	Datatype	NULL	Description
PATH	VARCHAR2 (1024)		Path name of the file
SEQUENCENUMBER	NUMBER		Sequence number of this piece of the file
STARTOFFSET	NUMBER		Begin offset of this piece in the tarball
ENDOFFSET	NUMBER		End offset of this piece in the tarball
TARBALLID	NUMBER		Tarball ID
BACKUPFILENAME	VARCHAR2 (256)		File on back end in which this tarball is located
TARSTARTOFFSET	NUMBER		Begin offset of this tarball in the backup file
TARENDOFFSET	NUMBER		End offset of this tarball in the backup file

6.428 USER_DBFS_HS_FIXED_PROPERTIES

USER_DBFS_HS_FIXED_PROPERTIES shows non-modifiable properties of all Database File System (DBFS) hierarchical stores owned by current user. Its columns (except for STORE_OWNER) are the same as those in DBA_DBFS_HS_FIXED_PROPERTIES.

 See Also:

["DBA_DBFS_HS_FIXED_PROPERTIES"](#)

6.429 USER_DBFS_HS_PROPERTIES

USER_DBFS_HS_PROPERTIES shows modifiable properties of all Database File System (DBFS) hierarchical stores owned by current user. Its columns (except for STOREOWNER) are the same as those in DBA_DBFS_HS_PROPERTIES.

 See Also:

["DBA_DBFS_HS_PROPERTIES"](#)

6.430 USER_DEPENDENCIES

USER_DEPENDENCIES describes dependencies between procedures, packages, functions, package bodies, and triggers owned by the current user, including dependencies on views created without any database links. Its columns are the same as those in ALL_DEPENDENCIES.

See Also:

"[ALL_DEPENDENCIES](#)"

6.431 USER_DIM_ATTRIBUTES

USER_DIM_ATTRIBUTES describes the relationship between dimension levels and functionally dependent columns in the current user's schema.

The level columns and the dependent column must be in the same table. This view's columns are the same as those in ALL_DIM_ATTRIBUTES.

See Also:

"[ALL_DIM_ATTRIBUTES](#)"

6.432 USER_DIM_CHILD_OF

USER_DIM_CHILD_OF describes a hierarchical relationship of 1 to n between pairs of levels in dimensions owned by the current user. Its columns are the same as those in ALL_DIM_CHILD_OF.

See Also:

"[ALL_DIM_CHILD_OF](#)"

6.433 USER_DIM_HIERARCHIES

USER_DIM_HIERARCHIES describes the dimension hierarchies owned by the current user. Its columns are the same as those in ALL_DIM_HIERARCHIES.

See Also:

"[ALL_DIM_HIERARCHIES](#)"

6.434 USER_DIM_JOIN_KEY

USER_DIM_JOIN_KEY describes the join between two dimension tables owned by the current user. The join is always specified between a parent dimension level column and a child column. This view's columns are the same as those in ALL_DIM_JOIN_KEY.

 **See Also:**

"[ALL_DIM_JOIN_KEY](#)"

6.435 USER_DIM_LEVEL_KEY

USER_DIM_LEVEL_KEY describes columns of dimension levels owned by the current user. This view's columns are the same as those in ALL_DIM_LEVEL_KEY.

 **See Also:**

"[ALL_DIM_LEVEL_KEY](#)"

6.436 USER_DIM_LEVELS

USER_DIM_LEVELS describes the levels of dimensions owned by the current user. All columns of a dimension level must come from the same relation. This view's columns are the same as those in ALL_DIM_LEVELS.

 **See Also:**

"[ALL_DIM_LEVELS](#)"

6.437 USER_DIMENSIONS

USER_DIMENSIONS describes dimension objects in the user's schema. Its columns are the same as those in ALL_DIMENSIONS.

 **See Also:**

"[ALL_DIMENSIONS](#)"

6.438 USER_EDITIONED_TYPES

USER_EDITIONED_TYPES lists the types that are editioned by default for the current user. Its columns (except for SCHEMA) are the same as those in DBA_EDITIONED_TYPES.

 See Also:

["DBA_EDITIONED_TYPES"](#)

6.439 USER_EDITIONING_VIEW_COLS

USER_EDITIONING_VIEW_COLS describes the relationship between the columns of the editioning views owned by the current user and the table columns to which they map. Its columns (except for OWNER) are the same as those in ALL_EDITIONING_VIEW_COLS.

 See Also:

["ALL_EDITIONING_VIEW_COLS"](#)

6.440 USER_EDITIONING_VIEW_COLS_AE

USER_EDITIONING_VIEW_COLS_AE describes the relationship between the columns of the editioning views (across all editions) owned by the current user and the table columns to which they map. Its columns (except for OWNER) are the same as those in ALL_EDITIONING_VIEW_COLS_AE.

 See Also:

["ALL_EDITIONING_VIEW_COLS_AE"](#)

6.441 USER_EDITIONING_VIEWS

USER_EDITIONING_VIEWS describes the editioning views owned by the current user. Its columns (except for OWNER) are the same as those in ALL_EDITIONING_VIEWS.

 See Also:

["ALL_EDITIONING_VIEWS"](#)

6.442 USER_EDITIONING_VIEWS_AE

USER_EDITIONING_VIEWS_AE describes the editioning views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_EDITIONING_VIEWS_AE.

 **See Also:**

["ALL_EDITIONING_VIEWS_AE"](#)

6.443 USER_ENCRYPTED_COLUMNS

USER_ENCRYPTED_COLUMNS maintains encryption algorithm information for all encrypted columns in all tables in the user's schema. Its columns (except for OWNER) are the same as those in ALL_ENCRYPTED_COLUMNS.

 **See Also:**

["ALL_ENCRYPTED_COLUMNS"](#)

6.444 USER_EPG_DAD_AUTHORIZATION

USER_EPG_DAD_AUTHORIZATION describes the DADs that are authorized to use the user's privileges. Its columns (except for USERNAME) are the same as those in DBA_EPG_DAD_AUTHORIZATION.

 **See Also:**

["DBA_EPG_DAD_AUTHORIZATION"](#)

6.445 USER_ERROR_TRANSLATIONS

USER_ERROR_TRANSLATIONS describes all error translations owned by the user. Its columns (except for OWNER) are the same as those in ALL_ERROR_TRANSLATIONS.

 **See Also:**

["ALL_ERROR_TRANSLATIONS"](#)

6.446 USER_ERRORS

USER_ERRORS describes the current errors on the stored objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ERRORS.

 See Also:

["ALL_ERRORS"](#)

6.447 USER_ERRORS_AE

USER_ERRORS_AE describes the current errors on the stored objects (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_ERRORS_AE.

 See Also:

["ALL_ERRORS_AE"](#)

6.448 USER_EVALUATION_CONTEXT_TABLES

USER_EVALUATION_CONTEXT_TABLES describes the tables in the rule evaluation contexts owned by the current user. Its columns (except for EVALUATION_CONTEXT_OWNER) are the same as those in ALL_EVALUATION_CONTEXT_TABLES.

 See Also:

["ALL_EVALUATION_CONTEXT_TABLES"](#)

6.449 USER_EVALUATION_CONTEXT_VARS

USER_EVALUATION_CONTEXT_VARS describes the variables in the rule evaluation contexts owned by the current user. Its columns (except for EVALUATION_CONTEXT_OWNER) are the same as those in ALL_EVALUATION_CONTEXT_VARS.

 See Also:

["ALL_EVALUATION_CONTEXT_VARS"](#)

6.450 USER_EVALUATION_CONTEXTS

USER_EVALUATION_CONTEXTS describes the rule evaluation contexts owned by the current user. Its columns (except for EVALUATION_CONTEXT_OWNER) are the same as those in ALL_EVALUATION_CONTEXTS.

 **See Also:**

["ALL_EVALUATION_CONTEXTS"](#)

6.451 USER_EXPRESSION_STATISTICS

USER_EXPRESSION_STATISTICS provides expression usage tracking statistics for tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_EXPRESSION_STATISTICS.

 **See Also:**

["ALL_EXPRESSION_STATISTICS"](#)

6.452 USER_EXTENTS

USER_EXTENTS describes the extents comprising the segments owned by the current user's objects. Its columns (except for OWNER, FILE_ID, BLOCK_ID, and RELATIVE_FNO) are the same as those in DBA_EXTENTS.

 **See Also:**

["DBA_EXTENTS"](#)

6.453 USER_EXTERNAL_LOCATIONS

USER_EXTERNAL_LOCATIONS describes the locations (data sources) of the external tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_EXTERNAL_LOCATIONS.

 **See Also:**

["ALL_EXTERNAL_LOCATIONS"](#)

6.454 USER_EXTERNAL_TABLES

`USER_EXTERNAL_TABLES` describes the external tables owned by the current user. Its columns (except for `OWNER`) are the same as those in `ALL_EXTERNAL_TABLES`.

 **See Also:**

["ALL_EXTERNAL_TABLES"](#)

6.455 USER_FILE_GROUP_EXPORT_INFO

`USER_FILE_GROUP_EXPORT_INFO` shows export-related information for all file groups that the current user can manage. Its columns (except for `FILE_GROUP_OWNER`) are the same as those in `ALL_FILE_GROUP_EXPORT_INFO`.

 **See Also:**

["ALL_FILE_GROUP_EXPORT_INFO"](#)

6.456 USER_FILE_GROUP_FILES

`USER_FILE_GROUP_FILES` shows the file set for each versioned group owned by the current user. Its columns (except for `FILE_GROUP_OWNER`) are the same as those in `ALL_FILE_GROUP_FILES`.

 **See Also:**

["ALL_FILE_GROUP_FILES"](#)

6.457 USER_FILE_GROUP_TABLES

`USER_FILE_GROUP_TABLES` shows information about tables owned by the current user that can be imported using the file set. Its columns (except for `FILE_GROUP_OWNER`) are the same as those in `ALL_FILE_GROUP_TABLES`.

 **See Also:**

["ALL_FILE_GROUP_TABLES"](#)

6.458 USER_FILE_GROUP_TABLESPACES

USER_FILE_GROUP_TABLESPACES shows information about the transportable tablespaces present (partially or completely) in the file set owned by the current user (when the file set contains dump files). Its columns (except for FILE_GROUP_OWNER) are the same as those in ALL_FILE_GROUP_TABLESPACES.

 See Also:

"[ALL_FILE_GROUP_TABLESPACES](#)"

6.459 USER_FILE_GROUP VERSIONS

USER_FILE_GROUP VERSIONS shows top-level version information for all file groups owned by the current user. Its columns (except for FILE_GROUP_OWNER) are the same as those in ALL_FILE_GROUP VERSIONS.

 See Also:

"[ALL_FILE_GROUP VERSIONS](#)"

6.460 USER_FILE_GROUPS

USER_FILE_GROUPS shows top-level metadata about file groups owned by the current user. Its columns (except for FILE_GROUP_OWNER) are the same as those in ALL_FILE_GROUPS.

 See Also:

"[ALL_FILE_GROUPS](#)".

6.461 USER_FLASHBACK_ARCHIVE

USER_FLASHBACK_ARCHIVE describes flashback data archives, which consist of multiple tablespaces and historic data from all transactions against tracked tables.

The content of this view depends on the privileges of the user who queries it, as follows:

- If the user has the FLASHBACK ARCHIVE ADMINISTER system privilege, then USER_FLASHBACK_ARCHIVE describes the flashback archives for all users who have been granted the FLASHBACK ARCHIVE object privilege.
- If the user does not have the FLASHBACK ARCHIVE ADMINISTER system privilege, then USER_FLASHBACK_ARCHIVE describes flashback archives for which the current user has been granted the FLASHBACK ARCHIVE object privilege.

The columns of the `USER_FLASHBACK_ARCHIVE` view are the same as those in `DBA_FLASHBACK_ARCHIVE`.

 **See Also:**

["DBA_FLASHBACK_ARCHIVE"](#)

6.462 USER_FLASHBACK_ARCHIVE_TABLES

`USER_FLASHBACK_ARCHIVE_TABLES` displays information about the tables owned by the current user that are enabled for Flashback Archive. Its columns are the same as those in `DBA_FLASHBACK_ARCHIVE_TABLES`.

 **See Also:**

["DBA_FLASHBACK_ARCHIVE_TABLES"](#)

6.463 USER_FLASHBACK_TXN_REPORT

`USER_FLASHBACK_TXN_REPORT` displays information about the compensating transactions owned by the current user that have been committed in the database. Its columns (except for `USERNAME`) are the same as those in `DBA_FLASHBACK_TXN_REPORT`.

 **See Also:**

["DBA_FLASHBACK_TXN_REPORT"](#)

6.464 USER_FLASHBACK_TXN_STATE

`USER_FLASHBACK_TXN_STATE` displays information about the compensating status of the transactions owned by the current user. Its columns (except for `USERNAME`) are the same as those in `DBA_FLASHBACK_TXN_STATE`.

 **See Also:**

["DBA_FLASHBACK_TXN_STATE"](#)

6.465 USER_FREE_SPACE

USER_FREE_SPACE describes the free extents in the tablespaces accessible to the current user. Its columns are the same as those in DBA_FREE_SPACE.

 See Also:

["DBA_FREE_SPACE"](#)

6.466 USER_GOLDENGATE_PRIVILEGES

USER_GOLDENGATE_PRIVILEGES displays details about Oracle GoldenGate privileges. Its columns (except for USERNAME) are the same as those in ALL_GOLDENGATE_PRIVILEGES.

 See Also:

["ALL_GOLDENGATE_PRIVILEGES"](#)

6.467 USER_HEAT_MAP_SEG_HISTOGRAM

USER_HEAT_MAP_SEG_HISTOGRAM displays segment access information for segments owned by the user. Its columns (except for OWNER) are the same as those in ALL_HEAT_MAP_SEG_HISTOGRAM.

 See Also:

["ALL_HEAT_MAP_SEG_HISTOGRAM"](#)

6.468 USER_HEAT_MAP_SEGMENT

USER_HEAT_MAP_SEGMENT displays the latest segment access time for all segments owned by the user. Its columns (except for OWNER) are the same as those in ALL_HEAT_MAP_SEGMENT.

 See Also:

["ALL_HEAT_MAP_SEGMENT"](#)

6.469 USER_HIER_CLASS

USER_HIER_CLASS describes the classifications of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_CLASS.

 **See Also:**

["ALL_HIER_CLASS"](#)

6.470 USER_HIER_CLASS_AE

USER_HIER_CLASS_AE describes the classifications of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_CLASS_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

["ALL_HIER_CLASS_AE"](#)

6.471 USER_HIER_COLUMNS

USER_HIER_COLUMNS describes the columns of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_COLUMNS.

 **See Also:**

["ALL_HIER_COLUMNS"](#)

6.472 USER_HIER_COLUMNS_AE

USER_HIER_COLUMNS_AE describes the columns of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_COLUMNS_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

["ALL_HIER_COLUMNS_AE"](#)

6.473 USER_HIER_HIER_ATTR_CLASS

USER_HIER_HIER_ATTR_CLASS describes the classifications of the hierarchical attributes of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_HIER_ATTR_CLASS.

 **See Also:**

["ALL_HIER_HIER_ATTR_CLASS"](#)

6.474 USER_HIER_HIER_ATTR_CLASS_AE

USER_HIER_HIER_ATTR_CLASS_AE describes the classifications of the hierarchical attributes of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_HIER_ATTR_CLASS_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

["ALL_HIER_HIER_ATTR_CLASS_AE"](#)

6.475 USER_HIER_HIER_ATTRIBUTES

USER_HIER_HIER_ATTRIBUTES describes the hierarchical attributes of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_HIER_ATTRIBUTES.

 **See Also:**

["ALL_HIER_HIER_ATTRIBUTES"](#)

6.476 USER_HIER_HIER_ATTRIBUTES_AE

USER_HIER_HIER_ATTRIBUTES_AE describes the hierarchical attributes of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_HIER_ATTRIBUTES_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

["ALL_HIER_HIER_ATTRIBUTES_AE"](#)

6.477 USER_HIER_JOIN_PATHS

USER_HIER_JOIN_PATHS describes the join paths for the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_JOIN_PATHS.

 **See Also:**

["ALL_HIER_JOIN_PATHS"](#)

6.478 USER_HIER_JOIN_PATHS_AE

USER_HIER_JOIN_PATHS_AE describes the join paths for the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_JOIN_PATHS_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

"[ALL_HIER_JOIN_PATHS_AE](#)"

6.479 USER_HIER_LEVEL_ID_ATTRS

USER_HIER_LEVEL_ID_ATTRS describes the attributes that uniquely identify members of the levels of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_LEVEL_ID_ATTRS.

 **See Also:**

"[ALL_HIER_LEVEL_ID_ATTRS](#)"

6.480 USER_HIER_LEVEL_ID_ATTRS_AE

USER_HIER_LEVEL_ID_ATTRS_AE describes the attributes that uniquely identify members of the levels of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_LEVEL_ID_ATTRS_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

"[ALL_HIER_LEVEL_ID_ATTRS_AE](#)"

6.481 USER_HIER_LEVELS

USER_HIER_LEVELS describes the levels of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_LEVELS.

 **See Also:**

"[ALL_HIER_LEVELS](#)"

6.482 USER_HIER_LEVELS_AE

USER_HIER_LEVELS_AE describes the levels of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIER_LEVELS_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

"[ALL_HIER_LEVELS_AE](#)"

6.483 USER_HIERARCHIES

USER_HIERARCHIES describes the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIERARCHIES.

 **See Also:**

"[ALL_HIERARCHIES](#)"

6.484 USER_HIERARCHIES_AE

USER_HIERARCHIES_AE describes the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_HIERARCHIES_AE.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.13.

 **See Also:**

["ALL_HIERARCHIES_AE"](#)

6.485 USER_HISTOGRAMS

USER_HISTOGRAMS is a synonym for USER_TAB_HISTOGRAMS.

 **See Also:**

["USER_TAB_HISTOGRAMS"](#)

6.486 USER_HIVE_COLUMNS

USER_HIVE_COLUMNS describes all Hive columns owned by the current user in a Hive metastore. Its columns are the same as those in ALL_HIVE_COLUMNS.

 **See Also:**

["ALL_HIVE_COLUMNS"](#)

6.487 USER_HIVE_DATABASES

USER_HIVE_DATABASES describes all the Hive schemas owned by the current user in a Hadoop cluster. Its columns are the same as those in ALL_HIVE_DATABASES.

 **See Also:**

["ALL_HIVE_DATABASES"](#)

6.488 USER_HIVE_PART_KEY_COLUMNS

USER_HIVE_PART_KEY_COLUMNS provides information about all Hive table partition columns owned by the current user in the database. Its columns are the same as those in ALL_HIVE_PART_KEY_COLUMNS.

 **See Also:**

["ALL_HIVE_PART_KEY_COLUMNS"](#)

6.489 USER_HIVE_TAB_PARTITIONS

USER_HIVE_TAB_PARTITIONS provides information about all Hive table partitions owned by the current user in the database. Its columns are the same as those in ALL_HIVE_TAB_PARTITIONS.

 **See Also:**

["ALL_HIVE_TAB_PARTITIONS"](#)

6.490 USER_HIVE_TABLES

USER_HIVE_TABLES provides information about all the Hive tables owned by the current user in the Hive metastore. Its columns are the same as those in ALL_HIVE_TABLES.

 **See Also:**

["ALL_HIVE_TABLES"](#)

6.491 USER_HOST_ACES

USER_HOST_ACES describes the status of access control entries for the current user to access network hosts through PL/SQL network utility packages.

Its columns (except for ACE_ORDER, START_DATE, END_DATE, GRANT_TYPE, INVERTED_PRINCIPAL, PRINCIPAL, PRINCIPAL_TYPE, and STATUS) are the same as those in DBA_HOST_ACES.

 **See Also:**

["DBA_HOST_ACES"](#)

6.492 USER_IDENTIFIERS

USER_IDENTIFIERS displays information about the identifiers in the stored objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL_IDENTIFIERS.

 **See Also:**

["ALL_IDENTIFIERS"](#)

6.493 USER_ILMDATAMOVEMENTPOLICIES

USER_ILMDATAMOVEMENTPOLICIES contains information specific to data movement-related attributes of an Automatic Data Optimization policy for a user. Its columns are the same as those in DBA_ILMDATAMOVEMENTPOLICIES.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

 **See Also:**

"[DBA_ILMDATAMOVEMENTPOLICIES](#)"

6.494 USER_ILMEVALUATIONDETAILS

USER_ILMEVALUATIONDETAILS displays details on evaluation of Automatic Data Optimization policies considered for Automatic Data Optimization tasks for a user.

It also shows the job name that executes the policy, in case the policy was selected for execution. If the policy was not selected for execution, this view provides a reason. Its columns are the same as those in DBA_ILMEVALUATIONDETAILS.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

 **See Also:**

"[DBA_ILMEVALUATIONDETAILS](#)"

6.495 USER_ILMOBJECTS

USER_ILMOBJECTS displays all the Automatic Data Optimization policies and objects for a user.

Many objects inherit policies via their parent objects or because they were created in a particular tablespace. This view provides a mapping between the policies and objects and indicates whether a policy is inherited by an object or is directly specified on it. Its columns are the same as those in DBA_ILMOBJECTS.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

 **See Also:**

"[DBA_ILMOBJECTS](#)"

6.496 USER_ILMPOLICIES

`USER_ILMPOLICIES` displays details about Automatic Data Optimization policies owned by the user.

The view contains common details relevant to all types of Automatic Data Optimization policies, not just details relevant to the data movement-related Automatic Data Optimization policies. Its columns are the same as those in `DBA_ILMPOLICIES`.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

 **See Also:**

"[DBA_ILMPOLICIES](#)"

6.497 USER_IILMRESULTS

`USER_IILMRESULTS` displays information on data movement-related Automatic Data Optimization jobs for tasks created by the user.

Its columns are the same as those in `DBA_IILMRESULTS`.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

 **See Also:**

["DBA_ILMRESULTS"](#)

6.498 USER_ILMTASKS

USER_ILMTASKS displays information on Automatic Data Optimization tasks created by a user. Its columns are the same as those in DBA_ILMTASKS.

 **Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

 **See Also:**

["DBA_ILMTASKS"](#)

6.499 USER_IM_EXPRESSIONS

USER_IM_EXPRESSIONS provides information about the list of expressions (SYSIME virtual columns) that are currently enabled for in-memory storage in schemas owned by the current user. Its columns (except for OWNER) are the same as those in DBA_IM_EXPRESSIONS.

Typically, you can query this view after invoking the DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS PL/SQL procedure to see the list of hot expressions added to tables owned by you across the database.

Based on this view, you can:

- Populate expressions on a particular table immediately
- Drop certain expressions that are marked for in-memory but not desired by you

 **See Also:**

["DBA_IM_EXPRESSIONS"](#)

6.500 USER_IMMUTABLE_TABLES

`USER_IMMUTABLE_TABLES` describes the immutable tables owned by the current user. Its columns (except for `SCHEMA_NAME`) are the same as those in `ALL_IMMUTABLE_TABLES`.

 **Note:**

This view is available starting with Oracle Database 19c, Release Update 19.11.

 **See Also:**

["ALL_IMMUTABLE_TABLES"](#)

6.501 USER_IND_COLUMNS

`USER_IND_COLUMNS` describes the columns of the indexes owned by the current user and columns of indexes on tables owned by the current user.

Its columns (except for `INDEX_OWNER` and `TABLE_OWNER`) are the same as those in ["ALL_IND_COLUMNS"](#).

6.502 USER_IND_EXPRESSIONS

`USER_IND_EXPRESSIONS` describes expressions of function-based indexes on tables owned by the current user. Its columns (except for `INDEX_OWNER` and `TABLE_OWNER`) are the same as those in `ALL_IND_EXPRESSIONS`.

 **See Also:**

["ALL_IND_EXPRESSIONS"](#)

6.503 USER_IND_PARTITIONS

`USER_IND_PARTITIONS` displays, for each index partition owned by the current user, the partition-level partitioning information, the storage parameters for the partition, and various partition statistics generated by the `DBMS_STATS` package. Its columns are the same as those in `ALL_IND_PARTITIONS`.

 **See Also:**

["ALL_IND_PARTITIONS"](#)

6.504 USER_IND_PENDING_STATS

USER_IND_PENDING_STATS describes pending statistics for all tables, partitions, and subpartitions owned by the current user and collected using the DBMS_STATS package. Its columns (except for OWNER) are the same as those in ALL_IND_PENDING_STATS.

 **See Also:**

["ALL_IND_PENDING_STATS"](#)

6.505 USER_IND_STATISTICS

USER_IND_STATISTICS displays optimizer statistics for the indexes on the tables owned by the current user and collected using the DBMS_STATS package. Its columns (except for OWNER) are the same as those in ALL_IND_STATISTICS.

 **See Also:**

["ALL_IND_STATISTICS"](#)

6.506 USER_IND_SUBPARTITIONS

USER_IND_SUBPARTITIONS displays, for each index subpartition owned by the current user, the subpartition-level partitioning information, the storage parameters for the subpartition, and various subpartition statistics generated by the DBMS_STATS package.

Its columns are the same as those in "[ALL_IND_SUBPARTITIONS](#)".

6.507 USER_INDEXES

USER_INDEXES describes indexes owned by the current user. To gather statistics for this view, use the DBMS_STATS package. This view supports parallel partitioned index scans. Its columns (except for OWNER) are the same as those in ALL_INDEXES.

 **See Also:**

["ALL_INDEXES"](#)

6.508 USER_INDEXTYPE_ARRAYTYPES

USER_INDEXTYPE_ARRAYTYPES displays information about the array types specified by the indextypes owned by the current user. Its columns are the same as those in ALL_INDEXTYPE_ARRAYTYPES.

See Also:

"[ALL_INDEXTYPE_ARRAYTYPES](#)"

6.509 USER_INDEXTYPE_COMMENTS

USER_INDEXTYPE_COMMENTS displays comments for the user-defined indextypes owned by the current user. Its columns are the same as those in ALL_INDEXTYPE_COMMENTS.

See Also:

"[ALL_INDEXTYPE_COMMENTS](#)"

6.510 USER_INDEXTYPE_OPERATORS

USER_INDEXTYPE_OPERATORS lists all the operators supported by indextypes owned by the current user. Its columns are the same as those in ALL_INDEXTYPE_OPERATORS.

See Also:

"[ALL_INDEXTYPE_OPERATORS](#)"

6.511 USER_INDEXTYPES

USER_INDEXTYPES describes the indextypes owned by the current user. Its columns are the same as those in ALL_INDEXTYPES.

See Also:

"[ALL_INDEXTYPES](#)"

6.512 USER_INTERNAL_TRIGGER

USER_INTERNAL_TRIGGER describes the internal triggers on all tables owned by the current user. Its columns are the same as those in ALL_INTERNAL_TRIGGER.

 See Also:

"[ALL_INTERNAL_TRIGGER](#)".

6.513 USER_JAVA_ARGUMENTS

USER_JAVA_ARGUMENTS displays argument information about the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_JAVA_ARGUMENTS.

 See Also:

"[ALL_JAVA_ARGUMENTS](#)"

6.514 USER_JAVA_CLASSES

USER_JAVA_CLASSES displays class level information about the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_JAVA_CLASSES.

 See Also:

"[ALL_JAVA_CLASSES](#)"

6.515 USER_JAVA_COMPILER_OPTIONS

USER_JAVA_COMPILER_OPTIONS displays information about the native compiler options owned by the current user. Its columns (except for OWNER) are the same as those in ALL_JAVA_COMPILER_OPTIONS.

 See Also:

"[ALL_JAVA_COMPILER_OPTIONS](#)"

6.516 USER_JAVA_DERIVATIONS

USER_JAVA_DERIVATIONS displays mapping information about Java source objects and their derived Java class objects and Java resource objects for the Java classes owned by the current user.

Its columns (except for OWNER) are the same as those in ALL_JAVA_DERIVATIONS.

 **See Also:**

["ALL_JAVA_DERIVATIONS"](#)

6.517 USER_JAVA_FIELDS

USER_JAVA_FIELDS displays field information about the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_JAVA_FIELDS.

 **See Also:**

["ALL_JAVA_FIELDS"](#)

6.518 USER_JAVA_IMPLEMENTS

USER_JAVA_IMPLEMENTS describes interfaces implemented by the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_JAVA_IMPLEMENTS.

 **See Also:**

["ALL_JAVA_IMPLEMENTS"](#)

6.519 USER_JAVA_INNERS

USER_JAVA_INNERS displays information about inner classes referred to by the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_JAVA_INNERS.

 **See Also:**

["ALL_JAVA_INNERS"](#)

6.520 USER_JAVA_LAYOUTS

`USER_JAVA_LAYOUTS` displays class layout information about the stored Java classes owned by the current user. Its columns (except for `OWNER`) are the same as those in `ALL_JAVA_LAYOUTS`.

See Also:

["ALL_JAVA_LAYOUTS"](#)

6.521 USER_JAVA_METHODS

`USER_JAVA_METHODS` displays method information about the stored Java classes owned by the current user. Its columns (except for `OWNER`) are the same as those in `ALL_JAVA_METHODS`.

See Also:

["ALL_JAVA_METHODS"](#)

6.522 USER_JAVA_NCOMPS

`USER_JAVA_NCOMPS` displays ncomp-related information about the Java classes owned by the current user. Its columns (except for `OWNER`) are the same as those in `ALL_JAVA_NCOMPS`.

See Also:

["ALL_JAVA_NCOMPS"](#)

6.523 USER_JAVA_POLICY

`USER_JAVA_POLICY` describes Java security permissions for the current user. Its columns are the same as those in `DBA_JAVA_POLICY`.

See Also:

["DBA_JAVA_POLICY"](#)

6.524 USER_JAVA_RESOLVERS

USER_JAVA_RESOLVERS displays information about resolvers of the Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_JAVA_RESOLVERS.

 **See Also:**

["ALL_JAVA_RESOLVERS"](#)

6.525 USER_JAVA_THROWS

USER_JAVA_THROWS displays information about exceptions thrown from methods of the Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_JAVA_THROWS.

 **See Also:**

["ALL_JAVA_THROWS"](#)

6.526 USER_JOBS

USER_JOBS describes the jobs owned by the current user. Its columns are the same as those in DBA_JOBS.

 **See Also:**

["DBA_JOBS"](#)

6.527 USER_JOIN_IND_COLUMNS

USER_JOIN_IND_COLUMNS describes all join conditions owned by the current user. Its columns are the same as those in ALL_JOIN_IND_COLUMNS.

 **See Also:**

["ALL_JOIN_IND_COLUMNS"](#)

6.528 USER_JOININGROUPS

USER_JOININGROUPS describes join groups belonging to the user. A join group is a user-created object that consists of two or more columns that can be meaningfully joined. The maximum number of columns that can be included in a join group is 255. The USER_JOININGROUPS columns (except for JOINGROUP_OWNER) are the same as those in DBA_JOININGROUPS.

In certain queries, join groups enable the database to eliminate the performance overhead of decompressing and hashing column values. Join groups require an In-Memory column store (IM column store).

 **See Also:**

- "[DBA_JOININGROUPS](#)"
- *Oracle Database In-Memory Guide* for an introduction to join groups
- *Oracle Database SQL Language Reference* for information about creating a join group using the CREATE INMEMORY JOIN GROUP statement

6.529 USER_JSON_COLUMNS

USER_JSON_COLUMNS provides information on the JavaScript Object Notation (JSON) columns for which the user is the owner. Its columns (except for OWNER) are the same as those in ALL_JSON_COLUMNS.

Each column owned by the user that has an IS JSON check constraint in an AND condition appears in this view. This view enables a user to find all the JSON columns that he or she owns.

For example, if a check constraint combines the IS JSON condition with another condition using logical condition OR, then the column is not listed in this view. In this case, it is not certain that the data in the column is JSON data. For example, the following constraint does not ensure that the data in column jcol is JSON data:

```
jcol is json OR length(jcol) < 1000
```

 **See Also:**

- "[ALL_JSON_COLUMNS](#)"
- *Oracle Database JSON Developer's Guide* for more information about using JSON with Oracle Database

6.530 USER_JSON_DATAGUIDE_FIELDS

USER_JSON_DATAGUIDE_FIELDS extracts the path and type information from all the data guides in the current user's schema, which are the data guides returned to the user by the

USER_JSON_DATAGUIDE view. Its columns (except for OWNER) are the same as those in ALL_JSON_DATAGUIDE_FIELDS.

 **See Also:**

["ALL_JSON_DATAGUIDE_FIELDS"](#)

6.531 USER_JSON_DATAGUIDES

USER_JSON_DATAGUIDES provides information on the JavaScript Object Notation (JSON) columns owned by the current user that have data guide enabled. Its columns (except for OWNER) are the same as those in ALL_JSON_DATAGUIDES.

 **See Also:**

["ALL_JSON_DATAGUIDES"](#)

6.532 USER_LIBRARIES

USER_LIBRARIES describes the libraries owned by the current user. Its columns (except for OWNER) are the same as those in ALL_LIBRARIES.

 **See Also:**

["ALL_LIBRARIES"](#)

6.533 USER_LOB_PARTITIONS

USER_LOB_PARTITIONS displays the LOB partitions contained in the tables owned by the current user. Its columns are the same as those in ALL_LOB_PARTITIONS.

 **See Also:**

["ALL_LOB_PARTITIONS"](#)

6.534 USER_LOB_SUBPARTITIONS

USER_LOB_SUBPARTITIONS displays partition-level attributes of the LOB data subpartitions owned by the current user. Its columns are the same as those in ALL_LOB_SUBPARTITIONS.

DBA_LOB_TEMPLATES describes all LOB subpartition templates in the database.

 See Also:

["ALL_LOB_SUBPARTITIONS"](#)

6.535 USER_LOB_TEMPLATES

USER_LOB_TEMPLATES describes the LOB subpartition templates owned by the current user. Its columns (except for USER_NAME) are the same as those in ALL_LOB_TEMPLATES.

 See Also:

["ALL_LOB_TEMPLATES"](#)

6.536 USER_LOBS

USER_LOBS displays the user's CLOBs and BLOBS contained in the user's tables. BFILEs are stored outside the database, so they are not described by this view. This view's columns are the same as those in ALL_LOBS.

 See Also:

["ALL_LOBS"](#)

6.537 USER_LOG_GROUP_COLUMNS

USER_LOG_GROUP_COLUMNS describes columns that are owned by the current user and that are specified in log groups. Its columns are the same as those in ALL_LOG_GROUP_COLUMNS.

 See Also:

["ALL_LOG_GROUP_COLUMNS"](#)

6.538 USER_LOG_GROUPS

USER_LOG_GROUPS describes log group definitions on tables owned by the current user. Its columns are the same as those in ALL_LOG_GROUPS.

 See Also:

["ALL_LOG_GROUPS"](#)

6.539 USER_MEASURE_FOLDER_CONTENTS

USER_MEASURE_FOLDER_CONTENTS describes the contents of the OLAP measure folders owned by the current user. Its columns (except for OWNER) are the same as those in ALL_MEASURE_FOLDER_CONTENTS.

 **See Also:**

["ALL_MEASURE_FOLDER_CONTENTS"](#)

6.540 USER_MEASURE_FOLDER_SUBFOLDERS

USER_MEASURE_FOLDER_SUBFOLDERS describes the OLAP measure folders contained within the OLAP measure folders owned by the current user. Its columns (except for OWNER) are the same as those in ALL_MEASURE_FOLDER_SUBFOLDERS.

 **See Also:**

["ALL_MEASURE_FOLDER_SUBFOLDERS"](#)

6.541 USER_MEASURE_FOLDERS

USER_MEASURE_FOLDERS describes the OLAP measure folders owned by the current user. Its columns (except for OWNER) are the same as those in ALL_MEASURE_FOLDERS.

 **See Also:**

["ALL_MEASURE_FOLDERS"](#)

6.542 USER_METADATA_PROPERTIES

USER_METADATA_PROPERTIES describes OLAP metadata properties in the current user's schema. Its columns (except for OWNER) are the same as those in ALL_METADATA_PROPERTIES.

 **See Also:**

["ALL_METADATA_PROPERTIES"](#)

6.543 USER_METHOD_PARAMS

USER_METHOD_PARAMS describes the method parameters of the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_METHOD_PARAMS.

 **See Also:**

["ALL_METHOD_PARAMS"](#)

6.544 USER_METHOD_RESULTS

USER_METHOD_RESULTS describes the method results of the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_METHOD_RESULTS.

 **See Also:**

["ALL_METHOD_RESULTS"](#)

6.545 USER_MINING_MODEL_ATTRIBUTES

USER_MINING_MODEL_ATTRIBUTES describes the mining model attributes owned by the current user. Its columns (except for OWNER) are the same as those in ALL_MINING_MODEL_ATTRIBUTES.

 **See Also:**

["ALL_MINING_MODEL_ATTRIBUTES"](#)

6.546 USER_MINING_MODEL_PARTITIONS

USER_MINING_MODEL_PARTITIONS describes the user's own model partitions. Its columns (except OWNER) are the same as those in ALL_MINING_MODEL_PARTITIONS.

 **Note:**

The USER_MINING_MODEL_PARTITIONS view is available in Oracle Database 12c Release 2 and later.

 **See Also:**

["ALL_MINING_MODEL_PARTITIONS"](#)

6.547 USER_MINING_MODEL_SETTINGS

USER_MINING_MODEL_SETTINGS describes the mining model settings owned by the current user. Its columns (except for OWNER) are the same as those in ALL_MINING_MODEL_SETTINGS.

 **See Also:**

["ALL_MINING_MODEL_SETTINGS"](#)

6.548 USER_MINING_MODEL_VIEWS

USER_MINING_MODEL_VIEWS describes the user's own model views. Its columns (except OWNER) are the same as those in ALL_MINING_MODEL_VIEWS.

 **See Also:**

["ALL_MINING_MODEL_VIEWS"](#)

6.549 USER_MINING_MODEL_XFORMS

USER_MINING_MODEL_XFORMS describes the user-specified transformations embedded with the user's own models. Its columns (except OWNER) are the same as those in ALL_MINING_MODEL_XFORMS.

 **See Also:**

["ALL_MINING_MODEL_XFORMS"](#)

6.550 USER_MINING_MODELS

USER_MINING_MODELS describes the mining models owned by the current user. Its columns (except for OWNER) are the same as those in ALL_MINING_MODELS.

 **See Also:**

["ALL_MINING_MODELS"](#)

6.551 USER_MVIEW_AGGREGATES

`USER_MVIEW_AGGREGATES` describes the grouping functions (aggregated measures) that appear in the `SELECT` list of aggregated materialized views owned by the current user. Its columns are the same as those in `ALL_MVIEW_AGGREGATES`.

 **See Also:**

["ALL_MVIEW_AGGREGATES"](#)

6.552 USER_MVIEW_ANALYSIS

`USER_MVIEW_ANALYSIS` describes all materialized views owned by the current user that potentially support query rewrite and that provide additional information for analysis by applications. Its columns are the same as those in `ALL_MVIEW_ANALYSIS`.

 **Note:**

This view excludes materialized views that reference remote tables or that include references to non-static values such as `SYSDATE` or `USER`. This view also excludes materialized views that were created as snapshots before Oracle8i and that were never altered to enable query rewrite.

 **See Also:**

["ALL_MVIEW_ANALYSIS"](#)

6.553 USER_MVIEW_COMMENTS

`USER_MVIEW_COMMENTS` displays comments on the materialized views owned by the current user. Its columns (except for `OWNER`) are the same as those in `ALL_MVIEW_COMMENTS`.

 **See Also:**

["ALL_MVIEW_COMMENTS"](#)

6.554 USER_MVIEW_DETAIL_PARTITION

USER_MVIEW_DETAIL_PARTITION displays freshness information, with respect to partition change tracking (PCT) detail partitions, for the materialized views owned by the current user. Its columns are the same as those in ALL_MVIEW_DETAIL_PARTITION.

 **See Also:**

"[ALL_MVIEW_DETAIL_PARTITION](#)"

6.555 USER_MVIEW_DETAIL_RELATIONS

USER_MVIEW_DETAIL_RELATIONS represents the named detail relations that are either in the FROM list of a materialized view, or that are indirectly referenced through views in the FROM list. Its columns are the same as those in ALL_MVIEW_DETAIL_RELATIONS.

 **See Also:**

"[ALL_MVIEW_DETAIL_RELATIONS](#)"

6.556 USER_MVIEW_DETAIL_SUBPARTITION

USER_MVIEW_DETAIL_SUBPARTITION displays freshness information, with respect to partition change tracking (PCT) detail subpartitions, for the materialized views owned by the current user. Its columns are the same as those in ALL_MVIEW_DETAIL_SUBPARTITION.

 **See Also:**

"[ALL_MVIEW_DETAIL_SUBPARTITION](#)"

6.557 USER_MVIEW_JOINS

USER_MVIEW_JOINS describes a join between two columns in the WHERE clause of a subquery that defines a materialized view. Its columns are the same as those in ALL_MVIEW_JOINS.

 **See Also:**

"[ALL_MVIEW_JOINS](#)"

6.558 USER_MVIEW_KEYS

USER_MVIEW_KEYS describes the columns or expressions in the SELECT list upon which materialized views in the current user's schema are based. Its columns are the same as those in ALL_MVIEW_KEYS.

 **See Also:**

"[ALL_MVIEW_KEYS](#)"

6.559 USER_MVIEW_LOGS

USER_MVIEW_LOGS describes all materialized view logs owned by the current user. Its columns are the same as those in ALL_MVIEW_LOGS.

 **See Also:**

"[ALL_MVIEW_LOGS](#)"

6.560 USER_MVIEW_REFRESH_TIMES

USER_MVIEW_REFRESH_TIMES describes refresh times of the materialized views owned by the current user. Its columns are the same as those in ALL_MVIEW_REFRESH_TIMES.

 **See Also:**

"[ALL_MVIEW_REFRESH_TIMES](#)"

6.561 USER_MVIEWS

USER_MVIEWS describes all materialized views owned by the current user. Its columns are the same as those in ALL_MVIEWS.

 **See Also:**

"[ALL_MVIEWS](#)"

6.562 USER_MVREF_CHANGE_STATS

USER_MVREF_CHANGE_STATS displays the change data load information on the master tables associated with a refresh run for all the materialized views in the database that are accessible to the current user. Its columns are the same as those in DBA_MVREF_CHANGE_STATS.

 **See Also:**

["DBA_MVREF_CHANGE_STATS"](#)

6.563 USER_MVREF_RUN_STATS

USER_MVREF_RUN_STATS has information about each refresh run for the materialized views accessible for the current database user, with each run being identified by the REFRESH_ID. The information includes timing statistics related to the run and the parameters specified in that run.

Its columns (except for RUN_OWNER) are the same as those in DBA_MVREF_RUN_STATS.

 **See Also:**

["DBA_MVREF_RUN_STATS"](#)

6.564 USER_MVREF_STATS

USER_MVREF_STATS shows the REFRESH_ID associated with each refresh run of each materialized view for the database that is accessible to the current user. It also provides some basic timing statistics related to that materialized view's refresh in that run.

Its columns (except for MV_OWNER) are the same as those in DBA_MVREF_STATS.

 **See Also:**

["DBA_MVREF_STATS"](#)

6.565 USER_MVREF_STATS_PARAMS

USER_MVREF_STATS_PARAMS displays the refresh statistics properties associated with each materialized view accessible to the current user. These properties can be modified with the DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS procedure.

Its columns are the same as those in DBA_MVREF_STATS_PARAMS.

 See Also:

"[DBA_MVREF_STATS_PARAMS](#)"

6.566 USER_MVREF_STATS_SYS_DEFAULTS

USER_MVREF_STATS_SYS_DEFAULTS displays the system-wide defaults for the refresh history statistics properties for materialized views accessible to the current user. These values can be altered with the SET_SYSTEM_DEFAULTS procedure by a database administrator.

Its columns are the same as those in DBA_MVREF_STATS_SYS_DEFAULTS.

This view contains exactly two rows corresponding to the collection-level and retention-period properties; their initial values are TYPICAL and 31 respectively.

 See Also:

"[DBA_MVREF_STATS_SYS_DEFAULTS](#)"

6.567 USER_MVREF_STMT_STATS

USER_MVREF_STMT_STATS shows information associated with each refresh statement of a materialized view accessible to the current user in a refresh run.

Its columns are the same as those in DBA_MVREF_STMT_STATS.

 See Also:

"[DBA_MVREF_STMT_STATS](#)"

6.568 USER_NESTED_TABLE_COLS

USER_NESTED_TABLE_COLS describes the columns of the nested tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_NESTED_TABLE_COLS.

To gather statistics for this view, use the DBMS_STATS package.

 See Also:

"[ALL_NESTED_TABLE_COLS](#)"

6.569 USER_NESTED_TABLES

USER_NESTED_TABLES describes the nested tables in tables owned by the current user. Its columns are the same as those in ALL_NESTED_TABLES.

 **See Also:**

["ALL_NESTED_TABLES"](#)

6.570 USER_NETWORK_ACL_PRIVILEGES

USER_NETWORK_ACL_PRIVILEGES describes the status of the network privileges for the current user to access network hosts.

 **Note:**

This USER_NETWORK_ACL_PRIVILEGES view is deprecated in Oracle Database 12c Release 1 (12.1). Oracle recommends that you use the `USER_HOST_ACES` view, instead.

Column	Datatype	NULL	Description
HOST	VARCHAR2(1000)	NOT NULL	Network host
LOWER_PORT	NUMBER(5)		Lower bound of the port range
UPPER_PORT	NUMBER(5)		Upper bound of the port range
PRIVILEGE	CHAR(128)		Network privilege
STATUS	VARCHAR2(7)		Privilege status: <ul style="list-style-type: none">• DENIED• GRANTED

 **See Also:**

["USER_HOST_ACES"](#)

6.571 USER_OBJ_AUDIT_OPTS

USER_OBJ_AUDIT_OPTS describes auditing options on all objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA_OBJ_AUDIT_OPTS.

 **Note:**

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED_AUDIT_TRAIL.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

 **See Also:**

"[DBA_OBJ_AUDIT_OPTS](#)"

6.572 USER_OBJ_COLATTRS

USER_OBJ_COLATTRS describes object columns and attributes contained in the tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_OBJ_COLATTRS.

 **See Also:**

"[ALL_OBJ_COLATTRS](#)"

6.573 USER_OBJECT_SIZE

USER_OBJECT_SIZE lists the sizes, in bytes, of various PL/SQL objects. Its columns are the same as those in DBA_OBJECT_SIZE.

 **See Also:**

"[DBA_OBJECT_SIZE](#)"

6.574 USER_OBJECT_TABLES

USER_OBJECT_TABLES describes the object tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_OBJECT_TABLES.

See Also:

["ALL_OBJECT_TABLES"](#)

6.575 USER_OBJECT_USAGE

USER_OBJECT_USAGE displays statistics about index usage gathered from the database for the indexes owned by the current user.

You can use this view to monitor index usage. All indexes owned by the current user that have been used at least once can be monitored and displayed in this view. Its columns (except for OWNER) are the same as those in DBA_OBJECT_USAGE.

See Also:

["DBA_OBJECT_USAGE"](#)

6.576 USER_OBJECTS

USER_OBJECTS describes all objects owned by the current user. Its columns (except for OWNER), are the same as those in ALL_OBJECTS.

See Also:

["ALL_OBJECTS"](#)

6.577 USER_OBJECTS_AE

USER_OBJECTS_AE describes the objects (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_OBJECTS_AE.

See Also:

["ALL_OBJECTS_AE"](#)

6.578 USER_OPANCILLARY

USER_OPANCILLARY provides ancillary information for operators owned by the current user. Its columns are the same as those in ALL_OPANCILLARY.

 **See Also:**

"[ALL_OPANCILLARY](#)"

6.579 USER_OPARGUMENTS

USER_OPARGUMENTS provides argument information for operator bindings owned by the current user. Its columns are the same as those in ALL_OPARGUMENTS.

 **See Also:**

"[ALL_OPARGUMENTS](#)"

6.580 USER_OPBINDINGS

USER_OPBINDINGS describes the binding functions and methods on the operators owned by the current user. Its columns are the same as those in ALL_OPBINDINGS.

 **See Also:**

"[ALL_OPBINDINGS](#)"

6.581 USER_OPERATOR_COMMENTS

USER_OPERATOR_COMMENTS displays comments for the user-defined operators owned by the current user. Its columns are the same as those in ALL_OPERATOR_COMMENTS.

 **See Also:**

"[ALL_OPERATOR_COMMENTS](#)"

6.582 USER_OPERATORS

USER_OPERATORS describes all operators owned by the current user. Its columns are the same as those in ALL_OPERATORS.

See Also:

"ALL_OPERATORS"

6.583 USER_OUTLINE_HINTS

USER_OUTLINE_HINTS describes the set of hints stored in the outlines owned by the current user. Its columns (except for OWNER) are the same as those in DBA_OUTLINE_HINTS.

See Also:

"DBA_OUTLINE_HINTS"

6.584 USER_OUTLINES

USER_OUTLINES describes the stored outlines owned by the current user. Its columns (except for OWNER) are the same as those in DBA_OUTLINES.

See Also:

"DBA_OUTLINES"

6.585 USER_PARALLEL_EXECUTE_CHUNKS

USER_PARALLEL_EXECUTE_CHUNKS displays the chunks for tasks created by the current user. Its columns (except for TASK_OWNER) are the same as those in DBA_PARALLEL_EXECUTE_CHUNKS.

See Also:

"DBA_PARALLEL_EXECUTE_CHUNKS"

6.586 USER_PARALLEL_EXECUTE_TASKS

USER_PARALLEL_EXECUTE_TASKS displays the tasks created by the current user. Its columns (except for `TASK_OWNER`) are the same as those in DBA_PARALLEL_EXECUTE_TASKS.

 **See Also:**

["DBA_PARALLEL_EXECUTE_TASKS"](#)

6.587 USER_PART_COL_STATISTICS

USER_PART_COL_STATISTICS displays column statistics and histogram information for the table partitions owned by the current user. Its columns (except for `OWNER`) are the same as those in ALL_PART_COL_STATISTICS.

 **See Also:**

["ALL_PART_COL_STATISTICS"](#)

6.588 USER_PART_HISTOGRAMS

USER_PART_HISTOGRAMS displays the histogram data (endpoints per histogram) for the histograms on the table partitions owned by the current user. Its columns (except for `OWNER`) are the same as those in ALL_PART_HISTOGRAMS.

 **See Also:**

["ALL_PART_HISTOGRAMS"](#)

6.589 USER_PART_INDEXES

USER_PART_INDEXES displays the object-level partitioning information for the partitioned indexes owned by the current user. Its columns (except for `OWNER`) are the same as those in ALL_PART_INDEXES.

 **See Also:**

["ALL_PART_INDEXES"](#)

6.590 USER_PART_KEY_COLUMNS

USER_PART_KEY_COLUMNS describes the partitioning key columns for the partitioned objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL_PART_KEY_COLUMNS.

 **See Also:**

["ALL_PART_KEY_COLUMNS"](#)

6.591 USER_PART_LOBS

USER_PART_LOBS displays table-level information about the partitioned LOBs owned by the current user, including default attributes for LOB data partitions. Its columns (except for TABLE_OWNER) are the same as those in ALL_PART_LOBS.

 **See Also:**

["ALL_PART_LOBS"](#)

6.592 USER_PART_TABLES

USER_PART_TABLES displays the object-level partitioning information for the partitioned tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_PART_TABLES.

 **See Also:**

["ALL_PART_TABLES"](#)

6.593 USER_PARTIAL_DROP_TABS

USER_PARTIAL_DROP_TABS describes all tables in the schema of the current user that have partially completed DROP COLUMN operations. Its columns are the same as those in ALL_PARTIAL_DROP_TABS.

 **See Also:**

["ALL_PARTIAL_DROP_TABS"](#)

6.594 USER_PASSWORD_LIMITS

USER_PASSWORD_LIMITS describes the password profile parameters that are assigned to the user.

Column	Datatype	NULL	Description
RESOURCE_NAME	VARCHAR2(32)	NOT NULL	Name of the password resource
LIMIT	VARCHAR2(40)		Value of the resource limit

6.595 USER_PENDING_CONV_TABLES

USER_PENDING_CONV_TABLES describes the pending conversion tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_PENDING_CONV_TABLES.

 See Also:

["ALL_PENDING_CONV_TABLES"](#)

6.596 USER_PLSQL_COLL_TYPES

USER_PLSQL_COLL_TYPES describes the user's own named PL/SQL collection types. Its columns (except for OWNER and CHAR_USED) are the same as those in ALL_PLSQL_COLL_TYPES.

 See Also:

["ALL_PLSQL_COLL_TYPES"](#)

6.597 USER_PLSQL_OBJECT_SETTINGS

USER_PLSQL_OBJECT_SETTINGS displays information about the compiler settings for the stored objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL_PLSQL_OBJECT_SETTINGS.

 See Also:

["ALL_PLSQL_OBJECT_SETTINGS"](#)

6.598 USER_PLSQL_TYPE_ATTRS

USER_PLSQL_TYPE_ATTRS describes the attributes of the user's own PL/SQL types. Its columns (except for OWNER and CHAR_USED) are the same as those in ALL_PLSQL_TYPE_ATTRS.

 **See Also:**

["ALL_PLSQL_TYPE_ATTRS"](#)

6.599 USER_PLSQL_TYPES

USER_PLSQL_TYPES describes the user's own PL/SQL types. Its columns (except for OWNER) are the same as those in ALL_PLSQL_TYPES.

 **See Also:**

["ALL_PLSQL_TYPES"](#)

6.600 USER_POLICIES

USER_POLICIES describes all Oracle Virtual Private Database (VPD) security policies associated with objects owned by the current user. Its columns (except for OBJECT_OWNER) are the same as those in ALL_POLICIES.

 **See Also:**

["ALL_POLICIES"](#)

6.601 USER_POLICY_ATTRIBUTES

USER_POLICY_ATTRIBUTES lists the attribute associations {Namespaces, Attributes} of all context-sensitive and shared-context sensitive Oracle Virtual Private Database (VPD) policies for synonyms, tables, or views owned by the user.

Its columns are the same as those in ALL_POLICY_ATTRIBUTES.

 **See Also:**

["ALL_POLICY_ATTRIBUTES"](#)

6.602 USER_POLICY_CONTEXTS

USER_POLICY_CONTEXTS describes the driving contexts defined for the synonyms, tables, and views owned by the current user. Its columns (except for OBJECT_OWNER) are the same as those in ALL_POLICY_CONTEXTS.

 **See Also:**

["ALL_POLICY_CONTEXTS"](#)

6.603 USER_POLICY_GROUPS

USER_POLICY_GROUPS describes the policy groups defined for the synonyms, tables, and views owned by the current user. Its columns (except for OBJECT_OWNER) are the same as those in ALL_POLICY_GROUPS.

 **See Also:**

["ALL_POLICY_GROUPS"](#)

6.604 USER_PRIVATE_TEMP_TABLES

USER_PRIVATE_TEMP_TABLES describes the private temporary tables in the current session. Its columns (except for INST_ID) are the same as those in DBA_PRIVATE_TEMP_TABLES.

 **See Also:**

["DBA_PRIVATE_TEMP_TABLES"](#)

6.605 USER_PRIVILEGE_MAP

USER_PRIVILEGE_MAP shows privilege (auditing option) type codes for object privileges that can be granted on a user.

This table can be used to map privilege type numbers to type names.

Column	Datatype	NULL	Description
PRIVILEGE	NUMBER	NOT NULL	A numeric privilege (auditing option) type code
NAME	VARCHAR2(40)	NOT NULL	Name of the type of privilege (auditing option)

6.606 USER_PROCEDURES

USER_PROCEDURES lists all functions and procedures that are owned by the current user, along with their associated properties. Its columns (except OWNER) are the same as those in ALL_PROCEDURES.

 See Also:

- "[ALL_PROCEDURES](#)"
- "[USER_ARGUMENTS](#)" for information about the arguments of the functions and procedures owned by the current user

6.607 USER_PROXYES

USER_PROXYES displays information about connections the current user is allowed to proxy. Its columns (except for PROXY) are the same as those in DBA_PROXYES.

 See Also:

["DBA_PROXYES"](#)

6.608 USER_QUEUE_SCHEDULES

USER_QUEUE_SCHEDULES describes the propagation schedules whose source queues are owned by the current user. Its columns (except for SCHEMA) are the same as those in ALL_QUEUE_SCHEDULES.

 See Also:

["ALL_QUEUE_SCHEDULES"](#)

6.609 USER_QUEUE_SUBSCRIBERS

USER_QUEUE_SUBSCRIBERS displays the list of subscribers on queues that are under the current user's schema. Its columns (except for OWNER) are the same as those in ALL_QUEUE_SUBSCRIBERS.

 See Also:

["ALL_QUEUE_SUBSCRIBERS"](#)

6.610 USER_QUEUE_TABLES

USER_QUEUE_TABLES describes the queues in the queue tables created in the current user's schema. Its columns (except for OWNER) are the same as those in ALL_QUEUE_TABLES.

 **See Also:**

["ALL_QUEUE_TABLES"](#)

6.611 USER_QUEUES

USER_QUEUES describes the operational characteristics of every queue in the user's schema. Its columns (except for OWNER) are the same as those in ALL_QUEUES.

 **See Also:**

- ["ALL_QUEUES"](#)
- *Oracle Database Advanced Queuing User's Guide* for more information about these views and Advanced Queuing

6.612 USER_RECYCLEBIN

USER_RECYCLEBIN displays information about the recycle bin owned by the current user. Its columns (except for OWNER) are the same as those in DBA_RECYCLEBIN.

 **See Also:**

["DBA_RECYCLEBIN"](#)

6.613 USER_REFRESH

USER_REFRESH describes all refresh groups owned by the current user. Its columns are the same as those in ALL_REFRESH.

 **See Also:**

["ALL_REFRESH"](#)

6.614 USER_REFRESH_CHILDREN

USER_REFRESH_CHILDREN lists all the objects in refresh groups owned by the current user. Its columns are the same as those in ALL_REFRESH_CHILDREN.

 **See Also:**

"ALL_REFRESH_CHILDREN"

6.615 USER_REFS

USER_REFS describes the REF columns and REF attributes in the object type columns of tables owned by the current user. Its columns are the same as those in ALL_REFS.

 **See Also:**

"ALL_REFS"

6.616 USER_REGISTERED_MVIEWS

USER_REGISTERED_MVIEWS describes all registered materialized views (registered at a master site or a master materialized view site) owned by the current user. Its columns are the same as those in ALL_REGISTERED_MVIEWS.

 **See Also:**

"ALL_REGISTERED_MVIEWS"

6.617 USER_REGISTRY

USER_REGISTRY displays information about the components owned by the current user that are loaded into the component registry. Its columns are the same as those in DBA_REGISTRY.

 **See Also:**

"DBA_REGISTRY"

6.618 USER_RESOURCE_LIMITS

USER_RESOURCE_LIMITS displays the resource limits for the current user.

Column	Datatype	NULL	Description
RESOURCE_NAME	VARCHAR2(32)	NOT NULL	Name of the resource
LIMIT	VARCHAR2(40)		Limit placed on this resource

6.619 USER_RESUMABLE

USER_RESUMABLE displays the resumable statements executed by the current user. Its columns (except for `USER_ID`) are the same as those in DBA_RESUMABLE.

 **See Also:**

["DBA_RESUMABLE"](#)

6.620 USER_REWRITE_EQUIVALENCES

USER_REWRITE_EQUIVALENCES describes the rewrite equivalences owned by the current user. Its columns are the same as those in ALL_REWRITE_EQUIVALENCES.

 **See Also:**

["ALL_REWRITE_EQUIVALENCES"](#)

6.621 USER_ROLE_PRIVS

USER_ROLE_PRIVS describes the roles granted to the current user.

Column	Datatype	NULL	Description
USERNAME	VARCHAR2(128)		Name of the user, or PUBLIC
GRANTED_ROLE	VARCHAR2(128)		Name of the role granted to the user
ADMIN_OPTION	VARCHAR2(3)		Indicates whether the grant was with the ADMIN OPTION (YES) or not (NO)
DELEGATE_OPTION	VARCHAR2(3)		Indicates whether the grant was with the DELEGATE OPTION (YES) or not (NO)
DEFAULT_ROLE	VARCHAR2(3)		Indicates whether the role is designated as a DEFAULT ROLE for the user (YES) or not (NO)
OS_GRANTED	VARCHAR2(3)		Indicates whether the role was granted by the operating system (YES) or not (NO); occurs if the OS_ROLES initialization parameter is true
COMMON	VARCHAR2(3)		Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> • YES if the role was granted commonly (CONTAINER=ALL was used) • NO if the role was granted locally (CONTAINER=ALL was not used)

Column	Datatype	NULL	Description
INHERITED	VARCHAR2 (3)		Indicates whether the grant was inherited from another container (YES) or not (NO)

 See Also:["DBA_ROLE_PRIVS"](#)

6.622 USER_RSRC_CONSUMER_GROUP_PRIVS

USER_RSRC_CONSUMER_GROUP_PRIVS displays information about the resource consumer groups to which the current user is assigned. Its columns (except for GRANTEE) are the same as those in DBA_RSRC_CONSUMER_GROUP_PRIVS.

 See Also:["DBA_RSRC_CONSUMER_GROUP_PRIVS"](#)

6.623 USER_RSRC_MANAGER_SYSTEM_PRIVS

USER_RSRC_MANAGER_SYSTEM_PRIVS displays information about the users who are granted system privileges for the DBMS_RESOURCE_MANAGER package. Its columns (except for GRANTEE) are the same as those in DBA_RSRC_MANAGER_SYSTEM_PRIVS.

 See Also:["DBA_RSRC_MANAGER_SYSTEM_PRIVS"](#)

6.624 USER_RULE_SET_RULES

USER_RULE_SET_RULES describes the rules in the rule sets owned by the current user. Its columns (except for RULE_SET_OWNER) are the same as those in ALL_RULE_SET_RULES.

 See Also:["ALL_RULE_SET_RULES"](#)

6.625 USER_RULE_SETS

USER_RULE_SETS describes the rule sets owned by the current user. Its columns (except for RULE_SET_OWNER) are the same as those in ALL_RULE_SETS.

See Also:

["ALL_RULE_SETS"](#)

6.626 USER_RULES

USER_RULES describes the rules owned by the current user. Its columns (except for RULE_OWNER) are the same as those in ALL_RULES.

See Also:

["ALL_RULES"](#)

6.627 USER_SCHEDULER_CHAIN_RULES

USER_SCHEDULER_CHAIN_RULES displays information about the rules for the chains owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_CHAIN_RULES.

See Also:

["ALL_SCHEDULER_CHAIN_RULES"](#)

6.628 USER_SCHEDULER_CHAIN_STEPS

USER_SCHEDULER_CHAIN_STEPS displays information about the defined steps of the chains owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_CHAIN_STEPS.

See Also:

["ALL_SCHEDULER_CHAIN_STEPS"](#)

6.629 USER_SCHEDULER_CHAINS

USER_SCHEDULER_CHAINS displays information about the chains owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_CHAINS.

 **See Also:**

["ALL_SCHEDULER_CHAINS"](#)

6.630 USER_SCHEDULER_CREDENTIALS

USER_SCHEDULER_CREDENTIALS displays information about the credentials owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_CREDENTIALS.

 **Note:**

This view is deprecated in favor of the USER_CREDENTIALS view. Oracle recommends that you use USER_CREDENTIALS instead. USER_SCHEDULER_CREDENTIALS is retained for backward compatibility only.

 **See Also:**

- ["USER_CREDENTIALS"](#)
- ["ALL_SCHEDULER_CREDENTIALS"](#)

6.631 USER_SCHEDULER_DB_DESTS

USER_SCHEDULER_DB_DESTS displays information about the destination objects owned by the current user pointing to remote databases. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_DB_DESTS.

 **See Also:**

["ALL_SCHEDULER_DB_DESTS"](#)

6.632 USER_SCHEDULER_DESTS

USER_SCHEDULER_DESTS displays information about the destination objects for jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_DESTS.

 **See Also:**

["ALL_SCHEDULER_DESTS"](#)

6.633 USER_SCHEDULER_FILE_WATCHERS

USER_SCHEDULER_FILE_WATCHERS displays information about the Scheduler file watch requests owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_FILE_WATCHERS.

 **See Also:**

["ALL_SCHEDULER_FILE_WATCHERS"](#)

6.634 USER_SCHEDULER_GROUP_MEMBERS

USER_SCHEDULER_GROUP_MEMBERS displays information about the members of the Scheduler object groups owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_GROUP_MEMBERS.

 **See Also:**

["ALL_SCHEDULER_GROUP_MEMBERS"](#)

6.635 USER_SCHEDULER_GROUPS

USER_SCHEDULER_GROUPS displays information about the Scheduler object groups owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_GROUPS.

 **See Also:**

["ALL_SCHEDULER_GROUPS"](#)

6.636 USER_SCHEDULER_INCOMPAT_MEMBER

USER_SCHEDULER_INCOMPAT_MEMBER displays all Scheduler incompatibility resource objects members owned by the current user. Its columns are the same as those in ALL_SCHEDULER_INCOMPAT_MEMBER.

 **See Also:**

["ALL_SCHEDULER_INCOMPAT_MEMBER"](#)

6.637 USER_SCHEDULER_INCOMPATS

USER_SCHEDULER_INCOMPATS displays all Scheduler incompatibility resource objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_INCOMPATS.

 **See Also:**

["ALL_SCHEDULER_INCOMPATS"](#)

6.638 USER_SCHEDULER_JOB_ARGS

USER_SCHEDULER_JOB_ARGS displays information about the arguments of the Scheduler jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_JOB_ARGS.

 **See Also:**

["ALL_SCHEDULER_JOB_ARGS"](#)

6.639 USER_SCHEDULER_JOB_DESTS

USER_SCHEDULER_JOB_DESTS displays information about the state of the jobs owned by the current user at each of their destinations. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_JOB_DESTS.

 **See Also:**

["ALL_SCHEDULER_JOB_DESTS"](#)

6.640 USER_SCHEDULER_JOB_LOG

USER_SCHEDULER_JOB_LOG displays log information for the Scheduler jobs owned by the current user. Its columns are the same as those in ALL_SCHEDULER_JOB_LOG.

 **See Also:**

["ALL_SCHEDULER_JOB_LOG"](#)

6.641 USER_SCHEDULER_JOB_RUN_DETAILS

USER_SCHEDULER_JOB_RUN_DETAILS displays log run details for the Scheduler jobs owned by the current user. Its columns are the same as those in ALL_SCHEDULER_JOB_RUN_DETAILS.

 **See Also:**

["ALL_SCHEDULER_JOB_RUN_DETAILS"](#)

6.642 USER_SCHEDULER_JOBS

USER_SCHEDULER_JOBS displays information about the Scheduler jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_JOBS.

 **See Also:**

["ALL_SCHEDULER_JOBS"](#)

6.643 USER_SCHEDULER_NOTIFICATIONS

USER_SCHEDULER_NOTIFICATIONS displays information about the E-mail notifications for the jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_NOTIFICATIONS.

 **See Also:**

["ALL_SCHEDULER_NOTIFICATIONS"](#)

6.644 USER_SCHEDULER_PROGRAM_ARGS

USER_SCHEDULER_PROGRAM_ARGS displays information about the arguments of the Scheduler programs owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_PROGRAM_ARGS.

 **See Also:**

["ALL_SCHEDULER_PROGRAM_ARGS"](#)

6.645 USER_SCHEDULER_PROGRAMS

USER_SCHEDULER_PROGRAMS displays information about the Scheduler programs owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_PROGRAMS.

 **See Also:**

["ALL_SCHEDULER_PROGRAMS"](#)

6.646 USER_SCHEDULER_REMOTE_JOBSTATE

USER_SCHEDULER_REMOTE_JOBSTATE displays information about the state of the jobs owned by the current user at remote databases. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_REMOTE_JOBSTATE.

 **See Also:**

["ALL_SCHEDULER_REMOTE_JOBSTATE"](#)

6.647 USER_SCHEDULER_RESOURCES

USER_SCHEDULER_RESOURCES displays all scheduler resource objects in the database from the schema of the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_RESOURCES.

 **See Also:**

["ALL_SCHEDULER_RESOURCES"](#)

6.648 USER_SCHEDULER_RSC_CONSTRAINTS

USER_SCHEDULER_RSC_CONSTRAINTS lists all Oracle Scheduler resource constraint members owned by the current user. Its columns are the same as those in ALL_SCHEDULER_RSC_CONSTRAINTS.

 **See Also:**

["ALL_SCHEDULER_RSC_CONSTRAINTS"](#)

6.649 USER_SCHEDULER_RUNNING_CHAINS

USER_SCHEDULER_RUNNING_CHAINS displays information about the chain steps of the running chains owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_RUNNING_CHAINS.

 **See Also:**

["ALL_SCHEDULER_RUNNING_CHAINS"](#)

6.650 USER_SCHEDULER_RUNNING_JOBS

USER_SCHEDULER_RUNNING_JOBS displays information about the running Scheduler jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_RUNNING_JOBS.

 **See Also:**

["ALL_SCHEDULER_RUNNING_JOBS"](#)

6.651 USER_SCHEDULER_SCHEDULES

USER_SCHEDULER_SCHEDULES displays information about the Scheduler schedules owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SCHEDULER_SCHEDULES.

 **See Also:**

["ALL_SCHEDULER_SCHEDULES"](#)

6.652 USER_SEC_RELEVANT_COLS

USER_SEC_RELEVANT_COLS describes the security relevant columns of the security policies for the tables and views owned by the current user. Its columns (except for OBJECT_OWNER) are the same as those in ALL_SEC_RELEVANT_COLS.

 **See Also:**

["ALL_SEC_RELEVANT_COLS"](#)

6.653 USER_SECONDARY_OBJECTS

USER_SECONDARY_OBJECTS provides information about secondary objects associated with domain indexes owned by the current user. Its columns are the same as those in ALL_SECONDARY_OBJECTS.

This view is only relevant in the context of domain indexes.

 **See Also:**

["ALL_SECONDARY_OBJECTS"](#)

6.654 USER_SEGMENTS

USER_SEGMENTS describes the storage allocated for the segments owned by the current user's objects. Its columns (except for OWNER, HEADER_FILE, HEADER_BLOCK, and RELATIVE_FNO) are the same as those in DBA_SEGMENTS.

 **See Also:**

["DBA_SEGMENTS"](#)

6.655 USER_SEQUENCES

USER_SEQUENCES describes all sequences owned by the current user. Its columns are the same as those in ALL_SEQUENCES.

 **See Also:**

["ALL_SEQUENCES"](#)

6.656 USER_SODA_COLLECTIONS

`USER_SODA_COLLECTIONS` describes the Simple Oracle Document Access (SODA) collections owned by the current user. Its columns (except for `OWNER`) are the same as those in `DBA_SODA_COLLECTIONS`.

 **Note:**

The `USER_SODA_COLLECTIONS` view is available in on-premises Oracle databases and Oracle Autonomous Database. However, the `DBA_SODA_COLLECTIONS` view is available only in Oracle Autonomous Database.

 **See Also:**

["DBA_SODA_COLLECTIONS"](#)

6.657 USER_SOURCE

`USER_SOURCE` describes the text source of the stored objects owned by the current user. Its columns (except for `OWNER`) are the same as those in `ALL_SOURCE`.

 **See Also:**

["ALL_SOURCE"](#)

6.658 USER_SOURCE_AE

`USER_SOURCE_AE` describes the text source of the stored objects (across all editions) owned by the current user. Its columns (except for `OWNER`) are the same as those in `ALL_SOURCE_AE`.

 **See Also:**

["ALL_SOURCE_AE"](#)

6.659 USER_SQL_TRANSLATION_PROFILES

USER_SQL_TRANSLATION_PROFILES describes all SQL translation profiles owned by the user. Its columns (except for OWNER) are the same as those in ALL_SQL_TRANSLATION_PROFILES.

 **See Also:**

["ALL_SQL_TRANSLATION_PROFILES"](#)

6.660 USER_SQL_TRANSLATIONS

USER_SQL_TRANSLATIONS describes all SQL translations owned by the user. Its columns (except for OWNER) are the same as those in ALL_SQL_TRANSLATIONS.

 **See Also:**

["ALL_SQL_TRANSLATIONS"](#)

6.661 USER_SQLJ_TYPE_ATTRS

USER_SQLJ_TYPE_ATTRS describes the attributes of the SQLJ object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SQLJ_TYPE_ATTRS.

 **See Also:**

["ALL_SQLJ_TYPE_ATTRS"](#)

6.662 USER_SQLJ_TYPE_METHODS

USER_SQLJ_TYPE_METHODS describes the methods of the SQLJ object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SQLJ_TYPE_METHODS.

 **See Also:**

["ALL_SQLJ_TYPE_METHODS"](#)

6.663 USER_SQLJ_TYPES

USER_SQLJ_TYPES describes the SQLJ object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SQLJ_TYPES.

See Also:

"ALL_SQLJ_TYPES"

6.664 USER_SQLSET

USER_SQLSET displays information about the SQL tuning sets owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SQLSET.

See Also:

"ALL_SQLSET"

6.665 USER_SQLSET_BINDS

USER_SQLSET_BINDS displays the bind values associated with the SQL tuning sets owned by the current user. Its columns (except for SQLSET_OWNER) are the same as those in ALL_SQLSET_BINDS.

See Also:

"ALL_SQLSET_BINDS"

6.666 USER_SQLSET_PLANS

USER_SQLSET_PLANS describes captured plans for statements in the SQL tuning sets owned by the current user. Its columns (except for SQLSET_OWNER) are the same as those in ALL_SQLSET_PLANS.

See Also:

"ALL_SQLSET_PLANS"

6.667 USER_SQLSET_REFERENCES

USER_SQLSET_REFERENCES describes whether or not the SQL tuning sets owned by the current user are active. Its columns (except for SQLSET_OWNER) are the same as those in ALL_SQLSET_REFERENCES.

 **See Also:**

["ALL_SQLSET_REFERENCES"](#)

6.668 USER_SQLSET_STATEMENTS

USER_SQLSET_STATEMENTS displays information about the SQL statements, along with their statistics, that form the SQL tuning sets owned by the current user. Its columns (except for SQLSET_OWNER) are the same as those in ALL_SQLSET_STATEMENTS.

 **See Also:**

["ALL_SQLSET_STATEMENTS"](#)

6.669 USER_SQLTUNE_BINDS

USER_SQLTUNE_BINDS displays the bind values associated with the tuned SQL statements owned by the current user. Its columns are the same as those in DBA_SQLTUNE_BINDS.

 **See Also:**

["DBA_SQLTUNE_BINDS"](#)

6.670 USER_SQLTUNE_PLANS

USER_SQLTUNE_PLANS displays information about the execution plans generated for the SQL statements owned by the current user during a SQL tuning session. Its columns are the same as those in DBA_SQLTUNE_PLANS.

 **See Also:**

["DBA_SQLTUNE_PLANS"](#)

6.671 USER_SQLTUNE_RATIONALE_PLAN

USER_SQLTUNE_RATIONALE_PLAN displays the association between rationales and operations in the execution plan of the SQL statements owned by the current user. Its columns are the same as those in DBA_SQLTUNE_RATIONALE_PLAN.

 **See Also:**

["DBA_SQLTUNE_RATIONALE_PLAN"](#)

6.672 USER_SQLTUNE_STATISTICS

USER_SQLTUNE_STATISTICS displays statistics associated with the SQL statements owned by the current user. Its columns are the same as those in DBA_SQLTUNE_STATISTICS.

 **See Also:**

["DBA_SQLTUNE_STATISTICS"](#)

6.673 USER_SR_GRP_STATUS

USER_SR_GRP_STATUS provides information on the current refresh operations for the current synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA_SR_GRP_STATUS.

 **See Also:**

["DBA_SR_GRP_STATUS"](#)

6.674 USER_SR_GRP_STATUS_ALL

USER_SR_GRP_STATUS_ALL provides information on the refresh operations on the synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA_SR_GRP_STATUS_ALL.

 **See Also:**

["DBA_SR_GRP_STATUS_ALL"](#)

6.675 USER_SR_OBJ

USER_SR_OBJ provides information on the objects currently registered for synchronous refresh for current groups for the current user. Its columns are the same as those in DBA_SR_OBJ.

 **See Also:**

["DBA_SR_OBJ"](#)

6.676 USER_SR_OBJ_ALL

USER_SR_OBJ_ALL provides information on the objects registered for synchronous refresh for current and defunct groups for the current user. Its columns are the same as those in DBA_SR_OBJ_ALL.

 **See Also:**

["DBA_SR_OBJ_ALL"](#)

6.677 USER_SR_OBJ_STATUS

USER_SR_OBJ_STATUS provides information on the status of objects registered for synchronous refresh for the current refresh operations for the current synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA_SR_OBJ_STATUS.

 **See Also:**

["DBA_SR_OBJ_STATUS"](#)

6.678 USER_SR_OBJ_STATUS_ALL

USER_SR_OBJ_STATUS_ALL provides information on the status of objects registered for synchronous refresh in the database which are owned by the current user. Its columns are the same as those in DBA_SR_OBJ_STATUS_ALL.

 **See Also:**

["DBA_SR_OBJ_STATUS_ALL"](#)

6.679 USER_SR_PARTN_OPS

USER_SR_PARTN_OPS provides information on the partition operations registered on the base tables of the materialized views registered for synchronous refresh belonging to the current user. Its columns are the same as those in DBA_SR_PARTN_OPS.

 **See Also:**

["DBA_SR_PARTN_OPS"](#)

6.680 USER_SR_STLOG_EXCEPTIONS

USER_SR_STLOG_EXCEPTIONS provides information on the exceptions in the staging logs for the tables belonging to the current user processed by DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG. Its columns are the same as those in DBA_SR_STLOG_EXCEPTIONS.

 **See Also:**

["DBA_SR_STLOG_EXCEPTIONS"](#)

6.681 USER_SR_STLOG_STATS

USER_SR_STLOG_STATS provides information on the statistics in the staging logs for the tables belonging to the current user processed by DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG. Its columns are the same as those in DBA_SR_STLOG_STATS.

 **See Also:**

["DBA_SR_STLOG_STATS"](#)

6.682 USER_STAT_EXTENSIONS

USER_STAT_EXTENSIONS displays information about the optimizer statistics extensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_STAT_EXTENSIONS.

 **See Also:**

["ALL_STAT_EXTENSIONS"](#)

6.683 USER_STATEMENTS

USER_STATEMENTS SQL statements in stored PL/SQL objects accessible to the user. Its columns (except for OWNER) are the same as those in ALL_STATEMENTS.

See Also:

["ALL_STATEMENTS"](#)

6.684 USER_STORED_SETTINGS

USER_STORED_SETTINGS lists information about the persistent parameter settings for stored PL/SQL units, but only shows information about PL/SQL units owned by the current user.

USER_STORED_SETTINGS does not display the OWNER column. The rest of its columns are the same as those in ALL_STORED_SETTINGS.

See Also:

["ALL_STORED_SETTINGS"](#)

6.685 USER_SUBPART_COL_STATISTICS

USER_SUBPART_COL_STATISTICS provides column statistics and histogram information for subpartitions of subpartitioned objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SUBPART_COL_STATISTICS.

See Also:

["ALL_SUBPART_COL_STATISTICS"](#)

6.686 USER_SUBPART_HISTOGRAMS

USER_SUBPART_HISTOGRAMS lists actual histogram data (end-points per histogram) for histograms on table subpartitions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_SUBPART_HISTOGRAMS.

See Also:

["ALL_SUBPART_HISTOGRAMS"](#)

6.687 USER_SUBPART_KEY_COLUMNS

USER_SUBPART_KEY_COLUMNS lists subpartitioning key columns for composite-partitioned tables (and local indexes on composite-partitioned tables) owned by the current user. Its columns are the same as those in ALL_SUBPART_KEY_COLUMNS.

See Also:

["ALL_SUBPART_KEY_COLUMNS"](#)

6.688 USER_SUBPARTITION_TEMPLATES

USER_SUBPARTITION_TEMPLATES describes the subpartition templates owned by the current user. Its columns (except for USER_NAME) are the same as those in ALL_SUBPARTITION_TEMPLATES.

See Also:

["ALL_SUBPARTITION_TEMPLATES"](#)

6.689 USER_SUBSCR_REGISTRATIONS

USER_SUBSCR_REGISTRATIONS displays information about the subscription registrations owned by the current user. Its columns are the same as those in DBA_SUBSCR_REGISTRATIONS.

See Also:

["DBA_SUBSCR_REGISTRATIONS"](#)

6.690 USER_SYNONYMS

USER_SYNONYMS describes the private synonyms (synonyms owned by the current user). Its columns (except for OWNER) are the same as those in ALL_SYNONYMS.

See Also:

["ALL_SYNONYMS"](#)

6.691 USER_SYS_PRIVS

USER_SYS_PRIVS describes system privileges granted to the current user.

Column	Datatype	NULL	Description
USERNAME	VARCHAR2(128)		Name of the user, or PUBLIC
PRIVILEGE	VARCHAR2(40)		System privilege
ADMIN_OPTION	VARCHAR2(3)		Indicates whether the grant was with the ADMIN option (YES) or not (NO)
COMMON	VARCHAR2(3)		Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> • YES if the privilege was granted commonly (CONTAINER=ALL was used) • NO if the privilege was granted locally (CONTAINER=ALL was not used)
INHERITED	VARCHAR2(3)		Indicates whether the grant was inherited from another container (YES) or not (NO)

 **See Also:**

["DBA_SYS_PRIVS"](#)

6.692 USER_TAB_COL_STATISTICS

USER_TAB_COL_STATISTICS contains column statistics and histogram information extracted from USER_TAB_COLUMNS.

Its columns (except for OWNER) are the same as those in ALL_TAB_COL_STATISTICS.

 **See Also:**

- ["USER_TAB_COLUMNS"](#)
- ["ALL_TAB_COL_STATISTICS"](#)

6.693 USER_TAB_COLS

USER_TAB_COLS describes the columns of the tables, views, and clusters owned by the current user.

Its columns (except for OWNER) are the same as those in ALL_TAB_COLS.

To gather statistics for this view, use the DBMS_STATS package.

This view differs from USER_TAB_COLUMNS in that system-generated hidden columns are not filtered out.

 See Also:

- "[ALL_TAB_COLS](#)"
- "[USER_TAB_COLUMNS](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_STATS` package

6.694 USER_TAB_COLUMNS

`USER_TAB_COLUMNS` describes the columns of the tables, views, and clusters owned by the current user.

Its columns (except for `OWNER`) are the same as those in `ALL_TAB_COLUMNS`.

To gather statistics for this view, use the `DBMS_STATS` package.

This view filters out system-generated hidden columns. The `USER_TAB_COLS` view does not filter out system-generated hidden columns.

 See Also:

- "[ALL_TAB_COLUMNS](#)"
- "[USER_TAB_COLS](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_STATS` package

6.695 USER_TAB_COMMENTS

`USER_TAB_COMMENTS` displays comments on the tables and views owned by the current user. Its columns (except for `OWNER`) are the same as those in `ALL_TAB_COMMENTS`.

 See Also:

- "[ALL_TAB_COMMENTS](#)"

6.696 USER_TAB_HISTGRM_PENDING_STATS

USER_TAB_HISTGRM_PENDING_STATS describes pending statistics for tables, partitions, and subpartitions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TAB_HISTGRM_PENDING_STATS.

 **See Also:**

["ALL_TAB_HISTGRM_PENDING_STATS"](#)

6.697 USER_TAB_HISTOGRAMS

USER_TAB_HISTOGRAMS describes histograms on columns of tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TAB_HISTOGRAMS.

 **See Also:**

["ALL_TAB_HISTOGRAMS"](#)

6.698 USER_TAB_IDENTITY_COLS

USER_TAB_IDENTITY_COLS describes all table identity columns. Its columns (except for OWNER) are the same as those in ALL_TAB_IDENTITY_COLS.

 **See Also:**

["ALL_TAB_IDENTITY_COLS"](#)

6.699 USER_TAB_MODIFICATIONS

USER_TAB_MODIFICATIONS describes modifications to all tables owned by the current user that have been modified since the last time statistics were gathered on the tables. Its columns are the same as those in ALL_TAB_MODIFICATIONS.

 **Note:**

For performance reasons, Oracle Database does not populate this view immediately when the actual modifications occur.

 See Also:

["ALL_TAB_MODIFICATIONS"](#)

6.700 USER_TAB_PARTITIONS

USER_TAB_PARTITIONS describes partition-level partitioning information, partition storage parameters, and partition statistics generated by the DBMS_STATS package for all partitions owned by the current user.

Its columns are the same as those in ALL_TAB_PARTITIONS.

 See Also:

["ALL_TAB_PARTITIONS"](#)

6.701 USER_TAB_PENDING_STATS

USER_TAB_PENDING_STATS describes pending statistics for tables, partitions, and subpartitions owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TAB_PENDING_STATS.

 See Also:

["ALL_TAB_PENDING_STATS"](#)

6.702 USER_TAB_PRIVS

USER_TAB_PRIVS describes the object grants for which the current user is the object owner, grantor, or grantee. Its columns are the same as those in DBA_TAB_PRIVS.

 See Also:

["DBA_TAB_PRIVS"](#)

6.703 USER_TAB_PRIVS_MADE

USER_TAB_PRIVS_MADE describes the object grants for which the current user is the object owner. Its columns (except for OWNER) are the same as those in ALL_TAB_PRIVS_MADE.

See Also:

"ALL_TAB_PRIVS_MADE"

6.704 USER_TAB_PRIVS_REC'D

USER_TAB_PRIVS_REC'D describes the object grants for which the current user is the grantee. Its columns (except for GRANTEE) are the same as those in ALL_TAB_PRIVS_REC'D.

See Also:

"ALL_TAB_PRIVS_REC'D"

6.705 USER_TAB_STAT_PREFS

USER_TAB_STAT_PREFS displays information about statistics preferences for the tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TAB_STAT_PREFS.

See Also:

"ALL_TAB_STAT_PREFS"

6.706 USER_TAB_STATISTICS

USER_TAB_STATISTICS displays optimizer statistics for the tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TAB_STATISTICS.

See Also:

"ALL_TAB_STATISTICS"

6.707 USER_TAB_STATS_HISTORY

USER_TAB_STATS_HISTORY provides a history of table statistics modifications for all tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TAB_STATS_HISTORY.

 **See Also:**

["ALL_TAB_STATS_HISTORY"](#)

6.708 USER_TAB_SUBPARTITIONS

USER_TAB_SUBPARTITIONS describes, for each table subpartition owned by the current user, the subpartition name, name of the table and partition to which it belongs, and its storage attributes. Its columns are the same as those in ALL_TAB_SUBPARTITIONS.

 **See Also:**

["ALL_TAB_SUBPARTITIONS"](#)

6.709 USER_TABLES

USER_TABLES describes the relational tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TABLES.

To gather statistics for this view, use the DBMS_STATS package.

 **See Also:**

["ALL_TABLES"](#)

6.710 USER_TABLESPACES

USER_TABLESPACES describes the tablespaces accessible to the current user. Its columns (except for PLUGGED_IN) are the same as those in DBA_TABLESPACES.

 **See Also:**

["DBA_TABLESPACES"](#)

6.711 USER_TRANSFORMATIONS

USER_TRANSFORMATIONS displays information about the transformations owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TRANSFORMATIONS.

 See Also:

["ALL_TRANSFORMATIONS"](#)

6.712 USER_TRIGGER_COLS

USER_TRIGGER_COLS describes the use of columns in the triggers owned by the current user and in triggers on tables owned by the current user. Its columns are the same as those in ALL_TRIGGER_COLS.

 See Also:

["ALL_TRIGGER_COLS"](#)

6.713 USER_TRIGGER_ORDERING

USER_TRIGGER_ORDERING describes the triggers owned by the current user that have FOLLOWS or PRECEDES ordering. Its columns (except for TRIGGER_OWNER) are the same as those in ALL_TRIGGER_ORDERING.

 See Also:

["ALL_TRIGGER_ORDERING"](#)

6.714 USER_TRIGGERS

USER_TRIGGERS describes the triggers owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TRIGGERS.

 See Also:

["ALL_TRIGGERS"](#)

6.715 USER_TRIGGER_AE

USER_TRIGGER_AE describes the triggers (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TRIGGER_AE.

 **Note:**

This view is available starting with Oracle Database 19c.

 **See Also:**

"[ALL_TRIGGER_AE](#)"

6.716 USER_TS_QUOTAS

USER_TS_QUOTAS contains information about tablespace quotas for the current user. Its columns (except for USERNAME) are the same as those in DBA_TS_QUOTAS.

 **See Also:**

"[DBA_TS_QUOTAS](#)"

6.717 USER_TSTZ_TAB_COLS

USER_TSTZ_TAB_COLS displays information about the columns of the tables owned by the current user, which have columns defined on TIMESTAMP WITH TIME ZONE data types or object types containing attributes of TIMESTAMP WITH TIME ZONE data types.

Its columns (except for OWNER, COLUMN_NAME, NESTED, VIRTUAL_COLUMN, SCALAR_COLUMN, and UNUSED_COLUMN) are the same as those in ALL_TSTZ_TAB_COLS.

 **See Also:**

"[ALL_TSTZ_TAB_COLS](#)"

6.718 USER_TSTZ_TABLES

USER_TSTZ_TABLES displays information about the tables owned by the current user, which have columns defined on TIMESTAMP WITH TIME ZONE data types or object types containing attributes of TIMESTAMP WITH TIME ZONE data types.

Its columns (except for OWNER) are the same as those in ALL_TSTZ_TABLES.

See Also:

"[ALL_TSTZ_TABLES](#)"

6.719 USER_TUNE_MVIEW

USER_TUNE_MVIEW displays the result of executing the DBMS_ADVISOR.TUNE_MVIEW procedure. Its columns (except for OWNER) are the same as those in DBA_TUNE_MVIEW.

See Also:

"[DBA_TUNE_MVIEW](#)"

6.720 USER_TYPE_ATTRS

USER_TYPE_ATTRS describes the attributes of the object types owned by the current user. Its columns (except for OWNER and CHAR_USED) are the same as those in ALL_TYPE_ATTRS.

See Also:

"[ALL_TYPE_ATTRS](#)"

6.721 USER_TYPE_METHODS

USER_TYPE_METHODS describes the methods of the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TYPE_METHODS.

See Also:

"[ALL_TYPE_METHODS](#)"

6.722 USER_TYPE VERSIONS

USER_TYPE VERSIONS describes the versions of the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TYPE VERSIONS.

 See Also:

["ALL_TYPE VERSIONS"](#)

6.723 USER_TYPES

USER_TYPES describes the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_TYPES.

 See Also:

["ALL_TYPES"](#)

6.724 USER_UNUSED_COL_TABS

USER_UNUSED_COL_TABS describes the tables owned by the current user that contain unused columns. Its columns (except for OWNER) are the same as those in ALL_UNUSED_COL_TABS.

 See Also:

["ALL_UNUSED_COL_TABS"](#)

6.725 USER_UPDATABLE_COLUMNS

USER_UPDATABLE_COLUMNS describes columns in a join view that can be updated by the current user, subject to appropriate privileges. Its columns are the same as those in ALL_UPDATABLE_COLUMNS.

 See Also:

- ["ALL_UPDATABLE_COLUMNS"](#)
- *Oracle Database Concepts* for information on updatable join views

6.726 USER_USERS

USER_USERS describes the current user.

Column	Datatype	NULL	Description
USERNAME	VARCHAR2 (128)	NOT NULL	Name of the user
USER_ID	NUMBER	NOT NULL	ID number of the user

Column	Datatype	NULL	Description
ACCOUNT_STATUS	VARCHAR2(32)	NOT NULL	<p>Account status:</p> <ul style="list-style-type: none"> • OPEN The account is open. • EXPIRED The password for the account is expired, either because the <code>PASSWORD_LIFE_TIME</code> limit was reached or because the password was expired by the <code>ALTER USER ... PASSWORD EXPIRE</code> command. The user can log in with the expired password, then change the password. • EXPIRED(GRACE) The password for the account is expired because the <code>PASSWORD_LIFE_TIME</code> limit was reached, but the password change grace period (<code>PASSWORD_GRACE_TIME</code>) has not yet elapsed. The user can log in with the expired password, but will receive an <code>ORA-28002</code> warning as a reminder that the password must soon be changed. If the <code>PASSWORD_GRACE_TIME</code> elapses, the user can log in with the expired password, then change the password. • LOCKED The account is locked, either by the <code>ALTER USER ... ACCOUNT LOCK</code> command, or because the number of consecutive failed login attempts exceeded the <code>FAILED_LOGIN_ATTEMPTS</code> limit and the value of <code>PASSWORD_LOCK_TIME</code> is <code>UNLIMITED</code>. The account can be unlocked by the <code>ALTER USER ... ACCOUNT UNLOCK</code> command. • LOCKED(TIMED) The account is locked because the number of consecutive failed login attempts exceeded the <code>FAILED_LOGIN_ATTEMPTS</code> limit and the <code>PASSWORD_LOCK_TIME</code> has not yet elapsed. The account can be unlocked either by the <code>ALTER USER ... ACCOUNT UNLOCK</code> command or by waiting until the <code>PASSWORD_LOCK_TIME</code> has elapsed. • EXPIRED & LOCKED The password for the account is expired, as described for the <code>EXPIRED</code> account status, and the account is locked as described for the <code>LOCKED</code> account status. The account can first be unlocked as described for the <code>LOCKED</code> account status, then the password can be changed as described for the <code>EXPIRED</code> account status. • EXPIRED(GRACE) & LOCKED The password for the account is expired, as described for the <code>EXPIRED(GRACE)</code> account status, and the account is locked as described for the <code>LOCKED</code> account status. The account can first be unlocked as described for the <code>LOCKED</code> account status, then the password can be changed as described for the <code>EXPIRED(GRACE)</code> account status. • EXPIRED & LOCKED(TIMED) The password for the account is expired, as described for the <code>EXPIRED</code> account status, and the

Column	Datatype	NULL	Description
			account is locked as described for the LOCKED(TIMED) account status. The account can first be unlocked as described for the LOCKED(TIMED) account status, then the password can be changed as described for the EXPIRED account status.
		• EXPIRED(GRACE) & LOCKED(TIMED)	The password for the account is expired, as described for the EXPIRED(GRACE) account status, and the account is locked as described for the LOCKED(TIMED) account status. The account can first be unlocked as described for the LOCKED(TIMED) account status, then the password can be changed as described for the EXPIRED(GRACE) account status.
		• OPEN & IN ROLLOVER	The account is in the password rollover period. The user can log in with either the earlier password or the new password. However, at the time the user logs in, the server recalculates whether the account is still in its password rollover period. If the password rollover period has elapsed, then the login will succeed only if the new password was specified, and the account status will change to OPEN.
		• EXPIRED & IN ROLLOVER	The account is in the password rollover period and the password is expired as described for the EXPIRED account status. The user can log in with either the earlier password or the new password. However, at the time the user logs in, the server recalculates whether the account is still in its password rollover period. If the password rollover period has elapsed, then the login will succeed only if the new password was specified, and the account status will change to EXPIRED. After logging in, the user will be prompted to change the password.
		• LOCKED & IN ROLLOVER	The account is in the password rollover period and is also locked as described for the LOCKED account status. The account can be unlocked as described for the LOCKED account status, after which the user can log in as described for the OPEN & IN ROLLOVER account status.
		• EXPIRED & LOCKED & IN ROLLOVER	The account is in the password rollover period, its password is expired as described for the EXPIRED account status, and the account is locked as described for the LOCKED account status. The account can be unlocked as described for the LOCKED account status, after which the user can log in as described for the EXPIRED & IN ROLLOVER account status.
		• LOCKED(TIMED) & IN ROLLOVER	The account is in the password rollover period and is also locked as described for the

Column	Datatype	NULL	Description
			<p>LOCKED (TIMED) account status. The account can be unlocked as described for the LOCKED (TIMED) account status, after which the user can log in with either the earlier password or the new password. However, at the time the user logs in, the server recalculates whether the account is still in its password rollover period. If the password rollover period has elapsed, then the login will succeed only if the new password was specified.</p> <ul style="list-style-type: none"> • EXPIRED & LOCKED(TIMED) & IN ROL <p>The account is in the password rollover period, its password is expired as described for the EXPIRED account status, and the account is locked as described for the LOCKED (TIMED) account status. The account can be unlocked as described for the LOCKED (TIMED) account status, after which the user can log in as described for the EXPIRED & IN ROLLOVER account status.</p>
LOCK_DATE	DATE		Date the account was locked if account status was LOCKED
EXPIRY_DATE	DATE		Date of expiration of the account
DEFAULT_TABLESPACE	VARCHAR2(30)	NOT NULL	Default tablespace for data
TEMPORARY_TABLESPACE	VARCHAR2(30)	NOT NULL	Name of the default tablespace for temporary tables or the name of a tablespace group
LOCAL_TEMP_TABLESPACE	VARCHAR2(30)		Default local temporary tablespace for the user
CREATED	DATE	NOT NULL	User creation date
INITIAL_RSRC_CONSUMER_GRP	VARCHAR2(128)		Initial resource consumer group for the user
EXTERNAL_NAME	VARCHAR2(4000)		User external name. For centrally managed users, if the database user mapping is an exclusive mapping, then this will be the directory service DN for the user. If this database user is a shared schema, it will be the DN of a group.
PROXY_ONLY_CONNECT	VARCHAR2(1)		<p>Indicates whether a user can connect directly (N) or whether the account can only be proxied (Y) by users who have proxy privileges for this account (that is, by users who have been granted the "connect through" privilege for this account).</p> <p>For more information about creating proxy user accounts and authorizing users to connect through them, see <i>Oracle Database Security Guide</i>.</p>
COMMON	VARCHAR2(3)		<p>Indicates whether a given user is common. Possible values</p> <ul style="list-style-type: none"> • YES if a user is common • NO if a user is local (not common)
ORACLE_MAINTAINED	VARCHAR2(1)		Denotes whether the user was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). A user for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script.
INHERITED	VARCHAR2(3)		Indicates whether the user definition was inherited from another container (YES) or not (NO)

Column	Datatype	NULL	Description
DEFAULT_COLLATION	VARCHAR2(100)		Default collation for the user's schema
IMPLICIT	VARCHAR2(3)		Indicates whether this user is a common user created by an implicit application (YES) or not (NO)
ALL_SHARD	VARCHAR2(3)		In a sharded database, the value in this column indicates whether the user was created with shard DDL enabled. The possible values are: <ul style="list-style-type: none"> • YES: The user was created with shard DDL enabled. The user exists on all shards and the shard catalog. • NO: The user was created without shard DDL enabled. The user exists only in the database in which the user was created. In a non-sharded database, the value in this column is always NO.
PASSWORD_CHANGE_DATE ¹	DATE		Date on which the user's password was last set This column is populated only when the value of the AUTHENTICATION_TYPE column is PASSWORD. Otherwise, this column is null.

¹ This column is available starting with Oracle Database 19c.

 **See Also:**

- "[DBA_USERS](#)"
- *Using Oracle Sharding* for more information about sharded database management

6.727 USER_USTATS

USER_USTATS describes the user-defined statistics collected on the tables and indexes owned by the current user. Its columns are the same as those in ALL_USTATS.

 **See Also:**

- "[ALL_USTATS](#)"

6.728 USER_VARRAYS

USER_VARRAYS describes the varrays owned by the current user. Its columns (except for OWNER) are the same as those in ALL_VARRAYS.

 See Also:

"[ALL_VARRAYS](#)"

6.729 USER_VIEWS

USER_VIEWS describes the views owned by the current user. Its columns (except for OWNER) are the same as those in ALL_VIEWS.

 See Also:

"[ALL_VIEWS](#)"

6.730 USER_VIEWS_AE

USER_VIEWS_AE describes the views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL_VIEWS_AE.

 See Also:

"[ALL_VIEWS_AE](#)"

6.731 USER_WALLET_ACES

USER_WALLET_ACES describes the status of access control entries for the current user to access wallets through PL/SQL network utility packages.

Its columns (except for ACE_ORDER, START_DATE, END_DATE, GRANT_TYPE, INVERTED_PRINCIPAL, PRINCIPAL, PRINCIPAL_TYPE, and STATUS) are the same as those in DBA_WALLET_ACES.

 See Also:

"[DBA_WALLET_ACES](#)"

6.732 USER_WARNING_SETTINGS

USER_WARNING_SETTINGS displays information about the warning parameter settings for the objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL_WARNING_SETTINGS.

 See Also:

"[ALL_WARNING_SETTINGS](#)"

6.733 USER_XML_INDEXES

USER_XML_INDEXES describes the XML indexes owned by the current user. Its columns (except for INDEX_OWNER) are the same as those in ALL_XML_INDEXES.

 See Also:

"[ALL_XML_INDEXES](#)"

6.734 USER_XML_NESTED_TABLES

USER_XML_NESTED_TABLES describes all the tables and their corresponding nested tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_NESTED_TABLES.

 See Also:

"[ALL_XML_NESTED_TABLES](#)"

6.735 USER_XML_OUT_OF_LINE_TABLES

USER_XML_OUT_OF_LINE_TABLES describes all the out of line tables connected to a given root table for the same schema owned by the current user. Its columns (except for TABLE_OWNER) are the same as those in ALL_XML_OUT_OF_LINE_TABLES.

 See Also:

"[ALL_XML_OUT_OF_LINE_TABLES](#)"

6.736 USER_XML_SCHEMA_ATTRIBUTES

USER_XML_SCHEMA_ATTRIBUTES describes all the attributes and their properties owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_SCHEMA_ATTRIBUTES.

 **See Also:**

["ALL_XML_SCHEMA_ATTRIBUTES"](#)

6.737 USER_XML_SCHEMA_COMPLEX_TYPES

USER_XML_SCHEMA_COMPLEX_TYPES describes all complex types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_SCHEMA_COMPLEX_TYPES.

 **See Also:**

["ALL_XML_SCHEMA_COMPLEX_TYPES"](#)

6.738 USER_XML_SCHEMA_ELEMENTS

USER_XML_SCHEMA_ELEMENTS describes all the elements and their properties owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_SCHEMA_ELEMENTS.

 **See Also:**

["ALL_XML_SCHEMA_ELEMENTS"](#)

6.739 USER_XML_SCHEMA_NAMESPACES

USER_XML_SCHEMA_NAMESPACES describes all the available namespaces owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_SCHEMA_NAMESPACES.

 **See Also:**

["ALL_XML_SCHEMA_NAMESPACES"](#)

6.740 USER_XML_SCHEMA_SIMPLE_TYPES

USER_XML_SCHEMA_SIMPLE_TYPES describes all simple types owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_SCHEMA_SIMPLE_TYPES.

 **See Also:**

["ALL_XML_SCHEMA_SIMPLE_TYPES"](#)

6.741 USER_XML_SCHEMA_SUBSTGRP_HEAD

USER_XML_SCHEMA_SUBSTGRP_HEAD describes the heads of substitution groups owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_SCHEMA_SUBSTGRP_HEAD.

 **See Also:**

["ALL_XML_SCHEMA_SUBSTGRP_HEAD"](#)

6.742 USER_XML_SCHEMA_SUBSTGRP_MBRS

USER_XML_SCHEMA_SUBSTGRP_MBRS describes all members of substitution groups owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_SCHEMA_SUBSTGRP_MBRS.

 **See Also:**

["ALL_XML_SCHEMA_SUBSTGRP_MBRS"](#)

6.743 USER_XML_SCHEMAS

USER_XML_SCHEMAS describes the registered XML schemas owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_SCHEMAS.

 **See Also:**

["ALL_XML_SCHEMAS"](#)

6.744 USER_XML_TAB_COLS

USER_XML_TAB_COLS describes the columns of the XML tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_TAB_COLS.

See Also:

["ALL_XML_TAB_COLS"](#)

6.745 USER_XML_TABLES

USER_XML_TABLES describes the XML tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_TABLES.

See Also:

["ALL_XML_TABLES"](#)

6.746 USER_XML_VIEW_COLS

USER_XML_VIEW_COLS describes the columns of the XML views owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_VIEW_COLS.

See Also:

["ALL_XML_VIEW_COLS"](#)

6.747 USER_XML_VIEWS

USER_XML_VIEWS describes the XML views owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XML_VIEWS.

See Also:

["ALL_XML_VIEWS"](#)

6.748 USER_XTERNAL_LOC_PARTITIONS

USER_XTERNAL_LOC_PARTITIONS describes partition-level locations owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XTERNAL_LOC_PARTITIONS.

 **See Also:**

["ALL_XTERNAL_LOC_PARTITIONS"](#)

6.749 USER_XTERNAL_LOC_SUBPARTITIONS

USER_XTERNAL_LOC_SUBPARTITIONS describes subpartition-level locations owned by the current user. Its columns (except for TABLE_OWNER) are the same as those in ALL_XTERNAL_LOC_SUBPARTITIONS.

 **See Also:**

["ALL_XTERNAL_LOC_SUBPARTITIONS"](#)

6.750 USER_XTERNAL_PART_TABLES

USER_XTERNAL_PART_TABLES describes object-level information for partitioned external tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL_XTERNAL_PART_TABLES.

 **See Also:**

["ALL_XTERNAL_PART_TABLES"](#)

6.751 USER_XTERNAL_TAB_PARTITIONS

USER_XTERNAL_TAB_PARTITIONS describes partition-level information for partitioned external tables owned by the current user. Its columns (except for TABLE_OWNER) are the same as those in ALL_XTERNAL_TAB_PARTITIONS.

 **See Also:**

["ALL_XTERNAL_TAB_PARTITIONS"](#)

6.752 USER_XTERNAL_TAB_SUBPARTITIONS

USER_XTERNAL_TAB_SUBPARTITIONS describes subpartition-level information for partitioned external tables owned by the current user. Its columns (except for TABLE_OWNER) are the same as those in ALL_XTERNAL_TAB_SUBPARTITIONS.

 **See Also:**

["ALL_XTERNAL_TAB_SUBPARTITIONS"](#)

6.753 USER_ZONEMAP_MEASURES

USER_ZONEMAP_MEASURES describes the measures for all the zone maps owned by the user. Its columns are the same as those in ALL_ZONEMAP_MEASURES.

 **Note:**

This view is intended for use with Oracle Exadata release 12.1.2.1.1 or later.

 **See Also:**

- ["ALL_ZONEMAP_MEASURES"](#)
- *Oracle Database Data Warehousing Guide* for more information about zone maps

6.754 USER_ZONEMAPS

USER_ZONEMAPS describes the zone maps owned by the user. Its columns are the same as those in ALL_ZONEMAPS.

 **Note:**

This view is intended for use with Oracle Exadata release 12.1.2.1.1 or later.

 **See Also:**

- "[ALL_ZONEMAPS](#)"
- *Oracle Database Data Warehousing Guide* for more information about zone maps

Part III

Dynamic Performance Views

This part describes the **dynamic performance views**, which are often referred to as `V$` views.

This part contains the following chapters:

- [Dynamic Performance \(V\\$\) Views: V\\$ACCESS to V\\$HVMMASTER_INFO](#)
- [Dynamic Performance \(V\\$\) Views: V\\$IM_COLUMN_LEVEL to V\\$RULE_SET_AGGREGATE_STATS](#)
- [Dynamic Performance \(V\\$\) Views: V\\$SCHEDULER_RUNNING_JOBS to V\\$ZONEMAP_USAGE_STATS](#)

 **Note:**

Oracle also maintains tables and views that change only when a change is made to the data dictionary. These **static** tables and views are described in [Static Data Dictionary Views](#).

Dynamic Performance (V\$) Views: V\$ACCESS to V\$HVMMASTER_INFO

This chapter describes the first set (in alphabetical order) of dynamic performance views.

The remaining dynamic performance views appear in alphabetical order in [Dynamic Performance \(V\\$\) Views: V\\$IM_COLUMN_LEVEL to V\\$RULE_SET_AGGREGATE_STATS](#) through [Dynamic Performance \(V\\$\) Views: V\\$SCHEDULER_RUNNING_JOBS to V\\$ZONEMAP_USAGE_STATS](#).

This chapter contains the following topics:

- [About Dynamic Performance Views](#)
- [Oracle Exadata Database Machine Views](#)
- [Dynamic Performance View Descriptions](#)

7.1 About Dynamic Performance Views

Oracle contains a set of underlying views that are maintained by the database server and accessible to the database administrator user `SYS`. These views are called **dynamic performance views** because they are continuously updated while a database is open and in use, and their contents relate primarily to performance.

Although these views appear to be regular database tables, they are not. These views provide data on internal disk structures and memory structures. You can select from these views, but you can never update or alter them.

Note:

- You can query the dynamic performance views to extract information from them. However, only simple queries are supported. If sorts, joins, `GROUP BY` clauses and the like are needed, then you should copy the information from each `V$` view into a table (for example, using a `CREATE TABLE ... AS SELECT` statement), and then query from those tables.
- Because the information in the `V$` views is dynamic, read consistency is not guaranteed for `SELECT` operations on these views.

The `catalog.sql` script contains definitions of the views and public synonyms for the dynamic performance views. You must run `catalog.sql` to create these views and synonyms. After installation, only user `SYS` or anyone with `SYSDBA` privilege has access to the dynamic performance tables. See *Oracle Database Administrator's Guide* for more information about running `catalog.sql`.

7.1.1 V\$ Views

The actual dynamic performance views are identified by the prefix `V_`. Public synonyms for these views have the prefix `V$`. Database administrators and other users should access only the `V$` objects, not the `V_` objects.

The dynamic performance views are used by Oracle Enterprise Manager, which is the primary interface for accessing information about system performance. After an instance is started, the `V$` views that read from memory are accessible. Views that read data from disk require that the database be mounted, and some require that the database be open.

`V$` views are `CONTAINER_DATA` objects. When a user connected to the root queries a `V$` view, the query results will depend on the `CONTAINER_DATA` attribute for users for the view. The `CONTAINER_DATA` clause of the SQL `ALTER USER` statement is used to set and modify users' `CONTAINER_DATA` attribute.

`V$` views can return data from different containers in a CDB when queried from the root container. These objects will implicitly convert data to the character set of the root container (AL32UTF8) and then return the result to the user. Some character sets may have character expansion (more bytes needed to represent a character) when converted to AL32UTF8, so there may be data truncation if the view column width is not able to accommodate data from a given PDB.

See Also:

- *Oracle Database Security Guide* for more information about container data objects
- *Oracle Database SQL Language Reference* for more information about the `CONTAINER_DATA` clause for the SQL `ALTER USER` statement

7.1.2 GV\$ Views

For almost every `V$` view described in this chapter, Oracle has a corresponding `GV$` (global `V$`) view. In Oracle Real Application Clusters, querying a `GV$` view retrieves the `V$` view information from all qualified instances. In addition to the `V$` information, each `GV$` view contains an extra column named `INST_ID` of data type `NUMBER`. The `INST_ID` column displays the instance number from which the associated `V$` view information was obtained. The `INST_ID` column can be used as a filter to retrieve `V$` information from a subset of available instances. For example, the following query retrieves the information from the `V$LOCK` view on instances 2 and 5:

```
SQL> SELECT * FROM GV$LOCK WHERE INST_ID = 2 OR INST_ID = 5;
```

See Also:

Oracle Real Application Clusters Installation and Configuration Guide for your operating system

GV\$ views are `CONTAINER_DATA` objects. When a user connected to the root queries a GV\$ view, the query results will depend on the `CONTAINER_DATA` attribute for users for the view. The `CONTAINER_DATA` clause of the SQL `ALTER USER` statement is used to set and modify users' `CONTAINER_DATA` attribute.

GV\$ views can return data from different containers in a CDB when queried from the root container. These objects will implicitly convert data to the character set of the root container (AL32UTF8) and then return the result to the user. Some character sets may have character expansion (more bytes needed to represent a character) when converted to AL32UTF8, so there may be data truncation if the view column width is not able to accommodate data from a given PDB.

See Also:

- *Oracle Database Security Guide* for more information about container data objects
- *Oracle Database SQL Language Reference* for more information about the `CONTAINER_DATA` clause for the SQL `ALTER USER` statement

7.2 Oracle Exadata Database Machine Views

Descriptions of Oracle Exadata Database Machine views are not provided in this manual.

See *Oracle Exadata System Software User's Guide* for descriptions of Oracle Exadata Database Machine views.

Note:

Oracle Exadata Database Machine view names begin with `V$CELL`.

7.3 Dynamic Performance View Descriptions

The remainder of this chapter describes the dynamic performance views in alphabetical order.

7.4 V\$ACCESS

`V$ACCESS` displays information about locks that are currently imposed on library cache objects.

The locks are imposed to ensure that they are not aged out of the library cache while they are required for SQL execution.

Column	Datatype	Description
SID	NUMBER	Session number that is accessing an object
OWNER	VARCHAR2 (64)	Owner of the object
OBJECT	VARCHAR2 (1000)	Name of the object
TYPE	VARCHAR2 (64)	Type identifier for the object

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.5 V\$ACTIVE_INSTANCES

V\$ACTIVE_INSTANCES displays the mapping between instance names and instance numbers for all instances that have the database currently mounted.

Column	Datatype	Description
INST_NUMBER	NUMBER	Instance number
INST_NAME	VARCHAR2 (256)	Instance name
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.6 V\$ACTIVE_SERVICES

V\$ACTIVE_SERVICES displays information about the active services in the database.

Column	Datatype	Description
SERVICE_ID	NUMBER	Service ID
NAME	VARCHAR2 (64)	Name of the service
NAME_HASH	NUMBER	Service name hash
NETWORK_NAME	VARCHAR2 (512)	Network name
CREATION_DATE	DATE	Creation date
CREATION_DATE_HASH	NUMBER	Creation date hash
GOAL	VARCHAR2 (12)	<p>Runtime Load Balancing Goal being used to create run-time load balancing and connection load balancing advice:</p> <ul style="list-style-type: none"> • NONE • SERVICE_TIME - Connections are balanced by response time • THROUGHPUT - Connections are balanced by throughput

Column	Datatype	Description
DTP	VARCHAR2 (1)	<p>Indicates whether or not Distributed Transaction Processing is enabled for this service. When Distributed Transaction Processing is set to Y (YES), it means that the service is offered at exactly one instance at a time for XA affinity. Possible values:</p> <ul style="list-style-type: none"> • Y - YES • N - NO
BLOCKED	CHAR (2)	Indicates whether a service on the specified instance is blocked from accepting new connections altogether (YES) or not (NO). If a service is blocked, then all connections will be directed to other instances (if any) that are hosting the desired service.
AQ_HA_NOTIFICATION	VARCHAR2 (3)	Indicates whether FAN - Fast Application Notification for OCI connections is set (YES) or not (NO)
CLB_GOAL	VARCHAR2 (5)	Connection load balancing goal used with statistics that are sent to the listeners to determine how new connections are distributed:
		<ul style="list-style-type: none"> • LONG • SHORT
COMMIT_OUTCOME	VARCHAR2 (3)	<p>For Transaction Guard, indicates whether the database service associated with the user session has the <code>COMMIT_OUTCOME</code> service attribute enabled (YES) or not (NO). This attribute applies on a per session basis and is set at connect time.</p> <p>When <code>COMMIT_OUTCOME</code> = YES:</p> <ul style="list-style-type: none"> • Transaction Guard manages the commit status for all supported transaction types. The outcome of a <code>COMMIT</code> transaction is known. If there is an outage, the application can use <code>DBMS_APP_CONT.GET_LTXID_OUTCOME</code> to return a reliable status for the last in-flight work. • A logical transaction ID (LTXID) is set for each user session at login and at each successful commit. <p>See Also: For information about preserving the commit outcome, see <i>Oracle Database Development Guide</i>. For information about logical transaction IDs, see <i>Oracle Database Development Guide</i></p>
RETENTION_TIME	NUMBER	For Transaction Guard, when <code>COMMIT_OUTCOME</code> = YES , this value indicates the amount of time (in seconds) that the commit outcome is retained in the database.
REPLAY_INITIATION_TIMEOUT	NUMBER	For Application Continuity, this option specifies the difference between the time (in seconds) of original execution of the first operation of a request and the time that the replay is ready to start after a successful reconnect. Application Continuity will not replay after the specified amount of time has passed. This option is intended to avoid the unintentional execution of a transaction when a system is recovered after a long period of time. The default is 5 minutes (300 seconds).
SESSION_STATE_CONSISTENCY	VARCHAR2 (128)	Describes how non-transactional is changed during a request. This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If non-transactional values change after the request starts, the default value of <code>DYNAMIC</code> should be set. Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode.

Column	Datatype	Description
GLOBAL	VARCHAR2 (3)	Indicates whether the service is global. A global service is managed by Global Service Manager (GSM) and can be provided by multiple databases that contain replicated data. Possible values: <ul style="list-style-type: none"> • YES: Indicates the service is global • NO: Indicates the service is not global
CON_NAME	VARCHAR2 (128)	Container name of the object. The value of this column is NULL in non-CDBs.
SQL_TRANSLATION_PROFILE	VARCHAR2 (261)	A non-NULL value specifies the initial SQL translation profile for subsequent database connections that use the service and do not specify a SQL translation profile. A NULL value has no effect.
MAX_LAG_TIME	VARCHAR2 (128)	The maximum replication lag (in seconds) that is acceptable for a data replica to be used for providing the database service. Can only be specified for global services.
STOP_OPTION	VARCHAR2 (128)	Stop option for sessions of this service for planned maintenance
FAILOVER_RESTORE	VARCHAR2 (128)	Indicates whether sessions recover their commonly used session state (like NLS, schema) when they are failed over with TAF
DRAIN_TIMEOUT	NUMBER	Number of seconds to wait for sessions to be drained
TABLE_FAMILY_ID ¹	NUMBER	Sharded table family ID associated with the service
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

¹ This column is available starting with Oracle Database 19c.

7.7 V\$ACTIVE_SESS_POOL_MTH

V\$ACTIVE_SESS_POOL_MTH displays available active session pool resource allocation methods.

Column	Datatype	Description
NAME	VARCHAR2 (40)	Name of the active session pool resource allocation method
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.8 V\$ACTIVE_SESSION_HISTORY

V\$ACTIVE_SESSION_HISTORY displays sampled session activity in the database.

It contains snapshots of active database sessions taken once a second. A database session is considered active if it was on the CPU or was waiting for an event that didn't belong to the Idle wait class. Refer to the V\$EVENT_NAME view for more information on wait classes.

This view contains one row for each active session per sample and returns the latest session sample rows first. A majority of the columns describing the session in the active session history are present in the V\$SESSION view.

Column	Datatype	Description
SAMPLE_ID	NUMBER	ID of the sample
SAMPLE_TIME	TIMESTAMP (3)	Time at which the sample was taken
SAMPLE_TIME_UTC	TIMESTAMP (3)	Time at which the sample was taken in UTC (Coordinated Universal Time) time zone
USECS_PER_ROW	NUMBER	Time in microseconds since the last sample was taken
IS_AWR_SAMPLE	VARCHAR2 (1)	Indicates whether this sample has been flushed or will be flushed to the Automatic Workload Repository (DBA_HIST_ACTIVE_SESS_HISTORY) (Y) or not (N)
SESSION_ID	NUMBER	Session identifier; maps to V\$SESSION.SID
SESSION_SERIAL#	NUMBER	Session serial number (used to uniquely identify a session's objects); maps to V\$SESSION.SERIAL#
SESSION_TYPE	VARCHAR2 (10)	Session type: <ul style="list-style-type: none"> • FOREGROUND • BACKGROUND
FLAGS	NUMBER	Reserved for future use
USER_ID	NUMBER	Oracle user identifier; maps to V\$SESSION.USER#
SQL_ID	VARCHAR2 (13)	SQL identifier of the SQL statement that the session was executing at the time of sampling
IS_SQLID_CURRENT	VARCHAR2 (1)	Indicates whether the SQL identifier in the SQL_ID column is being executed (Y) or not (N)
SQL_CHILD_NUMBER	NUMBER	Child number of the SQL statement that the session was executing at the time of sampling
SQL_OPCODE	NUMBER	Indicates what phase of operation the SQL statement was in; maps to V\$SESSION.COMMAND
SQL_OPNAME	VARCHAR2 (64)	See Also: " V\$SESSION " for information on interpreting this column
FORCE_MATCHING_SIGNATURE	NUMBER	SQL command name
TOP_LEVEL_SQL_ID	VARCHAR2 (13)	Signature used when the CURSOR_SHARING parameter is set to FORCE
TOP_LEVEL_SQL_OPCODE	NUMBER	SQL identifier of the top level SQL statement
SQL_ADAPTIVE_PLAN_RESOLVED	NUMBER	Indicates what phase of operation the top level SQL statement was in
SQL_FULL_PLAN_HASH_VALUE	NUMBER	Indicates whether the SQL plan of the sampled database session is a resolved adaptive plan or not
		Numerical representation of the complete SQL plan for the cursor being executed by this session

Column	Datatype	Description
SQL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the SQL plan for the cursor. This information might not be available for all session samples. V\$SESSION does not contain this information.
SQL_PLAN_LINE_ID	NUMBER	SQL plan line ID
SQL_PLAN_OPERATION	VARCHAR2 (30)	Plan operation name
SQL_PLAN_OPTIONS	VARCHAR2 (30)	Plan operation options
SQL_EXEC_ID	NUMBER	SQL execution identifier
SQL_EXEC_START	DATE	Time when the execution of the SQL started
PLSQL_ENTRY_OBJECT_ID	NUMBER	Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack. Maps to DBA_OBJECTS.OBJECT_ID.
PLSQL_ENTRY_SUBPROGRAM_ID	NUMBER	Subprogram ID of the top-most PL/SQL subprogram on the stack. Maps to DBA_OBJECTS.DATA_OBJECT_ID.
PLSQL_OBJECT_ID	NUMBER	Object ID of the currently executing PL/SQL subprogram. Maps to DBA_OBJECTS.OBJECT_ID.
PLSQL_SUBPROGRAM_ID	NUMBER	Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL. Maps to DBA_OBJECTS.DATA_OBJECT_ID.
QC_INSTANCE_ID	NUMBER	Query coordinator instance ID. This information is only available if the sampled session is a parallel query slave. For all other sessions, the value is 0.
QC_SESSION_ID	NUMBER	Query coordinator session ID. This information is only available if the sampled session is a parallel query slave. For all other sessions, the value is 0.
QC_SESSION_SERIAL#	NUMBER	Query coordinator session serial number. This information is only available if the sampled session is a parallel query slave. For all other sessions, the value is 0.
PX_FLAGS	NUMBER	Reserved for internal use
EVENT	VARCHAR2 (64)	If SESSION_STATE = WAITING, then the event for which the session was waiting for at the time of sampling. If SESSION_STATE = ON CPU, then this column is NULL.
EVENT_ID	NUMBER	Identifier of the resource or event for which the session is waiting or for which the session last waited. Interpretation is similar to that of the EVENT column.
EVENT#	NUMBER	Number of the resource or event for which the session is waiting or for which the session last waited. Interpretation is similar to that of the EVENT column.
SEQ#	NUMBER	Sequence number that uniquely identifies the wait (incremented for each wait)
P1TEXT	VARCHAR2 (64)	Text of the first additional parameter
P1	NUMBER	First additional parameter
P2TEXT	VARCHAR2 (64)	Text of the second additional parameter
P2	NUMBER	Second additional parameter
P3TEXT	VARCHAR2 (64)	Text of the third additional parameter
P3	NUMBER	Third additional parameter

Column	Datatype	Description
WAIT_CLASS	VARCHAR2(64)	Wait class name of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the EVENT column. Maps to V\$SESSION.WAIT_CLASS.
WAIT_CLASS_ID	NUMBER	Wait class identifier of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the EVENT column. Maps to V\$SESSION.WAIT_CLASS_ID.
WAIT_TIME	NUMBER	Total wait time for the event for which the session last waited if the session was on the CPU when sampled; 0 if the session was waiting at the time of sampling Note: Whether or not WAIT_TIME = 0 is what is useful to find the SESSION_STATE at the time of sampling, rather than the actual value of WAIT_TIME itself. Maps to V\$SESSION.WAIT_TIME.
SESSION_STATE	VARCHAR2(7)	Session state: <ul style="list-style-type: none">• WAITING• ON CPU
TIME_WAITED	NUMBER	If SESSION_STATE = WAITING, then the time that the session actually spent waiting for that event (in microseconds). This column is set for waits that were in progress at the time the sample was taken. If a wait event lasted for more than a second and was caught waiting in more than one session sample row, then the actual time spent waiting for that wait event will be populated in the last of those session sample rows. At any given time, this information will not be available for the latest session sample.
BLOCKING_SESSION_STATUS	VARCHAR2(11)	Status of the blocking session: <ul style="list-style-type: none">• VALID• NO HOLDER• GLOBAL• NOT IN WAIT• UNKNOWN
BLOCKING_SESSION	NUMBER	Session identifier of the blocking session. Populated only if the blocker is on the same instance and the session was waiting for enqueues or a "buffer busy" wait. Maps to V\$SESSION.BLOCKING_SESSION.
BLOCKING_SESSION_SERIAL#	NUMBER	Serial number of the blocking session
BLOCKING_INST_ID	NUMBER	Instance number of the blocker shown in BLOCKING_SESSION
BLOCKING_HANGCHAIN_INFO	VARCHAR2(1)	Indicates whether the information about BLOCKING_SESSION comes from the hang chain (Y) or not (N)
CURRENT_OBJ#	NUMBER	Object ID of the object that the session is referencing. This information is only available if the session was waiting for application, cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_OBJ#.
CURRENT_FILE#	NUMBER	File number of the file containing the block that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_FILE#.
CURRENT_BLOCK#	NUMBER	ID of the block that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_BLOCK#.
CURRENT_ROW#	NUMBER	Row identifier that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_ROW#.

Column	Datatype	Description
TOP_LEVEL_CALL#	NUMBER	Oracle top level call number
TOP_LEVEL_CALL_NAME	VARCHAR2(64)	Oracle top level call name
CONSUMER_GROUP_ID	NUMBER	Consumer group ID
XID	RAW(8)	Transaction ID that the session was working on at the time of sampling. V\$SESSION does not contain this information.
REMOTE_INSTANCE#	NUMBER	Remote instance identifier that will serve the block that this session is waiting for. This information is only available if the session was waiting for cluster events.
TIME_MODEL	NUMBER	Time model information
IN_CONNECTION_MGMT	VARCHAR2(1)	Indicates whether the session was doing connection management at the time of sampling (Y) or not (N)
IN_PARSE	VARCHAR2(1)	Indicates whether the session was parsing at the time of sampling (Y) or not (N)
IN_HARD_PARSE	VARCHAR2(1)	Indicates whether the session was hard parsing at the time of sampling (Y) or not (N)
IN_SQL_EXECUTION	VARCHAR2(1)	Indicates whether the session was executing SQL statements at the time of sampling (Y) or not (N)
IN_PLSQL_EXECUTION	VARCHAR2(1)	Indicates whether the session was executing PL/SQL at the time of sampling (Y) or not (N)
IN_PLSQL_RPC	VARCHAR2(1)	Indicates whether the session was executing inbound PL/SQL RPC calls at the time of sampling (Y) or not (N)
IN_PLSQL_COMPILATION	VARCHAR2(1)	Indicates whether the session was compiling PL/SQL at the time of sampling (Y) or not (N)
IN_JAVA_EXECUTION	VARCHAR2(1)	Indicates whether the session was executing Java at the time of sampling (Y) or not (N)
IN_BIND	VARCHAR2(1)	Indicates whether the session was doing bind operations at the time of sampling (Y) or not (N)
IN_CURSOR_CLOSE	VARCHAR2(1)	Indicates whether the session was closing a cursor at the time of sampling (Y) or not (N)
IN_SEQUENCE_LOAD	VARCHAR2(1)	Indicates whether the session is loading in sequence (in sequence load code) (Y) or not (N)
IN_INMEMORY_QUERY	VARCHAR2(1)	Indicates whether the session was querying the In-Memory Column Store (IM column store) at the time of sampling (Y) or not (N)
IN_INMEMORY_POPULATE	VARCHAR2(1)	Indicates whether the session was populating the IM column store at the time of sampling (Y) or not (N)
IN_INMEMORY_PREPOPULATE	VARCHAR2(1)	Indicates whether the session was prepopulating the IM column store at the time of sampling (Y) or not (N)
IN_INMEMORY_REPOPULATE	VARCHAR2(1)	Indicates whether the session was repopulating the IM column store at the time of sampling (Y) or not (N)
IN_INMEMORY_TREPOPULATE	VARCHAR2(1)	Indicates whether the session was trickle repopulating the IM column store at the time of sampling (Y) or not (N)
IN_TABLESPACE_ENCRYPTION	VARCHAR2(1)	Indicates whether encryption or decryption of a tablespace occurred at the time of sampling (Y) or not (N)
CAPTURE_OVERHEAD	VARCHAR2(1)	Indicates whether the session is executing capture code (Y) or not (N)
REPLAY_OVERHEAD	VARCHAR2(1)	Indicates whether the session is executing replay code (Y) or not (N)
IS_CAPTURED	VARCHAR2(1)	Indicates whether the session is being captured (Y) or not (N)

Column	Datatype	Description
IS_REPLAYED	VARCHAR2(1)	Indicates whether the session is being replayed (Y) or not (N)
IS_REPLAY_SYNC_TOKEN_HOLDER	VARCHAR2(1)	Indicates whether the session is holding a synchronization token (Y) or not (N) during workload replay
SERVICE_HASH	NUMBER	Hash that identifies the Service; maps to V\$ACTIVE_SERVICES.NAME_HASH
PROGRAM	VARCHAR2(48)	Name of the operating system program
MODULE	VARCHAR2(64)	Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_MODULE procedure
ACTION	VARCHAR2(64)	Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_ACTION procedure
CLIENT_ID	VARCHAR2(64)	Client identifier of the session; maps to V\$SESSION.CLIENT_IDENTIFIER
MACHINE	VARCHAR2(64)	Client's operating system machine name
PORT	NUMBER	Client port number
ECID	VARCHAR2(64)	Execution context identifier (sent by Application Server)
DBREPLAY_FILE_ID	NUMBER	If the session is being captured or replayed, then DBREPLAY_FILE_ID is the file ID for the workload capture or workload replay; otherwise it is NULL.
DBREPLAY_CALL_COUNTER	NUMBER	If the session is being captured or replayed, then DBREPLAY_CALL_COUNTER is the call counter of the user call that is being captured or replayed; otherwise it is NULL.
TM_DELTA_TIME	NUMBER	Time interval (in microseconds) over which TM_DELTA_CPU_TIME and TM_DELTA_DB_TIME are accumulated
TM_DELTA_CPU_TIME	NUMBER	Amount of time this session spent on CPU over the last TM_DELTA_TIME microseconds
TM_DELTA_DB_TIME	NUMBER	Amount of time spent by this session in database calls over the last TM_DELTA_TIME microseconds
DELTA_TIME	NUMBER	Time interval (in microseconds) since the last time this session was sampled or created, over which the next five statistics are accumulated
DELTA_READ_IO_REQUESTS	NUMBER	Number of read I/O requests made by this session over the last DELTA_TIME microseconds
DELTA_WRITE_IO_REQUESTS	NUMBER	Number of write I/O requests made by this session over the last DELTA_TIME microseconds
DELTA_READ_IO_BYTES	NUMBER	Number of I/O bytes read by this session over the last DELTA_TIME microseconds
DELTA_WRITE_IO_BYTES	NUMBER	Number of I/O bytes written by this session over the last DELTA_TIME microseconds
DELTA_INTERCONNECT_IO_BYTES	NUMBER	Number of I/O bytes sent over the I/O interconnect over the last DELTA_TIME microseconds
DELTA_READ_MEM_BYTES	NUMBER	Number of read bytes through the buffer cache
PGA_ALLOCATED	NUMBER	Amount of PGA memory (in bytes) consumed by this session at the time this sample was taken
TEMP_SPACE_ALLOCATED	NUMBER	Amount of TEMP memory (in bytes) consumed by this session at the time this sample was taken
CON_DBID	NUMBER	The database ID of the pluggable database (PDB)

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
DBOP_NAME	VARCHAR2 (30)	Database operation name. If the type is SQL, the DBOP_NAME will be NULL.
DBOP_EXEC_ID	NUMBER	Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.

7.9 V\$ADVISOR_PROGRESS

V\$ADVISOR_PROGRESS displays information about the progress of advisor execution.

Column	Datatype	Description
SID	NUMBER	Session ID
SERIAL#	NUMBER	Session serial number
USERNAME	VARCHAR2 (128)	Oracle user name
OPNAME	VARCHAR2 (64)	Operation name
ADVISOR_NAME	VARCHAR2 (64)	Advisor name
TASK_ID	NUMBER	Task ID
TARGET_DESC	VARCHAR2 (32)	Description of the target of the advisor
SOFAR	NUMBER	Amount of work done so far
TOTALWORK	NUMBER	Total work to be done
UNITS	VARCHAR2 (32)	Units that the work is measured in
BENEFIT_SOFAR	NUMBER	Benefit obtained so far
BENEFIT_MAX	NUMBER	Estimate of maximum benefit that could be obtained
FINDINGS	NUMBER	Number of findings so far
RECOMMENDATIONS	NUMBER	Number of recommendations so far

Column	Datatype	Description
TIME_REMAINING	NUMBER	Estimate of time remaining for the completion of the task (in seconds)
START_TIME	DATE	Start time of the task
LAST_UPDATE_TIME	DATE	Last time progress was posted
ELAPSED_SECONDS	NUMBER	Elapsed time so far
ADVISOR_METRIC1	NUMBER	Value of the advisor-specific metric
METRIC1_DESC	VARCHAR2(64)	Description of the advisor-specific metric
EXECUTION_TYPE	VARCHAR2(64)	Type of the last execution. This information is optional for single-execution tasks.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.10 V\$ALERT_TYPES

V\$ALERT_TYPES displays information about server alert types.

Column	Datatype	Description
REASON_ID	NUMBER	ID of the alert reason
OBJECT_TYPE	VARCHAR2(64)	Object type
TYPE	VARCHAR2(9)	Alert type: <ul style="list-style-type: none"> • Stateful • Stateless
GROUP_NAME	VARCHAR2(64)	Group name
SCOPE	VARCHAR2(8)	Scope: <ul style="list-style-type: none"> • Database • Instance
INTERNAL_METRIC_CATEGORY	VARCHAR2(64)	Internal metric category
INTERNAL_METRIC_NAME	VARCHAR2(64)	Internal metric name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.11 V\$ALL_ACTIVE_SESSION_HISTORY

V\$ALL_ACTIVE_SESSION_HISTORY displays sampled session activity in the database.

Note:

V\$ALL_ACTIVE_SESSION_HISTORY allows application developers to view their own session activity. It is similar to the V\$ACTIVE_SESSION_HISTORY view, with the following exception:

- When queried by the SYS user, or any user with the SYSDBA privilege, the V\$ALL_ACTIVE_SESSION_HISTORY view displays the same data as the V\$ACTIVE_SESSION_HISTORY view.
- When queried by any other user, the V\$ALL_ACTIVE_SESSION_HISTORY view displays only data about sessions owned by that user.

See also "[V\\$ACTIVE_SESSION_HISTORY](#)"

Column	Datatype	Description
SAMPLE_ID	NUMBER	ID of the sample
SAMPLE_TIME	TIMESTAMP (3)	Time at which the sample was taken
SAMPLE_TIME_UTC	TIMESTAMP (3)	Time at which the sample was taken in UTC (Coordinated Universal Time) time zone
USECS_PER_ROW	NUMBER	Time in microseconds since the last sample was taken
IS_AWR_SAMPLE	VARCHAR2 (1)	Indicates whether this sample has been flushed or will be flushed to the Automatic Workload Repository (DBA_HIST_ACTIVE_SESS_HISTORY) (Y) or not (N)
SESSION_ID	NUMBER	Session identifier; maps to V\$SESSION.SID
SESSION_SERIAL#	NUMBER	Session serial number (used to uniquely identify a session's objects); maps to V\$SESSION.SERIAL#
SESSION_TYPE	VARCHAR2 (10)	Session type: <ul style="list-style-type: none"> • FOREGROUND • BACKGROUND
FLAGS	NUMBER	Reserved for future use
USER_ID	NUMBER	Oracle user identifier; maps to V\$SESSION.USER#
SQL_ID	VARCHAR2 (13)	SQL identifier of the SQL statement that the session was executing at the time of sampling
IS_SQLID_CURRENT	VARCHAR2 (1)	Indicates whether the SQL identifier in the SQL_ID column is being executed (Y) or not (N)
SQL_CHILD_NUMBER	NUMBER	Child number of the SQL statement that the session was executing at the time of sampling
SQL_OPCODE	NUMBER	Indicates what phase of operation the SQL statement was in; maps to V\$SESSION.COMMAND
SQL_OPNAME	VARCHAR2 (64)	See Also: " V\$SESSION " for information on interpreting this column
FORCE_MATCHING_SIGNATURE	NUMBER	SQL command name
		Signature used when the CURSOR_SHARING parameter is set to FORCE

Column	Datatype	Description
TOP_LEVEL_SQL_ID	VARCHAR2(13)	SQL identifier of the top level SQL statement
TOP_LEVEL_SQL_OPCODE	NUMBER	Indicates what phase of operation the top level SQL statement was in
SQL_ADAPTIVE_PLAN_RESOLVED	NUMBER	Indicates whether the SQL plan of the sampled database session is a resolved adaptive plan or not
SQL_FULL_PLAN_HASH_VALUE	NUMBER	Numerical representation of the complete SQL plan for the cursor being executed by this session
SQL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the SQL plan for the cursor. This information might not be available for all session samples. V\$SESSION does not contain this information.
SQL_PLAN_LINE_ID	NUMBER	SQL plan line ID
SQL_PLAN_OPERATION	VARCHAR2(30)	Plan operation name
SQL_PLAN_OPTIONS	VARCHAR2(30)	Plan operation options
SQL_EXEC_ID	NUMBER	SQL execution identifier
SQL_EXEC_START	DATE	Time when the execution of the SQL started
PLSQL_ENTRY_OBJECT_ID	NUMBER	Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack. Maps to DBA_OBJECTS.OBJECT_ID.
PLSQL_ENTRY_SUBPROGRAM_ID	NUMBER	Subprogram ID of the top-most PL/SQL subprogram on the stack. Maps to DBA_OBJECTS.DATA_OBJECT_ID.
PLSQL_OBJECT_ID	NUMBER	Object ID of the currently executing PL/SQL subprogram. Maps to DBA_OBJECTS.OBJECT_ID.
PLSQL_SUBPROGRAM_ID	NUMBER	Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL. Maps to DBA_OBJECTS.DATA_OBJECT_ID.
PLSQL_CURRENT_ENTRY_OBJECT_ID	NUMBER	Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL.
QC_INSTANCE_ID	NUMBER	Query coordinator instance ID. This information is only available if the sampled session is a parallel query worker. For all other sessions, the value is 0.
QC_SESSION_ID	NUMBER	Query coordinator session ID. This information is only available if the sampled session is a parallel query worker. For all other sessions, the value is 0.
QC_SESSION_SERIAL#	NUMBER	Query coordinator session serial number. This information is only available if the sampled session is a parallel query worker. For all other sessions, the value is 0.
PX_FLAGS	NUMBER	Reserved for internal use
EVENT	VARCHAR2(64)	If SESSION_STATE = WAITING, then the event for which the session was waiting for at the time of sampling. If SESSION_STATE = ON CPU, then this column is NULL.
EVENT_ID	NUMBER	Identifier of the resource or event for which the session is waiting or for which the session last waited. Interpretation is similar to that of the EVENT column.
EVENT#	NUMBER	Number of the resource or event for which the session is waiting or for which the session last waited. Interpretation is similar to that of the EVENT column.
SEQ#	NUMBER	Sequence number that uniquely identifies the wait (incremented for each wait)

Column	Datatype	Description
P1TEXT	VARCHAR2 (64)	Text of the first additional parameter
P1	NUMBER	First additional parameter
P2TEXT	VARCHAR2 (64)	Text of the second additional parameter
P2	NUMBER	Second additional parameter
P3TEXT	VARCHAR2 (64)	Text of the third additional parameter
P3	NUMBER	Third additional parameter
WAIT_CLASS	VARCHAR2 (64)	Wait class name of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the EVENT column. Maps to V\$SESSION.WAIT_CLASS.
WAIT_CLASS_ID	NUMBER	Wait class identifier of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the EVENT column. Maps to V\$SESSION.WAIT_CLASS_ID.
WAIT_TIME	NUMBER	Total wait time for the event for which the session last waited if the session was on the CPU when sampled; 0 if the session was waiting at the time of sampling Note: Whether or not WAIT_TIME = 0 is what is useful to find the SESSION_STATE at the time of sampling, rather than the actual value of WAIT_TIME itself. Maps to V\$SESSION.WAIT_TIME.
SESSION_STATE	VARCHAR2 (7)	Session state: <ul style="list-style-type: none">• WAITING• ON CPU
TIME_WAITED	NUMBER	If SESSION_STATE = WAITING, then the time that the session actually spent waiting for that event (in microseconds). This column is set for waits that were in progress at the time the sample was taken. If a wait event lasted for more than a second and was caught waiting in more than one session sample row, then the actual time spent waiting for that wait event will be populated in the last of those session sample rows. At any given time, this information will not be available for the latest session sample.
BLOCKING_SESSION_STATUS	VARCHAR2 (11)	Status of the blocking session: <ul style="list-style-type: none">• VALID• NO HOLDER• GLOBAL• NOT IN WAIT• UNKNOWN
BLOCKING_SESSION	NUMBER	Session identifier of the blocking session. Populated only if the blocker is on the same instance and the session was waiting for enqueues or a "buffer busy" wait. Maps to V\$SESSION.BLOCKING_SESSION.
BLOCKING_SESSION_SERIAL#	NUMBER	Serial number of the blocking session
BLOCKING_INST_ID	NUMBER	Instance number of the blocker shown in BLOCKING_SESSION
BLOCKING_HANGCHAIN_INFO	VARCHAR2 (1)	Indicates whether the information about BLOCKING_SESSION comes from the hang chain (Y) or not (N)
CURRENT_OBJ#	NUMBER	Object ID of the object that the session is referencing. This information is only available if the session was waiting for application, cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_OBJ#.

Column	Datatype	Description
CURRENT_FILE#	NUMBER	File number of the file containing the block that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_FILE#.
CURRENT_BLOCK#	NUMBER	ID of the block that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_BLOCK#.
CURRENT_ROW#	NUMBER	Row identifier that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_ROW#.
TOP_LEVEL_CALL#	NUMBER	Oracle top level call number
TOP_LEVEL_CALL_NAME	VARCHAR2(64)	Oracle top level call name
CONSUMER_GROUP_ID	NUMBER	Consumer group ID
XID	RAW(8)	Transaction ID that the session was working on at the time of sampling. V\$SESSION does not contain this information.
REMOTE_INSTANCE#	NUMBER	Remote instance identifier that will serve the block that this session is waiting for. This information is only available if the session was waiting for cluster events.
TIME_MODEL	NUMBER	Time model information
IN_CONNECTION_MGMT	VARCHAR2(1)	Indicates whether the session was doing connection management at the time of sampling (Y) or not (N)
IN_PARSE	VARCHAR2(1)	Indicates whether the session was parsing at the time of sampling (Y) or not (N)
IN_HARD_PARSE	VARCHAR2(1)	Indicates whether the session was hard parsing at the time of sampling (Y) or not (N)
IN_SQL_EXECUTION	VARCHAR2(1)	Indicates whether the session was executing SQL statements at the time of sampling (Y) or not (N)
IN_PLSQL_EXECUTION	VARCHAR2(1)	Indicates whether the session was executing PL/SQL at the time of sampling (Y) or not (N)
IN_PLSQL_RPC	VARCHAR2(1)	Indicates whether the session was executing inbound PL/SQL RPC calls at the time of sampling (Y) or not (N)
IN_PLSQL_COMPILATION	VARCHAR2(1)	Indicates whether the session was compiling PL/SQL at the time of sampling (Y) or not (N)
IN_JAVA_EXECUTION	VARCHAR2(1)	Indicates whether the session was executing Java at the time of sampling (Y) or not (N)
IN_BIND	VARCHAR2(1)	Indicates whether the session was doing bind operations at the time of sampling (Y) or not (N)
IN_CURSOR_CLOSE	VARCHAR2(1)	Indicates whether the session was closing a cursor at the time of sampling (Y) or not (N)
IN_SEQUENCE_LOAD	VARCHAR2(1)	Indicates whether the session is loading in sequence (in sequence load code) (Y) or not (N)
IN_INMEMORY_QUERY	VARCHAR2(1)	Indicates whether the session was querying the In-Memory Column Store (IM column store) at the time of sampling (Y) or not (N)
IN_INMEMORY_POPULATE	VARCHAR2(1)	Indicates whether the session was populating the IM column store at the time of sampling (Y) or not (N)
IN_INMEMORY_PREPOPULATE	VARCHAR2(1)	Indicates whether the session was prepopulating the IM column store at the time of sampling (Y) or not (N)

Column	Datatype	Description
IN_INMEMORY_REPOPULATE	VARCHAR2(1)	Indicates whether the session was repopulating the IM column store at the time of sampling (Y) or not (N)
IN_INMEMORY_TREPOPULATE	VARCHAR2(1)	Indicates whether the session was trickle repopulating the IM column store at the time of sampling (Y) or not (N)
IN_TABLESPACE_ENCRYPTION	VARCHAR2(1)	Indicates whether encryption or decryption of a tablespace occurred at the time of sampling (Y) or not (N)
CAPTURE_OVERHEAD	VARCHAR2(1)	Indicates whether the session is executing capture code (Y) or not (N)
REPLAY_OVERHEAD	VARCHAR2(1)	Indicates whether the session is executing replay code (Y) or not (N)
IS_CAPTURED	VARCHAR2(1)	Indicates whether the session is being captured (Y) or not (N)
IS_REPLAYED	VARCHAR2(1)	Indicates whether the session is being replayed (Y) or not (N)
IS_REPLY_SYNC_TOKEN_HOLDER	VARCHAR2(1)	Indicates whether the session is holding a synchronization token (Y) or not (N) during workload replay
SERVICE_HASH	NUMBER	Hash that identifies the Service; maps to V\$ACTIVE_SERVICES.NAME_HASH
PROGRAM	VARCHAR2(48)	Name of the operating system program
MODULE	VARCHAR2(64)	Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_MODULE procedure
ACTION	VARCHAR2(64)	Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_ACTION procedure
CLIENT_ID	VARCHAR2(64)	Client identifier of the session; maps to V\$SESSION.CLIENT_IDENTIFIER
MACHINE	VARCHAR2(64)	Client's operating system machine name
PORT	NUMBER	Client port number
ECID	VARCHAR2(64)	Execution context identifier (sent by Application Server)
DBREPLAY_FILE_ID	NUMBER	If the session is being captured or replayed, then DBREPLAY_FILE_ID is the file ID for the workload capture or workload replay; otherwise it is NULL.
DBREPLAY_CALL_COUNTER	NUMBER	If the session is being captured or replayed, then DBREPLAY_CALL_COUNTER is the call counter of the user call that is being captured or replayed; otherwise it is NULL.
TM_DELTA_TIME	NUMBER	Time interval (in microseconds) over which TM_DELTA_CPU_TIME and TM_DELTA_DB_TIME are accumulated
TM_DELTA_CPU_TIME	NUMBER	Amount of time this session spent on CPU over the last TM_DELTA_TIME microseconds
TM_DELTA_DB_TIME	NUMBER	Amount of time spent by this session in database calls over the last TM_DELTA_TIME microseconds
DELTA_TIME	NUMBER	Time interval (in microseconds) since the last time this session was sampled or created, over which the next five statistics are accumulated
DELTA_READ_IO_REQUESTS	NUMBER	Number of read I/O requests made by this session over the last DELTA_TIME microseconds
DELTA_WRITE_IO_REQUESTS	NUMBER	Number of write I/O requests made by this session over the last DELTA_TIME microseconds
DELTA_READ_IO_BYTES	NUMBER	Number of I/O bytes read by this session over the last DELTA_TIME microseconds
DELTA_WRITE_IO_BYTES	NUMBER	Number of I/O bytes written by this session over the last DELTA_TIME microseconds

Column	Datatype	Description
DELTA_INTERCONNECT_IO_BYTES	NUMBER	Number of I/O bytes sent over the I/O interconnect over the last DELTA_TIME microseconds
DELTA_READ_MEM_BYTES	NUMBER	Number of read bytes through the buffer cache
PGA_ALLOCATED	NUMBER	Amount of PGA memory (in bytes) consumed by this session at the time this sample was taken
TEMP_SPACE_ALLOCATED	NUMBER	Amount of TEMP memory (in bytes) consumed by this session at the time this sample was taken
CON_DBID	NUMBER	The database ID of the pluggable database (PDB)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
DBOP_NAME	VARCHAR2(30)	Database operation name. If the type is SQL, the DBOP_NAME will be NULL.
DBOP_EXEC_ID	NUMBER	Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.

7.12 V\$ALL_SQL_MONITOR

V\$ALL_SQL_MONITOR displays SQL statements whose execution have been (or are being) monitored by Oracle.

 **Note:**

V\$ALL_SQL_MONITOR allows application developers to view information about their own SQL statements. It is similar to the V\$SQL_MONITOR view, with the following exception:

- When queried by the SYS user, or any user with the SYSDBA privilege, the V\$ALL_SQL_MONITOR view displays the same data as the V\$SQL_MONITOR view.
- When queried by any other user, the V\$ALL_SQL_MONITOR view displays data only about SQL statements that were executed in sessions owned by that user.

See also "[V\\$SQL_MONITOR](#)"

Column	Datatype	Description
KEY	NUMBER	Artificial join key to efficiently join V\$ALL_SQL_MONITOR with its corresponding plan level monitoring statistics stored in V\$ALL_SQL_PLAN_MONITOR
REPORT_ID	NUMBER	Unique ID of the XML report stored in Automatic Workload Repository (AWR) for this monitored entity

Column	Datatype	Description
STATUS	VARCHAR2(19)	SQL execution status: <ul style="list-style-type: none"> • QUEUED - SQL statement is queued • EXECUTING - SQL statement is still executing • DONE (ERROR) - Execution terminated with an error • DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched • DONE (ALL ROWS) - Execution terminated and all rows were fetched • DONE - Execution terminated (parallel execution)
USER#	NUMBER	User ID of the database user who issued the SQL being monitored
USERNAME	VARCHAR2(128)	User name of the database user who issued the SQL being monitored
MODULE	VARCHAR2(64)	Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_MODULE procedure
ACTION	VARCHAR2(64)	Name of the executing action when sampled, as set by the DBMS_APPLICATION_INFO.SET_ACTION procedure
SERVICE_NAME	VARCHAR2(64)	Service name of the user session
CLIENT_IDENTIFIER	VARCHAR2(64)	Client identifier from the user session
CLIENT_INFO	VARCHAR2(64)	Client information for the user session
PROGRAM	VARCHAR2(48)	Name of the operating system program that issued the monitored SQL
PLSQL_ENTRY_OBJECT_ID	NUMBER	Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack
PLSQL_ENTRY_SUBPROGRAM_ID	NUMBER	Subprogram ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack
PLSQL_OBJECT_ID	NUMBER	Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL
PLSQL_OWNER_ID	NUMBER	ID of the owner of the currently executing PL/SQL subprogram; NULL if executing SQL
PLSQL_SUBPROGRAM_ID	NUMBER	Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL
FIRST_REFRESH_TIME	DATE	Time when monitoring of the SQL statement started, generally a few seconds after execution start time
LAST_REFRESH_TIME	DATE	Time when statistics in V\$ALL_SQL_MONITOR were last updated for the SQL statement. Statistics are generally refreshed every second when the statement executes.
REFRESH_COUNT	NUMBER	Number of times V\$ALL_SQL_MONITOR statistics have been refreshed (generally once every second when the SQL statement executes)
DBOP_EXEC_ID	NUMBER	Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.
DBOP_NAME	VARCHAR2(30)	Database operation name. If the type is SQL, the DBOP_NAME will be NULL.
SID	NUMBER	Session identifier executing (or having executed) the SQL statement being monitored
PROCESS_NAME	VARCHAR2(5)	Process name identifier executing (or having executed) the statement; ora if the process is foreground, else the background process name (for example, p001 for PX server p001)
SQL_ID	VARCHAR2(13)	SQL identifier of the statement being monitored
SQL_TEXT	VARCHAR2(2000)	Up to the first 2000 characters of the text of the SQL being monitored

Column	Datatype	Description
IS_FULL_SQLTEXT	VARCHAR2(1)	Indicates whether the SQL_TEXT column has the entire SQL text (Y) or not (N)
SQL_EXEC_START	DATE	Time when the execution started
SQL_EXEC_ID	NUMBER	Execution identifier. Together, the three columns SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID represent the execution key. The execution key is used to uniquely identify one execution of the SQL statement.
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value
SQL_FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one SQL_FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the SQL_FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
EXACT_MATCHING_SIGNATURE	NUMBER	Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.
FORCE_MATCHING_SIGNATURE	NUMBER	Same as EXACT_MATCHING_SIGNATURE but literals in the SQL text are replaced by binds
SQL_CHILD_ADDRESS	RAW(8)	Address of the child cursor (can be used with SQL_ID to join with V\$SQL)
SESSION_SERIAL#	NUMBER	Session serial number executing the statement being monitored
PX_IS_CROSS_INSTANCE	VARCHAR2(1)	Indicates whether the SQL statement ran parallel across multiple instances (Y) or not (N)
PX_MAXDOP	NUMBER	Maximum degree of parallelism for any plan operation executed on behalf of the monitored SQL
PX_MAXDOP_INSTANCES	NUMBER	Number of database instances touched at the maximum degree of parallelism
PX_SERVERS_REQUESTED	NUMBER	Total number of parallel execution servers requested to execute the monitored SQL
PX_SERVERS_ALLOCATED	NUMBER	Actual number of parallel execution servers allocated to execute the query
PX_SERVER#	NUMBER	Logical parallel execution server process number executing (or having executed) the statement being monitored; NULL if this monitoring entry is not associated with an execution server. This is a logical number within the parallel server set (see SERVER# in V\$PX_SESSION).
PX_SERVER_GROUP	NUMBER	Logical parallel execution server group number to which PX_SERVER# belongs (see SERVER_GROUP in V\$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server. This value is generally 1 unless the SQL statement has one or more parallel sub-queries.
PX_SERVER_SET	NUMBER	Number (1 or 2) of the logical set of parallel execution servers to which PX_SERVER# belongs (see SERVER_SET in V\$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server
PX_QCINST_ID	NUMBER	Instance identifier where the parallel execution coordinator runs; NULL if PX_SERVER# is NULL
PX_QCSID	NUMBER	Session identifier for the parallel execution coordinator; NULL if PX_SERVER# is NULL
ERROR_NUMBER	VARCHAR2(40)	Error number encountered in case a SQL fails to execute successfully (for example, 932 in case of ORA-00932)

Column	Datatype	Description
ERROR_FACILITY	VARCHAR2(4)	Error facility in case a SQL fails to execute successfully (for example, ORA in case of ORA-00932)
ERROR_MESSAGE	VARCHAR2(256)	Detailed error message displayed corresponding to the error number and error facility when a SQL fails to execute successfully
BINDS_XML	CLOB	Information about bind variables used with the SQL, such as name, position, value, data type, and so on (stored in XML format)
OTHER_XML	CLOB	Additional information about SQL execution stored in XML format
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds); updated as the statement executes
QUEUING_TIME	NUMBER	Duration of time (in microseconds) spent by SQL in the statement queue
CPU_TIME	NUMBER	CPU time (in microseconds); updated as the statement executes
FETCHES	NUMBER	Number of fetches associated with the SQL statement; updated as the statement executes
BUFFER_GETS	NUMBER	Number of buffer get operations; updated as the statement executes
DISK_READS	NUMBER	Number of disk reads; updated as the statement executes
DIRECT_WRITES	NUMBER	Number of direct writes; updated as the statement executes
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds); updated as the statement executes
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds); updated as the statement executes
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds); updated as the statement executes
USER_IO_WAIT_TIME	NUMBER	User I/O Wait Time (in microseconds); updated as the statement executes
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds); updated as the statement executes
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds); updated as the statement executes
RM_LAST_ACTION	VARCHAR2(48)	The most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none">• CANCEL_SQL• KILL_SESSION• LOG_ONLY• SWITCH TO <CG NAME> For the last value, <CG NAME> is the name of the consumer group that the SQL operation was switched to. If the Resource Plan has since been changed then <CG NAME> is the ID of the consumer group.

Column	Datatype	Description
RM_LAST_ACTION_REASON	VARCHAR2(128)	The reason for the most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none"> • SWITCH_CPU_TIME • SWITCH_IO_REQS • SWITCH_IO_MBS • SWITCH_ELAPSED_TIME • SWITCH_IO_LOGICAL
RM_LAST_ACTION_TIME	DATE	The time of the most recent action that was taken on this SQL operation by Resource Manager
RM_CONSUMER_GROUP	VARCHAR2(128)	The current consumer group for this SQL operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
CON_NAME	VARCHAR2(128)	Container name of the object. The value of this column is NULL in non-CDBs.
ECID	VARCHAR2(64)	Execution context identifier (sent by Application Server)
IS_ADAPTIVE_PLAN	VARCHAR2(1)	Indicates whether the statistics are from an adaptive plan (Y) or not (N).
IS_FINAL_PLAN	VARCHAR2(1)	Indicates whether the statistics are from the final plan (Y) or not (N).
IN_DBOP_NAME	VARCHAR2(30)	If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the name of that DBOP
IN_DBOP_EXEC_ID	NUMBER	If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the execution ID of that DBO
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells See Also: Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system See Also: Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells) See Also: Oracle Exadata Storage Server Software documentation for more information
CURRENT_USER#	NUMBER	Unique number identifying the current user
CURRENT_USERNAME	VARCHAR2(128)	Username for the current user

7.13 V\$ALL_SQL_PLAN_MONITOR

V\$ALL_SQL_PLAN_MONITOR displays plan level monitoring statistics for each SQL statement found in V\$ALL_SQL_MONITOR.

 **Note:**

V\$ALL_SQL_PLAN_MONITOR allows application developers to view statistics about their own SQL statements. It is similar to the V\$SQL_PLAN_MONITOR view, with the following exception:

- When queried by the SYS user, or any user with the SYSDBA privilege, the V\$ALL_SQL_PLAN_MONITOR view displays the same data as the V\$SQL_PLAN_MONITOR view.
- When queried by any other user, the V\$ALL_SQL_PLAN_MONITOR view displays data only about SQL statements that were executed in sessions owned by that user.

See also "V\$SQL_PLAN_MONITOR"

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
KEY	NUMBER	Foreign key to efficiently join V\$ALL_SQL_PLAN_MONITOR with V\$ALL_SQL_MONITOR (see V\$ALL_SQL_MONITOR)
STATUS	VARCHAR2(19)	SQL execution status: <ul style="list-style-type: none"> • EXECUTING - SQL statement is still executing • DONE (ERROR) - Execution terminated with an error • DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched • DONE (ALL ROWS) - Execution terminated and all rows were fetched • DONE - Execution terminated (parallel execution)
FIRST_REFRESH_TIME	DATE	Time when monitoring of the SQL statement started
LAST_REFRESH_TIME	DATE	Time when statistics were last updated for the SQL statement
FIRST_CHANGE_TIME	DATE	First time a row was produced by this operation
LAST_CHANGE_TIME	DATE	Last time a row was produced by this operation
REFRESH_COUNT	NUMBER	Number of times statistics have been refreshed
SID	NUMBER	Session identifier executing (or having executed) the SQL statement being monitored
PROCESS_NAME	VARCHAR2(5)	Process name identifier
SQL_ID	VARCHAR2(13)	SQL identifier

Column	Datatype	Description
SQL_EXEC_START	DATE	Time when the execution started
SQL_EXEC_ID	NUMBER	Execution identifier
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value
SQL_CHILD_ADDRESS	RAW (8)	Address of the child cursor
PLAN_PARENT_ID	NUMBER	ID of the next execution step that operates on the output of the current step
PLAN_LINE_ID	NUMBER	Plan line number for the entry
PLAN_OPERATION	VARCHAR2 (30)	Plan operation name (from V\$SQL_PLAN)
PLAN_OPTIONS	VARCHAR2 (30)	Plan option name (from V\$SQL_PLAN)
PLAN_OBJECT_OWNER	VARCHAR2 (128)	Name of the user who owns the schema containing the table or index
PLAN_OBJECT_NAME	VARCHAR2 (128)	Name of the table or index
PLAN_OBJECT_TYPE	VARCHAR2 (80)	Type of the object
PLAN_DEPTH	NUMBER	Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.
PLAN_POSITION	NUMBER	Order of processing for all operations that have the same PARENT_ID
PLAN_COST	NUMBER	Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_CARDINALITY	NUMBER	Estimate, by the cost-based optimizer, of the number of rows produced by the operation
PLAN_BYTES	NUMBER	Estimate, by the cost-based optimizer, of the number of bytes produced by the operation
PLAN_TIME	NUMBER	Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_PARTITION_START	VARCHAR2 (256)	Start partition of a range of accessed partitions
PLAN_PARTITION_STOP	VARCHAR2 (256)	Stop partition of a range of accessed partitions
PLAN_CPU_COST	NUMBER	CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_IO_COST	NUMBER	I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_TEMP_SPACE	NUMBER	Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
STARTS	NUMBER	Number of times this operation was executed. For example, an operation is executed multiple times when it is on the right side of a nested-loop join (once for each row of the left input of that nested-loop join).

Column	Datatype	Description
OUTPUT_ROWS	NUMBER	Number of rows produced by this operation since the execution started. This number is cumulated for all executions of this operation. Divide by the value of the STARTS column to compute the average number of rows per execution of the operation. Note that the value in the STARTS column is equal to or higher than the value in the OUTPUT_ROWS column. The value will usually be equal, but depending on internal optimizations a higher value may be seen.
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
WORKAREA_MEM	NUMBER	Amount of memory (in bytes) used by the operation when the query is executing; NULL if the execution is done. This applies only to operations using a work area, such as sort, hash-join, group-by, and so on.
WORKAREA_MAX_MEM	NUMBER	Maximum value (in bytes) for WORKAREA_MEM; NULL if the operation is not using a work area. When the execution is finished, this value will hold the maximum amount of memory consumed by this operation during the execution of the statement.
WORKAREA_TEMPSEG	NUMBER	Amount of temporary space (in bytes) used by the operation when the query is executing; NULL if the operation has not spilled to disk or if the execution is finished
WORKAREA_MAX_TEMPSEG	NUMBER	Maximum value (in bytes) for WORKAREA_TEMPSEG; NULL if this operation never spilled to disk. When the execution is done, this value will hold the maximum amount of temporary space consumed by this operation during the entire execution.
OTHERSTAT_GROUP_ID	NUMBER	Plan line statistic group identifier (see GROUP_ID column in V\$SQL_MONITOR_STATNAME)
OTHERSTAT_1_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 1 of that plan line
OTHERSTAT_1_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_1_VALUE	NUMBER	Value of statistic number 1 of that plan line
OTHERSTAT_2_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 2 of that plan line
OTHERSTAT_2_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_2_VALUE	NUMBER	Value of statistic number 2 of that plan line
OTHERSTAT_3_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 3 of that plan line
OTHERSTAT_3_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_3_VALUE	NUMBER	Value of statistic number 3 of that plan line
OTHERSTAT_4_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 4 of that plan line

Column	Datatype	Description
OTHERSTAT_4_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_4_VALUE	NUMBER	Value of statistic number 4 of that plan line
OTHERSTAT_5_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 5 of that plan line
OTHERSTAT_5_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_5_VALUE	NUMBER	Value of statistic number 5 of that plan line
OTHERSTAT_6_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 6 of that plan line
OTHERSTAT_6_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_6_VALUE	NUMBER	Value of statistic number 6 of that plan line
OTHERSTAT_7_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 7 of that plan line
OTHERSTAT_7_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_7_VALUE	NUMBER	Value of statistic number 7 of that plan line
OTHERSTAT_8_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 8 of that plan line
OTHERSTAT_8_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_8_VALUE	NUMBER	Value of statistic number 8 of that plan line
OTHERSTAT_9_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 9 of that plan line
OTHERSTAT_9_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_9_VALUE	NUMBER	Value of statistic number 9 of that plan line
OTHERSTAT_10_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 10 of that plan line
OTHERSTAT_10_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_10_VALUE	NUMBER	Value of statistic number 10 of that plan line
OTHER_XML	CLOB	Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML because it allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan
PLAN_OPERATION_INACTIVE	NUMBER	Indicates whether this plan operation was part of the final resolved plan

7.14 V\$AQ

V\$AQ displays statistics for the queues in the database.

Column	Datatype	Description
QID	NUMBER	Unique queue identifier
WAITING	NUMBER	Number of messages in the queue in the state 'WAITING'
READY	NUMBER	Number of messages in the queue in the state 'READY'
EXPIRED	NUMBER	Number of messages in the queue the state 'EXPIRED'
AVERAGE_MSG_AGE	NUMBER	Average age of the messages in the queue'
TOTAL_WAIT	NUMBER	Total wait time of all 'READY' messages in the queue
AVERAGE_WAIT	NUMBER	Average wait time of 'READY' messages in the queue
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Advanced Queueing User's Guide for more information about Oracle Database Advanced Queueing

7.15 V\$AQ_BACKGROUND_COORDINATOR

V\$AQ_BACKGROUND_COORDINATOR lists performance statistics for the Oracle Database Advanced Queueing master background coordinator process (AQPC).

Column	Datatype	Description
PROCESS_ID	VARCHAR2(24)	Operating system process ID of the master
PROCESS_NAME	VARCHAR2(48)	Operating system name of the master
NUM_JOBS	NUMBER	Number of jobs started
JOB_LATENCY	NUMBER	Job start latency
NUM_COORDINATORS	NUMBER	Number of masters started
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

 **See Also:**

Oracle Database Advanced Queueing User's Guide for more information about Oracle Database Advanced Queueing

7.16 V\$AQ_BMAP_NONDUR_SUBSCRIBERS

V\$AQ_BMAP_NONDUR_SUBSCRIBERS can be used to get the available bit positions. The view is queried to get the free bit position during creation of a non-durable subscriber.

Column	Datatype	Description
QUEUE_ID	NUMBER	Queue ID
USED_POS	RAW(128)	Stream of bits to identify used and available bit positions
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Advanced Queueing User's Guide for more information about Oracle Database Advanced Queueing

7.17 V\$AQ_CROSS_INSTANCE_JOBS

V\$AQ_CROSS_INSTANCE_JOBS describes each of the cross process jobs.

Each job serves to forward messages for a shard from a source instance to a destination instance for a set of subscribers of a sharded queue.

Column	Datatype	Description
JOB_ID	NUMBER	Job ID within this coordinator
SCHEMA_NAME	VARCHAR2(128)	Source schema of the job
QUEUE_NAME	VARCHAR2(128)	Source queue name of the cross job
SHARD_ID	NUMBER	Source shard ID
START_SUBSHARD_ID	NUMBER	Start subshard ID of the job
DESTINATION_INSTANCE_ID	NUMBER	Destination instance of the cross job
COORDINATOR_ID	NUMBER	Index of the coordinator serving the job
DEST_SERVER_PROCESS_ID	NUMBER	Process ID of the destination server
JOB_STATE	VARCHAR2(28)	State of the job: <ul style="list-style-type: none"> • REQUESTED • RUNNING • STOPPED • PAUSED • CRASHED • INACTIVE

Column	Datatype	Description
FLOW_CONTROL	NUMBER	Indicates whether the job is flow controlled: <ul style="list-style-type: none"> • 0 - The job is not flow controlled • 1 - The job is flow controlled
MSG_S_SENT	NUMBER	Messages sent during the job
BYTES_SENT	NUMBER	Bytes sent during the job
ACK_LATENCY	NUMBER	Latency for receiving ACK for the job
JOB_TYPE	VARCHAR2 (26)	Cross instance job type. Values: <ul style="list-style-type: none"> • CROSS_STREAM : This job type is responsible for forwarding a shard from its owner instance to a destination dequeue instance for all subscribers performing dequeue from that shard at the destination dequeue instance. • DEQUEUE_AFFINITY_TO_REMOTE: This job type is responsible for switching a subscriber's dequeue affinity from a shard's owner instance to a remote dequeue instance. • DEQUEUE_AFFINITY_TO_LOCAL: This job type is responsible for switching back a subscriber's dequeue affinity from a remote dequeue instance to a shard's owner instance.
PRIORITY0_CROSS_LWM	NUMBER	Last priority 0 subshard received at DESTINATION_INSTANCE_ID
PRIORITY1_CROSS_LWM	NUMBER	Last priority 1 subshard received at DESTINATION_INSTANCE_ID
PRIORITY2_CROSS_LWM	NUMBER	Last priority 2 subshard received at DESTINATION_INSTANCE_ID
PRIORITY3_CROSS_LWM	NUMBER	Last priority 3 subshard received at DESTINATION_INSTANCE_ID
PRIORITY4_CROSS_LWM	NUMBER	Last priority 4 subshard received at DESTINATION_INSTANCE_ID
PRIORITY5_CROSS_LWM	NUMBER	Last priority 5 subshard received at DESTINATION_INSTANCE_ID
PRIORITY6_CROSS_LWM	NUMBER	Last priority 6 subshard received at DESTINATION_INSTANCE_ID
PRIORITY7_CROSS_LWM	NUMBER	Last priority 7 subshard received at DESTINATION_INSTANCE_ID
PRIORITY8_CROSS_LWM	NUMBER	Last priority 8 subshard received at DESTINATION_INSTANCE_ID
PRIORITY9_CROSS_LWM	NUMBER	Last priority 9 subshard received at DESTINATION_INSTANCE_ID
JOB_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Start time of this job
SUBSCRIBER_ID	NUMBER	Subscriber ID whose affinity is being switched for the DEQUEUE_AFFINITY_TO_REMOTE and DEQUEUE_AFFINITY_TO_LOCAL job types
SUBSCRIBER_NAME	VARCHAR2 (512)	Subscriber name whose affinity is being switched for the DEQUEUE_AFFINITY_TO_REMOTE and DEQUEUE_AFFINITY_TO_LOCAL job types. This column is NULL for the CROSS_STREAM job type.
OWNER_INSTANCE_ID	NUMBER	Owner instance of the shard
QUEUE_ID	NUMBER	Queue ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Advanced Queueing User's Guide for more information about Oracle Database Advanced Queueing

7.18 V\$AQ_IPC_ACTIVE_MSGS

V\$AQ_IPC_ACTIVE_MSGS displays the information related to active IPC messages being processed by AQ background processes.

Column	Datatype	Description
PROCESS_NAME	VARCHAR2 (48)	Slave process name
PROCESS_ID	NUMBER	Oracle process ID for this slave
SLAVE_STATE	NUMBER	Slave status: <ul style="list-style-type: none"> • 3: Picked task • 4: Running • 7: Idle
SLAVEOBJ_STATE	NUMBER	Slave object status: <ul style="list-style-type: none"> • 0: Invalid • 1: Valid
SEQUENCE_NUMBER	NUMBER	Message sequence number
MSG_CLASS_NAME	VARCHAR2 (30)	Message class name
MSG_FLAGS	NUMBER	Message flags: <ul style="list-style-type: none"> • 1: This message needs ack • 2: Short • 4: Long • 8: Priority • 10: Special ack
MSG_SUBMT_TIME	NUMBER	Time this message was added into the IPC master's list (in seconds)
MSG_PICKD_TIME	NUMBER	Time this message was picked by slave or master for processing (in seconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.19 V\$AQ_IPC_MSG_STATS

V\$AQ_IPC_MSG_STATS displays the statistics of each IPC message class, such as the total number of invocations of a message class, total pending message/processed message count,

and last failure related data. Information like total processed message count, average pending time/average processing time gives a real-time outline of AQ IPC background state.

Column	Datatype	Description
MSG_CLASS_NAME	VARCHAR2 (30)	Message class name
TOTAL_MSG_CALLS	NUMBER	Total number of calls for this message class
TOTAL_ACTIVE_MSGS	NUMBER	Total number of active messages presently processed by slaves and master
TOTAL_PENDING_MSGS	NUMBER	Total number of pending messages in the master's local context
TOTAL_PROCESSED_MSGS	NUMBER	Total number of processed messages
LAST_RECEIVED_TIME	TIMESTAMP (3) WITH TIME ZONE	Time when the last message of this type was received in the master's context list
LAST_PROCESS_TIME	TIMESTAMP (3) WITH TIME ZONE	Time when the last message was picked for processing
LAST_DONE_TIME	TIMESTAMP (3) WITH TIME ZONE	Time when the last message was done processing
AVERAGE_PENDING_TIME	NUMBER	Average pending time for this message class (in seconds)
AVERAGE_PROCESSING_TIME	NUMBER	Average processing time for this message class (in seconds)
LAST_FAILURE_TIME	TIMESTAMP (3) WITH TIME ZONE	Time of the last failure for this message class
LAST_ERROR_MSG	VARCHAR2 (512)	Last error message for this message class
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.20 V\$AQ_IPC_PENDING_MSGS

V\$AQ_IPC_PENDING_MSGS displays information about pending messages, present in the local master context.

Column	Datatype	Description
SEQUENCE_NUMBER	NUMBER	Message sequence number
MSG_CLASS_NAME	VARCHAR2 (30)	Message class name
MSG_FLAGS	NUMBER	Message flags: <ul style="list-style-type: none"> • 1: This message needs ack • 2: Short • 4: Long • 8: Priority • 10: Special ack
MSG_SUBMT_TIME	NUMBER	Time this message was added into the IPC master's list (in seconds)

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.21 V\$AQ_JOB_COORDINATOR

V\$AQ_JOB_COORDINATOR lists performance statistics per coordinator, for every AQ coordinator controlled by the Oracle Database Advanced Queueing master coordinator.

Column	Datatype	Description
COORDINATOR_ID	NUMBER	ID of the coordinator
PROCESS_ID	VARCHAR2 (24)	Operating system process ID of the coordinator
PROCESS_NAME	VARCHAR2 (48)	Operating system process name of the coordinator
JOB_NAME	VARCHAR2 (32)	Name of the job handled
JOB_TYPE	NUMBER	Type of job handled
SERVER_COUNT	NUMBER	Number of servers active
MAX_SERVER_COUNT	NUMBER	Maximum server fanout achieved
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

 **See Also:**

Oracle Database Advanced Queueing User's Guide for more information about Oracle Database Advanced Queueing

7.22 V\$AQ_MESSAGE_CACHE

V\$AQ_MESSAGE_CACHE provides performance statistics of the message cache for sharded queues at the subshard level in the instance.

Column	Datatype	Description
QUEUE_ID	NUMBER	Queue ID
SHARD_ID	NUMBER	Shard ID
PRIORITY	NUMBER	Priority of the subshard for dequeue, range 0–9
SUBSHARD_ID	NUMBER	Subshard ID in the shard
PARTITION_ID	NUMBER	Partition id for the particular subshard

Column	Datatype	Description
MAX_MSGS	NUMBER	Maximum number of messages of sub shard
ENQUEUED_MSGS	NUMBER	Number of messages enqueued for the sub shard
MSGs_MADE_EXPIRED	NUMBER	Number of messages made expired
CHUNK_SIZE	NUMBER	The size of the memory chunk for storing messages
NUM_CHUNKS	NUMBER	Number of chunks for the sub shard
NUM_FREE_CHUNKS	NUMBER	Number of free chunks for the sub shard
USED_MEMORY_SIZE	NUMBER	Total estimated size of memory in use (in bytes) for the sub shard
STATE	VARCHAR2 (13)	Sub shard state. Possible values: <ul style="list-style-type: none"> • CACHED (in memory) • UNCACHED (on disk) • UNCACHED_FREE • CACHED_FREE • UNKNOWN
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Advanced Queueing User's Guide for more information about Oracle Database Advanced Queueing

7.23 V\$AQ_MESSAGE_CACHE_ADVICE

V\$AQ_MESSAGE_CACHE_ADVICE shows simulated metrics for a range of potential message cache sizes. This view assists in cache sizing by providing information in the form of metrics as described below.

Column	Datatype	Description
SIZE_FOR_ESTIMATE	NUMBER	Cache size for simulation (in megabytes)
SIZE_FACTOR	NUMBER	Size factor with respect to the current cache size
ESTD_SIZE_TYPE	VARCHAR2 (9)	Possible values: <ul style="list-style-type: none"> • MINIMUM: This cache size is required to have all dequeues in-memory (no uncached). • PREFERRED: This is the smallest message cache size required to eliminate 80% of unevictions that occur with a message cache size of MINIMUM for subscribers who keep up, that is, subscribers whose dequeue rate matches the enqueue rate. • MAXIMUM: This cache size is required to have zero evictions. • NULL: This is the value in all other cases.

Column	Datatype	Description
ESTD_CACHED_SUBSHARDS	NUMBER	Estimated number of cached subshards for this size
ESTD_UNCACHED_SUBSHARDS	NUMBER	Estimated number of uncached subshards for this size
ESTD_EVICTIONS	NUMBER	Estimated number of subshards evicted for this size
ESTD_EVICTION_RATE	NUMBER	Estimated number of subshards getting evicted per minute
ESTD_FG_UNEVICTIONS	NUMBER	Estimated number of subshards unevicted by foreground processes
ESTD_FG_UNEVICTED_RATE	NUMBER	Estimated number of subshards getting unevicted by foreground processes
ESTD_BG_UNEVICTIONS	NUMBER	Estimated number of subshards unevicted by background processes
ESTD_BG_UNEVICTED_RATE	NUMBER	Estimated number of subshards getting unevicted by background processes
ESTD_BG_PROCESSES	NUMBER	Estimated number of background processes required for this size
TOTAL_ENQUEUE_RATE	NUMBER	Simulated number of messages being enqueued per second
TOTAL_DEQUEUE_RATE	NUMBER	Simulated number of messages being dequeued per second
AVG_SUBSHARD_SIZE	NUMBER	Simulated average number of messages per cached sub shard
AVG_SUBSHARD_MEMORY	NUMBER	Simulated average memory per cached sub shard (in megabytes)
AVG_EVICTION_TIME	NUMBER	Simulated average time to evict a cached sub shard (in milliseconds)
AVG_UNEVICTED_TIME	NUMBER	Simulated average time to unevict a cached sub shard (in milliseconds)
FLAGS	NUMBER	Reserved for internal use
SIMULATION_TIME	NUMBER	Amount of time that was simulated for (in minutes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

7.24 V\$AQ_MESSAGE_CACHE_STAT

V\$AQ_MESSAGE_CACHE_STAT displays statistics about memory management for sharded queues in the Streams pool within the System Global Area (SGA). Sharded queues use the Streams pool in units of subshards. Thus, columns of this view shows statistics at sub shard level. This view shows statistics across all sharded queues.

Column	Datatype	Description
NUM_EVICTED	NUMBER	Number of evicted subshards across all sharded queues
NUM_PREFETCHED	NUMBER	Number of subshards pre-fetched by AQ background process
NUM_UNEVICTED	NUMBER	Number of subshards un-evicted by foreground process (like dequeue process)
NUM_UNCACHED	NUMBER	Number of subshards stored as uncached
NUM_TRACKED	NUMBER	Number of subshards which are actively tracking dequeue rates
NUM_CACHED	NUMBER	Number of subshards stored as cached

Column	Datatype	Description
MAX_SUBSH_SIZE	NUMBER	Maximum sub shard size seen till now, in terms of number of messages per sub shard
MIN_SUBSH_SIZE	NUMBER	Minimum sub shard size seen till now, in terms of number of messages per sub shard
MEAN_SUBSH_SIZE	NUMBER	Mean sub shard size seen till now, in terms of number of messages per sub shard
AVG_EVICTION_RATE	NUMBER	Average number subshards evicted per second
AVG_LOAD_RATE	NUMBER	Average number of subshards pre-fetched or un-evicted per second
AVG_EVICTION_TIME	NUMBER	Average time taken to evict one sub shard (in milliseconds)
AVG_LOAD_TIME	NUMBER	Average time taken to un-evict one sub shard (in milliseconds)
AVG_MISS_RATIO	NUMBER	Average ratio of number of foreground un-evictions versus background pre-fetch
AVG_THRASH_RATIO	NUMBER	Average ratio of number of sub shard pre-fetched by background without dequeue attempt versus total number of subshards prefetched
MANDATORY_AFF_SWITCH_ATTEMPTS	NUMBER	An affinity switch is a change in dequeue instance for a shard-subscriber pair. A mandatory affinity switch is when there are local enqueues in the queue at the instance but no local dequeues present, so the dequeue affinity is switched to another instance for that shard-subscriber pair. This column shows the number of times mandatory affinity switches were attempted across all instances. Populated at the smallest instance id only.
OPTIONAL_AFF_SWITCH_ATTEMPTS	NUMBER	Optional affinity switches are affinity switches that are not mandatory. Optional affinity switches are done for global load balancing across the Oracle Real Application Clusters (Oracle RAC) database. This column shows the number of times optional affinity switches were attempted across all instances. Populated at the smallest instance id only.
MIN_EVICT_PERCENT	NUMBER	Percentage of streams_pool memory beyond which sharded queue sub shard eviction is triggered
LAST_AVG_CACHED_HORIZON	NUMBER	Last average number of cached subshards seen in sharded queue memory manager horizon
LAST_AVG_MEMORY_HORIZON	NUMBER	Last average memory of cached subshards seen in sharded queue memory manager horizon
LAST_AVG_SUBSHARD_HORIZON	NUMBER	Last average number of subshards seen in sharded queue memory manager horizon
LAST_LEEWAY_SHIFT	NUMBER	Internal leeway for memory threshold
AVG_OPTTIME_DRIFT	NUMBER	Average drift of opt_time for all subshards. A drift is defined as a difference between opt_time as set on a sub shard and the actual time at which sub shard is first dequeued after prefetch/uneviction.
NUM_THRESHOLD_DRIFT	NUMBER	Number of times drift value has gone over threshold time. A typical threshold time can be horizon_time/2.
MAX_OPT_TIME_DRIFT	NUMBER	Maximum drift till now
MIN_OPT_TIME_DRIFT	NUMBER	Minimum drift till now
AVG_OPT_TIME_ERROR	NUMBER	An opt_time error occurs when a cached sub shard is unevicted by a foreground process (instead of being prefetched by the aq background). Thus, opt_time error is the difference between the actual opt_time set for a sharded queue sub shard and the absolute time at which foreground unevicts the same sub shard. This column represents average time of this error.
MAX_OPT_TIME_ERROR	NUMBER	Maximum opt_time error

Column	Datatype	Description
MIN_OPT_TIME_ERROR	NUMBER	Minimum opt_time error
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.25 V\$AQ_NONDUR_REGISTRATIONS

V\$AQ_NONDUR_REGISTRATIONS provides information about non-durable subscriptions.

Column	Datatype	Description
REG_ID	NUMBER	Registration ID
SUBSCRIPTION	VARCHAR2(128)	Subscription name
LOCATION	VARCHAR2(256)	Location name
USER#	NUMBER	User ID
USER_CONTEXT	RAW(32)	Context the user provided
CONTEXT_SIZE	NUMBER	Size of the context
NAMESPACE	NUMBER	Subscription namespace
VERSION	NUMBER	Database version number
STATE	NUMBER	State of the registration: <ul style="list-style-type: none"> • ENABLED: The registration is enabled for notification • STOPPING: The registration is in a transient state before it becomes DISABLED • DISABLED: The registration is disabled for notification • DEAD: The registration does not exist any more, and it is marked for deferred cleanup.
QOS	NUMBER	Quality of service
REG_TIME	TIMESTAMP(3) WITH TIMEZONE	Time of registration
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

7.26 V\$AQ_NONDUR_SUBSCRIBER

V\$AQ_NONDUR_SUBSCRIBER provides information about the non-durable subscriptions on sharded queues.

Column	Datatype	Description
QUEUE_ID	NUMBER	Queue ID
SUBSCRIBER_ID	NUMBER	ID of the non-durable subscriber
SUBSCRIBER_NAME	VARCHAR2(128)	Subscriber name
RULE_CONDITION	VARCHAR2(4000)	Rule condition of the subscriber
TRANSFORMATION_OWNER	VARCHAR2(128)	Owner of the transformation (for JMS queues)
TRANSFORMATION_NAME	VARCHAR2(128)	Name of the transformation (for JMS queues)
CREATION_TIME	TIMESTAMP(1) WITH TIME ZONE	Non-durable subscriber creation time
FLAGS	NUMBER	Property of the subscriber: <ul style="list-style-type: none"> • 0x0001 – Persistent subscriber • 0x0002 – Buffered subscriber • 0x0004 – JMS subscriber • 0x0008 – Rule-based subscriber • 0x0010 – Subscriber has transformation • 0x0020 – Notification-only non-durable subscriber subscriber
SUBSCRIBER_TYPE	NUMBER	Type of subscriber: <ul style="list-style-type: none"> • 1 – JMS non-durable subscriber • 2 – Service layer dummy non-durable subscriber • 3 – Notification-only non-durable subscriber
BITPOS	NUMBER	Position of subscriber in subscriber bitmap
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

7.27 V\$AQ_NONDUR_SUBSCRIBER_LWM

V\$AQ_NONDUR_SUBSCRIBER_LWM projects the low watermarks (LWMs) of non-durable subscribers in a sharded queue. The LWM of a non-durable subscriber is a combination of shard, priority and LWM (subshard).

Column	Datatype	Description
QUEUE_ID	NUMBER	Queue ID
SUBSCRIBER_ID	NUMBER	ID of the non-durable subscriber
SHARD_ID	NUMBER	Shard ID
PRIORITY	NUMBER	Priority of the shard
LWM	NUMBER	Lower watermark (in a subshard) of the non-durable subscriber
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Advanced Queueing User's Guide for more information about Oracle Database Advanced Queueing

7.28 V\$AQ_NOTIFICATION_CLIENTS

V\$AQ_NOTIFICATION_CLIENTS displays performance statistics for secure OCI client connections.

Column	Datatype	Description
CLIENT_ID	VARCHAR2(29)	Internally generated client ID for secure notification clients
EMON_ID	NUMBER	Emon ID serving the client
NOTIFICATION_STATE	NUMBER	Notification state: <ul style="list-style-type: none"> • ACTIVE – Sending notification • WAIT_FOR_ACK – Waiting for client acknowledgment • INACTIVE - Idle connection
NUM_MESSAGE_SENT	NUMBER	Number of messages sent on the connection
NUM_BYTES_SENT	NUMBER	Number of bytes sent on the connection
NUM_MESSAGE_RECEIVED	NUMBER	Number of messages successfully received by the client
LAST_SEND_TIME	TIMESTAMP(3) WITH TIMEZONE	Time when the last message was sent on the connection
LAST_RECEIVE_TIME	TIMESTAMP(3) WITH TIMEZONE	Time when the last message was received over the connection

Column	Datatype	Description
CONNECT_TIME	TIMESTAMP(3) WITH TIME ZONE	Time at which the client connected
DISCONNECT_TIME	TIMESTAMP(3) WITH TIME ZONE	Time at which the client disconnected
LAST_ERROR	NUMBER	The last error that occurred on the client connection
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

Oracle Database Advanced Queueing User's Guide for more information about Oracle Database Advanced Queueing

7.29 V\$AQ_PARTITION_STATS

V\$AQ_PARTITION_STATS displays usage statistics for the queue partition cache and the dequeue log partition cache.

Column	Datatype	Description
INST_ID	NUMBER	Current instance ID
QUEUE_ID	NUMBER	Queue ID
QUEUE_TABLE_ID	NUMBER	Queue table object ID
QUEUE_SCHEMA	VARCHAR2(128)	Queue schema name
QUEUE_NAME	VARCHAR2(128)	Queue name
PT_TUNED_SIZE_QT	NUMBER	Current tuned size of the queue partition cache, expressed in number of partition cache elements
PT_CACHED_PTNS_QT	NUMBER	Current number of cached partitions in the queue partition cache
PT_OVER_CACHED_PTNS_QT	NUMBER	Current number of over-cached partitions in the queue partition cache, that is, the number of cached partitions whose partition cache elements exceed the current tuned size of the queue partition cache
PT_TOTAL_UPTUNE_QT	NUMBER	Total amount of space added to the queue partition cache due to tune-ups, since the cache was initialized, expressed in number of partition cache elements
PT_NO_OF_UPTUNES_QT	NUMBER	Total number of times a tune-up was triggered on the queue partition cache, since the cache was initialized
PT_TOTAL_DOWNTUNE_QT	NUMBER	Total amount of space removed from the queue partition cache due to tune-downs, since the cache was initialized, expressed in number of partition cache elements

Column	Datatype	Description
PT_NO_OF_DWTUNES_QT	NUMBER	Total number of times a tune-down was triggered on the queue partition cache, since the cache was initialized
PT_CACHE_MISS_QT	NUMBER	Total number of cache misses during partition lookups on the queue partition cache
PT_CACHE_HIT_QT	NUMBER	Total number of cache hits during partition lookups on the queue partition cache
PT_TOTAL_CACH_GET_QT	NUMBER	Total number of successful fetches from the queue partition cache
PT_TOTAL_CACH_PUT_QT	NUMBER	Total number of caching operations that occurred on the queue partition cache
PT_UNBOUNDINGS_QT	NUMBER	Total number of times queue partitions were unbounded
PT_TUNED_SIZ_DQ	NUMBER	Current tuned size of the dequeue log partition cache, expressed in number of partition cache elements
PT_CACHED_PTNS_DQ	NUMBER	Current number of cached partitions in the dequeue log partition cache
PT_OVER_CACHED_PTNS_DQ	NUMBER	Current number of over-cached partitions in the dequeue log partition cache, that is, the number of cached dequeue log partitions whose partition cache elements exceed the current tuned size of the dequeue log partition cache
PT_TOTAL_UPTUNE_DQ	NUMBER	Total amount of space added to the dequeue log partition cache due to tune-ups, since the cache was initialized, expressed in number of partition cache elements
PT_NO_OF_UPTUNES_DQ	NUMBER	Total number of times a tune-up was triggered on the dequeue log partition cache, since the cache was initialized
PT_TOTAL_DWTUNE_DQ	NUMBER	Total amount of space removed from the dequeue log partition cache due to tune-downs, since the cache was initialized, expressed in number of partition cache elements
PT_NO_OF_DWTUNES_DQ	NUMBER	Total number of times a tune-down was triggered on the dequeue log partition cache, since the cache was initialized
PT_CACHE_MISS_DQ	NUMBER	Total number of cache misses during partition lookups on the dequeue log partition cache
PT_CACHE_HIT_DQ	NUMBER	Total number of cache hits during partition lookups on the dequeue log partition cache
PT_TOTAL_CACH_GET_DQ	NUMBER	Total number of successful fetches from the dequeue log partition cache
PT_TOTAL_CACH_PUT_DQ	NUMBER	Total number of caching operations that occurred on the dequeue log partition cache
PT_UNBOUNDINGS_DQ	NUMBER	Total number of times dequeue log partitions were unbounded
ADD_PARTITION_FG_QT	NUMBER	Total number of queue partitions created inline during foreground AQ enqueue operations
ADD_PARTITION_BG_QT	NUMBER	Total number of queue partitions created asynchronously by the AQ partitioning background process
ADD_PARTITION_FG_DQLOG	NUMBER	Total number of dequeue log partitions created inline during foreground AQ dequeue operations
ADD_PARTITION_BG_DQLOG	NUMBER	Total number of dequeue log partitions created asynchronously by the AQ partitioning background process
TRUNC_PARTITION_QT	NUMBER	Total number of truncated and recycled queue partitions
TRUNC_PARTITION_DQLOG	NUMBER	Total number of truncated and recycled dequeue log partitions

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **Note:**

This view is available starting with Oracle Database 19c.

7.30 V\$AQ_REMOTE_DEQUEUE_AFFINITY

V\$AQ_REMOTE_DEQUEUE_AFFINITY lists the dequeue affinity instance of the subscribers not dequeuing locally from the shard's owner instance. Cross instance message forwarding is used for these subscribers.

Column	Datatype	Description
QUEUE_ID	NUMBER	Queue ID
SHARD_ID	NUMBER	Shard ID which is being forwarded from SOURCE_INSTANCE to INST_ID for the subscriber
SOURCE_INSTANCE_ID	NUMBER	Owner instance ID from where the shard is being forwarded
SUBSCRIBER_ID	NUMBER	Subscriber ID
QUEUE_SCHEMA	VARCHAR2 (128)	Queue schema name
QUEUE_NAME	VARCHAR2 (128)	Queue name
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.31 V\$AQ_SERVER_POOL

V\$AQ_SERVER_POOL lists performance statistics for all the servers in the pool.

Column	Datatype	Description
COORDINATOR_ID	NUMBER	ID of the coordinator
COORDINATOR_INSTANCE_ID	NUMBER	Instance of the coordinator
PROCESS_ID	VARCHAR2 (24)	Operating system process ID of the server

Column	Datatype	Description
PROCESS_NAME	VARCHAR2(48)	Operating system process name of the server
JOB_NAME	VARCHAR2(32)	Name of the job handled
POOL_STATE	VARCHAR2(20)	State of the pool: <ul style="list-style-type: none">• REMOTE• IDLE• ACTIVE
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

 See Also:

Oracle Database Advanced Queueing User's Guide for more information about Oracle Database Advanced Queueing

7.32 V\$AQ_SHARDED_SUBSCRIBER_STAT

V\$AQ_SHARDED_SUBSCRIBER_STAT displays basic statistical information about the subscribers of sharded queues. There is one row per queue per shard per subscriber.

Column	Datatype	Description
QUEUE_ID	NUMBER	Queue identifier
SUBSCRIBER_ID	NUMBER	Subscriber identifier
SHARD_ID	NUMBER	Shard identifier
PRIORITY	NUMBER	Priority value of the shard
DEQUEUE_SUBSHARD	NUMBER	Last known dequeue position in this shard
ENQUEUED_MSGS	NUMBER	Number of enqueued messages
DEQUEUED_MSGS	NUMBER	Number of dequeued messages
ELAPSED_DEQUEUE_TIME	NUMBER	Amount of time spent performing dequeues (in seconds)
CPU_DEQUEUE_TIME	NUMBER	Actual amount of CPU time spent performing dequeues (in seconds)
DEQUEUE_RATE	NUMBER	Number of messages dequeued per second
TIME_SINCE_LAST_DEQUEUE	NUMBER	Time since last dequeue activity (in seconds)
ESTD_TIME_TO_DRAIN	NUMBER	Estimated amount of time to drain the shard (in seconds) with current enqueue and dequeue rates. Null, if the enqueue rate is greater than the dequeue rate.
ESTD_TIME_TO_DRAIN_NO_ENQ	NUMBER	Estimated amount of time to drain the shard (in seconds) with no new enqueues

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.33 V\$AQ_SUBSCRIBER_LOAD

V\$AQ_SUBSCRIBER_LOAD describes the load of all subscribers of sharded queues in terms of latency at every instance in an Oracle RAC environment.

Latency denotes the predicted amount of time (in seconds) required from the current time to drain all the messages for that subscriber at each respective instance. The latency calculation considers past enqueue/dequeue rates and future enqueue/dequeue rates based on history.

Column	Datatype	Description
QUEUE_ID	NUMBER	Queue ID
QUEUE_SCHEMA	VARCHAR2(128)	Queue schema
QUEUE_NAME	VARCHAR2(128)	Queue name
SUBSCRIBER_ID	NUMBER	Subscriber ID
SUBSCRIBER_NAME	VARCHAR2(128)	Subscriber name
LATENCY_STATE	VARCHAR2(8)	<p>Possible values:</p> <ul style="list-style-type: none"> • FINITE - The subscriber will be able to dequeue all the messages in a finite amount of time • INFINITE - The subscriber's dequeue rate may not catch up to the enqueue rate • UNKNOWN - Latency is not yet known
LATENCY	NUMBER	Latency (in seconds). Valid only when LATENCY_STATE is FINITE.
DEQUEUE_REQUESTS	NUMBER	Approximate number of dequeue requests noted recently
ACTIVE_SHARDS	NUMBER	Number of queue shards that have messages for this subscriber
ACTIVE_LISTENER	VARCHAR2(5)	Indicates whether the subscriber is actively listening at this instance for messages (TRUE) or not (FALSE)
DEQUEUE_SESSIONS ¹	NUMBER	Displays the number of active dequeue sessions for this subscriber
FLAGS	NUMBER	For internal use only
MANDATORY_AFF_SWITCHES	NUMBER	An affinity switch is a change in the dequeue instance for a shard-subscriber pair. A mandatory affinity switch is when there are local enqueue in the queue at the instance but no local dequeues present, so the dequeue affinity is switched to another instance for that shard-subscriber pair. This column shows the number of times mandatory affinity switches were needed from this instance to another for this subscriber.

Column	Datatype	Description
OPTIONAL_AFF_SWITCHES	NUMBER	Optional affinity switches are affinity switches that are not mandatory. Optional affinity switches are done for global load balancing across the Oracle Real Application Clusters (Oracle RAC) database. This column shows the number of times optional affinity switches were needed from this instance to another for this subscriber.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

¹ This column is available starting with Oracle Database 19c.

Oracle Database Advanced Queuing User's Guide for more information about Oracle Database Advanced Queueing

7.34 V\$ARCHIVE

V\$ARCHIVE displays information about redo log files in need of archiving.

Each row displays information for one thread. This information is also available in V\$LOG. Oracle recommends that you use V\$LOG.

See Also:

"V\$LOG"

Column	Datatype	Description
GROUP#	NUMBER	Log file group number
THREAD#	NUMBER	Log file thread number
SEQUENCE#	NUMBER	Log file sequence number
ISCURRENT	VARCHAR2 (3)	This is the current online redo log
CURRENT	VARCHAR2 (3)	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in ISCURRENT.
FIRST_CHANGE#	NUMBER	First SCN stored in the current log

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.35 V\$ARCHIVE_DEST

V\$ARCHIVE_DEST displays, for the current instance, all of the destinations in the Data Guard configuration, including each destination's current value, mode, and status.

Column	Datatype	Description
DEST_ID	NUMBER	Log archive destination parameter identifier (1 to 31)
DEST_NAME	VARCHAR2 (256)	Log archive destination parameter name
STATUS	VARCHAR2 (9)	<p>Identifies the current status of the destination:</p> <ul style="list-style-type: none"> • VALID - Initialized and available • INACTIVE - No destination information • DEFERRED - Manually disabled by the user • ERROR - Error during open or copy • DISABLED - Disabled after error • BAD PARAM - Parameter has errors • ALTERNATE - Destination is available as an alternate • FULL - Exceeded quota size for the destination
BINDING	VARCHAR2 (9)	<p>Specifies how failure will affect the archival operation:</p> <ul style="list-style-type: none"> • MANDATORY - Successful archival is required • OPTIONAL - Successful archival is not required (depends on LOG_ARCHIVE_MIN_SUCCEED_DEST)
NAME_SPACE	VARCHAR2 (7)	<p>Identifies the scope of parameter setting:</p> <ul style="list-style-type: none"> • SYSTEM - System definition • SESSION - Session definition
TARGET	VARCHAR2 (7)	<p>For a primary database, this column specifies whether the archive destination is local or remote to the primary database:</p> <ul style="list-style-type: none"> • PRIMARY - local • STANDBY - remote <p>For a standby database, this column specifies whether the archive destination is local or remote to the standby database:</p> <ul style="list-style-type: none"> • LOCAL - local • REMOTE - remote
ARCHIVER	VARCHAR2 (10)	<p>Identifies the archiver process relative to the database where the query is issued:</p> <ul style="list-style-type: none"> • ARCn • FOREGROUND • LGWR • RFS

Column	Datatype	Description
SCHEDULE	VARCHAR2 (8)	Indicates whether the archival of this destination is INACTIVE, PENDING, ACTIVE, or LATENT
DESTINATION	VARCHAR2 (256)	Specifies the location where the archived redo logs are to be archived
LOG_SEQUENCE	NUMBER	Identifies the sequence number of the last archived redo log to be archived
REOPEN_SECS	NUMBER	Identifies the retry time (in seconds) after error
DELAY_MINS	NUMBER	Identifies the delay interval (in minutes) before the archived redo log is automatically applied to a standby database
MAX_CONNECTIONS ¹	NUMBER	Maximum number of connections
NET_TIMEOUT	NUMBER	Number of seconds the log writer process will wait for status from the network server of a network operation issued by the log writer process
PROCESS	VARCHAR2 (10)	Identifies the archiver process relative to the primary database, even if the query is issued on the standby database: <ul style="list-style-type: none">• ARCn• FOREGROUND• LGWR
REGISTER	VARCHAR2 (3)	Indicates whether the archived redo log is registered in the remote destination control file (YES) or not (NO). If the archived redo log is registered, it is available to log apply services.
FAIL_DATE	DATE	Date and time of last error
FAIL_SEQUENCE	NUMBER	Sequence number of the archived redo log being archived when the last error occurred
FAIL_BLOCK	NUMBER	Block number of the archived redo log being archived when the last error occurred
FAILURE_COUNT	NUMBER	Current number of contiguous archival operation failures that have occurred for the destination
MAX_FAILURE	NUMBER	Allows you to control the number of times log transport services will attempt to reestablish communication and resume archival operations with a failed destination
ERROR	VARCHAR2 (256)	Displays the error text
ALTERNATE	VARCHAR2 (256)	Alternate destination, if any
DEPENDENCY	VARCHAR2 (256)	Reserved for future use
REMOTE_TEMPLATE	VARCHAR2 (256)	Specifies the template to be used to derive the location to be recorded
QUOTA_SIZE	NUMBER	Destination quotas, expressed in bytes
QUOTA_USED	NUMBER	Size of all the archived redo logs currently residing on the specified destination
MOUNTID	NUMBER	Instance mount identifier
TRANSMIT_MODE	VARCHAR2 (12)	Specifies network transmission mode: <ul style="list-style-type: none">• SYNCHRONOUS• PARALLEL SYNC• ASYNCHRONOUS
ASYNC_BLOCKS	NUMBER	Number of blocks specified for the ASYNC attribute
AFFIRM	VARCHAR2 (3)	Specifies disk I/O mode

Column	Datatype	Description
TYPE	VARCHAR2 (7)	Indicates whether the archived log destination definition is PUBLIC or PRIVATE. Only PUBLIC destinations can be modified at run time using the ALTER SYSTEM SET or ALTER SESSION SET statements. By default, all archived log destinations are PUBLIC.
VALID_NOW	VARCHAR2 (16)	Indicates whether the destination is valid right now for archival operations: <ul style="list-style-type: none"> • YES - Redo log type and database role for this destination are valid for the current database • WRONG VALID_TYPE - Redo log type specified for this destination is not valid for the current database role. For example, WRONG VALID_TYPE would be returned if a destination specified with the VALID_FOR=(STANDBY_LOGFILE, STANDBY_ROLE) attribute is running in the standby database role but does not have standby redo logs implemented. • WRONG VALID_ROLE - Database role specified for this destination is not the role in which the database is currently running. For example, the WRONG VALID_ROLE would be returned when a destination defined with the VALID_FOR=(ONLINE_LOGFILE, STANDBY_ROLE) attribute is running in the primary database role. • INACTIVE - Destination is inactive, probably due to an error
VALID_TYPE	VARCHAR2 (15)	Redo log type or types that are valid for the destination: <ul style="list-style-type: none"> • ONLINE_LOGFILE • STANDBY_LOGFILE • ALL_LOGFILES
VALID_ROLE	VARCHAR2 (12)	Database role or roles that are valid for the destination: <ul style="list-style-type: none"> • PRIMARY_ROLE • STANDBY_ROLE • ALL_ROLES
DB_UNIQUE_NAME	VARCHAR2 (30)	Unique database name
VERIFY	VARCHAR2 (3)	Indicates whether the value of the VERIFY attribute on the LOG_ARCHIVE_DEST_n parameter is verified (YES) or not verified (NO)
COMPRESSION	VARCHAR2 (7)	Indicates whether network compression is ENABLED or DISABLED, or whether the ZLIB or LZO algorithm is in use. These values correspond to the values accepted by the COMPRESSION attribute for the database initialization parameter LOG_ARCHIVE_DEST_n. The possible values include: <ul style="list-style-type: none"> • DISABLE: Compression is disabled. • ENABLE: Compression is enabled. The ZLIB compression algorithm is used. • ZLIB: ZLIB compression is used. • LZO: LZO compression is used.
APPLIED_SCN	NUMBER	For a destination that corresponds to a physical or logical standby database, the SCN of the last applied redo. For a destination that corresponds to a snapshot standby database, the SCN of the last redo applied before conversion to a snapshot standby database. This column is only valid for enabled and active standby database destinations on a primary or cascading standby database.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
ENCRYPTION	VARCHAR2 (7)	Indicates whether encryption of the redo stream sent to Zero Data Loss Recovery Appliance (Recovery Appliance) is enabled (<code>ENABLED</code>) or not (<code>DISABLED</code>)

¹ Starting with Oracle Database 19c, the data in this column is not meaningful. This column may be removed in a future release.

- "[LOG_ARCHIVE_MIN_SUCCEED_DEST](#)"

7.36 V\$ARCHIVE_DEST_STATUS

V\$ARCHIVE_DEST_STATUS displays run time and configuration information for the archived redo log destinations.

The information in this view does not persist across an instance shutdown.

Column	Datatype	Description
DEST_ID	NUMBER	Identifies the log archive destination parameter (1 to 31)
DEST_NAME	VARCHAR2 (256)	Log archive destination parameter name
STATUS	VARCHAR2 (9)	Current status of the destination: <ul style="list-style-type: none"> • VALID - Initialized and available • INACTIVE - No destination information • DEFERRED - Manually disabled by the user • ERROR - Error during open or copy • DISABLED - Disabled after error • BAD PARAM - Parameter has errors • ALTERNATE - Destination is in an alternate state • FULL - Exceeded quota size for the destination

Column	Datatype	Description
TYPE	VARCHAR2 (14)	<p>Type of archival destination database:</p> <ul style="list-style-type: none"> • LOCAL - Local to primary database • PHYSICAL - Physical standby • CROSS-INSTANCE - An instance of the primary • LOGICAL - Logical standby • SNAPSHOT - Snapshot standby database • DOWNSTREAM - Streams downstream capture database • FAR SYNC - Far Sync Instance
DATABASE_MODE	VARCHAR2 (15)	<p>Current mode of the archival destination database:</p> <ul style="list-style-type: none"> • STARTED - Instance started, not mounted • MOUNTED - Mounted • MOUNTED-STANDBY - Mounted standby • OPEN - Open read/write • OPEN_READ-ONLY - Open read-only
RECOVERY_MODE	VARCHAR2 (23)	<p>Current apply mode at the archival destination:</p> <ul style="list-style-type: none"> • IDLE - Managed recovery is not active • MANAGED - Managed recovery is active. This value is used when the standby database is mounted. In this recovery mode, users cannot query data on the standby. • MANAGED WITH QUERY - Managed recovery is active in this recovery mode. In a non-CDB, this value is used when the database is open, and users can query data on the standby. In a CDB, this value is used when one or more PDBs in the CDB are open, and users can query data on the standby. • MANAGED REAL TIME APPLY - In this recovery mode, log apply services recover redo data from standby redo logs at the same time the logs are being written to, as opposed to recovering redo from archived redo logs when a log switch occurs. In this recovery mode, users cannot query data on the standby. • MANAGED REAL TIME APPLY WITH QUERY - In this recovery mode, log apply services recover redo data from standby redo logs at the same time the logs are being written to, as opposed to recovering redo from archived redo logs when a log switch occurs. In a non-CDB, this mode is used when the database is open, and users can query data on the standby. In a CDB, this value is used when one or more PDBs in the CDB are open, and users can query data on the standby. • LOGICAL REAL TIME APPLY - Real time SQL Apply • LOGICAL APPLY - SQL Apply
PROTECTION_MODE	VARCHAR2 (20)	<p>Indicates whether the database is protected:</p> <ul style="list-style-type: none"> • MAXIMUM PROTECTION • MAXIMUM AVAILABILITY • RESYNCHRONIZATION • MAXIMUM PERFORMANCE • UNPROTECTED
DESTINATION	VARCHAR2 (256)	Specifies the location where the redo data is to be archived
STANDBY_LOGFILE_COUNT	NUMBER	Indicates the total number of standby redo logs created on the standby database
STANDBY_LOGFILE_ACTIVE	NUMBER	Indicates the total number of standby redo logs on the standby database that are active and contain primary database online redo log information

Column	Datatype	Description
ARCHIVED_THREAD#	NUMBER	Identifies the thread number of the most recent archived redo log received at the destination
ARCHIVED_SEQ#	NUMBER	Identifies the log sequence number of the most recent archived redo log received at the destination
APPLIED_THREAD#	NUMBER	Identifies the thread number of the most recent applied redo log received at the destination
APPLIED_SEQ#	NUMBER	Identifies the log sequence number of the most recent applied redo log received at the destination
ERROR	VARCHAR2 (256)	Displays the error text
SRL	VARCHAR2 (3)	Indicates whether standby redo logfiles are used on the standby database (YES) or not (NO)
DB_UNIQUE_NAME	VARCHAR2 (30)	Specifies the unique database name of the current instance that was defined with the DB_UNIQUE_NAME attribute on the LOG_ARCHIVE_DEST_n parameter
SYNCHRONIZATION_STATUS	VARCHAR2 (22)	<p>Possible values for this column are as follows:</p> <ul style="list-style-type: none"> • CHECK CONFIGURATION - Synchronization with this destination is not possible because this database is either not in MAXIMUM PROTECTION or MAXIMUM AVAILABILITY data protection mode, or the LOG_ARCHIVE_DEST_n parameter associated with this destination has not been configured with the SYNC and AFFIRM attributes. • CHECK STANDBY REDO LOG - The standby redo log at this destination is configured improperly. • CHECK NETWORK - One or more instances of this database cannot send redo data to this destination. • DESTINATION HAS A GAP - This destination is missing redo data needed for synchronization with this database. • OK - This destination is synchronized with this database. • NOT AVAILABLE - Synchronization status is not available. <p>See Also: Oracle Data Guard Concepts and Administration for more information about redo transport configuration</p>
SYNCHRONIZED	VARCHAR2 (3)	<p>Possible values are:</p> <ul style="list-style-type: none"> • YES - This destination is synchronized with the primary database. • NO - The destination is not synchronized with the primary database. • UNKNOWN - The synchronization status of this destination cannot be determined.
GAP_STATUS	VARCHAR2 (24)	<p>Redo gap status:</p> <ul style="list-style-type: none"> • NO GAP - Destination does not have a redo gap. • LOG SWITCH GAP - Destination has not yet received all of the redo from the previous log file. • RESOLVABLE GAP - Destination has a redo gap that can be automatically resolved by fetching the missing redo from this database. • UNRESOLVABLE GAP - Destination has a redo gap that cannot be automatically resolved by fetching the missing redo from this database and there are no other destinations from which redo can be fetched. • LOCALLY UNRESOLVABLE GAP - Destination has a redo gap that cannot be automatically resolved by fetching the missing redo from this database. It may be possible to resolve the gap by fetching the missing redo from another destination.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.37 V\$ARCHIVE_GAP

V\$ARCHIVE_GAP displays information about archive gaps on a standby database. This view can be used to find out the current archive gap that is blocking recovery for the current recovery incarnation.

Column	Datatype	Description
THREAD#	NUMBER	Thread number of the missing archived redo log files. The number is 1 for a single instance. For Oracle Real Application Clusters, this column will contain different numbers.
LOW_SEQUENCE#	NUMBER	Lowest sequence number of the log files received on the standby system
HIGH_SEQUENCE#	NUMBER	Highest sequence number of the log files received on the standby system
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.38 V\$ARCHIVE_PROCESSES

V\$ARCHIVE_PROCESSES displays the state of the various ARCH processes for the instance.

Column	Datatype	Description
PROCESS	NUMBER	Identifier for the ARCH process for the instance, numbered from 0-9
STATUS	VARCHAR2 (10)	Status of the ARCH process, displayed as a keyword. Possible values are: STOPPED, SCHEDULED, STARTING, ACTIVE, STOPPING, and TERMINATED.
LOG_SEQUENCE	NUMBER	This is the online redo log sequence number currently being archived, if STATE="BUSY"
STATE	VARCHAR2 (4)	This is the current state of the ARCH process, displayed as a keyword. Possible keywords are IDLE or BUSY.
ROLES	VARCHAR2 (36)	The list of roles assigned to the archive process. The roles include: HEART_BEAT, NO_FAL, NO_SRL, CLEAR_LOGS

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.39 V\$ARCHIVED_LOG

V\$ARCHIVED_LOG displays archived log information from the control file, including archive log names.

An archive log record is inserted after the online redo log is successfully archived or cleared (name column is `NULL` if the log was cleared). If the log is archived twice, there will be two archived log records with the same `THREAD#`, `SEQUENCE#`, and `FIRST_CHANGE#`, but with a different name. An archive log record is also inserted when an archive log is restored from a backup set or a copy and whenever a copy of a log is made with the RMAN `COPY` command.

Column	Datatype	Description
RECID	NUMBER	Archived log record ID
STAMP	NUMBER	Archived log record stamp
NAME	VARCHAR2 (513)	Archived log file name. If set to <code>NULL</code> , either the log file was cleared before it was archived or an RMAN backup command with the "delete input" option was executed to back up archivelog all (<code>RMAN> backup archivelog all delete input;</code>).
DEST_ID	NUMBER	Original destination from which the archive log was generated. The value is 0 if the destination identifier is not available.
THREAD#	NUMBER	Redo thread number
SEQUENCE#	NUMBER	Redo log sequence number
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the database when the log was written
RESETLOGS_TIME	DATE	Resetlogs time of the database when the log was written
RESETLOGS_ID	NUMBER	Resetlogs identifier associated with the archived redo log
FIRST_CHANGE#	NUMBER	First change number in the archived log
FIRST_TIME	DATE	Timestamp of the first change
NEXT_CHANGE#	NUMBER	First change in the next log
NEXT_TIME	DATE	Timestamp of the next change
BLOCKS	NUMBER	Size of the archived log (in blocks)
BLOCK_SIZE	NUMBER	Redo log block size. This is the logical block size of the archived log, which is the same as the logical block size of the online log from which the archived log was copied. The online log logical block size is a platform-specific value that is not adjustable by the user.

Column	Datatype	Description
CREATOR	VARCHAR2 (7)	<p>Creator of the archivelog:</p> <ul style="list-style-type: none"> • ARCH - Archiver process • FGRRD - Foreground process • RMAN - Recovery Manager • SRMN - RMAN at standby • LGWR - Logwriter process
REGISTRAR	VARCHAR2 (7)	<p>Registrar of the entry:</p> <ul style="list-style-type: none"> • RFS - Remote File Server process • ARCH - Archiver process • FGRRD - Foreground process • RMAN - Recovery manager • SRMN - RMAN at standby • LGWR - Logwriter process
STANDBY_DEST	VARCHAR2 (3)	Indicates whether the entry is an archivelog destination (YES) or not (NO)
ARCHIVED	VARCHAR2 (3)	Indicates whether the online redo log was archived (YES) or whether RMAN only inspected the log and created a record for future application of redo logs during recovery (NO).
APPLIED	VARCHAR2 (9)	<p>Indicates whether an archived redo log file has been applied to the corresponding physical standby database. The value is always NO for local destinations.</p> <p>This column is meaningful on a physical standby database for rows where REGISTRAR = RFS:</p> <ul style="list-style-type: none"> • If REGISTRAR = RFS and APPLIED = NO, then the log file has been received but has not yet been applied. • If REGISTRAR = RFS and APPLIED = IN-MEMORY, then the log file has been applied in memory, but the data files have not yet been updated. • If REGISTRAR = RFS and APPLIED = YES, then the log file has been applied and the data files have been updated. <p>This column can be used to identify log files that can be backed up and deleted. When used for this purpose, the value IN-MEMORY should be treated as if it were NO.</p>
DELETED	VARCHAR2 (3)	Indicates whether an RMAN DELETE command has physically deleted the archived log file from disk, as well as logically removing it from the control file of the target database and from the recovery catalog (YES) or not (NO)
STATUS	VARCHAR2 (1)	<p>Status of the archived log:</p> <p>A - Available</p> <p>D - Deleted</p> <p>U - Unavailable</p> <p>X - Expired</p>
COMPLETION_TIME	DATE	Time when the archiving completed
DICTIONARY_BEGIN	VARCHAR2 (3)	Indicates whether the log contains the start of a LogMiner dictionary (YES) or not (NO)
DICTIONARY_END	VARCHAR2 (3)	Indicates whether the log contains the end of a LogMiner dictionary (YES) or not (NO)
END_OF_REDO	VARCHAR2 (3)	Indicates whether the archived redo log contains the end of all redo information from the primary database (YES) or not (NO)

Column	Datatype	Description
BACKUP_COUNT	NUMBER	Indicates the number of times this file has been backed up. Values range from 0-15. If the file has been backed up more than 15 times, the value remains 15.
ARCHIVAL_THREAD#	NUMBER	Redo thread number of the instance that performed the archival operation. This column differs from the THREAD# column only when a closed thread is archived by another instance.
ACTIVATION#	NUMBER	Number assigned to the database instantiation
IS_RECOVERY_DEST_FILE	VARCHAR2 (3)	Indicates whether the file was created in the fast recovery area (YES) or not (NO)
COMPRESSED	VARCHAR2 (3)	Reserved for internal use
FAL	VARCHAR2 (3)	Indicates whether the archive log was generated as the result of a FAL request (YES) or not (NO)
END_OF_REDO_TYPE	VARCHAR2 (10)	Possible values are as follows: <ul style="list-style-type: none"> • SWITCHOVER - Shows archived redo log files that are produced at the end of a switchover • TERMINAL - Shows archived redo log files produced after a failover • RESETLOGS - Shows online redo log files archived on the primary database after an ALTER DATABASE OPEN RESETLOGS statement is issued • ACTIVATION - Shows any log files archived on a physical standby database after an ALTER DATABASE ACTIVATE STANDBY DATABASE statement is issued • "empty string" - Any empty string implies that the log is just a normal archival and was not archived due to any of the other events
BACKED_BY_VSS	VARCHAR2 (3)	Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.40 V\$ASM_ACFS_ENCRYPTION_INFO

V\$ASM_ACFS_ENCRYPTION_INFO displays encryption information for every mounted Oracle ACFS.

Column	Datatype	Description
FS_NAME	VARCHAR2 (1024)	File system mount point (foreign key to V\$ASM_FILESYSTEM)
VOL_DEVICE	VARCHAR2 (256)	Name of the Oracle ADVM device
SET_STATUS	VARCHAR2 (7)	Indicates whether encryption parameters have been set on the file system (YES) or not (NO); otherwise UNKNOWN.
ENABLED_STATUS	VARCHAR2 (8)	Indicates whether file system level encryption is enabled (ENABLED) or not (DISABLED); otherwise UNKNOWN.

Column	Datatype	Description
ALGORITHM	VARCHAR2 (7)	Encryption algorithm used. AES is the only supported algorithm.
KEY_LENGTH	VARCHAR2 (7)	Key length used for the encryption key
LAST_REKEY_TIME	DATE	Time that the volume was last rekeyed
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.41 V\$ASM_ACFS_SEC_ADMIN

V\$ASM_ACFS_SEC_ADMIN contains Oracle ACFS security administrators in the cluster. This view also supports GV\$ global views.

Column	Datatype	Description
ADMIN_NAME	VARCHAR2 (32)	User name of the security administrator

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.42 V\$ASM_ACFS_SEC_CMDRULE

V\$ASM_ACFS_SEC_CMDRULE contains one row for every Oracle ACFS security command rule for each Oracle ACFS file system. This view also supports GV\$ global views.

Column	Datatype	Description
CMD_RULE_NAME	VARCHAR2 (32)	Name of the command rule
FS_NAME	VARCHAR2 (1024)	Mount path name to identify the file system
VOL_DEVICE	VARCHAR2 (256)	ADVM volume name

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

See Also:

Note:

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.43 V\$ASM_ACFS_SEC_REALM

V\$ASM_ACFS_SEC_REALM contains an entry for every realm in the Oracle ACFS security file system in an Oracle Automatic Storage Management (Oracle ASM) instance. This view also supports GV\$ global views.

Column	Datatype	Description
REALM_NAME	VARCHAR2 (255)	Realm name
REALM_STATUS	NUMBER	<p>Realm status:</p> <ul style="list-style-type: none"> • 0: disable • 1: enable
REALM_ENCR_STATUS	NUMBER	<p>Realm encryption status:</p> <ul style="list-style-type: none"> • 0: disable • 1: enable <p>Will be provided only when realm encryption status is 1. The values will be among 128, 192, 256.</p>

Column	Datatype	Description
REALM_ENCR_KEYLEN	NUMBER	Encryption key length. Will be provided only when realm encryption status is 1. The values will be among 128, 192, 256.
REALM_ENCR_ALGO	VARCHAR2 (7)	Encryption algorithm. Will be provided only when realm encryption status is 1.
REALM_DESC	VARCHAR2 (1024)	Realm description
FS_NAME	VARCHAR2 (1024)	Mount path name to identify the file system
VOL_DEVICE	VARCHAR2 (256)	ADVMD volume name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data For this view, the value is always 0.

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.44 V\$ASM_ACFS_SEC_REALM_FILTER

V\$ASM_ACFS_SEC_REALM_FILTER contains an entry for every filter in the Oracle ACFS security realm for each Oracle ACFS file system. A filter is a defined as a command rule/rule set pair in a realm. This view also supports GV\$ global views.

Column	Datatype	Description
REALM_NAME	VARCHAR2 (255)	Realm name
CMD_RULE_NAME	VARCHAR2 (32)	Command rule name
RULESET_NAME	VARCHAR2 (256)	Ruleset name
FS_NAME	VARCHAR2 (1024)	Mount path name to identify the file system
VOL_DEVICE	VARCHAR2 (256)	ADVM volume name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data For this view, the value is always 0.

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.45 V\$ASM_ACFS_SEC_REALM_GROUP

V\$ASM_ACFS_SEC_REALM_GROUP contains an entry for every group in the Oracle ACFS security realm for each Oracle ACFS file system. This view also supports GV\$ global views.

Column	Datatype	Description
REALM_NAME	VARCHAR2 (255)	Realm name
GROUP_NAME	VARCHAR2 (256)	Name of the group
FS_NAME	VARCHAR2 (1024)	Mount path name to identify the file system

Column	Datatype	Description
VOL_DEVICE	VARCHAR2 (256)	ADVM volume name
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.46 V\$ASM_ACFS_SEC_REALM_USER

V\$ASM_ACFS_SEC_REALM_USER contains an entry for every user in the Oracle ACFS security realm for each Oracle ACFS file system. This view also supports GV\$ global views.

Column	Datatype	Description
REALM_NAME	VARCHAR2 (255)	Realm name
USER_NAME	VARCHAR2 (32)	Name of the user
FS_NAME	VARCHAR2 (1024)	Mount path name to identify the file system
VOL_DEVICE	VARCHAR2 (256)	ADVM volume name

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.47 V\$ASM_ACFS_SEC_RULE

V\$ASM_ACFS_SEC_RULE contains information about all Oracle ACFS security rules for each Oracle ACFS file system. This view also supports GV\$ global views.

Column	Datatype	Description
RULE_NAME	VARCHAR2 (256)	Name of the rule
RULE_TYPE	VARCHAR2 (32)	<p>Type of the rule:</p> <ul style="list-style-type: none"> • time • username • groupname • hostname • application
RULE_VALUE	VARCHAR2 (512)	Value of the rule, which could include values such as 23:10:00 for time, Bob for username, dba for groupname, host147 for hostname, /sbin/cat for application.

Column	Datatype	Description
RULE_VALUE2	VARCHAR2 (512)	The value will be populated only if the rule type is time. When the rule type is time, the start time is entered in RULE_VALUE and the end time is entered in RULE_VALUE2.
RULE_OPTION	VARCHAR2 (7)	Possible values are ALLOW or DENY
FS_NAME	VARCHAR2 (1024)	Mount path name to identify the file system
VOL_DEVICE	VARCHAR2 (256)	ADVMD volume name
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

See Also:

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

Note:

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.48 V\$ASM_ACFS_SEC_RULESET

V\$ASM_ACFS_SEC_RULESET contains information about all Oracle ACFS security rule sets for each Oracle ACFS file system. This view also supports GV\$ global views.

Column	Datatype	Description
RULESET_NAME	VARCHAR2 (256)	Name of the ruleset
RULESET_OPTION	VARCHAR2 (8)	The possible values are ANY_TRUE or ALL_TRUE
FS_NAME	VARCHAR2 (1024)	Mount path name to identify the file system

Column	Datatype	Description
VOL_DEVICE	VARCHAR2 (256)	ADVM volume name
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.49 V\$ASM_ACFS_SEC_RULESET_RULE

V\$ASM_ACFS_SEC_RULESET_RULE contains an entry for every rule in the Oracle ACFS security rule set for each Oracle ACFS file system. This view also supports GV\$ global views.

Column	Datatype	Description
RULESET_NAME	VARCHAR2 (256)	Rule set name
RULE_NAME	VARCHAR2 (256)	Rule name
FS_NAME	VARCHAR2 (1024)	Mount path name to identify the file system
VOL_DEVICE	VARCHAR2 (256)	ADVM volume name

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

See Also:

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

Note:

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.50 V\$ASM_ACFS_SECURITY_INFO

V\$ASM_ACFS_SECURITY_INFO displays security information for every mounted Oracle ACFS.

Column	Datatype	Description
FS_NAME	VARCHAR2 (1024)	File system mount point (foreign key to V\$ASM_FILESYSTEM)
VOL_DEVICE	VARCHAR2 (256)	Name of the Oracle ADVM device
PREPARED_STATUS	VARCHAR2 (7)	Indicates whether the file system is prepared for security (YES) or not (NO); otherwise UNKNOWN.
ENABLED_STATUS	VARCHAR2 (8)	Indicates whether security is enabled for the file system (ENABLED) or not (DISABLED); otherwise UNKNOWN.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

See Also:

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)

Note:

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.51 V\$ASM_ACFSAUTORESIZE

V\$ASM_ACFSAUTORESIZE displays the auto-resize settings for each mounted Oracle ACFS file system.

Column	Datatype	Description
FS_NAME	VARCHAR2 (1024)	Full path name of the Oracle ACFS file system mount point
RESIZE_INCREMENT	NUMBER	Auto-resize increment (in megabytes)
RESIZE_MAXIMUM	NUMBER	Auto-resize maximum (in megabytes)

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **Note:**

This view is available starting with Oracle Database 19c.

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.52 V\$ASM_ACFSREPL

V\$ASM_ACFSREPL displays information for Oracle ACFS file systems that are initialized for replication.

Column	Datatype	Description
FSNAME	VARCHAR2 (1024)	File system mount point (foreign key to V\$ASM_FILESYSTEM)
VOLDEV	VARCHAR2 (256)	Name of the Oracle ADVM device
SITE	VARCHAR2 (7)	<p>Replication site role:</p> <ul style="list-style-type: none"> • PRIMARY - File system is initialized as a primary • STANDBY - File system is initialized as a standby

Column	Datatype	Description
LAG	VARCHAR2 (128)	Amount of time standby is behind primary in hours:minutes:seconds (primary only)
STATUS	VARCHAR2 (12)	Replication primary or standby status: <ul style="list-style-type: none"> • ONLINE - Replication is initialized and processing real-time changes • INITIALIZING - Replication is still processing files on the primary that existed before replication started • PAUSED - The primary is not sending logs to the standby or the standby is not applying logged changes
INITSTATUS	VARCHAR2 (11)	Replication primary or standby initialization status: <ul style="list-style-type: none"> • NONE - Replication is ONLINE and not initializing • DIRECTORIES - Directories are being initialized • FILES - Files are being initialized
DIRSSCAN	NUMBER	Number of directories scanned and logged (primary only)
PERCENT	NUMBER	Percentage of files initialized that existed before replication started (primary only)
LASTSYNC	DATE	Time of last apply on the standby site (standby only)
CRSRUN	NUMBER	Number of Cluster Ready Services replication daemons currently running
CRSTOTAL	NUMBER	Number of Cluster Ready Services replication daemons expected to be running
PMNTPT	VARCHAR2 (1024)	Replication primary site mount point
SMNTPT	VARCHAR2 (1024)	Replication standby site mount point
PSVCNAME	VARCHAR2 (1024)	Replication primary site service name
SSVCNAME	VARCHAR2 (1024)	Replication standby site service name
PHOST	VARCHAR2 (1024)	A replication primary cluster host name
SHOST	VARCHAR2 (1024)	A replication standby cluster host name
REMALIAS	VARCHAR2 (4096)	Replication remote alias name
TAGS	NUMBER	TRUE (1) if replicating tagged files
COMPRESSION	VARCHAR2 (3)	Replication log compression status: <ul style="list-style-type: none"> • OFF - Replication logs are not being compressed • ON - Replication logs are being compressed
DBG_LVL	NUMBER	Replication trace log debug level
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data For this view, the value is always 0.

 **Note:**

This view only contains records for Oracle ASM releases prior to Oracle Database 12c Release 2 (12.2.0.1). To display Oracle ACFS replication information for Oracle Database 12c Release 2 (12.2.0.1) or higher, use the `acfsutil repl info` command.

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.53 V\$ASM_ACFSREPLTAG

V\$ASM_ACFSREPLTAG displays replicated tag information for Oracle ACFS file systems that are initialized for replication.

Column	Datatype	Description
FSNAME	VARCHAR2 (1024)	File system mount point (foreign key to V\$ASM_FILESYSTEM)
VOLDEV	VARCHAR2 (256)	Name of the Oracle ADVM device
TAG	VARCHAR2 (32)	Tag name that is being replicated
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **Note:**

This view only contains records for Oracle ASM releases prior to Oracle Database 12c Release 2 (12.2.0.1). To display Oracle ACFS replication information for Oracle Database 12c Release 2 (12.2.0.1) or higher, use the `acfsutil repl info` command.

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.54 V\$ASM_ACFSSNAPSHOTS

V\$ASM_ACFSSNAPSHOTS displays snapshot information for every mounted Oracle ACFS.

Column	Datatype	Description
FS_NAME	VARCHAR2 (1024)	File system mount point (foreign key to V\$ASM_FILESYSTEM)
VOL_DEVICE	VARCHAR2 (256)	Name of the Oracle ADVM device
SNAP_NAME	VARCHAR2 (1024)	Name of the snapshot
CREATE_TIME	DATE	Time when the snapshot was created
TYPE	VARCHAR2 (2)	Snapshot type. Possible types are read-only (RO) or read/write (RW).
PARENT	VARCHAR2 (1024)	Parent name used to create the snapshot. If the snapshot was created using the mount point as a base, parent name will be NULL. If the snapshot was created using an existing snapshot as the base, the parent name will be the name of the snapshot passed to the acfsutil snap create -p operation.
LINK ¹	VARCHAR2 (1024)	If link has been set, the path of the link. If unset, NULL.
ADDITIONAL_STORAGE ¹	NUMBER	Equivalent to "storage added to snapshot" output
QUOTA ¹	NUMBER	Value of quota. If unset, NULL.

Column	Datatype	Description
REPL ¹	VARCHAR2 (5)	Indicates whether the snapshot is being used for replication (TRUE) or not (FALSE)
STATE ¹	VARCHAR2 (14)	The state of the snapshot: <ul style="list-style-type: none"> • AVAILABLE - Default • DELETE_WAITING - Maps to "delete waiting for last close" • DELETE_IN_PROGRESS - Maps to "delete in progress"
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

¹ This column is available starting with Oracle Database 19c.

See Also:

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

Note:

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.55 V\$ASM_ACFSTAG

V\$ASM_ACFSTAG displays every file or directory that has a tag and its tag name for every mounted Oracle ACFS.

Column	Datatype	Description
TAG_NAME	VARCHAR2 (32)	Tag name on file or directory
FS_NAME	VARCHAR2 (1024)	File system mount point

Column	Datatype	Description
PATH_NAME	VARCHAR2 (4096)	Complete file path name
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Automatic Storage Management Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.56 V\$ASM_ACFSVOLUMES

V\$ASM_ACFSVOLUMES displays information about mounted Oracle ACFS volumes, correlated with V\$ASM_FILESYSTEM.

Column	Datatype	Description
FS_NAME	VARCHAR2 (1024)	File system mount point (foreign key to V\$ASM_FILESYSTEM)
VOL_DEVICE	VARCHAR2 (256)	Name of the Oracle ADVM device
VOL_LABEL	VARCHAR2 (64)	Volume label (optional name) assigned through mkfs/acfsformat; NULL if no name exists
PRIMARY_VOL	VARCHAR2 (5)	Indicates whether the volume is the primary volume for the file system (TRUE) or not (FALSE)
TOTAL_MB	NUMBER	Size of the volume device (in megabytes)
FREE_MB	NUMBER	Available space on the volume device (in megabytes)

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

- "[V\\$ASM_FILESYSTEM](#)"

 **Note:**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

7.57 V\$ASM_ALIAS

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_ALIAS displays one row for every alias present in every disk group mounted by the Oracle ASM instance.

Column	Datatype	Description
NAME	VARCHAR2 (70)	Oracle ASM alias or alias directory name
GROUP_NUMBER	NUMBER	Owning disk group number of the alias (foreign key to the V\$ASM_DISKGROUP view)
FILE_NUMBER	NUMBER	Oracle ASM file number of the alias (foreign key to the V\$ASM_FILE view)
FILE_INCARNATION	NUMBER	Oracle ASM file incarnation number for the alias
ALIAS_INDEX	NUMBER	Alias entry number for the alias
ALIAS_INCARNATION	NUMBER	Incarnation number for the parent of the alias

Column	Datatype	Description
PARENT_INDEX	NUMBER	A 32-bit number consisting of a disk group number in the high-order 8 bits and an alias entry number in the low-order 24 bits (number of the directory containing the alias)
REFERENCE_INDEX	NUMBER	A 32-bit number consisting of a disk group number in the high-order 8 bits and an alias entry number in the low-order 24 bits (number of the directory describing the current entry)
ALIAS_DIRECTORY	VARCHAR2 (1)	Indicates whether the alias is to a directory (Y) or to an Oracle ASM file (N)
SYSTEM_CREATED	VARCHAR2 (1)	Indicates whether the alias is system created (Y) or user created (N)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data For this view, the value is always 0.

 See Also:

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.58 V\$ASM_ATTRIBUTE

V\$ASM_ATTRIBUTE displays one row for each attribute defined. In addition to attributes specified by CREATE DISKGROUP and ALTER DISKGROUP statements, the view may show other attributes that are created automatically.

Note that attributes are only displayed for disk groups where COMPATIBLE.ASM is set to 11.1 or higher.

Column	Datatype	Description
NAME	VARCHAR2 (256)	Full name of the attribute
VALUE	VARCHAR2 (256)	Value of the attribute
GROUP_NUMBER	NUMBER	Number of the disk group in which this attribute exists (composite primary key)
ATTRIBUTE_INDEX	NUMBER	Number of this attribute in the disk group (composite primary key)
ATTRIBUTE_INCARNATION	NUMBER	Incarnation number for this attribute (composite primary key)
READ_ONLY	VARCHAR2 (7)	Indicates whether the attribute is read-only (Y) or not (N)
SYSTEM_CREATED	VARCHAR2 (7)	Indicates whether this is a system-created attribute (Y) or not (N)

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

- *Oracle Automatic Storage Management Administrator's Guide* for more information about viewing Oracle ASM disk group attributes using this view
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle ASM information

7.59 V\$ASM_AUDIT_CLEANUP_JOBS

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_AUDIT_CLEANUP_JOBS displays information about the configured audit trail purge jobs.

In a database instance, V\$ASM_AUDIT_CLEANUP_JOBS displays no rows.

Column	Datatype	Description
JOB_NAME	VARCHAR2 (64)	Name of the audit trail purge job
JOB_STATUS	VARCHAR2 (64)	Current status of the audit trail purge job (ENABLED) or (DISABLED)
AUDIT_TRAIL	VARCHAR2 (64)	Audit trail for which the audit trail purge job is configured: OS AUDIT TRAIL and UNIFIED AUDIT TRAIL
JOB_FREQUENCY	NUMBER	Frequency at which the audit trail purge job runs
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

- Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle ASM information

7.60 V\$ASM_AUDIT_CONFIG_PARAMS

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_AUDIT_CONFIG_PARAMS displays information about the currently configured audit trail properties that are used by the DBMS_AUDIT_MGMT package.

In a database instance, V\$ASM_AUDIT_CONFIG_PARAMS displays no rows.

Column	Datatype	Description
PARAMETER_NAME	VARCHAR2(64)	Name of the property
PARAMETER_VALUE	VARCHAR2(64)	Value of the property
AUDIT_TRAIL	VARCHAR2(64)	Audit trails for which the property is configured: OS AUDIT TRAIL and UNIFIED AUDIT TRAIL
PARAMETER_UNIT ¹	VARCHAR2(64)	Provides description of units of audit properties (file size in KB and file age in day(s))
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

¹ This column is available starting with Oracle Database 19c.

See Also:

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_AUDIT_MGMT package
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle ASM information

7.61 V\$ASM_AUDIT_LAST_ARCH_TS

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_AUDIT_LAST_ARCH_TS displays information about the last archive timestamps set for audit trail cleanup or purges.

In a database instance, V\$ASM_AUDIT_LAST_ARCH_TS displays no rows.

Column	Datatype	Description
AUDIT_TRAIL	VARCHAR2(64)	Audit trail for which the last archive timestamp applies: OS AUDIT TRAIL and UNIFIED AUDIT TRAIL
LAST_ARCHIVE_TS	TIMESTAMP(6) WITH TIMEZONE	Timestamp of the last audit file that has been archived

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.62 V\$ASM_CLIENT

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_CLIENT identifies databases using disk groups managed by the Oracle ASM instance.

In a database instance, V\$ASM_CLIENT displays information about the Oracle ASM instance if the database has any open Oracle ASM files.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	<p>Number of the disk group being used by the database instance (foreign key to the V\$ASM_DISKGROUP view). When a client is connected to an Oracle ASM instance, but is not currently using any disk groups, V\$ASM_CLIENT.GROUP_NUMBER contains 0.</p> <p>When the Cluster Ready Services Daemon (CRSD) or Cluster Synchronization Services (OCSSD) connects to the Oracle ASM instance, this will represent the number of the disk group used for their OCR and voting files respectively.</p>
INSTANCE_NAME	VARCHAR2 (64)	<p>Identifier for the database instance client</p> <p>When CRSD or OCSSD has opened its files in the disk group mounted by the Oracle ASM instance, this will contain the node name where CRSD or OCSSD is running.</p>
DB_NAME	VARCHAR2 (8)	<p>Unique database name of the database client instance</p> <p>When CRSD has opened the Oracle Cluster Registry (OCR) file in the disk group mounted by the Oracle ASM instance, DB_NAME will contain _OCR.</p> <p>When OCSSD has opened the voting file in the disk group mounted by the Oracle ASM instance, DB_NAME will contain _CSS.</p>
CLUSTER_NAME	VARCHAR2 (31)	Name of the cluster

Column	Datatype	Description
STATUS	VARCHAR2 (12)	<p>Status of the client connection:</p> <ul style="list-style-type: none"> • CONNECTED - Database instance client has an active connection to the Oracle ASM instance • DISCONNECTED - Database instance client normally ended its connection to the Oracle ASM instance • BROKEN - Connection with the database instance client terminated abnormally <p>When CRSD or OCSSD has opened its files in the disk group mounted by the Oracle ASM instance, it will report Connected as status.</p>
SOFTWARE_VERSION	VARCHAR2 (60)	Software version number of the database or Oracle ASM instance for the selected disk group connection
COMPATIBLE_VERSION	VARCHAR2 (60)	Compatibility setting of the database or Oracle ASM instance for the selected disk group connection
CON_ID	NUMBER	<p>The value will be – when CRSD or OCSSD has opened its files in the disk group mounted by the Oracle ASM instance.</p> <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.63 V\$ASM_DBCLONE_INFO

V\$ASM_DBCLONE_INFO shows the relationship between the parent database and point-in-time database clones.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Disk group number
DBCLONE_NAME	VARCHAR2 (128)	Name of the point-in-time database clone
MIRRORCOPY_NAME	VARCHAR2 (128)	Name of the mirror copy associated with the database clone

Column	Datatype	Description
DBCLONE_STATUS	VARCHAR2 (128)	Status of the database clone. Possible values: <ul style="list-style-type: none"> • PREPARING — The process to prepare the database for splitting has started, but the database is not yet ready to be split. • PREPARED — The preparation process is complete and the database is ready to be split. • SPLITTING — The process to split the database files has started. • SPLIT COMPLETED — The database has been split. • DROPPING — The process to drop the prepared database clone has started. • FAILED — The clone operation has failed. The incomplete clone will be dropped.
PARENT_DBNAME	VARCHAR2 (128)	Name of the parent database
PARENT_FILEGROUP_NAME	VARCHAR2 (128)	Name of the file group associated with the parent database
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

Oracle Automatic Storage Management Administrator's Guide for information about point-in-time database clones

7.64 V\$ASM_DISK

V\$ASM_DISK displays one row for every disk discovered by the Oracle Automatic Storage Management (Oracle ASM) instance, including disks that are not part of any disk group.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Number of the disk group containing the disk (foreign key to the V\$ASM_DISKGROUP view)
DISK_NUMBER	NUMBER	Number assigned to the disk within its disk group
COMPOUND_INDEX	NUMBER	A 32-bit number consisting of a disk group number in the high-order 8 bits and a disk number in the low-order 24 bits (for efficient access to the view)
INCARNATION	NUMBER	Incarnation number for the disk

Column	Datatype	Description
MOUNT_STATUS	VARCHAR2(7)	<p>Per-instance status of the disk relative to group mounts:</p> <ul style="list-style-type: none"> • MISSING - Oracle ASM metadata indicates that the disk is known to be part of the Oracle ASM disk group but no disk in the storage system was found with the indicated name • CLOSED - Disk is present in the storage system but is not being accessed by Oracle ASM • OPENED - Disk is present in the storage system and is being accessed by Oracle ASM. This is the normal state for disks in a database instance which are part of a disk group being actively used by the instance. • CACHED - Disk is present in the storage system and is part of a disk group being accessed by the Oracle ASM instance. This is the normal state for disks in an Oracle ASM instance which are part of a mounted disk group. • IGNORED - Disk is present in the system but is ignored by Oracle ASM because of one of the following: <ul style="list-style-type: none"> – The disk is detected by the system library but is ignored because an Oracle ASM library discovered the same disk – Oracle ASM has determined that the membership claimed by the disk header is no longer valid • CLOSING - Oracle ASM is in the process of closing this disk
HEADER_STATUS	VARCHAR2(12)	<p>Per-instance status of the disk as seen by discovery:</p> <ul style="list-style-type: none"> • UNKNOWN - Oracle ASM disk header has not been read • CANDIDATE - Disk is not part of a disk group and may be added to a disk group with the <code>ALTER DISKGROUP</code> statement • INCOMPATIBLE - Version number in the disk header is not compatible with the Oracle ASM software version • PROVISIONED - Disk is not part of a disk group and may be added to a disk group with the <code>ALTER DISKGROUP</code> statement. The <code>PROVISIONED</code> header status is different from the <code>CANDIDATE</code> header status in that <code>PROVISIONED</code> implies that an additional platform-specific action has been taken by an administrator to make the disk available for Oracle ASM. • MEMBER - Disk is a member of an existing disk group. No attempt should be made to add the disk to a different disk group. The <code>ALTER DISKGROUP</code> statement will reject such an addition unless overridden with the <code>FORCE</code> option. • FORMER - Disk was once part of a disk group but has been dropped cleanly from the group. It may be added to a new disk group with the <code>ALTER DISKGROUP</code> statement. • CONFLICT - Oracle ASM disk was not mounted due to a conflict • FOREIGN - Disk contains data created by an Oracle product other than Oracle ASM. This includes data files, logfiles, and OCR disks.
MODE_STATUS	VARCHAR2(7)	<p>Global status about which kinds of I/O requests are allowed to the disk:</p> <ul style="list-style-type: none"> • ONLINE - Disk is online and operating normally. Reads and writes are attempted when the disk is mounted. Reads are attempted as part of disk discovery. • OFFLINE - Disk is offline and access to data is not permitted. Reads and writes are not attempted. An offline disk remains logically part of its disk group. • SYNCING - Disk is offline for reads, but online for writes. Oracle ASM is resyncing stale data on the disk. See <code>V\$ASM_OPERATION</code> to view resync progress.

Column	Datatype	Description
STATE	VARCHAR2 (8)	<p>Global state of the disk with respect to the disk group:</p> <ul style="list-style-type: none"> UNKNOWN - Oracle ASM disk state is not known (typically the disk is not mounted) NORMAL - Disk is online and operating normally ADDING - Disk is being added to a disk group, and is pending validation by all instances that have the disk group mounted DROPPING - Disk has been manually taken offline and space allocation or data access for the disk halts. Rebalancing will commence to relocate data off the disks to other disks in the disk group. Upon completion of the rebalance, the disk is expelled from the group. HUNG - Disk drop operation cannot continue because there is insufficient space to relocate the data from the disk being dropped FORCING - Disk is being removed from the disk group without attempting to offload its data. The data will be recovered from redundant copies, where possible.
REDUNDANCY	VARCHAR2 (7)	<p>Hardware redundancy of the disk:</p> <ul style="list-style-type: none"> UNKNOWN UNPROT MIRROR PARITY
		Note: This column is valid only if an ASMLIB is present that supports returning hardware redundancy information. This column is not related to the redundancy of the disk group of which the disk is a member.
LIBRARY	VARCHAR2 (64)	Name of the library that discovered the disk
OS_MB	NUMBER	Size of the disk (in megabytes) as reported by the host operating system
TOTAL_MB	NUMBER	Total capacity of the disk (in megabytes)
FREE_MB	NUMBER	Unused capacity of the disk (in megabytes)
HOT_USED_MB	NUMBER	Number of used megabytes in the hot region
COLD_USED_MB	NUMBER	Number of used megabytes in the cold region
NAME	VARCHAR2 (30)	Name of the disk
FAILGROUP	VARCHAR2 (30)	Name of the failure group containing the disk
LABEL	VARCHAR2 (31)	Disk label portion of the name returned by discovery
PATH	VARCHAR2 (256)	Operating system path name portion of the name returned by discovery
UDID	VARCHAR2 (64)	Unique Device ID portion of the name returned by discovery
PRODUCT	VARCHAR2 (32)	Name of the manufacturer and the name of the product. All disks with the same product id will have the same performance and reliability characteristics.
CREATE_DATE	DATE	Date and time when the disk was added to the disk group
MOUNT_DATE	DATE	Date and time when the disk was mounted by the first instance
REPAIR_TIMER	NUMBER	Seconds remaining until the disk is automatically dropped (0 if not failed)
READS	NUMBER	Total number of I/O read requests for the disk
WRITES	NUMBER	Total number of I/O write requests for the disk
READ_ERRS	NUMBER	Total number of failed I/O read requests for the disk
WRITE_ERRS	NUMBER	Total number of failed I/O write requests for the disk

Column	Datatype	Description
READ_TIMEOUT	NUMBER	Number of read I/Os that are timed out
WRITE_TIMEOUT	NUMBER	Number of write I/Os that are timed out
READ_TIME	NUMBER	Total I/O time (in seconds) for read requests for the disk if the TIMED_STATISTICS initialization parameter is set to true (0 if set to false)
WRITE_TIME	NUMBER	Total I/O time (in seconds) for write requests for the disk if the TIMED_STATISTICS initialization parameter is set to true (0 if set to false)
BYTES_READ	NUMBER	Total number of bytes read from the disk
BYTES_WRITTEN	NUMBER	Total number of bytes written to the disk
PREFERRED_READ	VARCHAR2(1)	Status of the preferred read failure group: <ul style="list-style-type: none"> • U - Disk group has no preferred read failure group • Y - Disk is a preferred read disk • N - Disk is not a preferred read disk For a disk group with one or more preferred read failure groups, if the disk is in one of the preferred read failure groups, the value of this column is Y; otherwise it is N.
HASH_VALUE	NUMBER	A unique hash value for an Oracle ASM disk, computed using the Oracle ASM disk name (as specified by NAME column in v\$asm_disk) and the Oracle ASM disk group name (as specified by NAME column in v\$asm_diskgroup).
HOT_READS	NUMBER	Number of reads from the hot region on disk
HOT_WRITES	NUMBER	Number of writes to the hot region on disk
HOT_BYTES_READ	NUMBER	Number of bytes read from the hot region on disk
HOT_BYTES_WRITTEN	NUMBER	Number of bytes written to the hot region on disk
COLD_READS	NUMBER	Number of reads from the cold region on disk
COLD_WRITES	NUMBER	Number of writes to the cold region on disk
COLD_BYTES_READ	NUMBER	Number of bytes read from the cold region on disk
COLD_BYTES_WRITTEN	NUMBER	Number of bytes written to the cold region on disk
VOTING_FILE	VARCHAR2(1)	Indicates whether the disk contains a voting file (Y) or not (N)
SECTOR_SIZE	NUMBER	Physical block size (in bytes)
LOGICAL_SECTOR_SIZE	NUMBER	Shows the logical sector size value of the disk in bytes. This is the smallest possible I/O that can be done by the disk. If the value of the LOGICAL_SECTOR_SIZE column is 512, while the value in the SECTOR_SIZE column is 4096, then the disk supports 512 sector size emulation. This means the disk can be used for both 512 native and 4096 native disk groups.
FAILGROUP_TYPE	VARCHAR2(7)	Type of the failure group: <ul style="list-style-type: none"> • REGULAR • QUORUM

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>
THIN_PROVISION_CAPABLE	VARCHAR2(1)	Indicates whether the disk supports Storage Thin Provisioning (Y) or not (N)
DATA_INTEGRITY_CAPABLE	VARCHAR2(1)	Indicates whether the disk supports the Data Integrity feature (Y) or not (N)
SITE_NAME	VARCHAR2(30)	The name of the site to which the specific disk belongs
SITE_GUID	VARCHAR2(33)	The GUID for the site to which the specific disk belongs
FAILGROUP_LABEL	VARCHAR2(30)	This is the suggested name for the failure group to which the disk belongs, as returned by discovery
SITE_LABEL	VARCHAR2(30)	This is the suggested name for the site to which the disk belongs, as returned by discovery
SITE_STATUS	VARCHAR2(11)	<p>This column is populated only for disks in Oracle ASM extended disk groups. The site status is computed after every Partnership and Status Table (PST) refresh or when the PST is read from disks into memory. The possible states include:</p> <ul style="list-style-type: none"> • UNKNOWN: This is the state before any checks have been performed. • UNAVAILABLE: This is the state when all the disks in the site are offline. • COMPROMISED: The state when enough disks or PST copies are offline, such that the site can no longer provide data availability. • AVAILABLE: The state when there is enough redundancy within the site to provide data availability in case another site becomes compromised or unavailable.

Note:

The GROUP_NUMBER and DISK_NUMBER columns will only be valid if the disk is part of a disk group which is currently mounted by the instance. Otherwise, GROUP_NUMBER will be 0, and DISK_NUMBER will be a unique value with respect to the other disks that also have a group number of 0.

Note:

This view performs disk discovery every time it is queried. Because performing disk discovery is very resource intensive, Oracle recommends against using this view for monitoring scripts. Instead, use the less expensive view [V\\$ASM_DISK_STAT](#).

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.65 V\$ASM_DISK_IOSTAT

V\$ASM_DISK_IOSTAT displays information about disk I/O statistics for each Oracle Automatic Storage Management (Oracle ASM) client.

If this view is queried from the database instance, only the rows for that instance are shown.

Column	Datatype	Description
INSTNAME	VARCHAR2 (64)	Identifier for the DB/ADVM instance client
DBNAME	VARCHAR2 (8)	Unique database name (<code>DB_UNIQUE_NAME</code>)
CLUSTERNAME	VARCHAR2 (31)	Name of the cluster
GROUP_NUMBER	NUMBER	Number of the disk group containing the disk
DISK_NUMBER	NUMBER	Number assigned to the disk within its disk group
FAILGROUP	VARCHAR2 (30)	Name of the failure group to which the disk belongs
SITE_NAME	VARCHAR2 (30)	This is the name of the site to which the disk belongs
READS	NUMBER	Total number of I/O read requests for the disk
WRITES	NUMBER	Total number of I/O write requests for the disk
READ_ERRS	NUMBER	Total number of failed I/O read requests for the disk
WRITE_ERRS	NUMBER	Total number of failed I/O write requests for the disk
READ_TIMEOUT	NUMBER	Number of read I/Os that are timed out
WRITE_TIMEOUT	NUMBER	Number of write I/Os that are timed out
READ_TIME	NUMBER	Total I/O time (in seconds) for read requests for the disk if the <code>TIMED_STATISTICS</code> initialization parameter is set to <code>TRUE</code> (0 if set to <code>FALSE</code>).
WRITE_TIME	NUMBER	Total I/O time (in seconds) for write requests for the disk if the <code>TIMED_STATISTICS</code> initialization parameter is set to <code>TRUE</code> (0 if set to <code>FALSE</code>)
BYTES_READ	NUMBER	Total number of bytes read from the disk
BYTES_WRITTEN	NUMBER	Total number of bytes written from the disk
HOT_READS	NUMBER	Number of reads from the hot region on disk
HOT_WRITES	NUMBER	Number of writes to the hot region on disk
HOT_BYTES_READ	NUMBER	Number of bytes read from the hot region on disk
HOT_BYTES_WRITTEN	NUMBER	Number of bytes written to the hot region on disk
COLD_READS	NUMBER	Number of reads from the cold region on disk
COLD_WRITES	NUMBER	Number of writes to the cold region on disk
COLD_BYTES_READ	NUMBER	Number of bytes read from the cold region on disk
COLD_BYTES_WRITTEN	NUMBER	Number of bytes written to the cold region on disk

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.66 V\$ASM_DISK_STAT

V\$ASM_DISK_STAT displays performance statistics in the same way that V\$ASM_DISK does, but without performing discovery of new disks

This results in a less expensive operation. However, since discovery is not performed, the output of this view does not include any data about disks that are new to the system.

The columns for V\$ASM_DISK_STAT are the same as those for V\$ASM_DISK.

 **See Also:**

"V\$ASM_DISK"

7.67 V\$ASM_DISKGROUP

V\$ASM_DISKGROUP displays one row for every Oracle Automatic Storage Management (Oracle ASM) disk group discovered by the Oracle ASM instance on the node.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Cluster-wide number assigned to the disk group (primary key)
NAME	VARCHAR2 (30)	Name of the disk group
SECTOR_SIZE	NUMBER	Physical block size (in bytes)

Column	Datatype	Description
LOGICAL_SECTOR_SIZE	NUMBER	<p>This column represents the logical sector size value of the disk group in bytes. This is the smallest possible I/O that can be done in this disk group. Any I/O smaller than the logical sector size will cause an assert in the code.</p> <p>If the value of the LOGICAL_SECTOR_SIZE column is 512, while the value in the SECTOR_SIZE column is 4096, then the disk group supports 512 sector size emulation. This means that I/O operations can be both 512 or 4096 aligned. For example, this means that you can have redo log files with a file block size of 512 bytes in this disk group that can be both read and written to, as well as create new redo log files with a file block size of 4096 bytes.</p>
BLOCK_SIZE	NUMBER	Oracle ASM metadata block size (in bytes)
ALLOCATION_UNIT_SIZE	NUMBER	Size of the allocation unit (in bytes)
STATE	VARCHAR2 (11)	<p>State of the disk group relative to the instance:</p> <ul style="list-style-type: none"> • BROKEN - Database instance lost connectivity to the Oracle ASM instance that mounted the disk group • CONNECTED - Disk group is in use by the database instance • DISMOUNTED - Disk group was cleanly dismounted by the Oracle ASM instance following a successful mount • MOUNTED - Instance is successfully serving the disk group to its database clients • QUIESCING - CRSCTL utility attempted to dismount a disk group that contains the Oracle Cluster Registry (OCR). The disk group cannot be dismounted until Cluster Ready Services (CRS) exits, because the disk group contains the OCR. • RESTRICTED - A disk group mounted in this mode can only be seen by this Oracle ASM instance for maintenance purposes • UNKNOWN - Oracle ASM instance has never attempted to mount the disk group
TYPE	VARCHAR2 (6)	<p>Redundancy type for the disk group:</p> <ul style="list-style-type: none"> • EXTEND • EXTERN • FLEX • HIGH • NORMAL
TOTAL_MB	NUMBER	Total capacity of the disk group, excluding that of quorum disks (in megabytes)
FREE_MB	NUMBER	Unused capacity of the disk group (in megabytes)
HOT_USED_MB	NUMBER	Number of used megabytes in the hot region
COLD_USED_MB	NUMBER	Number of used megabytes in the cold region
REQUIRED_MIRROR_FREE_MB	NUMBER	Amount of space that is required to be available in a given disk group in order to restore redundancy after one or more disk failures. The amount of space displayed in this column takes mirroring effects into account.
USABLE_FILE_MB	NUMBER	Amount of free space that can be safely utilized taking mirroring into account and yet be able to restore redundancy after a disk failure
OFFLINE_DISKS	NUMBER	Number of disks in the disk group that are currently offline
COMPATIBILITY	VARCHAR2 (60)	Minimum software version required for an Oracle ASM instance to mount this disk group
DATABASE_COMPATIBILITY	VARCHAR2 (60)	Minimum software version required for a database instance to use files in this disk group

Column	Datatype	Description
VOTING_FILES	VARCHAR2(1)	Indicates whether the disk contains voting files (Y) or not (N)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

Note:

The GROUP_NUMBER, TOTAL_MB, and FREE_MB columns are only meaningful if the disk group is mounted by the instance. Otherwise, their values will be 0.

Note:

This view performs disk discovery every time it is queried. Because performing disk discovery is very resource intensive, Oracle recommends against using this view for monitoring scripts. Instead, use the less expensive view [V\\$ASM_DISKGROUP_STAT](#).

See Also:

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.68 V\$ASM_DISKGROUP_STAT

V\$ASM_DISKGROUP_STAT displays performance statistics in the same way that V\$ASM_DISKGROUP does, but without performing discovery of new disk groups.

This results in a less expensive operation. However, since discovery is not performed, the output of this view does not include any data about disk groups that are new to the system.

The columns for V\$ASM_DISKGROUP_STAT are the same as those for V\$ASM_DISKGROUP.

See Also:

"V\$ASM_DISKGROUP"

7.69 V\$ASM_ESTIMATE

V\$ASM_ESTIMATE displays an estimate of the work involved in execution plans for Oracle Automatic Storage Management (Oracle ASM) disk group rebalance and resync operations.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Oracle ASM disk group number
STATEMENT_ID	VARCHAR2(30)	Value of the optional STATEMENT_ID parameter specified in the EXPLAIN WORK statement
TIMESTAMP	DATE	Date and time when the EXPLAIN WORK statement was issued
EST_WORK	NUMBER	Estimated number of Allocation Units that have to be moved by the operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data For this view, the value is always 0.

 **See Also:**

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.70 V\$ASM_FILE

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_FILE displays one row for each file in each disk group mounted by the Oracle ASM instance.

For example, if there are three disk groups and five files in each, fifteen rows are displayed (unless the query is qualified with a WHERE clause).

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Number of the disk group containing the file (composite primary key)
FILE_NUMBER	NUMBER	Number of the file within the disk group (composite primary key)
COMPOUND_INDEX	NUMBER	A 32-bit number consisting of a disk group number in the high-order 8 bits and a file number in the low-order 24 bits (for efficient access to the view)
INCARNATION	NUMBER	Incarnation number for the file (composite primary key)
BLOCK_SIZE	NUMBER	Block size of the file (in bytes)
BLOCKS	NUMBER	Number of blocks in the file
BYTES	NUMBER	Number of bytes in the file
SPACE	NUMBER	Number of bytes allocated to the file

Column	Datatype	Description
TYPE	VARCHAR2 (64)	Type of the file. Possible values are as follows: <ul style="list-style-type: none">• ARCHIVELOG• AUTOBACKUP• BACKUPSET• CHANGETRACKING• CONTROLFILE• DATAFILE• DATAGUARDCONFIG• DUMPSET• FLASHBACK• ONLINELOG• PARAMETERFILE• TEMPFILE• XTRANSPORT
REDUNDANCY	VARCHAR2 (6)	Redundancy of the file: <ul style="list-style-type: none">• HIGH• MIRROR• PARITY• UNPROT
STRIPED	VARCHAR2 (6)	Indicates how the file is striped: <ul style="list-style-type: none">• FINE• COARSE
CREATION_DATE	DATE	Date on which the file was created
MODIFICATION_DATE	DATE	Date of the last open/close for writing, rounded back to the nearest hour
REDUNDANCY_LOWERED	VARCHAR2 (1)	Indicates whether a file has lower redundancy than what was expected (Y) or not (N). Redundancy is said to have been lowered for a file when one or more data extents in that file are not mirrored at the level specified by the administrator. In case of unprotected files, data extents could be missing altogether. Another possible value for this column is (U), which means that it is unknown.
PERMISSIONS	VARCHAR2 (16)	This column is deprecated, and it always displays a value of U.
USER_NUMBER	NUMBER	Access permissions of the file, in order of user, group, and other
USER_INCARNATION	NUMBER	User number
USERGROUP_NUMBER	NUMBER	Incarnation number of the user
USERGROUP_INCARNATION	NUMBER	User group number
PRIMARY_REGION	VARCHAR2 (4)	Incarnation number of the user group
MIRROR_REGION	VARCHAR2 (4)	Region used for allocating primary extents: <ul style="list-style-type: none">• HOT• COLD
HOT_READS	NUMBER	Region for allocating mirrored extents: <ul style="list-style-type: none">• HOT• COLD
HOT_WRITES	NUMBER	Number of reads from the hot region for the file
HOT_BYTES_READ	NUMBER	Number of writes to the hot region for the file
HOT_BYTES_WRITTEN	NUMBER	Number of bytes read from the hot region for the file
COLD_READS	NUMBER	Number of bytes written to the hot region for the file
		Number of reads from the cold region for the file

Column	Datatype	Description
COLD_WRITES	NUMBER	Number of writes to the cold region for the file
COLD_BYTES_READ	NUMBER	Number of bytes read from the cold region for the file
COLD_BYTES_WRITTEN	NUMBER	Number of bytes written to the cold region for the file
FILEGROUP_NUMBER	NUMBER	Shows the number of the associated file group
FILEGROUP_INCARNATION	NUMBER	The incarnation number for the file group the file belongs to in a flex redundancy disk group
REMIRROR	VARCHAR2(1)	This column has the value <code>Y</code> when rebalance is needed for the file after a redundancy change in a flex redundancy disk group, <code>N</code> otherwise. A redundancy change can occur when the file is moved to a file group with a different redundancy, or when the redundancy property of the file group is changed. After rebalance is run for the file, the value changes to <code>N</code> .
PARENT_FILNUM	NUMBER	For internal use only.
PARENT_FILNUMINC	NUMBER	For internal use only.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data For this view, the value is always 0.

 **See Also:**

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.71 V\$ASM_FILEGROUP

V\$ASM_FILEGROUP describes the properties of the Oracle Automatic Storage Management (Oracle ASM) File Groups.

In both Oracle ASM and Oracle Database instances, V\$ASM_FILEGROUP displays one row for every File Group present in every Disk Group mounted by the Oracle ASM instance. File Groups are only displayed for Disk Groups where COMPATIBLE.ASM is set to 12.2 or higher.

 **Note:**

There will not be an entry for the default File Group.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Number of the Disk Group in which this File Group exists (composite primary key)
FILEGROUP_NUMBER	NUMBER	Number associated to the File Group within its Disk Group (composite primary key)
INCARNATION	NUMBER	Incarnation number for the File Group (composite primary key)
COMPOUND_INDEX	NUMBER	A 32-bit number consisting of a Disk Group number in the high-order bits and a File Group number in the low-order 24 bits (for efficient access to the view)
NAME	VARCHAR2 (128)	Name of the File Group
CLIENT_TYPE	NUMBER	Type of client that the File Group is associated to: <ul style="list-style-type: none"> • DATABASE • CLUSTER • VOLUME
CLIENT_NAME	VARCHAR2 (128)	Name of the client (database, PDB, CDB, cluster, or volume) that the File Group is associated to
GUID	VARCHAR2 (32)	If the CLIENT_TYPE is DATABASE: <ul style="list-style-type: none"> • In a CDB environment, it is the GUID of the PDB or CDB associated with the file group, the same value as the GUID in V\$CONTAINERS. • In a non-CDB environment it is the database identifier (DBID) of the database associated with that file group. If the CLIENT_TYPE is VOLUME or CLUSTER, the GUID column is empty.
QUOTAGROUP_NUMBER	NUMBER	Number of the quota group associated with this File Group (foreign key to the V\$ASM_QUOTAGROUP view)
QUOTAGROUP_INCARNATION	NUMBER	Incarnation number for the Quota Group
USED_QUOTA_MB	NUMBER	Used quota of the quota group in GB
USER_NUMBER	NUMBER	User number
USER_INCARNATION	NUMBER	Incarnation number of the user
USERGROUP_NUMBER	NUMBER	User group number
USERGROUP_INCARNATION	NUMBER	Incarnation number of the user group
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

["V\\$ASM_FILEGROUP_PROPERTY"](#)

7.72 V\$ASM_FILEGROUP_FILE

V\$ASM_FILEGROUP_FILE lists all the Oracle Automatic Storage Management (Oracle ASM) files associated with each File Group.

In both Oracle ASM and Oracle Database instances, V\$ASM_FILEGROUP_FILE will display one row for every file associated with a File Group contained in every Disk Group mounted by the instance.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Number of the Disk Group in which this File Group exists
FILEGROUP_NUMBER	NUMBER	Number associated to the File Group within its Disk Group
FILEGROUP_INCAR	NUMBER	Incarnation number for the File Group
FILE_NUMBER	NUMBER	Number associated to the ASM File (same file number as in V\$ASM_FILE)
INCARNATION	NUMBER	Incarnation number for the ASM File
COMPOUND_INDEX	NUMBER	A 32-bit number consisting of a Disk Group number in the high-order 8 bits and a File number in the low-order 24 bits (for efficient access to the view)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

- "[V\\$ASM_FILE](#)"
- "[V\\$ASM_FILEGROUP](#)"

7.73 V\$ASM_FILEGROUP_PROPERTY

V\$ASM_FILEGROUP_PROPERTY describes all the properties of every Oracle Automatic Storage Management (Oracle ASM) File Group.

In both Oracle ASM and Oracle Database instances, V\$ASM_FILEGROUP_PROPERTY will display one row for every property of every file type of every File Group contained in every Disk Group mounted by the instance.

File Group properties are only displayed for File Groups on Disk Groups where COMPATIBLE.ASM is set to 12.2 or higher.

 **Note:**

There will not be an entry for the default File Group.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Number of the Disk Group in which this File Group exists (composite primary key)
FILEGROUP_NUMBER	NUMBER	Number associated to the File Group within its Disk Group (composite primary key)
COMPOUND_INDEX	NUMBER	A 32-bit number consisting of a Disk Group number in the high-order 8 bits and a Property Number in the low-order 24 bits (for efficient access to the view)
PROPERTY_INDEX	NUMBER	Number of this property in the Disk Group for the File Group (composite primary key)
INCARNATION	NUMBER	Incarnation number for this property (composite primary key)
FILE_TYPE	VARCHAR2 (30)	Type of file the property will be applied to: <ul style="list-style-type: none"> • ARCHIVELOG • ASMPARAMETERFILE • ASMVDRL • ASMVOL • AUDIT_SPILLFILES • AUTOBACKUP • BACKUPSET • CHANGETRACKING • CONTAINER • CONTROLFILE • DATAFILE • DATAGUARDCONFIG • DUMPSET • FLASHBACK • FLASHFILE • KEY_STORE • OCRBACKUP • OCRFILE • ONLINELOG • PARAMETERFILE • TEMPFILE • VOTINGFILE • XTRANSPORT
NAME	VARCHAR2 (64)	The value can be NULL for properties with a File Group granularity. Full name of the property. Possible values: <ul style="list-style-type: none"> • COMPATIBLE.CLIENT • DBCLONE_STATUS • OWNER • PARENT_FILEGROUP_NUMBER • POWER_LIMIT • PRIORITY • REDUNDANCY • STRIPING • USER_GROUP

Column	Datatype	Description
VALUE	VARCHAR2 (256)	<p>Value of the property</p> <p>See <i>Oracle Automatic Storage Management Administrator's Guide</i> for information about file group property values.</p>
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

["V\\$ASM_FILEGROUP"](#)

7.74 V\$ASM_FILESYSTEM

V\$ASM_FILESYSTEM displays information for every mounted Oracle ACFS.

Column	Datatype	Description
FS_NAME	VARCHAR2 (1024)	Mount point (primary key)
AVAILABLE_TIME	DATE	Mount time or the time that the file system became available again; NULL if the file system is not available
BLOCK_SIZE	NUMBER	File system block size (in kilobytes)
STATE	VARCHAR2 (13)	<p>File system status:</p> <ul style="list-style-type: none"> • NOT AVAILABLE • AVAILABLE • OFFLINE - Either the Oracle ASM instance is down, the disk group has been forced dismounted, or less commonly, a metadata I/O failure occurred or serious metadata corruption was detected. In the case of a metadata I/O failure, the file system is also marked as corrupt. An offline file system can only be unmounted; other attempts at access result in errors.
CORRUPT	VARCHAR2 (5)	Indicates whether the file system needs the fixer (fsck, acfschkdsk) to be run (TRUE) or not (FALSE)
NUM_VOL	NUMBER	Number of volumes in the file system
TOTAL_SIZE	NUMBER	Total capacity of the file system (in megabytes)
TOTAL_FREE	NUMBER	Total free space in the file system (in megabytes)
TOTAL_SNAP_SPACE_USAGE	NUMBER	Total space used by snapshots (in megabytes)
REPLSTATE	VARCHAR2 (7)	<p>Replication status:</p> <ul style="list-style-type: none"> • NO REPL - Replication is not initialized • PRIMARY - File system is initialized for replication as a primary • STANDBY - File system is initialized for replication as a standby

Column	Datatype	Description
RESIZE_STATE ¹	VARCHAR2(5)	Possible resize states: <ul style="list-style-type: none">• NONE - AutoResize not configured• AUTO - Equivalent to AutoResizeEnabled flag• ERROR - Equivalent to AutoResizeError flag
COMPRESS_STATE ¹	VARCHAR2(7)	Compression status of the file system. Possible values: <ul style="list-style-type: none">• DISABLED - Compression is not active• ENABLED - Compression is active• PARTIAL - Compression is disabled, but the file system may contain compressed files
FROZEN_STATE ¹	VARCHAR2(5)	Indicates whether the filesystem is frozen (TRUE) or not (FALSE)
ACFS_COMPATIBILITY ¹	VARCHAR2(60)	Oracle Release streams where Oracle ACFS has shipped
METADATA_BLOCK_SIZE ¹	NUMBER	Metadata block size of the file system. Possible values: <ul style="list-style-type: none">• 512• 4096
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data For this view, the value is always 0.

¹ This column is available starting with Oracle Database 19c.

7.75 V\$ASM_OPERATION

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_OPERATION displays one row for every active Oracle ASM long running operation executing in the Oracle ASM instance.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Disk group number (primary key). This is the foreign key to the V\$ASM_DISKGROUP view.

Column	Datatype	Description
OPERATION	CHAR (5)	<p>Type of the operation:</p> <ul style="list-style-type: none"> • REBAL - Rebalance pending for this group. The disk group is rebalancing. • REMIRROR - Remirror is pending for this group. • SCRUB - Scrubbing is pending for this group. <p>Starting with Oracle Database 12c, new queries should use the PASS column instead of this column.</p>
PASS	VARCHAR2 (9)	<p>Type of the operation:</p> <ul style="list-style-type: none"> • COMPACT - Oracle ASM is moving user data closer together, which improves performance by reducing seek distance • PREPARE - Completing work corresponding to the prepare SQL operation. This phase is enabled only for FLEX or EXTENDED redundancy disk groups and COMPATIBLE.ASM must be set to 12.2 or higher. • REBALANCE - Rebalance pending for this group. The disk group is rebalancing. • REBUILD - Restoring the redundancy of forcing disks. Forcing disks are those disks that have been dropped with the FORCE option. • RESILVER - This value appears in Oracle Exadata environments when WriteBack FlashCache is enabled • RESYNC - Resync operation in progress to bring one or more Oracle ASM disks online • SCRUBBING - The disk group is scrubbing. <p>Starting with Oracle Database 12c, new queries should use this column instead of the OPERATION column.</p>
STATE	VARCHAR2 (4)	<p>State of the operation:</p> <ul style="list-style-type: none"> • WAIT - No operations running for the group • EST - An estimate is computed on the amount of work to be done for the rebalance • RUN - Operation running for the group • REAP - Operation is being run down • DONE - Displayed for a pass that is complete • ERRS - Operation halted by errors <p>Estimates are computed in parallel in the background while the work is being executed. Thus, the transition from the EST to the RUN state may be extremely fast.</p>
POWER	NUMBER	<p>Power requested for the operation as specified by the ASM_POWER_LIMIT initialization parameter or command syntax. Or, power requested for the operation as specified by the power option of the scrubbing SQL syntax.</p>
ACTUAL	NUMBER	<p>Power allocated to the operation</p>
SOFAR	NUMBER	<p>Number of Allocation Units that are being moved per minute by the operation. Or, the number of Allocation Units that have been scrubbed so far.</p>
EST_WORK	NUMBER	<p>Estimated number of Allocation Units that have to be moved by the operation. Or, the estimated number of Allocation Units that have to be scrubbed by the scrubbing operation.</p>
EST_RATE	NUMBER	<p>Estimated number of Allocation Units that are being moved per minute by the operation</p>
EST_MINUTES	NUMBER	<p>Estimated amount of time (in minutes) that the remainder of the operation is expected to take</p>

Column	Datatype	Description
ERROR_CODE	VARCHAR2 (44)	Oracle external error code; NULL if no error
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

7.76 V\$ASM_QUOTAGROUP

V\$ASM_QUOTAGROUP displays one row for every Oracle Automatic Storage Management (Oracle ASM) quota group discovered by the Oracle ASM instance on the node.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Number of the disk group containing the quota group (composite primary key)
QUOTAGROUP_NUMBER	NUMBER	Number of the quota group within the disk group (composite primary key)
INCARNATION	NUMBER	Incarnation of the quota group (composite primary key)
NAME	VARCHAR2 (30)	Name of the quota group
USED_QUOTA_MB	NUMBER	Used quota of the quota group in GB
QUOTA_LIMIT_MB	NUMBER	Quota limit (capacity) of the quota group in GB
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.77 V\$ASM_TEMPLATE

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_TEMPLATE displays one row for every template present in every disk group mounted by the Oracle ASM instance.

In a database instance, V\$ASM_TEMPLATE displays one row for every template present in every disk group mounted by the Oracle ASM instance with which the database instance communicates.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Owning disk group number (foreign key to the V\$ASM_DISKGROUP view)
ENTRY_NUMBER	NUMBER	Template number (primary key)
REDUNDANCY	VARCHAR2 (6)	Redundancy of the template: <ul style="list-style-type: none"> • HIGH • MIRROR • PARITY • UNPROT
STRIPE	VARCHAR2 (6)	Indicates how the template is striped: <ul style="list-style-type: none"> • FINE • COARSE
SYSTEM	VARCHAR2 (1)	Indicates whether the template is a system template (Y) or not (N)
NAME	VARCHAR2 (30)	Name of the template
PRIMARY_REGION	VARCHAR2 (4)	Region used for allocating primary extents: <ul style="list-style-type: none"> • HOT • COLD
MIRROR_REGION	VARCHAR2 (4)	Region for allocating mirrored extents: <ul style="list-style-type: none"> • HOT • COLD
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.78 V\$ASM_USER

V\$ASM_USER displays the effective operating system user names of connected database instances and of file owners.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Oracle ASM disk group number
USER_NUMBER	NUMBER	Oracle ASM internal unique user number
COMPOUND_INDEX	NUMBER	A 32-bit number consisting of a disk group number in the high-order 8 bits and a user number in the low-order 24 bits (for efficient access to the view)
INCARNATION	NUMBER	Incarnation number of the user
CLUSTER_ID	VARCHAR2(128)	Oracle ASM cluster ID. The CLUSTER_ID and OS_NAME pair can be used to uniquely identify a user.
OS_ID	VARCHAR2(128)	Operating system user ID
OS_NAME	VARCHAR2(33)	Operating system user name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data For this view, the value is always 0.

See Also:

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.79 V\$ASM_USERGROUP

V\$ASM_USERGROUP displays the creator for each Oracle Automatic Storage Management (Oracle ASM) File Access Control group.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Oracle ASM disk group number
USERGROUP_NUMBER	NUMBER	Number of the user group
COMPOUND_INDEX	NUMBER	A 32-bit number consisting of a disk group number in the high-order 8 bits and a user group number in the low-order 24 bits (for efficient access to the view)
INCARNATION	NUMBER	Incarnation number of the user group
OWNER_NUMBER	NUMBER	User group owner identified by a unique number
OWNER_INCARNATION	NUMBER	Incarnation number of the user group owner

Column	Datatype	Description
NAME	VARCHAR2 (64)	User group name
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.80 V\$ASM_USERGROUP_MEMBER

V\$ASM_USERGROUP_MEMBER displays the members for each Oracle Automatic Storage Management (Oracle ASM) File Access Control group.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Oracle ASM disk group number
MEMBER_NUMBER	NUMBER	Number of the user group member
MEMBER_INCARNATION	NUMBER	Incarnation number of the user group member
USERGROUP_NUMBER	NUMBER	User group number
USERGROUP_INCARNATION	NUMBER	Incarnation number of the user group
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data <p>For this view, the value is always 0.</p>

 **See Also:**

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.81 V\$ASM_VOLUME

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_VOLUME displays information about each Oracle ADVM volume.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Cluster-wide number assigned to the disk group (composite primary key)
VOLUME_NAME	VARCHAR2 (30)	Name of the volume
COMPOUND_INDEX	NUMBER	A 32-bit number consisting of a disk group number in the high-order 8 bits and a volume number in the low-order 24 bits (for efficient access to the view)
SIZE_MB	NUMBER	Size of the volume (in megabytes)
VOLUME_NUMBER	NUMBER	Number of the Volume within the disk group (composite primary key)
REDUNDANCY	VARCHAR2 (6)	Redundancy type for the volume: <ul style="list-style-type: none"> • UNPROT • HIGH • MIRROR
STRIPE_COLUMNS	NUMBER	Number of columns in a stripe set
STRIPE_WIDTH_K	NUMBER	Stripe width of the volume (in kilobytes)
STATE	VARCHAR2 (8)	Indicates whether the volume is enabled (ENABLED), disabled (DISABLED), or remote (REMOTE)
FILE_NUMBER	NUMBER	Volume file number
INCARNATION	NUMBER	Volume file incarnation number
DRL_FILE_NUMBER	NUMBER	Volume Dirty Region Logging (DRL) file used for mirrored volumes
RESIZE_UNIT_MB	NUMBER	Volume allocation unit (in megabytes) that a volume can be created
USAGE	VARCHAR2 (30)	Optional usage string for the volume
VOLUME_DEVICE	VARCHAR2 (256)	OSD path for the volume device
MOUNTPATH	VARCHAR2 (1024)	Optional mount path string for the volume
PRIMARY_REGION	VARCHAR2 (4)	Region used for allocating primary extents: <ul style="list-style-type: none"> • HOT • COLD
MIRROR_REGION	VARCHAR2 (4)	Region used for allocating mirrored extents: <ul style="list-style-type: none"> • HOT • COLD
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data For this view, the value is always 0.

 See Also:

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.82 V\$ASM_VOLUME_STAT

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM_VOLUME_STAT displays information about statistics for each Oracle ADVM volume.

Column	Datatype	Description
GROUP_NUMBER	NUMBER	Cluster-wide number assigned to the disk group (composite primary key)
VOLUME_NAME	VARCHAR2 (30)	Name of the volume
COMPOUND_INDEX	NUMBER	A 32-bit number consisting of a disk group number in the high-order 8 bits and a volume number in the low-order 24 bits (for efficient access to the view)
VOLUME_NUMBER	NUMBER	Number of the Volume within the disk group (composite primary key)
READS	NUMBER	Total number of read requests for this volume
WRITES	NUMBER	Total number of write requests for this volume
READ_ERRS	NUMBER	Total number of failed read I/O operations for this volume
WRITE_ERRS	NUMBER	Total number of failed write I/O operations for this volume
READ_TIME	NUMBER	Total I/O time (in seconds) for read requests for this volume
WRITE_TIME	NUMBER	Total I/O time (in seconds) for write requests for this volume
BYTES_READ	NUMBER	Total number of bytes read for this volume
BYTES_WRITTEN	NUMBER	Total number of bytes written for this volume
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data For this view, the value is always 0.

 See Also:

Oracle Automatic Storage Management Administrator's Guide for additional information about using views to display Oracle ASM information

7.83 V\$AW_AGGREGATE_OP

V\$AW_AGGREGATE_OP displays the aggregation operators available in analytic workspaces. You can use this view in an application to provide a list of choices.

Column	Datatype	Description
NAME	VARCHAR2 (14)	Keyword for the aggregation operator
LONGNAME	VARCHAR2 (30)	Descriptive name for the operator
DEFAULT_WEIGHT	NUMBER	Default weight factor for weighted operators
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.84 V\$AW_ALLOCATE_OP

V\$AW_ALLOCATE_OP displays the allocation operators available in analytic workspaces. You can use this view in an application to provide a list of choices.

Column	Datatype	Description
NAME	VARCHAR2 (14)	Keyword for the allocation operator
LONGNAME	VARCHAR2 (30)	Descriptive name for the operator
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.85 V\$AW_CALC

V\$AW_CALC reports on the effectiveness of various caches used by Oracle OLAP during dynamic aggregation.

Column	Datatype	Description
SESSION_ID	NUMBER	A unique numeric identifier for the session.
AGGREGATE_CACHE_HITS	NUMBER	The number of times a dimension member is found in the aggregate cache (a hit).
		The number of hits for run-time aggregation can be increased by fetching data across the dense dimension
AGGREGATE_CACHE_MISSES	NUMBER	The number of times a dimension member is not found in the aggregate cache and must be read from disk (a miss).
SESSION_CACHE_HITS	NUMBER	The number of times the data is found in the session cache (a hit).
SESSION_CACHE_MISSES	NUMBER	The number of times the data is not found in the session cache (a miss).

Column	Datatype	Description
POOL_HITS	NUMBER	The number of times the data is found in a page in the OLAP page pool (a hit).
POOL_MISSES	NUMBER	The number of times the data is not found in the OLAP page pool (a miss).
POOL_NEW_PAGES	NUMBER	The number of newly created pages in the OLAP page pool that have not yet been written to the workspace LOB.
POOL_RECLAIMED_PAGES	NUMBER	The number of previously unused pages that have been recycled with new data.
CACHE_WRITES	NUMBER	The number of times the data from the OLAP page pool has been written to the database cache.
POOL_SIZE	NUMBER	The number of kilobytes in the OLAP page pool.
CURR_DML_COMMAND	VARCHAR2 (64)	The command currently being executed.
PREV_DML_COMMAND	VARCHAR2 (64)	The command most recently completed.
AGGR_FUNC_LOGICAL_NA	NUMBER	The number of times the aggregation engine returns a logical NA because the AGGINDEX option is on and the composite tuple does not exist.
AGGR_FUNC_PRECOMPUTE	NUMBER	The number of times the aggregation engine finds a value in a position that it was called to calculate.
AGGR_FUNC_CALCS	NUMBER	The number of times the aggregation engine calculates a parent value based on the values of its children.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.86 V\$AW_LONGOPS

V\$AW_LONGOPS displays status information about active SQL cursors initiated in an analytic workspace.

Column	Datatype	Description
SESSION_ID	NUMBER	Identifier for the session in which the fetch is executing. This table can be joined with V\$SESSION to obtain the user name.
CURSOR_NAME	VARCHAR2 (64)	Name assigned to the cursor

Column	Datatype	Description
COMMAND	VARCHAR2 (17)	Command that is actively fetching data from relational tables: <ul style="list-style-type: none"> • QUERY • FETCH • IMPORT • EXECUTE • UPDATE • SOLVE • CLEAR • LOAD CUBE • LOAD DIMENSION • DIMENSION COMPILE
STATUS	VARCHAR2 (9)	Status of the current operation: <ul style="list-style-type: none"> • EXECUTING - Command has begun executing • FETCHING - Data is being fetched into the analytic workspace • FINISHED - Command has finished executing. This status appears very briefly before the record disappears from the table.
ROWS_PROCESSED	NUMBER	Number of rows already inserted, updated, or deleted
SEQ_NUMBER	NUMBER	Sequence number in the Cube Build log
SQL_ID	VARCHAR2 (13)	SQL ID of the statement
TARGET	VARCHAR2 (64)	Operated object name
TARGET_DESC	VARCHAR2 (64)	A brief description of the operated object
START_TIME	DATE	Time the command started executing
LAST_UPDATE_TIME	DATE	Last updated time
ELAPSED_SECONDS	NUMBER	Number of seconds between START_TIME and LAST_UPDATE_TIME
SOFAR	NUMBER	Number of units so far
TOTALWORK	NUMBER	Total number of units
UNITS	VARCHAR2 (6)	Units description: <ul style="list-style-type: none"> • ROWS • NODES • VALUES
MESSAGE	VARCHAR2 (512)	Message for the user
USERNAME	VARCHAR2 (32)	User name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.87 V\$AW_OLAP

V\$AW_OLAP provides a record of active sessions and their use with analytic workspaces.

A row is generated whenever an analytic workspace is created or attached. The first row for a session is created when the first command is issued. It identifies the SYS.EXPRESS workspace,

which is attached automatically to each session. Rows related to a particular analytic workspace are deleted when the workspace is detached from the session or the session ends.

Column	Datatype	Description
SESSION_ID	NUMBER	A unique numeric identifier for a session
AW_NUMBER	NUMBER	A unique numeric identifier for an analytic workspace. To get the name of the analytic workspace, join this column to the AW_NUMBER column of the USER_AWS view or to the AWSEQ# column of the AW\$ table.
ATTACH_MODE	VARCHAR2(10)	READ ONLY or READ WRITE
GENERATION	NUMBER	The generation of an analytic workspace. Each UPDATE creates a new generation. Sessions attaching the same workspace between UPDATE commands share the same generation.
TEMP_SPACE_PAGES	NUMBER	The number of pages stored in temporary segments for the analytic workspace.
TEMP_SPACE_READS	NUMBER	The number of times data has been read from a temporary segment and not from the page pool.
LOB_READS	NUMBER	The number of times data has been read from the table where the analytic workspace is stored (the permanent LOB).
POOL_CHANGED_PAGES	NUMBER	The number of pages in the page pool that have been modified in this analytic workspace.
POOL_UNCHANGED_PAGES	NUMBER	The number of pages in the page pool that have not been modified in this analytic workspace.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.88 V\$AW_SESSION_INFO

V\$AW_SESSION_INFO provides information about each active session.

A transaction is a single exchange between a client session and Oracle OLAP. Multiple commands can execute within a single transaction.

Column	Datatype	Description
SESSION_ID	NUMBER	A unique numeric identifier for a session
CLIENT_TYPE	VARCHAR2(64)	OLAP
SESSION_STATE	VARCHAR2(64)	TRANSACTING, NOT_TRANSACTING, EXCEPTION_HANDLING, CONSTRUCTING, CONSTRUCTED, DECONSTRUCTING, or DECONSTRUCTED
SESSION_HANDLE	NUMBER	The session identifier
USERID	VARCHAR2(64)	The database user name under which the session opened
TOTAL_TRANSACTION	NUMBER	The total number of transactions executed within the session; this number provides a general indication of the level of activity in the session

Column	Datatype	Description
TRANSACTION_TIME	NUMBER	The elapsed time in milliseconds of the mostly recently completed transaction
TOTAL_TRANSACTION_TIME	NUMBER	The total elapsed time in milliseconds in which transactions were being executed
AVERAGE_TRANSACTION_TIME	NUMBER	The average elapsed time in milliseconds to complete a transaction
TRANSACTION_CPU_TIME	NUMBER	The total CPU time in milliseconds used to complete the most recent transaction
TOTAL_TRANSACTION_CPU_TIME	NUMBER	The total CPU time used to execute all transactions in this session; this total does not include transactions that are currently in progress
AVERAGE_TRANSACTION_CPU_TIME	NUMBER	The average CPU time to complete a transaction; this average does not include transactions that are currently in progress
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.89 V\$BACKUP

V\$BACKUP displays the backup status of all online data files.

Column	Datatype	Description
FILE#	NUMBER	File identifier
STATUS	VARCHAR2(18)	<p>File status: NOT ACTIVE, ACTIVE (backup in progress), OFFLINE NORMAL, or description of an error.</p> <p>NOT ACTIVE indicates that the file is not currently in backup mode (that is, an ALTER TABLESPACE ... BEGIN BACKUP or ALTER DATABASE BEGIN BACKUP statement has not been issued), whereas ACTIVE indicates that the file is currently in backup mode.</p>
CHANGE#	NUMBER	System change number when backup started
TIME	DATE	Time the backup started
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.90 V\$BACKUP_ARCHIVELOG_DETAILS

V\$BACKUP_ARCHIVELOG_DETAILS contains information about all restorable archive logs.

It will include all archived logs backed up in a backup set or proxy copies.

Column	Datatype	Description
BTYPE	CHAR (9)	Backup type container, either BACKUPSET or PROXYCOPY
BTYPE_KEY	NUMBER	Unique identifier for the backup type. For BACKUPSET, it is BS_KEY.
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp
ID1	NUMBER	If BACKUPSET, it contains SET_STAMP If PROXYCOPY, it is RECID from the control file
ID2	NUMBER	If BACKUPSET, it contains SET_COUNT If PROXYCOPY, it is STAMP
THREAD#	NUMBER	Thread number
SEQUENCE#	NUMBER	Sequence number
RESETLOGS_CHANGE#	NUMBER	Resetlogs change SCN
RESETLOGS_TIME	DATE	Resetlogs change time
FIRST_CHANGE#	NUMBER	First change SCN
FIRST_TIME	DATE	First change time
NEXT_CHANGE#	NUMBER	Next change SCN
NEXT_TIME	DATE	Next change time
FILESIZE	NUMBER	File size
COMPRESSION_RATIO	NUMBER	The ratio between the total blocks in the archive log and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.
FILESIZE_DISPLAY	VARCHAR2 (4000)	Same value as the FILESIZE column, but converted to a user-displayable format, for example nM, nG, nT, nP, and so on
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.91 V\$BACKUP_ARCHIVELOG_SUMMARY

V\$BACKUP_ARCHIVELOG_SUMMARY provides archive log summary information based on archive logs in the backup set or on proxy copies.

Column	Datatype	Description
NUM_FILES_BACKED	NUMBER	Number of files backed up
NUM_DISTINCT_FILES_BACKED	NUMBER	Number of distinct archive log files backed up
MIN_FIRST_CHANGE#	NUMBER	Lowest SCN range value
MAX_NEXT_CHANGE#	NUMBER	Highest SCN range value
MIN_FIRST_TIME	DATE	Lowest SCN range time

Column	Datatype	Description
MAX_NEXT_TIME	DATE	Highest SCN range time
INPUT_BYTES	NUMBER	Total input bytes read
OUTPUT_BYTES	NUMBER	Output size of backups
COMPRESSION_RATIO	NUMBER	The ratio between the total blocks in the archive log and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.
INPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for input bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.92 V\$BACKUP_ASYNC_IO

V\$BACKUP_ASYNC_IO displays performance information about ongoing and recently completed RMAN backups and restores.

For each backup, it contains one row for each input data file, one row for the aggregate total performance of all data files, and one row for the output backup piece. This data is not stored persistently, and is not preserved when the instance is re-started.

Column	Datatype	Description
SID	NUMBER	Oracle SID of the session doing the backup or restore
SERIAL	NUMBER	Use count for the SID doing the backup or restore
USE_COUNT	NUMBER	A counter that can be used to identify rows from different backup sets
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS record stamp
DEVICE_TYPE	VARCHAR2(17)	Device type where the file is located
TYPE	VARCHAR2(9)	INPUT, OUTPUT, or AGGREGATE
STATUS	VARCHAR2(11)	NOT STARTED, IN PROGRESS, or FINISHED
FILENAME	VARCHAR2(513)	Name of the backup file being read or written
SET_COUNT	NUMBER	Set count of the backup set being read or written
SET_STAMP	NUMBER	Set stamp of the backup set being read or written
BUFFER_SIZE	NUMBER	Size of the buffers being used to read/write the file, in bytes
BUFFER_COUNT	NUMBER	Number of buffers being used to read/write the file
TOTAL_BYTES	NUMBER	Total number of bytes that will be read or written for the file, if known. If not known, this column will be null
OPEN_TIME	DATE	Time the file was opened. If TYPE='AGGREGATE', then this is the time that the first file in the aggregate was opened

Column	Datatype	Description
CLOSE_TIME	DATE	Time the file was closed. If TYPE='AGGREGATE', then this is the time that the last file in the aggregate was closed
ELAPSED_TIME	NUMBER	Time, in hundredths of a second, that the file was open
MAXOPENFILES	NUMBER	Number of concurrently open DISK files. This value is only present in rows where TYPE='AGGREGATE'.
BYTES	NUMBER	Number of bytes read or written so far
EFFECTIVE_BYTES_PER_SECOND	NUMBER	I/O rate that was achieved with this device during this backup
IO_COUNT	NUMBER	Number of I/Os that were performed to this file
READY	NUMBER	Number of asynchronous requests for which a buffer was immediately ready for use
SHORT_WAITS	NUMBER	Number of times that a buffer was not immediately available, but a buffer became available after doing a nonblocking poll for I/O completion
SHORT_WAIT_TIME_TOTAL	NUMBER	Total time, in hundredths of a second, taken by nonblocking polls for I/O completion
SHORT_WAIT_TIME_MAX	NUMBER	Maximum time taken for a nonblocking poll for I/O completion, in hundredths of a second
LONG_WAITS	NUMBER	The number of times that a buffer was not immediately available, and only became available after a blocking wait was issued
LONG_WAIT_TIME_TOTAL	NUMBER	The total time, in hundredths of a second, taken by blocking waits for I/O completion
LONG_WAIT_TIME_MAX	NUMBER	The maximum time taken for a blocking wait for I/O completion, in hundredths of a second
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.93 V\$BACKUP_CONTROLFILE_DETAILS

V\$BACKUP_CONTROLFILE_DETAILS contains information about restorable control files.

It will include all the control files backed up in the backup set, image copies, and proxy copies.

Column	Datatype	Description
BTYPE	CHAR (9)	Backup type container. Possible values are BACKUPSET, IMAGECOPY, PROXYCOPY.
BTYPE_KEY	NUMBER	Unique identifier for the backup type, either BS_KEY or COPY_KEY.
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp

Column	Datatype	Description
ID1	NUMBER	If BACKUPSET, it contains SET_STAMP If IMAGECOPY or PROXYCOPY, it is RECID from the control file
ID2	NUMBER	If BACKUPSET, it contains SET_COUNT If IMAGECOPY or PROXYCOPY, it is STAMP
CREATION_TIME	DATE	File creation time
RESETLOGS_CHANGE#	NUMBER	Resetlogs change SCN
RESETLOGS_TIME	DATE	Resetlogs change time
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change SCN
CHECKPOINT_TIME	DATE	Checkpoint change time
FILESIZE	NUMBER	File size, in bytes, for the output of backing up this control file
COMPRESSION_RATIO	NUMBER	The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.
FILESIZE_DISPLAY	VARCHAR2(4000)	Same value as the FILESIZE column, but converted to a user-displayable format, for example nM, nG, nT, nP, and so on
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.94 V\$BACKUP_CONTROLFILE_SUMMARY

V\$BACKUP_CONTROLFILE_SUMMARY provides control file summary information, based on either a backup set of files, image copies, or proxy copies.

Column	Datatype	Description
NUM_FILES_BACKED	NUMBER	Number of files backed up for specific criteria
NUM_DISTINCT_FILES_BACKED	NUMBER	Number of distinct files backed up
MIN_CHECKPOINT_CHANGE#	NUMBER	Minimum checkpoint change number of the data file for specified criteria
MAX_CHECKPOINT_CHANGE#	NUMBER	Maximum checkpoint change number of the data file for specified criteria
MIN_CHECKPOINT_TIME	DATE	Minimum checkpoint time of the data file for specified criteria
MAX_CHECKPOINT_TIME	DATE	Maximum checkpoint time of the data file for specified criteria
INPUT_BYTES	NUMBER	Total input bytes of files read
OUTPUT_BYTES	NUMBER	Total output bytes written
COMPRESSION_RATIO	NUMBER	The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.
INPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for input bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.95 V\$BACKUP_COPY_DETAILS

V\$BACKUP_COPY_DETAILS contains information about all available control file and data file copies.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp
COPY_KEY	NUMBER	Unique identifier for this data file or control file copy
FILE#	NUMBER	Absolute data file number
NAME	VARCHAR2 (513)	File name of the data file copy. The maximum length of the name is dependent on your operating system.
TAG	VARCHAR2 (32)	Data file copy tag
CREATION_CHANGE#	NUMBER	Data file creation change number
CREATION_TIME	DATE	Data file creation timestamp
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change number of the data file when the copy was made
CHECKPOINT_TIME	DATE	Checkpoint timestamp of the data file when the copy was made
MARKED_CORRUPT	NUMBER	Number of blocks marked corrupt by this copy operation. That is, blocks that were not marked corrupted in the source data file, but were detected and marked as corrupted during the copy operation.
OUTPUT_BYTES	NUMBER	Total output bytes written
COMPLETION_TIME	DATE	Time when the copy was completed
CONTROLFILE_TYPE	VARCHAR2 (1)	Type of control file. B indicates normal copies. S indicates standby copies.
KEEP	VARCHAR2 (3)	(YES NO) Indicates whether or not this backup set has a retention policy that is different than the value for the configure retention policy
KEEP_UNTIL	DATE	If specified, this is the date after which the backup becomes obsolete. If this column is null, then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (11)	<p>Lists additional retention options for this backup set. Possible values are:</p> <ul style="list-style-type: none"> • LOGS - The logs needed to recover this backup set are kept • NOLOGS - The logs needed to recover this backup set are not kept
IS_RECOVERY_DEST_FILE	VARCHAR2 (3)	Indicates whether the file was created in the fast recovery area (YES) or not (NO)
SPARSE_BACKUP	VARCHAR2 (3)	Indicates whether the file is sparse (YES) or not (NO)

Column	Datatype	Description
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Size of backup set to display
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

7.96 V\$BACKUP_COPY_SUMMARY

V\$BACKUP_COPY_SUMMARY provides summary information for the output data file and control file copy.

Column	Datatype	Description
NUM_COPIES	NUMBER	Number of copies created
NUM_DISTINCT_COPIES	NUMBER	Number of distinct copies (that contain data files with different checkpoints)
MIN_CHECKPOINT_CHANGE#	NUMBER	Minimum checkpoint change SCN
MAX_CHECKPOINT_CHANGE#	NUMBER	Maximum checkpoint change SCN
MIN_CHECKPOINT_TIME	DATE	Minimum checkpoint change time
MAX_CHECKPOINT_TIME	DATE	Maximum checkpoint change time
OUTPUT_BYTES	NUMBER	Total number of output bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

7.97 V\$BACKUP_CORRUPTION

V\$BACKUP_CORRUPTION displays information about corrupt block ranges in data file backups from the control file.

Note that corruptions are not tolerated in the control file and archived redo log backups.

Column	Datatype	Description
RECID	NUMBER	Backup corruption record ID
STAMP	NUMBER	Backup corruption record stamp
SET_STAMP	NUMBER	Backup set stamp
SET_COUNT	NUMBER	Backup set count

Column	Datatype	Description
PIECE#	NUMBER	backup piece that contains this corrupt block
FILE#	NUMBER	Absolute file number of the data file that contains the corrupt blocks
BLOCK#	NUMBER	Block number of the first corrupt block in the range of corrupted blocks
BLOCKS	NUMBER	Number of corrupted blocks found starting with BLOCK#
CORRUPTION_CHANGE#	NUMBER	Change number at which the logical corruption was detected. Set to 0 to indicate media corruption.
MARKED_CORRUPT	VARCHAR2 (3)	Indicates whether this corruption was not previously detected by the Oracle Database (YES) or the Oracle Database had already discovered this corrupt block and marked it as corrupt (NO). Note that when a corrupt block is encountered in a backup, and was not already marked corrupt by the Oracle Database, then the backup process does not mark the block as corrupt in the production data file. Thus, this field may be YES for the same block in more than one backup set.
CORRUPTION_TYPE	VARCHAR2 (9)	Type of block corruption in the data file: <ul style="list-style-type: none"> • ALL_ZERO - Block header on disk contained only zeros. The block may be valid if it was never filled and if it is in an Oracle7 file. The buffer will be reformatted to the Oracle8 standard for an empty block. • FRACTURED - Block header looks reasonable, but the front and back of the block are different versions. • CHECKSUM - optional check value shows that the block is not self-consistent. It is impossible to determine exactly why the check value fails, but it probably fails because sectors in the middle of the block are from different versions. • CORRUPT - Block is wrongly identified or is not a data block (for example, the data block address is missing) • LOGICAL - Block is logically corrupt • NOLOGGING - Block does not have redo log entries (for example, NOLOGGING operations on primary database can introduce this type of corruption on a physical standby)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.98 V\$BACKUP_DATAFILE

V\$BACKUP_DATAFILE displays information about control files and data files in backup sets from the control file.

Column	Datatype	Description
RECID	NUMBER	Backup data file record ID
STAMP	NUMBER	Backup data file record stamp
SET_STAMP	NUMBER	Backup set stamp
SET_COUNT	NUMBER	Backup set count

Column	Datatype	Description
FILE#	NUMBER	Data file number; set to 0 for control file
CREATION_CHANGE#	NUMBER	Creation system change number (SCN) of the data file
CREATION_TIME	DATE	Creation timestamp of the data file
RESETLOGS_CHANGE#	NUMBER	Resetlogs system change number (SCN) of the data file when it was backed up
RESETLOGS_TIME	DATE	Resetlogs timestamp of the data file when it was backed up
INCREMENTAL_LEVEL	NUMBER	Normal full backups have a NULL value, level 0 incremental backups have a value of 0, and level 1 incremental backups have a value of 1
INCREMENTAL_CHANGE#	NUMBER	All blocks changed after the incremental change number is included in this backup; set to 0 for a full backup
CHECKPOINT_CHANGE#	NUMBER	All changes up to the checkpoint change number are included in this backup
CHECKPOINT_TIME	DATE	Timestamp of the checkpoint
ABSOLUTE_FUZZY_CHANGE#	NUMBER	Highest change number in this backup
MARKED_CORRUPT	NUMBER	Number of blocks marked corrupt
MEDIA_CORRUPT	NUMBER	Number of blocks media corrupt
LOGICALLY_CORRUPT	NUMBER	Number of blocks logically corrupt
DATAFILE_BLOCKS	NUMBER	Size of the data file in blocks at backup time. This value is also the number of blocks taken by the data file restarted from this backup.
BLOCKS	NUMBER	Size of the backup data file (in blocks). Unused blocks are not copied to the backup.
BLOCK_SIZE	NUMBER	Block size
OLDEST_OFFLINE_RANGE	NUMBER	RECID of the oldest offline range record in this backup control file. 0 for data file backups.
COMPLETION_TIME	DATE	Time completed
CONTROLFILE_TYPE	VARCHAR2(1)	B - Normal copies S - Standby copies
USED_CHANGE_TRACKING	VARCHAR2(3)	Indicates whether change tracking data was used to accelerate this incremental backup (YES) or whether change tracking data was not used (NO)
BLOCKS_READ	NUMBER	Number of blocks that were scanned while taking this backup. If this was an incremental backup, and change tracking was used to optimize the backup, then the value of this column will be smaller than DATAFILE_BLOCKS. Otherwise, the value of this column will be the same as DATAFILE_BLOCKS. Even when change tracking data is used, the value of this column may be larger than BLOCKS, because the data read by change tracking is further refined during the process of creating an incremental backup.
USED_OPTIMIZATION	VARCHAR2(3)	Indicates whether backup optimization was applied (YES) or not (NO)
FOREIGN_DBID	NUMBER	Foreign DBID of the database from which this data file was transported. The value is 0 if the file backed up is not a foreign database file.
PLUGGED_READONLY	VARCHAR2(3)	YES if this is a backup of a transported read-only foreign file; otherwise NO.
PLUGIN_CHANGE#	NUMBER	SCN at which the foreign data file was transported into the database. The value is 0 if this file is not a foreign database file.

Column	Datatype	Description
PLUGIN_RESETLOGS_CHANGE#	NUMBER	The SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_TIME	DATE	The time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
SECTION_SIZE	NUMBER	Specifies the number of blocks in each section of a multisection backup. Value is 0 for whole file backups.
UNDO_OPTIMIZED	VARCHAR2 (3)	Indicates whether undo blocks were ignored when creating the backup data file (YES) or not (NO)
BLOCKS_SKIPPED_IN_CELL	NUMBER	Number of blocks that were not backed up because they were skipped by the Exadata cell See Also: Oracle Exadata Storage Server Software documentation for more information
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
BACKED_BY_PDB	VARCHAR2 (3)	Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none">• YES: The backup was taken when connected to the PDB• NO: The backup was taken when connected to the root container
SPARSE_BACKUP	VARCHAR2 (3)	Indicates whether the file is sparse (YES) or not (NO)
GUID	RAW (16)	The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.

7.99 V\$BACKUP_DATAFILE_DETAILS

V\$BACKUP_DATAFILE_DETAILS contains information about restorable data files.

It will include all data files backed in the backup set, image copies, and proxy copies.

Column	Datatype	Description
BTYP	CHAR (9)	Backup type container. Possible values are: BACKUPSET, IMAGECOPY, PROXYCOPY.
BTYP_KEY	NUMBER	Unique identifier for the backup type. For BACKUPSET, it is BS_KEY.
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session record ID
SESSION_STAMP	NUMBER	Session stamp
ID1	NUMBER	If BACKUPSET, it contains SET_STAMP. If IMAGECOPY or PROXYCOPY, it is RECID from the control file.
ID2	NUMBER	If BACKUPSET, it contains SET_COUNT. If IMAGECOPY or PROXYCOPY, it is STAMP.

Column	Datatype	Description
FILE#	NUMBER	File number
CREATION_CHANGE#	NUMBER	File creation change SCN
CREATION_TIME	DATE	File creation time
RESETLOGS_CHANGE#	NUMBER	Resetlogs change SCN
RESETLOGS_TIME	DATE	Resetlogs change time
INCREMENTAL_LEVEL	NUMBER	Normal full backups have a NULL value, level 0 incremental backups have a value of 0, and level 1 incremental backups have a value of 1
INCREMENTAL_CHANGE#	NUMBER	Incremental change SCN
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change SCN
CHECKPOINT_TIME	DATE	Checkpoint change time
MARKED_CORRUPT	NUMBER	Number of blocks marked corrupt
FILESIZE	NUMBER	File size, in bytes
COMPRESSION_RATIO	NUMBER	The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.
SPARSE_BACKUP	VARCHAR2(3)	Indicates whether the file is sparse (YES) or not (NO)
TS#	NUMBER	Tablespace number
TSNAME	VARCHAR2(30)	Tablespace name
FILESIZE_DISPLAY	VARCHAR2(4000)	Same value as the FILESIZE column, but converted to a user-displayable format, for example nM, nG, nT, nP, and so on
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.100 V\$BACKUP_DATAFILE_SUMMARY

V\$BACKUP_DATAFILE_SUMMARY provides summary information for a specific criteria set, based on a backup job, a time range applicable to jobs, or a specific data file).

Column	Datatype	Description
NUM_FILES_BACKED	NUMBER	Number of files backed up for specified criteria
NUM_DISTINCT_FILES_BACKED	NUMBER	Number of distinct files backed up
NUM_DISTINCT_TS_BACKED	NUMBER	Number of distinct tablespaces backed up
MIN_CHECKPOINT_CHANGE#	NUMBER	Minimum checkpoint change number of the data file for specified criteria
MAX_CHECKPOINT_CHANGE#	NUMBER	Maximum checkpoint change number of the data file for specified criteria
MIN_CHECKPOINT_TIME	DATE	Minimum checkpoint time of the data file for specified criteria
MAX_CHECKPOINT_TIME	DATE	Maximum checkpoint time of the data file for specified criteria

Column	Datatype	Description
INPUT_BYTES	NUMBER	Total input bytes of files read
OUTPUT_BYTES	NUMBER	Total output bytes written
COMPRESSION_RATIO	NUMBER	The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.
INPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for input bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.101 V\$BACKUP_DEVICE

V\$BACKUP_DEVICE displays information about supported backup devices.

If a device type does not support named devices, then one row with the device type and a null device name is returned for that device type. If a device type supports named devices then one row is returned for each available device of that type. The special device type DISK is not returned by this view because it is always available.

Column	Datatype	Description
DEVICE_TYPE	VARCHAR2(17)	Type of the backup device
DEVICE_NAME	VARCHAR2(513)	Name of the backup device
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.102 V\$BACKUP_FILES

V\$BACKUP_FILES displays information about all RMAN backups (both image copies and backup sets) and archived logs.

This view simulates the LIST BACKUP and LIST COPY RMAN commands. This view requires that the database be set using the DBMS_RCMAN.SETDATABASE procedure.

Column	Datatype	Description
PKEY	NUMBER	Primary key for the backup

Column	Datatype	Description
BACKUP_TYPE	VARCHAR2 (32)	Type of the backup: <ul style="list-style-type: none"> • BACKUP SET • COPY • PROXY COPY
FILE_TYPE	VARCHAR2 (32)	Type of the file: <ul style="list-style-type: none"> • DATAFILE • CONTROLFILE • SPFILE • REDO LOG • ARCHIVED LOG • COPY (for an image copy backup) • PIECE (for a backup piece)
KEEP	VARCHAR2 (3)	Indicates whether the backup has a retention policy different from the value for CONFIGURE RETENTION POLICY (YES) or not (NO)
KEEP_UNTIL	DATE	If the KEEP UNTIL TIME clause of the BACKUP command was specified, then this column shows the date after which the backup becomes obsolete. If the column is null and KEEP_OPTIONS is not null, the backup never becomes obsolete.
KEEP_OPTIONS	VARCHAR2 (13)	KEEP options for the backup: <ul style="list-style-type: none"> • LOGS - RMAN keeps the logs needed to recover the backup • NOLOGS - RMAN does not keep the logs needed to recover the backup If this column is null, then the backup has no KEEP options and will be made obsolete based on the retention policy.
STATUS	VARCHAR2 (16)	Status of the backup: <ul style="list-style-type: none"> • AVAILABLE • UNAVAILABLE • EXPIRED • OTHER
FNAME	VARCHAR2 (1024)	Name of the file
TAG	VARCHAR2 (32)	Tag of the piece, copy, or proxy copy
MEDIA	VARCHAR2 (80)	Media ID of the piece or proxy copy
RECID	NUMBER	Recid of the record in the control file
STAMP	NUMBER	Stamp of the record in the control file
DEVICE_TYPE	VARCHAR2 (255)	Type of media device that stores the backup
BLOCK_SIZE	NUMBER	Block size for the backup (in bytes)
COMPLETION_TIME	DATE	Time when the backup completed
COMPRESSED	VARCHAR2 (3)	Indicates whether the backup piece is compressed (YES) or not (NO); valid only if FILE_TYPE is PIECE. Image copies cannot be compressed.
OBSOLETE	VARCHAR2 (3)	Indicates whether the backup piece or copy is obsolete (YES) or not (NO); valid only if FILE_TYPE is PIECE or COPY
BYTES	NUMBER	Size of the file (in bytes)
BS_KEY	NUMBER	Primary key of the backup set (valid only if BACKUP_TYPE is BACKUP_SET)
BS_COUNT	NUMBER	Count of the backup set from the control file record (valid only if BACKUP_TYPE is BACKUP_SET)
BS_STAMP	NUMBER	Stamp of the backup set from the control file record (valid only if BACKUP_TYPE is BACKUP_SET)

Column	Datatype	Description
BS_TYPE	VARCHAR2 (32)	Type of the backup set (valid only if BACKUP_TYPE is BACKUP_SET): <ul style="list-style-type: none"> • DATAFILE • ARCHIVED LOG
BS_INCR_TYPE	VARCHAR2 (32)	Incremental type of the backup set (valid only if BACKUP_TYPE is BACKUP_SET)
BS_PIECES	NUMBER	Number of backup pieces in the backup set (valid only if BACKUP_TYPE is BACKUP_SET)
BS_COPIES	NUMBER	Number of copies of the backup set (valid only if FILE_TYPE is PIECE and BACKUP_TYPE is BACKUP_SET)
BS_COMPLETION_TIME	DATE	Completion time of the backup set (valid only if BACKUP_TYPE is BACKUP_SET)
BS_STATUS	VARCHAR2 (16)	Status of the backup set (valid only if BACKUP_TYPE is BACKUP_SET): <ul style="list-style-type: none"> • AVAILABLE • UNAVAILABLE • EXPIRED • OTHER - Pieces which are part of the backup set do not have uniform status (that is, some of them are available, some not)
BS_BYTES	NUMBER	Sum of all backup piece sizes in the backup set (valid only if BACKUP_TYPE is BACKUP_SET)
BS_COMPRESSED	VARCHAR2 (3)	Indicates whether the backup pieces of the backup set are compressed (YES) or not (NO); valid only if BACKUP_TYPE is BACKUP_SET
BS_TAG	VARCHAR2 (1024)	Tags of the backup set. If pieces have different tags, then all piece tags are concatenated and separated by commas. Valid only if BACKUP_TYPE is BACKUP_SET)
BS_DEVICE_TYPE	VARCHAR2 (255)	Device type of the backup set. If there is more than one device type, then they are separated by commas. Valid only if BACKUP_TYPE is BACKUP_SET
BP_PIECE#	NUMBER	Number of pieces inside the backup set (valid only if FILE_TYPE is PIECE and BACKUP_TYPE is BACKUP_SET)
BP_COPY#	NUMBER	Number of copies of the backup set (valid only if FILE_TYPE is PIECE and BACKUP_TYPE is BACKUP_SET)
DF_FILE#	NUMBER	Absolute file number of the data file (valid only if FILE_TYPE is DATAFILE)
DF_TABLESPACE	VARCHAR2 (30)	Tablespace name of the data file (valid only if FILE_TYPE is DATAFILE)
DF_RESETLOGS_CHANGE#	NUMBER	System change number (SCN) of the most recent RESETLOGS when the control file or data file was created (valid only if FILE_TYPE is DATAFILE)
DF_CREATION_CHANGE#	NUMBER	Creation SCN of the control file or data file (valid only if FILE_TYPE is CONTROLFILE or DATAFILE)
DF_CHECKPOINT_CHANGE#	NUMBER	System change number (SCN) of the most recent control file or data file checkpoint (valid only if FILE_TYPE is CONTROLFILE or DATAFILE)
DF_CKP_MOD_TIME	DATE	Modification time in case of SPFILE, otherwise time when the control file or data file was checkpointed (valid only if FILE_TYPE is SPFILE, CONTROLFILE, or DATAFILE)
RL_THREAD#	NUMBER	Redo log thread number of the archived log (valid only if FILE_TYPE is REDO_LOG)
RL_SEQUENCE#	NUMBER	Redo log sequence number of the archived log (valid only if FILE_TYPE is REDO_LOG)

Column	Datatype	Description
RL_RESETLOGS_CHANGE#	NUMBER	System change number (SCN) of the most recent RESETLOGS when the record was created (valid only if FILE_TYPE is REDO LOG)
RL_FIRST_CHANGE#	NUMBER	First SCN of the redo log (valid only if FILE_TYPE is REDO LOG)
RL_FIRST_TIME	DATE	Time when the Oracle Database switched into the redo log (valid only if FILE_TYPE is REDO LOG)
RL_NEXT_CHANGE#	NUMBER	First SCN of the next redo log in the thread (valid only if FILE_TYPE is REDO LOG)
RL_NEXT_TIME	DATE	First timestamp of the next redo log in the thread (valid only if FILE_TYPE is REDO LOG)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.103 V\$BACKUP_NONLOGGED

V\$BACKUP_NONLOGGED displays information about nonlogged block ranges in data file backups, recorded in the control file.

Column	Datatype	Description
RECID	NUMBER	Nologged backup record ID
STAMP	NUMBER	Nologged backup record stamp
SET_STAMP	NUMBER	Backup set stamp
SET_COUNT	NUMBER	Backup set count
PIECE#	NUMBER	Backup piece that contains the range of nonlogged blocks
FILE#	NUMBER	Absolute file number of the data file that contains this range of nonlogged blocks
BLOCK#	NUMBER	Block number of the first nonlogged block in the range of nologged blocks
BLOCKS	NUMBER	Number of nonlogged blocks found starting with BLOCK#
NONLOGGED_CHANGE#	NUMBER	The smallest SCN on which any block in this block range became nonlogged. NULL if unknown.
NONLOGGED_TIME	VARCHAR2	The time that corresponds to NONLOGGED_CHANGE#. NULL if unknown.

Column	Datatype	Description
RESETLOGS_CHANGE#	VARCHAR2	The resetlogs SCN of the incarnation on which this block range was first marked as nonlogged. NULL if unknown.
RESETLOGS_TIME	VARCHAR2	The resetlogs time of the incarnation on which this block range was first marked as nologged. NULL if unknown.
OBJECT#	VARCHAR2	The object ID this range belongs to. If this field is NULL, the object number is unknown.
REASON	CHAR (7)	The reason why this block range appears in this list, for example, primary file offline, could not talk to primary, non-standby recovery, and so on. For Oracle Database 12c and later releases, it is always UNKNOWN.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.104 V\$BACKUP_PIECE

V\$BACKUP_PIECE displays information about backup pieces from the control file. Each backup set consists of one or more backup pieces.

Column	Datatype	Description
RECID	NUMBER	Backup piece record ID
STAMP	NUMBER	Backup piece record stamp
SET_STAMP	NUMBER	Backup set stamp
SET_COUNT	NUMBER	Backup set count
PIECE#	NUMBER	Backup piece number (1-N)
COPY#	NUMBER	Indicates the copy number for backup pieces created with duplex enabled. 1 if the backup piece is not duplexed.
DEVICE_TYPE	VARCHAR2 (17)	Type of the device on which the backup piece resides. Set to DISK for backup sets on disk. See Also: V\$BACKUP_DEVICE
HANDLE	VARCHAR2 (513)	Backup piece handle identifies the backup piece on restore
COMMENTS	VARCHAR2 (64)	Comment returned by the operating system or storage subsystem. Set to NULL for backup pieces on disk. This value is informational only; not needed for restore.
MEDIA	VARCHAR2 (65)	Name of the media on which the backup piece resides. This value is informational only; not needed for restore.
MEDIA_POOL	NUMBER	The media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.
CONCUR	VARCHAR2 (3)	(YES NO) Indicates whether the piece on a media that can be accessed concurrently

Column	Datatype	Description
TAG	VARCHAR2 (32)	Backup piece tag. The tag is specified at backup set level, but stored at piece level.
STATUS	VARCHAR2 (1)	Indicates the status of the piece: A (available), D (deleted), or X (expired)
START_TIME	DATE	Starting time
COMPLETION_TIME	DATE	Completion time
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds
DELETED	VARCHAR2 (3)	(YES/NO) NO indicates that the file still exists. YES indicates the file no longer exists because it has been deleted.
BYTES	NUMBER	Size of the backup piece (in bytes)
IS_RECOVERY_DEST_FILE	VARCHAR2 (3)	Indicates whether the file was created in the fast recovery area (YES) or not (NO)
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS record stamp
COMPRESSED	VARCHAR2 (3)	Indicates whether the backup piece is compressed (YES) or not (NO)
BACKED_BY_VSS	VARCHAR2 (3)	Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.
ENCRYPTED	VARCHAR2 (3)	A value of YES means an encrypted backup, otherwise not an encrypted backup.
BACKED_BY_OSB	VARCHAR2 (3)	A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.
FOR_XTTS	VARCHAR2 (3)	Indicates whether this is a cross platform backup piece: <ul style="list-style-type: none"> • YES: This is a cross platform backup piece. • NO: This is not a cross platform backup piece.
SAME_ENDIAN	VARCHAR2 (3)	If the value of FOR_XTTS is YES, then this column indicates whether the backup piece has the same endianess as the current database (YES) or not (NO); otherwise NULL.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
GUID	RAW(16)	The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.

7.105 V\$BACKUP_PIECE_DETAILS

V\$BACKUP_PIECE_DETAILS displays information about all available backup pieces.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp

Column	Datatype	Description
BS_KEY	NUMBER	Backup set identifier
BP_KEY	NUMBER	Backup piece key
RECID	NUMBER	Backup piece record ID
STAMP	NUMBER	Backup piece record stamp
SET_STAMP	NUMBER	Backup set stamp
SET_COUNT	NUMBER	Backup set count
PIECE#	NUMBER	Backup piece number (1-N)
COPY#	NUMBER	Indicates the copy number for backup pieces created with duplex enabled. The value is 1 if the backup piece is not duplexed.
DEVICE_TYPE	VARCHAR2(17)	Type of device on which the backup piece resides. Set to DISK for backup sets on disk.
HANDLE	VARCHAR2(513)	Backup piece handle identifies the backup piece on restore
COMMENTS	VARCHAR2(64)	Comments returned by the operating system or storage subsystem. Set to NULL for backup pieces on disk. This value is informational only. It is not needed for restore.
MEDIA	VARCHAR2(65)	Name of the media on which the backup piece resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	The media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.
CONCUR	VARCHAR2(3)	(YES NO) indicates whether or not the piece is on a media that can be accessed concurrently
TAG	VARCHAR2(32)	Backup piece tag. The tag is specified at backup set level, but stored at piece level.
STATUS	VARCHAR2(1)	Indicates the status of the piece: A (available), D (deleted), or X (expired)
START_TIME	DATE	Starting time
COMPLETION_TIME	DATE	Completion time
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds
DELETED	VARCHAR2(3)	NO indicates that the file still exists. YES indicates that the file no longer exists because it has been deleted.
BYTES	NUMBER	Size of the backup piece, in bytes
IS_RECOVERY_DEST_FILE	VARCHAR2(3)	Indicates whether or not the file was created in the fast recovery area (YES) or not (NO)
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS record stamp
COMPRESSED	VARCHAR2(3)	Indicates whether the backup piece is compressed (YES) or not (NO)
BACKED_BY_VSS	VARCHAR2(3)	Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.
ENCRYPTED	VARCHAR2(3)	A value of YES means an encrypted backup, otherwise not an encrypted backup.
BACKED_BY_OSB	VARCHAR2(3)	A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.
FOR_XTTS	VARCHAR2(3)	Indicates whether this is a cross platform backup piece: <ul style="list-style-type: none"> • YES: This is a cross platform backup piece. • NO: This is not a cross platform backup piece.

Column	Datatype	Description
SAME_ENDIAN	VARCHAR2 (3)	If the value of FOR_XTTS is YES, then this column indicates whether the backup piece has the same endianess as the current database (YES) or not (NO); otherwise NULL.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
PIECES_PER_SET	NUMBER	Number of backup pieces per set
SIZE_BYTES_DISPLAY	VARCHAR2 (4000)	Size (in bytes) of the backup piece to display

7.106 V\$BACKUP_REDOLOG

V\$BACKUP_REDOLOG displays information about archived logs in backup sets from the control file.

Note that online redo logs cannot be backed up directly; they must be archived first to disk and then backed up. An archive log backup set can contain one or more archived logs.

Column	Datatype	Description
RECID	NUMBER	Record ID for this row; it is an integer that identifies this row
STAMP	NUMBER	Timestamp used with RECID to uniquely identify this row
SET_STAMP	NUMBER	One of the foreign keys for the row of the V\$BACKUP_SET table that identifies this backup set
SET_COUNT	NUMBER	One of the foreign keys for the row of the V\$BACKUP_SET table that identifies this backup set
THREAD#	NUMBER	Thread number for the log
SEQUENCE#	NUMBER	Log sequence number
RESETLOGS_CHANGE#	NUMBER	Change number of the last resetlogs before the log was written
RESETLOGS_TIME	DATE	Change time of the last resetlogs before the log was written. These will be the same for all logs in a backup set.
FIRST_CHANGE#	NUMBER	SCN when the log was switched into. The redo in the log is at this SCN and greater.
FIRST_TIME	DATE	Time allocated when the log was switched into
NEXT_CHANGE#	NUMBER	SCN when the next log in this thread was switched into. The redo in the log is below this SCN.
NEXT_TIME	DATE	Time when the next log in this thread was switched into
BLOCKS	NUMBER	Size of the log in logical blocks including the header block
BLOCK_SIZE	NUMBER	Size of the log blocks in bytes
TERMINAL	VARCHAR2 (3)	Indicates whether this record corresponds to a terminal archived redo log, as defined in V\$ARCHIVED_LOG (YES) or not (NO)

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.107 V\$BACKUP_SET

V\$BACKUP_SET displays information about backup sets from the control file.

A backup set record is inserted after the backup set is successfully completed.

Column	Datatype	Description
RECID	NUMBER	Backup set record ID
STAMP	NUMBER	Backup set record stamp
SET_STAMP	NUMBER	Backup set stamp. The backup set stamp and count uniquely identify the backup set.
SET_COUNT	NUMBER	<p>Primary key for the V\$BACKUP_SET table, and the foreign key for the following tables: V\$BACKUP_PIECE, V\$BACKUP_DATAFILE, V\$BACKUP_REDOLOG, V\$BACKUP_CORRUPTION.</p> <p>Backup set count. The backup set count is incremented by one every time a new backup set is started (if the backup set is never completed the number is "lost"). If the control file is re-created then the count is reset to 1. Therefore the count must be used with the stamp to uniquely identify a backup set.</p> <p>Primary key for the V\$BACKUP_SET table, and the foreign key for the following tables: V\$BACKUP_PIECE, V\$BACKUP_DATAFILE, V\$BACKUP_REDOLOG, V\$BACKUP_CORRUPTION</p>
BACKUP_TYPE	VARCHAR2(1)	Type of files that are in this backup. If the backup contains archived redo logs, the value is L. If this is a data file full backup, the value is D. If this is an incremental backup, the value is I.
CONTROLFILE_INCLUDED	VARCHAR2(3)	<p>Provides information about the control file in the backup set:</p> <ul style="list-style-type: none"> • YES: The control file included is a primary control file. • SBY: The control file included is a standby control file. • NO: A control file is not included.
INCREMENTAL_LEVEL	NUMBER	Location where this backup set fits into the database's backup strategy. Set to NULL for full datafile, archivelog, controlfile, and spfile backups, set to 0 for incremental level 0 datafile backups, and set to 1 for incremental level 1 datafile backups.
PIECES	NUMBER	Number of distinct backup pieces in the backup set
START_TIME	DATE	Starting time
COMPLETION_TIME	DATE	Time that this backup set completed
ELAPSED_SECONDS	NUMBER	The number of elapsed seconds
BLOCK_SIZE	NUMBER	Block size of the backup set

Column	Datatype	Description
INPUT_FILE_SCAN_ONLY	VARCHAR2 (3)	YES indicates no actual backup is performed, but the data files are read. NO indicates a normal backup is performed.
KEEP	VARCHAR2 (3)	(YES/NO) Indicates whether or not this backup set has a retention policy that is different than the value for the configure retention policy
KEEP_UNTIL	DATE	If KEEP_UNTIL_TIME is specified, this is the date after which the backup becomes obsolete. If this column is null, then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (11)	Lists additional retention options for this backup set. Possible values are: LOGS - The logs need to recover this backup are kept NOLOGS - The logs needed to recover this backup will not be kept BACKUP_LOGS - An archive log backup exists to support this backup set
MULTI_SECTION	VARCHAR2 (3)	Indicates whether or not this backup set is a multi-section backup. Valid values are YES and NO. A multi-section backup is a backup in which multiple backup pieces are produced independently in parallel by multiple channels.
FOR_XTTS	VARCHAR2 (3)	Indicates whether this is a cross platform backup set: <ul style="list-style-type: none">• YES: This is a cross platform backup set.• NO: This is not a cross platform backup set.
SAME_ENDIAN	VARCHAR2 (3)	If the value of FOR_XTTS is YES, then this column indicates whether the backup set has the same endianess as the current database (YES) or not (NO); otherwise NULL.
INC_DMPFILE	VARCHAR2 (3)	If the value of FOR_XTTS is YES, then this column indicates whether the backup set includes a Data Pump export file of the backed up data files (YES) or not (NO), otherwise NULL.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
GUID	RAW (16)	The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.

7.108 V\$BACKUP_SET_DETAILS

V\$BACKUP_SET_DETAILS provides detailed information about the backup set.

This view will contain an extra row for each backup session that invokes BACKUP BACKUPSET (that is, creates new copies for the same backup set or copies backup set information from disk to tape). However, the remaining values of other columns belong to the complete backup set.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Identifies the job, together with SESSION_STAMP.
SESSION_STAMP	NUMBER	Identifies the job, together with SESSION_RECID

Column	Datatype	Description
BS_KEY	NUMBER	Backup set identifier
RECID	NUMBER	RECID from V\$BACKUP_SET record
STAMP	NUMBER	Stamp from V\$BACKUP_SET record
SET_STAMP	NUMBER	Backup set stamp
SET_COUNT	NUMBER	Backup count number
BACKUP_TYPE	VARCHAR2(1)	Type of backup (same as in V\$BACKUP_SET)
CONTROLFILE_INCLUDED	VARCHAR2(3)	Control file included in backup set (same as in V\$BACKUP_SET)
INCREMENTAL_LEVEL	NUMBER	Incremental level (same as in V\$BACKUP_SET)
PIECES	NUMBER	Number of pieces (same as in V\$BACKUP_SET)
START_TIME	DATE	Start time of the backup set (same as in V\$BACKUP_SET)
COMPLETION_TIME	DATE	Completion time of the backup set (same as in V\$BACKUP_SET)
ELAPSED_SECONDS	NUMBER	Time taken for backup set creation (same as in V\$BACKUP_SET)
BLOCK_SIZE	NUMBER	Block size (same as in V\$BACKUP_SET)
KEEP	VARCHAR2(3)	Keep value (same as in V\$BACKUP_SET)
KEEP_UNTIL	DATE	Keep Until time (same as in V\$BACKUP_SET)
KEEP_OPTIONS	VARCHAR2(11)	Keep options (same as in V\$BACKUP_SET)
DEVICE_TYPE	VARCHAR2(17)	Type of device. If the backup set exists on more than one device type, an * is indicated here.
COMPRESSED	VARCHAR2(3)	YES, if backup is compressed
NUM_COPIES	NUMBER	Number of identical copies
OUTPUT_BYTES	NUMBER	Size of the backup set
ORIGINAL_INPUT_BYTES	NUMBER	Amount of data backed up when the backup set was created
COMPRESSION_RATIO	NUMBER	The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.
STATUS	CHAR(1)	The status of the backup set. It is always A (all backup pieces available), because this view only reflects available backup sets.
ORIGINAL_INPRATE_BYTES	NUMBER	Number of bytes read per second when backup set was initially created
OUTPUT_RATE_BYTES	NUMBER	Number of bytes written per second when the backup set was initially created
ORIGINAL_INPUT_BYTES_DIS _{PLAY}	VARCHAR2(4000)	Input rate to display
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Size of backup set to display
ORIGINAL_INPRATE_BYTES_D _{ISPLAY}	VARCHAR2(4000)	Input rate per second for display
OUTPUT_RATE_BYTES_DISPLA _Y	VARCHAR2(4000)	Output rate per second for display
TIME_TAKEN_DISPLAY	VARCHAR2(4000)	Elapsed time in hh:mm:ss format
ENCRYPTED	VARCHAR2(3)	A value of YES means an encrypted backup, otherwise not an encrypted backup.
BACKED_BY_OSB	VARCHAR2(3)	A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$BACKUP_SET"](#)

7.109 V\$BACKUP_SET_SUMMARY

V\$BACKUP_SET_SUMMARY provides summary information for a backup set.

Column	Datatype	Description
NUM_BACKUPSETS	NUMBER	Total number of backup sets created
OLDEST_BACKUP_TIME	DATE	Oldest backup start time
NEWEST_BACKUP_TIME	DATE	Newest backup start time
OUTPUT_BYTES	NUMBER	Number of output bytes (not including multiple copies)
ORIGINAL_INPUT_BYTES	NUMBER	Number of input bytes when backup sets were created
ORIGINAL_INPRATE_BYTES	NUMBER	Average input rate
OUTPUT_RATE_BYTES	NUMBER	Average output rate
COMPRESSION_RATIO	NUMBER	The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.
ORIGINAL_INPUT_BYTES_DISP	VARCHAR2(4000) PLAY	Displayable format for input bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes
ORIGINAL_INPRATE_BYTES_DISP	VARCHAR2(4000) DISPLAY	Displayable format for input rate
OUTPUT_RATE_BYTES_DISP	VARCHAR2(4000) Y	Displayable format for output rate
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.110 V\$BACKUP_SPFILE

V\$BACKUP_SPFILE displays information about server parameter files in backup sets from the control file.

Column	Datatype	Description
RECID	NUMBER	Backup SPFILE record ID
STAMP	NUMBER	Backup SPFILE record stamp
SET_STAMP	NUMBER	Backup set stamp (of the set which contains this SPFILE backup)
SET_COUNT	NUMBER	Backup set count (of the set which contains this SPFILE backup)
MODIFICATION_TIME	DATE	Time when the SPFILE was last modified (this also includes creation time)
BYTES	NUMBER	Size of the SPFILE (in bytes)
COMPLETION_TIME	DATE	Time when the backup of the SPFILE completed
DB_UNIQUE_NAME	VARCHAR2 (30)	Unique database name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
GUID	RAW (16)	The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.

7.111 V\$BACKUP_SPFILE_DETAILS

V\$BACKUP_SPFILE_DETAILS displays information about all restorable SP files backed up in the backup set.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp
BS_KEY	NUMBER	Unique backup set identifier
SET_STAMP	NUMBER	Backup set stamp
SET_COUNT	NUMBER	Backup set count
MODIFICATION_TIME	DATE	Time the backup set was modified
FILESIZE	NUMBER	Size, in bytes, of the SPFILE that was backed up
FILESIZE_DISPLAY	VARCHAR2 (4000)	Same value as the FILESIZE column, but converted to a user-displayable format, for example <i>nM</i> , <i>nG</i> , <i>nT</i> , <i>nP</i> , and so on

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.112 V\$BACKUP_SPFILE_SUMMARY

V\$BACKUP_SPFILE_SUMMARY provides summary information for input SP file, based on either a backup job or time range applicable to jobs.

Column	Datatype	Description
NUM_FILES_BACKED	NUMBER	Number of files backed up
NUM_DISTINCT_FILES_BACKED	NUMBER	Number of distinct SP files backed up (with modification timestamp)
MIN_MODIFICATION_TIME	DATE	Minimum modification time
MAX_MODIFICATION_TIME	DATE	Maximum modification time
INPUT_BYTES	NUMBER	Total input bytes for all SP files backed up
INPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for all input bytes
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.113 V\$BACKUP_SYNC_IO

V\$BACKUP_SYNC_IO displays performance information about ongoing and recently completed RMAN backups and restores.

For each backup, it contains one row for each input data file, one row for the aggregate total performance of all data files, and one row for the output backup piece. This data is not stored persistently, and is not preserved when the instance is re-started.

Column	Datatype	Description
SID	NUMBER	The Oracle SID of the session doing the backup or restore
SERIAL	NUMBER	The use count for the SID doing the backup or restore
USE_COUNT	NUMBER	A counter that can be used to identify rows from different backup sets
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS record stamp

Column	Datatype	Description
DEVICE_TYPE	VARCHAR2(17)	The device type where the file is located
TYPE	VARCHAR2(9)	INPUT, OUTPUT, or AGGREGATE
STATUS	VARCHAR2(11)	NOT STARTED, IN PROGRESS, or FINISHED
FILENAME	VARCHAR2(513)	The name of the backup file being read or written
SET_COUNT	NUMBER	The set count of the backup set being read or written
SET_STAMP	NUMBER	The set stamp of the backup set being read or written
BUFFER_SIZE	NUMBER	The size of the buffers being used to read/write this file, in bytes
BUFFER_COUNT	NUMBER	The number of buffers being used to read/write this file
TOTAL_BYTES	NUMBER	The total number of bytes that will be read or written for this file, if known. If not known, this column will be null.
OPEN_TIME	DATE	The time this file was opened. If TYPE='AGGREGATE', then this is the time that the first file in the aggregate was opened.
CLOSE_TIME	DATE	The time this file was closed. If TYPE='AGGREGATE', then this is the time that the last file in the aggregate was closed.
ELAPSED_TIME	NUMBER	The time, in hundredths of a second, that the file was open
MAXOPENFILES	NUMBER	The number of concurrently open DISK files. This value is only present in rows where TYPE='AGGREGATE'.
BYTES	NUMBER	The number of bytes read or written so far
EFFECTIVE_BYTES_PER_SECOND	NUMBER	The I/O rate that was achieved with this device during this backup
IO_COUNT	NUMBER	The number of I/Os that were performed to this file
IO_TIME_TOTAL	NUMBER	The total time, in hundredths of a second, taken to do I/O for this file
IO_TIME_MAX	NUMBER	The maximum time taken for a single I/O request
DISCRETE_BYTES_PER_SECOND	NUMBER	The average transfer rate for this file
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.114 V\$BGPROCESS

V\$BGPROCESS displays information about the background processes.

Column	Datatype	Description
PADDR	RAW(4 8)	Address of the process state object
PSERIAL#	NUMBER	Process state object serial number
NAME	VARCHAR2(5)	Name of this background process
DESCRIPTION	VARCHAR2(64)	Description of the background process
ERROR	NUMBER	Error encountered

Column	Datatype	Description
TYPE	VARCHAR2 (5)	This column has a value of <code>SLAVE</code> for all background slave processes, otherwise it is null.
PRIORITY	VARCHAR2 (8)	Lists the current priority with which the process is running. This column has string values based on the operating system. On Linux, the values that can appear in this column are: <ul style="list-style-type: none"> • <code>TS</code>: Time sharing • <code>RT</code>: Real time priority
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.115 V\$BH

`V$BH` displays the status and number of pings for every buffer in the SGA. This is an Oracle Real Application Clusters view.

Column	Datatype	Description
FILE#	NUMBER	Data file identifier number (to find the file name, query <code>DBA_DATA_FILES</code> or <code>V\$DBFILE</code>)
BLOCK#	NUMBER	Block number
CLASS#	NUMBER	Class number
STATUS	VARCHAR2 (10)	Status of the buffer: <ul style="list-style-type: none"> • <code>free</code> - Not currently in use • <code>xcur</code> - Exclusive • <code>scur</code> - Shared current • <code>cr</code> - Consistent read • <code>read</code> - Being read from disk • <code>mrec</code> - In media recovery mode • <code>irec</code> - In instance recovery mode • <code>pi</code> - A past image in RAC mode • <code>securefile</code> - A secured file buffer • <code>flashfree</code> - A free flash cache buffer • <code>flashcur</code> - A current flash cache buffer
XNC	NUMBER	This column is obsolete. Its value is hard-coded to 0.
FORCED_READS	NUMBER	This column is obsolete. Its value is hard-coded to 0.
FORCED_WRITES	NUMBER	This column is obsolete. Its value is hard-coded to 0.
LOCK_ELEMENT_ADDR	RAW (4 8)	Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.
LOCK_ELEMENT_NAME	NUMBER	The address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.

Column	Datatype	Description
LOCK_ELEMENT_CLASS	NUMBER	The address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.
DIRTY	VARCHAR2 (1)	Y - block modified
TEMP	VARCHAR2 (1)	Y - temporary block
PING	VARCHAR2 (1)	Y - block pinged
STALE	VARCHAR2 (1)	Y - block is stale
DIRECT	VARCHAR2 (1)	Y - direct block
NEW	CHAR (1)	Always set to N. This column is obsolete and maintained for backward compatibility.
OBJD	NUMBER	Database object number of the block that the buffer represents
TS#	NUMBER	Tablespace number of block
LOBID	NUMBER	If the buffer belongs to a SecureFiles object, the value in this column is the unique identifier for the SecureFiles object. For other buffer types, the value in this column is meaningless.
CACHEHINT	NUMBER	Numeric representation of the values in the FLASH_CACHE and CELL_FLASH_CACHE columns. See the descriptions and possible values for the FLASH_CACHE and CELL_FLASH_CACHE columns in this view.
FLASH_CACHE	VARCHAR2 (7)	Database Smart Flash Cache hint to be used for segment blocks: <ul style="list-style-type: none"> • DEFAULT • KEEP • NONE Solaris and Oracle Linux functionality only.
CELL_FLASH_CACHE	VARCHAR2 (7)	Cell flash cache hint to be used for segment blocks: <ul style="list-style-type: none"> • DEFAULT • KEEP • NONE See Also: Oracle Exadata Storage Server Software documentation for more information
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.116 V\$BLOCK_CHANGE_TRACKING

V\$BLOCK_CHANGE_TRACKING displays the status of block change tracking for the database.

Column	Datatype	Description
STATUS	VARCHAR2 (10)	Status of block change tracking in the database: <ul style="list-style-type: none"> • DISABLED - Block change tracking is disabled • TRANSITION - Block change tracking is in the process of transitioning between the enabled and disabled states. The TRANSITION state should usually never be observed, because it only exists while enabling or disabling block change tracking. This state might be observed if the instance crashed while enabling or disabling block change tracking, in which case it will be cleaned up automatically the next time that the database is opened. • ENABLED - Block change tracking is enabled
FILENAME	VARCHAR2 (513)	Name of the block change tracking file for the database
BYTES	NUMBER	Size of the block change tracking file (in bytes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Backup and Recovery User's Guide for information on setting up block change tracking

7.117 V\$BLOCKING QUIESCE

V\$BLOCKING QUIESCE indicates if a session is blocking, or would block, a quiesce operation.

Column	Datatype	Description
SID	NUMBER	Session identifier
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.118 V\$BT_SCAN_CACHE

V\$BT_SCAN_CACHE shows the parameters and status of the big table cache section.

Column	Datatype	Description
BT_CACHE_ALLOC	NUMBER	Current ratio of the big table cache section to the buffer cache
BT_CACHE_TARGET	NUMBER	Target ratio of the big table cache section to the buffer cache
OBJECT_COUNT	NUMBER	Number of objects tracked by the big table cache section
MEMORY_BUF_ALLOC	NUMBER	Number of memory buffers allocated by the big table cache section to objects
MIN_CACHED_TEMP	NUMBER	Minimum temperature of any object that is allowed to be cached by the big table cache section
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

["DB_BIG_TABLE_CACHE_PERCENT_TARGET"](#) for more information about enabling the big table cache

7.119 V\$BT_SCAN_OBJ_TEMPS

V\$BT_SCAN_OBJ_TEMPS shows the active objects currently tracked by the big table cache.

Column	Datatype	Description
TS#	NUMBER	Tablespace number
DATAOBJ#	NUMBER	Data object number (objd)
SIZE_IN_BLKS	NUMBER	Size of the object being scanned on this instance, in blocks
TEMPERATURE	NUMBER	Temperature of this object
POLICY	VARCHAR2(10)	Caching policy of this object. Possible values: <ul style="list-style-type: none"> • MEM_ONLY: This object will be fully cached in memory. • MEM_PART: This object will be partially cached in memory and some portion will remain on disk and will not be cached. • DISK: this object will not be cached in memory or flash for the scan at all. • INVALID: The caching policy is not valid.
CACHED_IN_MEM	NUMBER	The number of blocks that are cached/allocated in memory for this object

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

["DB_BIG_TABLE_CACHE_PERCENT_TARGET"](#) for more information about enabling the big table cache

7.120 V\$BUFFER_POOL

V\$BUFFER_POOL displays information about all buffer pools available for the instance.

Column	Datatype	Description
ID	NUMBER	Buffer pool identifier number
NAME	VARCHAR2 (20)	<p>Name of the buffer pool:</p> <ul style="list-style-type: none"> • DEFAULT • KEEP • RECYCLE <p>Note: Currently, KEEP and RECYCLE pools only exist for the standard block size. All nonstandard block size pools are DEFAULT.</p>
BLOCK_SIZE	NUMBER	Block size (in bytes) for buffers in this pool. Possible values: the standard block size, the power of 2 nonstandard block sizes, 2048, 4096, 8192, 16384, 32768.
RESIZE_STATE	VARCHAR2 (10)	<p>Current state of the resize operation:</p> <p>STATIC - Not being resized</p> <p>ALLOCATING - Memory is being allocated (can be canceled by the user)</p> <p>ACTIVATING - New buffers are being created (user cannot cancel)</p> <p>SHRINKING - Buffers are being deleted (can be canceled by the user)</p>
CURRENT_SIZE	NUMBER	Present size of the sub-cache (in megabytes)
BUFFERS	NUMBER	Current instantaneous number of buffers
TARGET_SIZE	NUMBER	If a resize is in progress (state is not STATIC), records new target size (in megabytes). If the pool is STATIC, the value in this column is the same as the current size of the pool.
TARGET_BUFFERS	NUMBER	If a resize is in progress, records new target size in terms of buffers. Otherwise, the value in this column is the same as the current number of buffers.
PREV_SIZE	NUMBER	Previous buffer pool size. If the buffer pool has never been resized, the previous size is zero.

Column	Datatype	Description
PREV_BUFFERS	NUMBER	Previous number of buffers in the buffer pool. Value is zero if the buffer pool has never been resized.
LO_BNUM	NUMBER	Obsolete column
HI_BNUM	NUMBER	Obsolete column
LO_SETID	NUMBER	Obsolete column
HI_SETID	NUMBER	Obsolete column
SET_COUNT	NUMBER	Obsolete column
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["DB_BLOCK_SIZE"](#)

7.121 V\$BUFFER_POOL_STATISTICS

V\$BUFFER_POOL_STATISTICS displays statistics about all buffer pools available for the instance.

Column	Datatype	Description
ID	NUMBER	Buffer pool identifier number
NAME	VARCHAR2 (20)	Name of the buffer pool
BLOCK_SIZE	NUMBER	Block size (in bytes) for buffers in this pool. Possible values: the standard block size, the power of 2 nonstandard block sizes, 2048, 4096, 8192, 16384, 32768.
SET_MSIZE	NUMBER	Buffer pool maximum set size
CNUM_REPL	NUMBER	Number of buffers on replacement list
CNUM_WRITE	NUMBER	Number of buffers on write list
CNUM_SET	NUMBER	Number of buffers in set
BUF_GOT	NUMBER	Number of buffers gotten by the set
SUM_WRITE	NUMBER	Number of buffers written by the set
SUM_SCAN	NUMBER	Number of buffers scanned in the set
FREE_BUFFER_WAIT	NUMBER	Free buffer wait statistic
WRITE_COMPLETE_WAIT	NUMBER	Write complete wait statistic
BUFFER_BUSY_WAIT	NUMBER	Buffer busy wait statistic
FREE_BUFFER_INSPECTED	NUMBER	Free buffer inspected statistic
DIRTY_BUFFERS_INSPECTED	NUMBER	Dirty buffers inspected statistic

Column	Datatype	Description
DB_BLOCK_CHANGE	NUMBER	Database blocks changed statistic
DB_BLOCK_GETS	NUMBER	Database blocks gotten statistic
CONSISTENT_GETS	NUMBER	Consistent gets statistic
PHYSICAL_READS	NUMBER	Physical reads statistic
PHYSICAL_WRITES	NUMBER	Physical writes statistic
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

["DB_CACHE_SIZE"](#)

7.122 V\$BUFFERED_PUBLISHERS

V\$BUFFERED_PUBLISHERS displays information about all buffered publishers in the instance.

There is one row per queue per sender. The values are reset to zero when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QUEUE_ID	NUMBER	Identifier for the queue
QUEUE_SCHEMA	VARCHAR2(128)	Owner of the queue
QUEUE_NAME	VARCHAR2(128)	Name of the queue
SENDER_NAME	VARCHAR2(128)	Name of the agent enqueueing the message (the Streams name assigned for a capture process)
SENDER_ADDRESS	VARCHAR2(1024)	Queue name and database name of the source (last propagating) queue; database name is not specified if the source queue is in the local database
SENDER_PROTOCOL	NUMBER	Protocol used by the sender's address
NUM_MSGS	NUMBER	Current number of messages that have yet to be dequeued from the buffer queue
CNUM_MSGS	NUMBER	Cumulative total number of messages enqueued into the buffered queue since the database last started
LAST_ENQUEUED_MSG	NUMBER	Most recently enqueued message identifier
UNBROWSED_MSGS	NUMBER	Number of messages that have been enqueued but not browsed
OVERRILLED_MSGS	NUMBER	Number of messages that have been spilled but not browsed
MEMORY_USAGE	NUMBER	Percentage of the Streams pool that is being used (or 0 if there is no Streams pool)

Column	Datatype	Description
ELAPSED_ENQUEUE_TIME	NUMBER	Total time spent in enqueue (in hundredths of a second)
ENQUEUE_CPU_TIME	NUMBER	Total CPU time for enqueue (in hundredths of a second)
LAST_ENQUEUE_TIME	TIMESTAMP (3) WITH TIME ZONE	Last message enqueue time
PUBLISHER_STATE	VARCHAR2 (59)	<p>State of the publisher:</p> <ul style="list-style-type: none"> • IN FLOW CONTROL: TOO MANY UNBROWSED MESSAGES • IN FLOW CONTROL: OVERSPILLED MESSAGES • IN FLOW CONTROL: INSUFFICIENT MEMORY AND UNBROWSED MESSAGES • PUBLISHING MESSAGES - Normal
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.123 V\$BUFFERED_QUEUES

V\$BUFFERED_QUEUES displays information about all buffered queues in the instance. There is one row per queue.

Column	Datatype	Description
QUEUE_ID	NUMBER	Identifier for the queue
QUEUE_SCHEMA	VARCHAR2 (128)	Owner of the queue
QUEUE_NAME	VARCHAR2 (128)	Name of the queue
STARTUP_TIME	DATE	Startup time
NUM_MSGS	NUMBER	Total number of messages currently in the buffered queue
SPILL_MSGS	NUMBER	Current number of overflow messages spilled to disk from the buffered queue
CNUM_MSGS	NUMBER	Cumulative total number of messages enqueued into the buffered queue since the database last started
CSPILL_MSGS	NUMBER	Cumulative total number of overflow messages spilled to disk from the buffered queue since the database last started
EXPIRED_MSGS	NUMBER	Number of expired messages
OLDEST_MSGID	RAW (16)	Message ID of the oldest message
OLDEST_MSG_ENQTM	TIMESTAMP (3)	Enqueue time of the oldest message
QUEUE_STATE	VARCHAR2 (25)	Indicates whether the queue is in recovery mode (QUEUE IS IN RECOVERY MODE) or not (NORMAL)
ELAPSED_ENQUEUE_TIME	NUMBER	Total time spent in enqueue (in hundredths of a second)
ELAPSED_DEQUEUE_TIME	NUMBER	Total time spent in dequeue (in hundredths of a second)
ELAPSED_TRANSFORMATION_TIME	NUMBER	Total time for evaluating transformations (in hundredths of a second)

Column	Datatype	Description
ELAPSED_RULE_EVALUATION_TIME	NUMBER	Total time for rule evaluations (in hundredths of a second)
ENQUEUE_CPU_TIME	NUMBER	Total CPU time for enqueue (in hundredths of a second)
DEQUEUE_CPU_TIME	NUMBER	Total CPU time for dequeue (in hundredths of a second)
AVG_MSG_AGE	NUMBER	Average age of messages in the queue
LAST_ENQUEUE_TIME	TIMESTAMP(3) WITH TIME ZONE	Last message enqueue time
LAST_DEQUEUE_TIME	TIMESTAMP(3) WITH TIME ZONE	Last message dequeue time
QUEUE_SIZE	NUMBER	Size of queue, which is the total number of bytes allocated for all messages and metadata
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.124 V\$BUFFERED_SUBSCRIBERS

V\$BUFFERED_SUBSCRIBERS displays information about the subscribers for all buffered queues in the instance. There is one row per subscriber per queue.

Column	Datatype	Description
QUEUE_ID	NUMBER	Identifier for the queue
QUEUE_SCHEMA	VARCHAR2(128)	Owner of the queue
QUEUE_NAME	VARCHAR2(128)	Name of the queue
SUBSCRIBER_ID	NUMBER	Internal subscriber number (for identification)
SUBSCRIBER_NAME	VARCHAR2(512)	Name of the subscriber
SUBSCRIBER_ADDRESS	VARCHAR2(1024)	Address of the subscribing agent
PROTOCOL	NUMBER	Protocol of the subscribing agent
SUBSCRIBER_TYPE	VARCHAR2(128)	Type of the subscriber: <ul style="list-style-type: none"> • PROXY - Proxy subscriber • SUBSCRIBER
STARTUP_TIME	DATE	Startup time
LAST_BROWSED_SEQ	NUMBER	Sequence number of the most recently browsed message for the subscriber (comparable to the number of messages in the V\$STREAMS_APPLY_READER view)
LAST_BROWSED_NUM	NUMBER	Internal Message number for the most recently browsed message for the subscriber
LAST_DEQUEUED_SEQ	NUMBER	Sequence number of the most recently dequeued message for the subscriber (comparable to the number of messages in the V\$STREAMS_APPLY_COORDINATOR view)

Column	Datatype	Description
LAST_DEQUEUED_NUM	NUMBER	Internal Message number for the most recently dequeued message for the subscriber
CURRENT_ENQ_SEQ	NUMBER	Current sequence number of the most recently enqueued message for the subscriber
NUM_MSGS	NUMBER	Total number of outstanding messages currently enqueued in the buffered queue for the subscriber (includes the count of the messages overflowed to disk)
CNUM_MSGS	NUMBER	Cumulative total number of messages enqueued for the subscriber since the database last started
TOTAL_DEQUEUED_MSG	NUMBER	Total number of messages dequeued by the subscriber
TOTAL_SPILLED_MSG	NUMBER	Total number of spilled messages for the subscriber
EXPIRED_MSGS	NUMBER	Number of expired messages
MESSAGE_LAG	NUMBER	Message lag of the subscriber
ELAPSED_DEQUEUE_TIME	NUMBER	Total time spent in dequeue (in hundredths of a second)
DEQUEUE_CPU_TIME	NUMBER	Total CPU time for dequeue (in hundredths of a second)
AVG_MSG_AGE	NUMBER	Average age of messages currently enqueued in the buffered queue for the subscriber
LAST_DEQUEUE_TIME	TIMESTAMP(3) WITH TIME ZONE	Last message dequeue time
OLDEST_MSGID	RAW(16)	Message ID of the oldest message
OLDEST_MSG_ENQTM	TIMESTAMP(3)	Enqueue time of the oldest message
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.125 V\$CACHE

V\$CACHE displays information from the block header of each block in the SGA of the current instance as related to particular database objects. This is an Oracle Real Application Clusters view.

Column	Datatype	Description
FILE#	NUMBER	Data file identifier number (to find the file name, query DBA_DATA_FILES or V\$DBFILE)
BLOCK#	NUMBER	Block number
CLASS#	NUMBER	Class number

Column	Datatype	Description
STATUS	VARCHAR2(10)	<p>Status of the block:</p> <ul style="list-style-type: none"> • free - Not currently in use • xcur - Exclusive • scur - Shared current • cr - Consistent read • read - Being read from disk • mrec - In media recovery mode • irec - In instance recovery mode
XNC	NUMBER	Number of PCM x to null lock conversions due to contention with another instance. This column is obsolete and maintained for backward compatibility.
FORCED_READS	NUMBER	Number of times the block had to be reread from the cache because another instance has forced it out of this instance's cache by requesting the lock on the block in exclusive mode
FORCED_WRITES	NUMBER	Number of times GCS had to write this block to cache because this instance had used the block and another instance had requested the lock on the block in a conflicting mode
NAME	VARCHAR2(128)	Name of the database object containing the block
PARTITION_NAME	VARCHAR2(128)	Name of the partition (null for nonpartitioned objects)
KIND	VARCHAR2(15)	<p>Type of the database object:</p> <ul style="list-style-type: none"> • INDEX • TABLE • CLUSTER • VIEW • SYNONYM • SEQUENCE • PROCEDURE • FUNCTION • PACKAGE • NON-EXISTENT • PACKAGE BODY • TRIGGER • TYPE • TYPE BODY • TABLE PARTITION • INDEX PARTITION • LOB • LIBRARY • JAVA SOURCE • JAVA CLASS • JAVA RESOURCE • JAVA DATA • UNDO
OWNER#	NUMBER	Owner number
LOCK_ELEMENT_ADDR	RAW(4 8)	Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.
LOCK_ELEMENT_NAME	NUMBER	Name of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.126 V\$CACHE_LOCK

V\$CACHE_LOCK is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE_CACHE_TRANSFER and V\$SEGMENT_STATISTICS views.

Column	Datatype	Description
FILE#	NUMBER	Data file identifier number (to find file name, query DBA_DATA_FILES or V\$DBFILE)
BLOCK#	NUMBER	Block number
STATUS	VARCHAR2(10)	<p>Status of the block:</p> <ul style="list-style-type: none"> • free - Not currently in use • xcur - Exclusive • scur - Shared current • cr - Consistent read • read - Being read from disk • mrec - In media recovery mode • irec - In instance recovery mode
XNC	NUMBER	Number of parallel cache management (PCM) lock conversions due to contention with another instance
FORCED_READS	NUMBER	Number of times the block had to be reread from the cache because another instance has forced it out of this instance's cache by requesting the lock on the block in exclusive mode
FORCED_WRITES	NUMBER	Number of times GCS had to write this block to cache because this instance had used the block and another instance had requested the lock on the block in a conflicting mode
NAME	VARCHAR2(128)	Name of the database object containing the block

Column	Datatype	Description
KIND	VARCHAR2(15)	Type of database object: <ul style="list-style-type: none"> • 1 - Index • 2 - Table • 3 - Cluster • 4 - View • 5 - Synonym • 6 - Sequence • 7 - Procedure • 8 - Function • 9 - Package • 10 - Nonexistent • 11 - Package body • 12 - Trigger • 13 - Type • 14 - Type body • 19 - Table partition • 20 - Index partition • 21 - LOB • 22 - Library • Null - Unknown
OWNER#	NUMBER	Owner number
LOCK_ELEMENT_ADDR	RAW(4 8)	Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.
LOCK_ELEMENT_NAME	NUMBER	Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.
INDX	NUMBER	Platform-specific lock manager identifier
CLASS	NUMBER	Platform-specific lock manager identifier
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.127 V\$CACHE_TRANSFER

V\$CACHE_TRANSFER is identical to the V\$CACHE view but only displays blocks that have been pinged at least once.

This view contains information from the block header of each block in the SGA of the current instance as related to particular database objects. This is an Oracle Real Application Clusters view.

Column	Datatype	Description
FILE#	NUMBER	Data file identifier number (to find the file name, query DBA_DATA_FILES or V\$DBFILE)
BLOCK#	NUMBER	Block number
CLASS#	NUMBER	Class number
STATUS	VARCHAR2 (10)	Status of the block: <ul style="list-style-type: none"> • free - Not currently in use • xcur - Exclusive • scur - Shared current • cr - Consistent read • read - Being read from disk • mrec - In media recovery mode • irec - In instance recovery mode
XNC	NUMBER	Number of PCM lock conversions due to contention with another instance. This column is obsolete and maintained for backward compatibility.
FORCED_READS	NUMBER	Number of times the block had to be reread from the cache because another instance has forced it out of this instance's cache by requesting the lock on the block in exclusive mode
FORCED_WRITES	NUMBER	Number of times GCS had to write this block to cache because this instance had used the block and another instance had requested the lock on the block in a conflicting mode
NAME	VARCHAR2 (128)	Name of the database object containing the block
PARTITION_NAME	VARCHAR2 (128)	NULL for nonpartitioned objects
KIND	VARCHAR2 (15)	Type of database object
See Also: Table 8-1		
OWNER#	NUMBER	Owner number
LOCK_ELEMENT_ADDR	RAW (4 8)	Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.
LOCK_ELEMENT_NAME	NUMBER	The name of the lock that contains the PCM lock that is covering the buffer
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**
"V\$CACHE"

7.128 V\$CHUNK_METRIC

V\$CHUNK_METRIC displays the metric values captured for the most recent 30-second intervals for the workload against each chunk available on the database.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
CHUNK_ID	NUMBER	Chunk number (internal)
CALLSPERSEC	NUMBER	Number of user calls per second to the chunks
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

"V\$SERVICE_REGION_METRIC"

7.129 V\$CIRCUIT

V\$CIRCUIT contains information about virtual circuits, which are user connections to the database through dispatchers and servers.

Column	Datatype	Description
CIRCUIT	RAW(4 8)	Circuit address
DISPATCHER	RAW(4 8)	Current dispatcher process address
SERVER	RAW(4 8)	Current server process address
WAITER	RAW(4 8)	Address of the server process that is waiting for the (currently busy) circuit to become available
SADDR	RAW(4 8)	Address of the session bound to the circuit
STATUS	VARCHAR2(16)	Status of the circuit: <ul style="list-style-type: none"> • BREAK - currently interrupted • EOF - about to be removed • OUTBOUND - an outward link to a remote database • NORMAL - normal circuit into the local database

Column	Datatype	Description
QUEUE	VARCHAR2 (16)	Queue the circuit is currently on: <ul style="list-style-type: none"> • COMMON - on the common queue, waiting to be picked up by a server process • DISPATCHER - waiting for the dispatcher • SERVER - currently being serviced • NONE - idle circuit
MESSAGE0	NUMBER	Size in bytes of the messages in the first message buffer
MESSAGE1	NUMBER	Size in bytes of the messages in the second message buffer
MESSAGE2	NUMBER	Size in bytes of the messages in the third message buffer
MESSAGE3	NUMBER	Size in bytes of the messages in the fourth message buffer
MESSAGES	NUMBER	Total number of messages that have gone through this circuit
BYTES	NUMBER	Total number of bytes that have gone through this circuit
BREAKS	NUMBER	Total number of breaks (interruptions) for this circuit
PRESENTATION	VARCHAR2 (257)	Presentation protocol used by the client and server
PCIRCUIT	RAW(4 8)	Address of the parent circuit
BOUND_TIME ¹	NUMBER	Time that a circuit and shared server have been bound (in centiseconds)
BOUND_REASON ¹	VARCHAR2 (32)	Provides a reason (a short explanation) for why a shared server and circuit could not be unbound. This column is empty when a circuit is not bound to a server. When the server starts serving a circuit, BOUND_REASON is empty and remains empty unless the server tries unsuccessfully to unbind the circuit (after it finishes serving the current request). When this column is not empty, it will be cleared once the server and circuit are unbound (that is, once the resources preventing the session migration to another shared server are released).
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

¹ This column is available starting with Oracle Database 19c.

7.130 V\$CLASS_CACHE_TRANSFER

V\$CLASS_CACHE_TRANSFER is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE_CACHE_TRANSFER and V\$SEGMENT_STATISTICS views.

Column	Datatype	Description
CLASS	CHAR (10)	Block class; always data block
X_2_NULL	NUMBER	Number of blocks with Exclusive-to-NULL conversions; always 0
X_2_NULL_FORCED_WRITE	NUMBER	Number of Exclusive-to-NULL forced writes; always 0

Column	Datatype	Description
X_2_NULL_FORCED_STALE	NUMBER	Number of Exclusive-to-NULL blocks converted to CR; always 0
X_2_S	NUMBER	Number of blocks with Exclusive-to-Shared conversions; always 0
X_2_S_FORCED_WRITE	NUMBER	Number of Exclusive-to-Shared forced writes; always 0
S_2_NULL	NUMBER	Number of blocks with Shared-to-NULL conversions; always 0
S_2_NULL_FORCED_STALE	NUMBER	Number of Shared-to-NULL blocks converted to CR; always 0
NULL_2_X	NUMBER	Number of blocks with NULL-to-Exclusive conversions; always 0
S_2_X	NUMBER	Number of blocks with Shared-to-Exclusive conversions; always 0
NULL_2_S	NUMBER	Number of blocks with NULL-to-Shared conversions; always 0
CR_TRANSFER	NUMBER	Number of CR blocks transferred; always 0
CURRENT_TRANSFER	NUMBER	Number of current blocks transferred; always 0
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$INSTANCE_CACHE_TRANSFER](#)"
- "[V\\$SEGMENT_STATISTICS](#)"

7.131 V\$CLEANUP_PROCESS

V\$CLEANUP_PROCESS provides information on the PMON processes.

Column	Datatype	Description
NAME	VARCHAR2 (5)	Name of the cleanup process (PMON, CLMN, CL**)
PADDR	RAW (8)	Process pointer for the cleanup process (can join with V\$PROCESS)
SADDR	RAW (8)	Session pointer for the cleanup process (can join with V\$SESSION)
STATE	VARCHAR2 (4)	Cleanup process state: <ul style="list-style-type: none"> • IDLE: Not currently performing cleanup • BUSY: Currently performing cleanup
DEAD_IN_CLEANUP	RAW (8)	Pointer to the root of the tree in cleanup (can join with ROOT_ADDR in V\$DEAD_CLEANUP)
CLEANUP_TIME	NUMBER	If STATE = BUSY, the time spent in the current cleanup attempt (in seconds). Otherwise, 0.
TIME_SINCE_LAST_CLEANUP	NUMBER	If STATE = IDLE, time since last needed to perform cleanup (in seconds). Otherwise, 0.

Column	Datatype	Description
NUM_CLEANED	NUMBER	Number of trees cleaned up by the cleanup process. Increased by one every time a root tree is attempted.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$DEAD_CLEANUP"](#)

7.132 V\$CLIENT_SECRETS

V\$CLIENT_SECRETS lists the secrets that are present in the keystore.

Only SYS, SYSKM, and users with the ADMINISTER KEY MANAGEMENT privilege can access this view.

Column	Datatype	Description
CLIENT	VARCHAR2(2000)	Name provided by the client
SECRET_TAG	VARCHAR2(4000)	Associated information with the client
CREATION_TIME	TIMESTAMP(6) WITH TIME ZONE	Time when the secret was created
ACTIVATION_TIME	TIMESTAMP(6) WITH TIME ZONE	Time when the secret was actually put to use
OWNER	VARCHAR2(128)	User who created the secret
OWNER_ID	NUMBER	User ID of the user who created the secret
KEYSTORE_TYPE	VARCHAR2(17)	Type of keystore in which the secret is stored: <ul style="list-style-type: none"> • OKV - Oracle Key Vault • SOFTWARE KEYSTORE • UNDEFINED - This value is shown if the database has no information about the type of keystore where the master key resides
BACKED_UP	VARCHAR2(9)	Indicates whether the secret has been backed up or not
OWNER_DBNAME	VARCHAR2(128)	Database that created the secret
OWNER_DBID	NUMBER	Database ID where the secret was created
OWNER_INSTANCE_NAME	VARCHAR2(30)	Instance name of the instance where the secret was created
OWNER_INSTANCE_NUMBER	NUMBER	Instance number of the instance where the secret was created
OWNER_INSTANCE_SERIAL	NUMBER	Serial number of the instance where the secret was created

Column	Datatype	Description
OWNER_PDBNAME	VARCHAR2 (128)	Pluggable database (PDB) where the secret was created
OWNER_PDBID	NUMBER	PDB ID where the secret was created
OWNER_PBUID	NUMBER	PDB UID where the secret was created
OWNER_PDBGUID	RAW (16)	PDB GUID where the secret was created
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

Oracle Database Advanced Security Guide for information about keystore management

7.133 V\$CLIENT_STATS

V\$CLIENT_STATS displays measures for all sessions that are active for the client identifier per instance.

The statistics available in this view are a subset of those available in V\$SESSTAT and V\$SESS_TIME_MODEL.

Column	Datatype	Description
CLIENT_IDENTIFIER	VARCHAR2 (64)	Client identifier
STAT_ID	NUMBER	Statistic identifier
STAT_NAME	VARCHAR2 (64)	Derived statistic name from V\$STATNAME and V\$SESS_TIME_MODEL
VALUE	NUMBER	Cumulative value (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

- "[V\\$SESSTAT](#)"
- "[V\\$SESS_TIME_MODEL](#)"

7.134 V\$CLONEDFILE

V\$CLONEDFILE provides CloneDB file information.

Column	Datatype	Description
SNAPSHOTFILENAME	VARCHAR2 (513)	Snapshot/master file name. This file is the master file from the master database. The snapshot file is also sometimes referred to as the srcfile.
CLONEFILENAME	VARCHAR2 (513)	CloneDB file name. This file is the cloned file (of master file) which resides in the current (cloned database). The cloned file is sometimes referred to as the destfile.
SNAPSHOTBLKREAD	NUMBER	Number of blocks reads to the snapshot file (master file)
SNAPSHOTREQUEST	NUMBER	Number of read requests to the snapshot file (master file)
FILENUMBER	NUMBER	File number of the cloned file
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
BLOCKS_ALLOCATED	NUMBER	Amount of space allocated in blocks in the file system. This is less than or equal to the actual file size.

 **Note:**

When this view is queried in an Oracle Database environment, rows are returned for every opened file, even those without a parent file backing them (in those cases the column is empty/NULL).

In an Oracle ASM environment, rows are returned for files that an Oracle ASM instance has mounted in disk groups only if those files are children (a clonefile) of a parent snapshot file.

7.135 V\$CLUSTER_INTERCONNECTS

V\$CLUSTER_INTERCONNECTS displays one or more interconnects that are being used for cluster communication.

Column	Datatype	Description
NAME	VARCHAR2 (15)	Name of the interconnect (such as eth0)
IP_ADDRESS	VARCHAR2 (64)	IP address of the interconnect
IS_PUBLIC	VARCHAR2 (3)	If the value is YES, the interface is known to the public. If the value is NO, the interface is known to be private. Note that if the CLUSTER_INTERCONNECTS initialization parameter is also specified, then it is expected that the interconnect is private. Oracle expects cluster traffic to be run on private interconnects only. If the value is empty, it is unknown whether the interface is public or private. Oracle recommends that you set the interface for Oracle Real Application Clusters (Oracle RAC) communication in the Oracle Cluster Registry (OCR).
SOURCE	VARCHAR2 (31)	Indicates where this interface was picked up from: <ul style="list-style-type: none"> • Oracle Cluster Registry - Interface was configured in the OCR and Oracle Database found the interface in the OCR • Operating-system dependent software - Oracle Database automatically detects this • CLUSTER_INTERCONNECTS parameter - This initialization parameter was set
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.136 V\$CODE_CLAUSE

V\$CODE_CLAUSE contains the supported clause names and parameter names for the Oracle Data Vault ALTER SYSTEM and ALTER SESSION commands.

Column	Datatype	Description
CODE_ID#	NUMBER	The OCT code ID: <ul style="list-style-type: none"> • 42: For ALTER SESSION • 49: For ALTER SYSTEM
CLAUSE_ID#	NUMBER	Clause ID
CLAUSE_NAME	VARCHAR2 (100)	The clause name that is supported by the Oracle Data Vault command rule (for example, SET or ADVICE)
PARAMETER_NAME	VARCHAR2 (100)	The parameter name that is supported by the Oracle Data Vault command rule. For example, for ALTER SYSTEM SET EVENTS, EVENTS is the parameter.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.137 V\$CON_EVENT_HISTOGRAM_MICRO

V\$CON_EVENT_HISTOGRAM_MICRO displays a histogram of the number of waits, the maximum wait, and total wait time on an event basis for a container, in microseconds. The histogram has buckets of time intervals from < 1 us, < 2 us, < 4 us, < 8 us, ... < 2^{31} us, < 2^{32} us, and $\geq 2^{32}$ us.

The histogram will not be filled unless the `TIMED_STATISTICS` initialization parameter is set to true.

Column	Datatype	Description
EVENT#	NUMBER	Event number
EVENT	VARCHAR2(64)	Name of the event
WAIT_TIME_FORMAT	VARCHAR2(30)	A human readable time string which is converted from <code>WAIT_TIME_MICRO</code> . When <code>WAIT_TIME_MICRO</code> < 1 millisecond, <code>WAIT_TIME_FORMAT</code> is shown in microseconds. When <code>WAIT_TIME_MICRO</code> < 1 second, <code>WAIT_TIME_FORMAT</code> is shown in milliseconds. When <code>WAIT_TIME_MICRO</code> < 1 minute, <code>WAIT_TIME_FORMAT</code> is shown in seconds. When <code>WAIT_TIME_MICRO</code> > 1 minute, <code>WAIT_TIME_FORMAT</code> is shown in minutes and seconds.
WAIT_TIME_MICRO	NUMBER	Amount of time the bucket represents (in microseconds). If the duration = num, then this column represents waits of duration < num that are not included in any smaller bucket.
WAIT_COUNT	NUMBER	Number of waits of the duration belonging to the bucket of the histogram
LAST_UPDATE_TIME	VARCHAR2(73)	Indicates the last time the bucket was updated (the ending timestamp of the last wait falling into the bucket's duration)
CON_ID	NUMBER	<p>When queried from a non-CDB, the wait event data in that instance are returned, and the <code>CON_ID</code> value is 0.</p> <p>When queried from the root of a CDB, the wait event data in every container is returned, and the <code>CON_ID</code> value indicates the container to which the wait event data belong.</p> <p>When queried from a PDB, wait event data in that PDB are returned, and the <code>CON_ID</code> value is the container ID for that PDB.</p>

7.138 V\$CON_SYS_TIME_MODEL

V\$CON_SYS_TIME_MODEL displays the systemwide accumulated times for various operations for the container from which it is queried.

The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.

The time values are 8-byte integers and can therefore hold approximately 580,000 years worth of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

Column	Datatype	Description
STAT_ID	NUMBER	Statistic identifier for the time statistic
STAT_NAME	VARCHAR2 (64)	Name of the statistic (see Table 9-1)
VALUE	NUMBER	Amount of time (in microseconds) that the system has spent in this operation
CON_ID	NUMBER	When queried from a non-CDB, the accumulated times for operations in that instance are returned, and the CON_ID value is 0. When queried from the root of a CDB, accumulated times for operations in every container are returned, and the CON_ID value indicates the container to which the times belong. When queried from a PDB, accumulated times for operations in that PDB are returned, and the CON_ID value is the container ID for that PDB.

7.139 V\$CON_SYSMETRIC

V\$CON_SYSMETRIC displays the system metric values captured for the most current time interval for the PDB long duration (60-second) system metrics.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric group ID
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2 (64)	Metric name
VALUE	NUMBER	Metric value
METRIC_UNIT	VARCHAR2 (64)	Metric unit description

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> When queried from a non-CDB, the statistics for that instance are returned, and the CON_ID value is 0. When queried from the root of a CDB, the statistics for every container are returned, and the CON_ID value indicates the container to which the statistics belong. When queried from a PDB, statistics from that PDB are returned, and the CON_ID value is the container ID for that PDB.

See Also:

- "DBA_HIST_CON_SYS_TIME_MODEL"
- "DBA_HIST_SYS_TIME_MODEL"
- "V\$SYSMETRIC"

7.140 V\$CON_SYSMETRIC_HISTORY

V\$CON_SYSMETRIC_HISTORY displays all PDB long duration (60-second with 1 hour history) system metric values available in the database.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric group ID
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2(64)	Metric name
VALUE	NUMBER	Metric value
METRIC_UNIT	VARCHAR2(64)	Metric unit description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> When queried from a non-CDB, the statistics for that instance are returned, and the CON_ID value is 0. When queried from the root of a CDB, the statistics for every container are returned, and the CON_ID value indicates the container to which the statistics belong. When queried from a PDB, statistics from that PDB are returned, and the CON_ID value is the container ID for that PDB.

 See Also:

- "[DBA_HIST_CON_SYSMETRIC_HIST](#)"
- "[DBA_HIST_SYSMETRIC_HISTORY](#)"
- "[V\\$SYSMETRIC_HISTORY](#)"

7.141 V\$CON_SYSMETRIC_SUMMARY

V\$CON_SYSMETRIC_SUMMARY displays a summary of all system metric values for the PDB long-duration system metrics. The average, maximum value, minimum value, and the value of one standard deviation for the last hour are displayed for each metric item.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric group ID
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2 (64)	Metric name
NUM_INTERVAL	NUMBER	Number of intervals observed
MAXVAL	NUMBER	Maximum value observed
MINVAL	NUMBER	Minimum value observed
AVERAGE	NUMBER	Average value over the period
STANDARD_DEVIATION	NUMBER	One standard deviation
METRIC_UNIT	VARCHAR2 (64)	Metric unit description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • When queried from a non-CDB, the statistics for that instance are returned, and the CON_ID value is 0. • When queried from the root of a CDB, the statistics for every container are returned, and the CON_ID value indicates the container to which the statistics belong. • When queried from a PDB, statistics from that PDB are returned, and the CON_ID value is the container ID for that PDB.

 See Also:

- "[V\\$SYSMETRIC_HISTORY](#)"
- "[DBA_HIST_SYSMETRIC_SUMMARY](#)"
- "[V\\$SYSMETRIC_SUMMARY](#)"

7.142 V\$CON_SYSSTAT

V\$CON_SYSSTAT displays system statistics, including OLAP kernel statistics for the container from which it is queried. To find the name of the statistic associated with each statistic number (STATISTIC#), query the V\$STATNAME view.

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number Note: Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.
NAME	VARCHAR2 (64)	Statistic name. You can get a complete listing of statistic names by querying the V\$STATNAME view.
CLASS	NUMBER	A number representing one or more statistics class. The following class numbers are additive: <ul style="list-style-type: none"> • 1 - User • 2 - Redo • 4 - Enqueue • 8 - Cache • 16 - OS • 32 - Real Application Clusters • 64 - SQL • 128 - Debug
VALUE	NUMBER	Statistic value
STAT_ID	NUMBER	Identifier of the statistic
CON_ID	NUMBER	When queried from a non-CDB, the statistics in that instance are returned, and the CON_ID value is 0. When queried from the root of a CDB, the statistics in every container are returned, and the CON_ID value indicates the container to which the statistics belong. When queried from a PDB, statistics in that PDB are returned, and the CON_ID value is the container ID for that PDB.

See Also:

["V\\$STATNAME" and " Statistics Descriptions"](#)

7.143 V\$CON_SYSTEM_EVENT

V\$CON_SYSTEM_EVENT displays information on total waits for an event in a container.

Note that the TIME_WAITED and AVERAGE_WAIT columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you want this column to reflect true wait times, then you must set TIMED_STATISTICS to TRUE in the parameter file; doing this will have a small negative effect on system performance.

 **See Also:**

["TIMED_STATISTICS"](#)

Column	Datatype	Description
EVENT	VARCHAR2 (64)	Name of the wait event; derived statistic name from V\$EVENT_NAME See Also: " Oracle Wait Events "
TOTAL_WAITS	NUMBER	Total number of waits for the event
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event
TIME_WAITED	NUMBER	Total amount of time waited for the event (in hundredths of a second)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time waited for the event (in microseconds)
TOTAL_WAITS_FG	NUMBER	Total number of waits for the event, from foreground sessions
TOTAL_TIMEOUTS_FG	NUMBER	Total number of timeouts for the event, from foreground sessions
TIME_WAITED_FG	NUMBER	Total amount of time waited for the event, from foreground sessions (in hundredths of a second)
AVERAGE_WAIT_FG	NUMBER	Average amount of time waited for the event, from foreground sessions (in hundredths of a second)
TIME_WAITED_MICRO_FG	NUMBER	Total amount of time waited for the event, from foreground sessions (in microseconds)
EVENT_ID	NUMBER	Identifier of the wait event
WAIT_CLASS_ID	NUMBER	Identifier of the wait class of the wait event
WAIT_CLASS#	NUMBER	Number of the wait class of the wait event
WAIT_CLASS	VARCHAR2 (64)	Name of the wait class of the wait event
CON_ID	NUMBER	When queried from a non-CDB, the wait event data in that instance are returned, and the CON_ID value is 0. When queried from the root of a CDB, the wait event data in every container is returned, and the CON_ID value indicates the container to which the wait event data belong. When queried from a PDB, wait event data in that PDB are returned, and the CON_ID value is the container ID for that PDB.

7.144 V\$CON_SYSTEM_WAIT_CLASS

V\$CON_SYSTEM_WAIT_CLASS displays the time totals for each registered wait class in a container.

Column	Datatype	Description
WAIT_CLASS_ID	NUMBER	Identifier of the wait class
WAIT_CLASS#	NUMBER	Number of the wait class
WAIT_CLASS	VARCHAR2 (64)	Name of the wait class
TOTAL_WAITS	NUMBER	Total number of waits from this wait class
TIME_WAITED	NUMBER	Total amount of time spent in waits from this wait class (in hundredths of a second)

Column	Datatype	Description
TOTAL_WAITS_FG	NUMBER	Total number of waits from this wait class, from foreground sessions
TIME_WAITED_FG	NUMBER	Total amount of time spent in waits from this wait class, from foreground sessions (in hundredths of a second)
CON_ID	NUMBER	When queried from a non-CDB, time totals for each registered wait class in that instance are returned, and the CON_ID value is 0. When queried from the root of a CDB, time totals for each registered wait class in every container is returned, and the CON_ID value indicates the container to which the time total belong. When queried from a PDB, time totals for each registered wait class in that PDB are returned, and the CON_ID value is the container ID for that PDB.

7.145 V\$CONFIGURED_INTERCONNECTS

V\$CONFIGURED_INTERCONNECTS displays all the interconnects that Oracle is aware of. This view attempts to answer the question of where Oracle found the information about a specific interconnect.

Column	Datatype	Description
NAME	VARCHAR2 (15)	Name of the interconnect (such as eth0)
IP_ADDRESS	VARCHAR2 (64)	IP address of the interconnect
IS_PUBLIC	VARCHAR2 (3)	If the value is YES, the interface is known to the public. If the value is NO, the interface is known to be private. Note that if the CLUSTER_INTERCONNECTS initialization parameter is also specified, then it is expected that the interconnect is private. Oracle expects cluster traffic to be run on private interconnects only. If the value is empty, it is unknown whether the interface is public or private. Oracle recommends that you set the interface for Oracle Real Application Clusters (Oracle RAC) communication in the Oracle Cluster Registry (OCR).
SOURCE	VARCHAR2 (31)	Indicates where this interface was picked up from: <ul style="list-style-type: none"> • Oracle Cluster Registry - Interface was configured in the OCR and Oracle Database found the interface in the OCR • Operating-system dependent software - Oracle Database automatically detects this • CLUSTER_INTERCONNECTS parameter - This initialization parameter was set
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.146 V\$CONTAINERS

V\$CONTAINERS displays information about PDBs and the root associated with the current instance.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
DBID	NUMBER	PDB identifier calculated when the PDB is created and stored in all file headers associated with the PDB
CON_UID	NUMBER	Unique identifier associated with the PDB
GUID	RAW (16)	Globally unique identifier (GUID) of this PDB
NAME	VARCHAR2 (128)	Name of the PDB
OPEN_MODE	VARCHAR2 (10)	Open mode information. Possible values: <ul style="list-style-type: none"> • MOUNTED • READ WRITE • READ ONLY • MIGRATE
RESTRICTED	VARCHAR2 (3)	Indicates whether only users possessing RESTRICTED SESSION privilege can connect to the PDB
OPEN_TIME	TIMESTAMP (3)	Date and time when the database was last opened
CREATE_SCN	NUMBER	System change number (SCN) for the creation of this PDB
TOTAL_SIZE	NUMBER	If a PDB is opened, disk space (in bytes) used by the container, including both data and temp files. If a PDB is closed, will be set to 0.
BLOCK_SIZE	NUMBER	The current block size for the PDB
RECOVERY_STATUS	VARCHAR2 (8)	Shows whether recovery is enabled or disabled for the PDB. Possible values: <ul style="list-style-type: none"> • ENABLED • DISABLED
SNAPSHOT_PARENT_CON_ID	NUMBER	This column shows the container ID of the master PDB that this PDB is a snapshot clone of. This column shows a nonzero value only if the PDB is a snapshot clone. For all other cases, it shows a value of 0.
APPLICATION_ROOT	VARCHAR2 (3)	Indicates whether the PDB is an application root
APPLICATION_PDB	VARCHAR2 (3)	Indicates whether the PDB is an application PDB
APPLICATION_SEED	VARCHAR2 (3)	Indicates whether the PDB is an application seed (an application seed is also an application PDB)
APPLICATION_ROOT_CON_ID	NUMBER	If this PDB is an application PDB, the container ID of an application root to which this application PDB belongs. If this PDB is an application root clone, the container ID of an application root to which this application root clone belongs. Otherwise, NULL.
APPLICATION_ROOT_CLONE	VARCHAR2 (3)	Indicates whether this PDB is an application root clone (YES) or not (NO)

Column	Datatype	Description
PROXY_PDB	VARCHAR2 (3)	Indicates whether this PDB is a proxy PDB (YES) or not (NO)
LOCAL_UNDO	NUMBER	Shows whether the PDB is in local undo. Possible values: <ul style="list-style-type: none"> • 1 – PDB is in local undo mode • 0 – PDB is in shared undo mode This column is not relevant for CDB\$ROOT.
UNDO_SCN	NUMBER	System change number (SCN) at which the PDB was last converted from shared to local undo, or from local to shared undo. This column is not relevant for CDB\$ROOT.
UNDO_TIMESTAMP	DATE	Date and time at which the PDB was last converted from shared to local undo, or from local to shared undo. This column is not relevant for CDB\$ROOT.
CREATION_TIME	DATE	Date and time at which the PDB was created.
PDB_COUNT	NUMBER	The number of user-created PDBs belonging to a given application root or CDB\$ROOT. For all other containers, its value is 0.
AUDIT_FILES_SIZE	NUMBER	Shows the current disk space usage (in bytes) by Unified Audit files (.bin format) in the container
MAX_SIZE	NUMBER	Shows the maximum amount of disk space (in bytes) that can be used by data and temp files in the container
MAX_DIAGNOSTICS_SIZE	NUMBER	Shows the maximum amount of disk space (in bytes) that can be used by diagnostic traces generated in the container
MAX_AUDIT_SIZE	NUMBER	Shows the maximum amount of disk space (in bytes) that can be used by Unified Audit files (.bin format) in the container
LAST_CHANGED_BY	VARCHAR2 (11)	Indicates what type of user last changed the PDB. Possible values: <ul style="list-style-type: none"> • COMMON USER • LOCAL USER
MEMBER_CDB	VARCHAR2 (3)	Indicates whether the row corresponds to a Member CDB part of the CDB Fleet (YES) or not (NO). This column is only meaningful in the Lead CDB of a CDB Fleet, which keeps track of other CDBs as containers in the CDB Fleet.
TENANT_ID	VARCHAR2 (256)	Pluggable database tenant key
UPGRADE_LEVEL	NUMBER	For internal use only
GUID_BASE64	VARCHAR2 (30)	The GUID of the PDB, encoded in base64

7.147 V\$CONTEXT

V\$CONTEXT displays set attributes in the current session.

Column	Datatype	Description
NAMESPACE	VARCHAR2 (31)	Namespace that the attribute is in
ATTRIBUTE	VARCHAR2 (31)	Name of the attribute
VALUE	VARCHAR2 (4000)	Value of the attribute

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.148 V\$CONTROLFILE

V\$CONTROLFILE displays the names of the control files.

Column	Datatype	Description
STATUS	VARCHAR2 (7)	INVALID if the name cannot be determined (which should not occur); NULL if the name can be determined
NAME	VARCHAR2 (513)	Name of the control file
IS_RECOVERY_DEST_FILE	VARCHAR2 (3)	Indicates whether the file was created in the fast recovery area (YES) or not (NO)
BLOCK_SIZE	NUMBER	Control file block size
FILE_SIZE_BLKS	NUMBER	Control file size (in blocks)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.149 V\$CONTROLFILE_RECORD_SECTION

V\$CONTROLFILE_RECORD_SECTION displays information about the control file record sections.

Column	Datatype	Description
TYPE	VARCHAR2 (28)	<p>Identifies the type of record section:</p> <ul style="list-style-type: none"> • DATABASE • CKPT PROGRESS • REDO THREAD • REDO LOG • DATAFILE • FILENAME • TABLESPACE • TEMPORARY FILENAME • RMAN CONFIGURATION • LOG HISTORY • OFFLINE RANGE • ARCHIVED LOG • BACKUP SET • BACKUP PIECE • BACKUP DATAFILE • BACKUP REDOLOG • DATAFILE COPY • BACKUP CORRUPTION • COPY CORRUPTION • DELETED OBJECT • PROXY COPY • BACKUP SPFILE • DATABASE INCARNATION • FLASHBACK LOG • RECOVERY DESTINATION • INSTANCE SPACE RESERVATION • REMOVABLE RECOVERY FILES • RMAN STATUS • THREAD INSTANCE NAME MAPPING • MTTR • DATAFILE HISTORY • PLUGGED IN DATAFILE
RECORD_SIZE	NUMBER	Record size in bytes
RECORDS_TOTAL	NUMBER	Number of records allocated for the section
RECORDS_USED	NUMBER	Number of records used in the section
FIRST_INDEX	NUMBER	Index (position) of the first record
LAST_INDEX	NUMBER	Index of the last record
LAST_RECID	NUMBER	Record ID of the last record
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.150 V\$COPY_CORRUPTION

V\$COPY_CORRUPTION displays information about data file copy corruptions from the control file.

Column	Datatype	Description
RECID	NUMBER	Copy corruption record ID
STAMP	NUMBER	Copy corruption record stamp
COPY_RECID	NUMBER	Data file copy record ID
COPY_STAMP	NUMBER	Data file copy record stamp
FILE#	NUMBER	Data file number
BLOCK#	NUMBER	First block of the corrupted range
BLOCKS	NUMBER	Number of contiguous blocks in the corrupted range
CORRUPTION_CHANGE#	NUMBER	Change number at which the logical corruption was detected. Set to 0 to indicate media corruption.
MARKED_CORRUPT	VARCHAR2(3)	(YES NO) If set to YES the blocks were not marked corrupted in the data file, but were detected and marked as corrupted while making the data file copy
CORRUPTION_TYPE	VARCHAR2(9)	Type of block corruption in the data file: <ul style="list-style-type: none"> • ALL_ZERO - Block header on disk contained only zeros. The block may be valid if it was never filled and if it is in an Oracle7 file. The buffer will be reformatted to the Oracle8 standard for an empty block. • FRACTURED - Block header looks reasonable, but the front and back of the block are different versions. • CHECKSUM - optional check value shows that the block is not self-consistent. It is impossible to determine exactly why the check value fails, but it probably fails because sectors in the middle of the block are from different versions. • CORRUPT - Block is wrongly identified or is not a data block (for example, the data block address is missing) • LOGICAL - Block is logically corrupt • NOLOGGING - Block does not have redo log entries (for example, NOLOGGING operations on primary database can introduce this type of corruption on a physical standby)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.151 V\$COPY_NONLOGGED

V\$COPY_NONLOGGED displays information about nonlogged block ranges in data file copy blocks, recorded in the control file.

Column	Datatype	Description
INST_ID	NUMBER	Instance ID
RECID	NUMBER	Nonlogged copy record ID
STAMP	NUMBER	Nonlogged copy record stamp
COPY_RECID	NUMBER	Data file copy record ID
COPY_STAMP	NUMBER	Data file copy record stamp
FILE#	NUMBER	Absolute file number of the data file that contains this range of nonlogged blocks
BLOCK#	NUMBER	Block number of the first nonlogged block in the range of nologged blocks
BLOCKS	NUMBER	Number of nonlogged blocks found starting with BLOCK#
NONLOGGED_CHANGE#	NUMBER	The smallest SCN on which any block in this block range became nonlogged. NULL if unknown.
NONLOGGED_TIME	VARCHAR2	The time that corresponds to NONLOGGED_CHANGE#. NULL if unknown.
RESETLOGS_CHANGE#	VARCHAR2	The resetlogs SCN of the incarnation on which this block range was first marked as nonlogged. NULL if unknown.
RESETLOGS_TIME	VARCHAR2	The resetlogs time of the incarnation on which this block range was first marked as nologged. NULL if unknown.
OBJECT#	VARCHAR2	The object ID this range belongs to. If this field is NULL, the object number is unknown.
REASON	CHAR (7)	The reason why this block range appears in this list, for example, primary file offline, could not talk to primary, non-standby recovery, and so on. For Oracle Database 12c and later releases, it is always UNKNOWN.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.152 V\$CORRUPT_XID_LIST

V\$CORRUPT_XID_LIST displays all corrupted XIDs.

Column	Datatype	Description
CORRUPT_XID	VARCHAR2 (256)	Name of corrupt XID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.153 V\$CPOOL_CC_INFO

V\$CPOOL_CC_INFO displays information about the pool-to-connection class mapping for the Database Resident Connection Pool per instance.

Column	Datatype	Description
POOL_NAME	VARCHAR2 (1024)	Name of the Database Resident Connection Pool
CCLASS_NAME	VARCHAR2 (1024)	Name of the connection class
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

7.154 V\$CPOOL_CC_STATS

V\$CPOOL_CC_STATS displays information about the connection class level statistics for the Database Resident Connection Pool per instance.

Column	Datatype	Description
CCLASS_NAME	VARCHAR2 (1024)	Name of the connection class
NUM_REQUESTS	NUMBER	Number of session requests
NUM_HITS	NUMBER	Total number of times a session that matches with the request was found in the pool
NUM_MISSES	NUMBER	Total number of times an exact match to the request was not found in the pool and a new session had to be created
NUM_WAITS	NUMBER	Total number of times session requests had to wait before getting served
WAIT_TIME	NUMBER	Reserved for future use
CLIENT_REQ_TIMEOUTS	NUMBER	Reserved for future use
NUM_AUTHENTIFICATIONS	NUMBER	Total number of authentications of clients done by the pool
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

 Note:

In a multitenant container database (CDB), this view returns data only when queried from a CDB root. When queried from a PDB, this view returns 0 rows.

7.155 V\$CPOOL_CONN_INFO

V\$CPOOL_CONN_INFO displays connection information about each connection to the connection broker.

Column	Datatype	Description
CMON_ADDR	RAW (4 8)	Address of the connection broker
SESSION_ADDR	RAW (4 8)	Address of the session associated with the connection; NULL if the connection does not have an associated session
CONNECTION_ADDR	RAW (4 8)	Address of the connection
USERNAME	VARCHAR2 (1024)	Name of the user associated with the connection
PROXY_USER	VARCHAR2 (1024)	Name of the proxy user
CCLASS_NAME	VARCHAR2 (1024)	Connection class associated with the connection
PURITY	VARCHAR2 (1024)	Purity used to create the connection (can be SELF or NEW)
TAG	VARCHAR2 (1024)	Tag, if specified, at connection creation time
SERVICE	VARCHAR2 (64)	TNS service name for the connection
PROCESS_ID	VARCHAR2 (24)	Client process ID of the process which created the connection
PROGRAM	VARCHAR2 (48)	Program name of the client process which created the connection
MACHINE	VARCHAR2 (64)	Machine name of the client process which created the connection
TERMINAL	VARCHAR2 (30)	Terminal identifier of the client process which created the connection
CONNECTION_MODE	VARCHAR2 (1024)	Reserved for internal use
CONNECTION_STATUS	VARCHAR2 (10)	Status of the connection: <ul style="list-style-type: none"> • NONE • CONNECTING • ACTIVE: A pooled server has been mapped to this connection. • WAITING: The connection is waiting for a pooled server based on the client request. • IDLE: No pooled server has been mapped to this connection and there is no request to map one. • CLOSING
CLIENT_REGID	NUMBER	Query cache registration ID sent by the client
CURSTATUS_TIME	NUMBER	Time in microseconds spent in the current state. See CONNECTION_STATUS above.
IDLE_TIME	NUMBER	Total time in IDLE state for the connection (in microseconds)
ACTIVE_TIME	NUMBER	Total time in ACTIVE state for the connection (in microseconds)
WAIT_TIME	NUMBER	Total time in WAITING state for the connection (in microseconds)
THINK_TIME	NUMBER	Total think time for the connection assigned to the pooled server, but not doing any database activity (in microseconds)
LAST_IDLE_TIME	NUMBER	Time in last IDLE state for this connection (in microseconds)

Column	Datatype	Description
LAST_ACTIVE_TIME	NUMBER	Time in last ACTIVE state for this connection (in microseconds)
LAST_WAIT_TIME	NUMBER	Time in last WAITING state for this connection (in microseconds)
LAST_THINK_TIME	NUMBER	Time for the connection assigned to the pooled server, but not doing any database activity during the last ACTIVE state (in microseconds)
NUMGETS	NUMBER	Total number of requests at the connection level
NUMHITS	NUMBER	Total number of hits at the connection level
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.156 V\$CPOOL_STATS

V\$CPOOL_STATS displays information about the Database Resident Connection Pool statistics for an instance.

Column	Datatype	Description
POOL_NAME	VARCHAR2 (1024)	Name of the Database Resident Connection Pool
NUM_OPEN_SERVERS	NUMBER	Total number of busy and free servers in the pool (including the authentication servers)
NUM_BUSY_SERVERS	NUMBER	Total number of busy servers in the pool (not including the authentication servers)
NUM_AUTH_SERVERS	NUMBER	Number of authentication servers in the pool
NUM_REQUESTS	NUMBER	Number of client requests
NUM_HITS	NUMBER	Total number of times client requests found matching pooled servers in the pool
NUM_MISSES	NUMBER	Total number of times client requests could not find a matching pooled server in the pool
NUM_WAITS	NUMBER	Total number of client requests that had to wait due to non-availability of free pooled servers
WAIT_TIME	NUMBER	Reserved for future use
CLIENT_REQ_TIMEOUTS	NUMBER	Reserved for future use
NUM_AUTHENTICATIONS	NUMBER	Total number of authentications of clients done by the pool
NUM_PURGED	NUMBER	Total number of sessions purged by the pool
HISTORIC_MAX	NUMBER	Maximum size that the pool has ever reached

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **Note:**

In a multitenant container database (CDB), this view returns data only when queried from a CDB root. When queried from a PDB, this view returns 0 rows.

7.157 V\$CR_BLOCK_SERVER

V\$CR_BLOCK_SERVER displays statistics on the Global Cache Service processes (LMS) used in cache fusion.

Column	Datatype	Description
CR_REQUESTS	NUMBER	Number of CR blocks served due to remote CR block requests
CURRENT_REQUESTS	NUMBER	Number of current blocks served due to remote CR block requests $CR_REQUESTS + CURRENT_REQUESTS = \text{global cache CR blocks served (from V$SYSSTAT).}$
DATA_REQUESTS	NUMBER	Number of current or CR requests for data blocks
UNDO_REQUESTS	NUMBER	Number of CR requests for undo blocks
TX_REQUESTS	NUMBER	Number of CR requests for undo segment header blocks
OTHER_REQUESTS	NUMBER	Number of CR requests for other types of blocks $DATA_REQUESTS + UNDO_REQUESTS + TX_REQUESTS + OTHER_REQUESTS = \text{total number of requests handled by the LMS processes}$
CURRENT_RESULTS	NUMBER	Number of requests for which no changes were rolled out of the block returned to the requesting instance
PRIVATE_RESULTS	NUMBER	Number of requests for which changes were rolled out of the block returned to the requesting instance, and only the requesting transaction can use the resulting CR block
ZERO_RESULTS	NUMBER	Number of requests for which changes were rolled out of the block returned to the requesting instance. Only zero-XID transactions can use the block.
DISK_READ_RESULTS	NUMBER	Number of requests for which the requesting instance had to read the requested block from disk
FAIL_RESULTS	NUMBER	Number of requests that failed; the requesting transaction must reissue the request
STALE	NUMBER	Number of requests for which the disk read of the requested block was stale

Column	Datatype	Description
FAIRNESS_DOWN_CONVERTS	NUMBER	Number of times an instance receiving a request has down-converted an X lock on a block because it was not modifying the block
FAIRNESS_CLEARS	NUMBER	Number of times the "fairness counter" was cleared. This counter tracks the number of times a block was modified after it was served.
FREE_GC_ELEMENTS	NUMBER	Number of times a request was received from another instance and the X lock had no buffers
FLUSHES	NUMBER	Number of times the log has been flushed by an LMS process
FLUSHES_QUEUED	NUMBER	Number of flushes queued by an LMS process
FLUSH_QUEUE_FULL	NUMBER	Number of times the flush queue was full
FLUSH_MAX_TIME	NUMBER	Maximum time for flush
LIGHT_WORKS	NUMBER	Number of times the light-work rule was evoked. This rule prevents the LMS processes from going to disk while responding to CR requests for data, undo, or undo segment header blocks. This rule can prevent the LMS process from completing its response to the CR request.
ERRORS	NUMBER	Number of times an error was signalled by an LMS process
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **Note:**

This view contains internal diagnostic information for use by Oracle Support Services. It is subject to change without notice.

7.158 V\$CURRENT_BLOCK_SERVER

V\$CURRENT_BLOCK_SERVER displays statistics on the Global Cache Service processes (LMS) used in cache fusion.

Column	Datatype	Description
PIN0	NUMBER	Pins taking less than 100 microseconds
PIN1	NUMBER	Pins taking 100 microseconds to 1 millisecond
PIN10	NUMBER	Pins taking 1 to 10 milliseconds
PIN100	NUMBER	Pins taking 10 to 100 milliseconds
PIN1000	NUMBER	Pins taking 100 to 1000 milliseconds
PIN10000	NUMBER	Pins taking 1000 to 10000 milliseconds
FLUSH0	NUMBER	Flushes taking less than 100 microseconds
FLUSH1	NUMBER	Flushes taking 100 microseconds to 1 millisecond
FLUSH10	NUMBER	Flushes taking 1 to 10 milliseconds

Column	Datatype	Description
FLUSH100	NUMBER	Flushes taking 10 to 100 milliseconds
FLUSH1000	NUMBER	Flushes taking 100 to 1000 milliseconds
FLUSH10000	NUMBER	Flushes taking 1000 to 10000 milliseconds
WRITE1 ¹	NUMBER	Writes taking less than 1 millisecond
WRITE10 ¹	NUMBER	Writes taking 1 to 10 milliseconds
WRITE100 ¹	NUMBER	Writes taking 10 to 100 milliseconds
WRITE1000 ¹	NUMBER	Writes taking 100 to 1000 milliseconds
WRITE10000 ¹	NUMBER	Writes taking 1000 to 10000 milliseconds
CLEANDC	NUMBER	Reserved for internal use
RCVDC	NUMBER	Number of lock down-converts to S (shared) caused by instance recovery
QUEUEDC	NUMBER	Number of queued lock down-converts to NULL
EVICTDC	NUMBER	Number of lock down-converts to NULL caused by an SGA shrink
WRITEDC	NUMBER	Number of dirty blocks in read-mostly objects which were written and the X (exclusive) lock down-converted to S (shared) locks
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

¹ This column is deprecated in Oracle Database 12c Release 2 (12.2.0.1) and may be removed in a future release.

7.159 V\$DATABASE

V\$DATABASE displays information about the database from the control file.

Column	Datatype	Description
DBID	NUMBER	Database identifier calculated when the database is created and stored in all file headers
NAME	VARCHAR2 (9)	Name of the database
CREATED	DATE	Creation date of the database. If the control file was re-created using the CREATE CONTROLFILE statement, then this column displays the date that the control file was re-created.
RESETLOGS_CHANGE#	NUMBER	System change number (SCN) at open resetlogs
RESETLOGS_TIME	DATE	Timestamp of open resetlogs
PRIOR_RESETLOGS_CHANGE#	NUMBER	SCN at prior resetlogs
PRIOR_RESETLOGS_TIME	DATE	Timestamp of prior resetlogs

Column	Datatype	Description
LOG_MODE	VARCHAR2 (12)	<p>Archive log mode:</p> <ul style="list-style-type: none"> • NOARCHIVELOG • ARCHIVELOG • MANUAL
CHECKPOINT_CHANGE#	NUMBER	Last SCN checkpointed
ARCHIVE_CHANGE#	NUMBER	Database force archiving SCN. Any redo log with a start SCN below this will be forced to archive out.
CONTROLFILE_TYPE	VARCHAR2 (7)	<p>Type of control file:</p> <ul style="list-style-type: none"> • STANDBY - Indicates that the database is in standby mode • CLONE - Indicates a clone database • BACKUP CREATED - Indicates the database is being recovered using a backup or created control file • CURRENT - database is available for general use
CONTROLFILE_CREATED	DATE	Creation date of the control file
CONTROLFILE_SEQUENCE#	NUMBER	Control file sequence number incremented by control file transactions
CONTROLFILE_CHANGE#	NUMBER	Last SCN in backup control file; null if the control file is not a backup
CONTROLFILE_TIME	DATE	Last timestamp in backup control file; null if the control file is not a backup
OPEN_RESETLOGS	VARCHAR2 (11)	(NOT ALLOWED ALLOWED REQUIRED) Indicates whether the next database open allows or requires the resetlogs option
VERSION_TIME	DATE	Version time
OPEN_MODE	VARCHAR2 (20)	<p>Open mode information:</p> <ul style="list-style-type: none"> • MOUNTED • READ WRITE • READ ONLY • READ ONLY WITH APPLY - A physical standby database is open in real-time query mode
PROTECTION_MODE	VARCHAR2 (20)	<p>Protection mode currently in effect for the database:</p> <ul style="list-style-type: none"> • MAXIMUM PROTECTION - Database is running in maximized protection mode • MAXIMUM AVAILABILITY - Database is running in maximized availability mode • RESYNCHRONIZATION - Database is running in resynchronization mode • MAXIMUM PERFORMANCE - Database is running in maximized performance mode • UNPROTECTED - Database is unprotected (this normally occurs when the primary database is mounted and not open)

Column	Datatype	Description
PROTECTION_LEVEL	VARCHAR2(20)	<p>Aggregated protection mode currently in effect for the database:</p> <ul style="list-style-type: none"> • MAXIMUM PROTECTION - Database is running in maximized protection mode • MAXIMUM AVAILABILITY - Database is running in maximized availability mode • RESYNCHRONIZATION - Database is running in resynchronization mode • MAXIMUM PERFORMANCE - Database is running in maximized performance mode • UNPROTECTED - Database is unprotected (this normally occurs when the primary database is mounted and not open) <p>Note: This column is an aggregation of the PROTECTION_MODE of all standby archive log destinations.</p>
REMOTE_ARCHIVE	VARCHAR2(8)	Value of the REMOTE_ARCHIVE_ENABLE initialization parameter
ACTIVATION#	NUMBER	Number assigned to the database instantiation
SWITCHOVER#	NUMBER	Number assigned to the database switchover
DATABASE_ROLE	VARCHAR2(16)	<p>Current role of the database:</p> <ul style="list-style-type: none"> • SNAPSHOT STANDBY • LOGICAL STANDBY • PHYSICAL STANDBY • PRIMARY • FAR SYNC
ARCHIVELOG_CHANGE#	NUMBER	Highest NEXT_CHANGE# (from the V\$ARCHIVED_LOG view) for an archive log
ARCHIVELOG_COMPRESSION	VARCHAR2(8)	Status of the archive log compression (ENABLED) or (DISABLED)

Column	Datatype	Description
SWITCHOVER_STATUS	VARCHAR2 (20)	<p>Indicates whether switchover is allowed:</p> <ul style="list-style-type: none"> • NOT ALLOWED - On a primary database, this status indicates that there are no valid and enabled standby databases. On a standby database, this status indicates that a switchover request has not been received from the primary database. • SESSIONS ACTIVE - The database has active sessions. On a physical standby database, the WITH SESSION SHUTDOWN SQL clause must be specified to perform a role transition while in this state. On a logical standby database, a role transition can be performed while in this state, but the role transition will not complete until all current transactions have committed. • SWITCHOVER PENDING - On a physical standby database, this status indicates that a switchover request has been received from the primary database and is being processed. A physical standby database cannot switch to the primary role while in this transient state. • SWITCHOVER LATENT - On a physical standby database, this status indicates that a switchover request was pending, but the original primary database has been switched back to the primary role. • TO PRIMARY - The database is ready to switch to the primary role. • TO STANDBY - The database is ready to switch to either the physical or logical standby role. • TO LOGICAL STANDBY - The database has received a data dictionary from a logical standby database and is ready to switch to the logical standby role. • RECOVERY NEEDED - On a physical standby database, this status indicates that additional redo must be applied before the database can switch to the primary role. • PREPARING SWITCHOVER - On a primary database, this status indicates that a data dictionary is being received from a logical standby database in preparation for switching to the logical standby role. On a logical standby database, this status indicates that the data dictionary has been sent to the primary database and other standby databases. • PREPARING DICTIONARY - On a logical standby database, this status indicates that the data dictionary is being sent to the primary database and other standby databases in preparation for switching to the primary role. • FAILED DESTINATION - On a primary database, this status indicates that one or more standby destinations are in an error state. • RESOLVABLE GAP - On a primary database, this status indicates that one or more standby databases have a redo gap that can be automatically resolved by fetching the missing redo from the primary database or from another standby database. • UNRESOLVABLE GAP - On a primary database, this status indicates that one or more standby databases have a redo gap that cannot be automatically resolved by fetching the missing redo from the primary database or from another standby database. • LOG SWITCH GAP - On a primary database, this status indicates that one or more standby databases are missing redo due to a recent log switch.

Column	Datatype	Description
DATAGUARD_BROKER	VARCHAR2(8)	<p>Data Guard broker information:</p> <ul style="list-style-type: none"> • ENABLED - Database is part of a broker configuration and broker management of the database is enabled • DISABLED - Database is part of a broker configuration and broker management of the database is disabled. This value is displayed if the user disabled broker management of the database or configuration, or if broker management was disabled due to a role change (for example, the old primary was disabled after a failover operation).
GUARD_STATUS	VARCHAR2(7)	<p>Protects data from being changed:</p> <ul style="list-style-type: none"> • ALL - Indicates all users other than <code>SYS</code> are prevented from making changes to any data in the database. • STANDBY - Indicates all users other than <code>SYS</code> are prevented from making changes to any database object being maintained by logical standby. • NONE - Indicates normal security for all data in the database.
SUPPLEMENTAL_LOG_DATA_MI N	VARCHAR2(8)	<p>Ensures that LogMiner (and any products building on LogMiner technology) will have sufficient information to support chained rows and various storage arrangements such as cluster tables:</p> <ul style="list-style-type: none"> • NO - None of the database-wide supplemental logging directives are enabled. In a CDB, a value of <code>NO</code> means that minimal supplemental logging is not enabled in all of the PDBs in the CDB. • IMPLICIT - Minimal supplemental logging is enabled because all or a combination of primary key, unique key, and foreign key supplemental logging is enabled • YES - Minimal supplemental logging is enabled through an <code>ALTER DATABASE ADD SUPPLEMENTAL LOG DATA</code> statement. In a CDB, a value of <code>YES</code> means that minimal supplemental logging is enabled in all of the PDBs in the CDB. <p>See Also: <i>Oracle Database SQL Language Reference</i> for additional information about the <code>ALTER DATABASE ADD SUPPLEMENTAL LOG DATA</code> statement</p>
SUPPLEMENTAL_LOG_DATA_PK	VARCHAR2(3)	<p>For all tables with a primary key, indicates whether all columns of the primary key are placed into the redo log whenever an update is performed (<code>YES</code>) or not (<code>NO</code>).</p> <p>When a value of <code>YES</code> appears in a CDB, it means that primary key supplemental logging is enabled in all of the PDBs in the CDB.</p> <p>When a value of <code>NO</code> appears in a CDB, query the <code>PRIMARY_KEY</code> column in the <code>DBA_SUPPLEMENTAL_LOGGING</code> view for each PDB in the CDB to see whether primary key supplemental logging is enabled in the PDB.</p> <p>See Also: <i>Oracle Database SQL Language Reference</i> for more information about the <code>ALTER DATABASE ADD SUPPLEMENTAL LOG supplemental_id_key_clause</code> statement</p>

Column	Datatype	Description
SUPPLEMENTAL_LOG_DATA_UI	VARCHAR2(3)	<p>For all tables with a unique key, indicates whether all other columns belonging to the unique key are placed into the redo log if any of the unique key columns are modified (YES) or not (NO).</p> <p>When a value of YES appears in a CDB, it means that this value is enabled in all of the PDBs in the CDB.</p> <p>When a value of NO appears in a CDB, query the UNIQUE_INDEX column in the DBA_SUPPLEMENTAL_LOGGING view for each PDB in the CDB to see whether unique column supplemental logging is enabled in the PDB.</p> <p>See Also: Oracle Database SQL Language Reference for more information about the ALTER DATABASE ADD SUPPLEMENTAL LOG supplemental_id_key_clause statement</p>
FORCE_LOGGING	VARCHAR2(39)	<p>Indicates the type of logging mode that is currently in force. The valid values and their meanings are:</p> <ul style="list-style-type: none"> • NO - This value means that no logging mode has been enabled for the database • YES - This value means that FORCE LOGGING mode has been enabled for the database • STANDBY NOLOGGING FOR LOAD PERFORMANCE - This value is used when this is the current mode for the database • STANDBY NOLOGGING FOR DATA AVAILABILITY - This value is used when this is the current mode for the database
PLATFORM_ID	NUMBER	Platform identification number of the database
PLATFORM_NAME	VARCHAR2(101)	Platform name of the database
RECOVERY_TARGET_INCARNATION#	NUMBER	Incarnation number where all data files are recovered by the RECOVER DATABASE command
LAST_OPEN_INCARNATION#	NUMBER	Record number of the incarnation in V\$DATABASE_INCARNATION that was last opened successfully
CURRENT_SCN	NUMBER	Current SCN; null if the database is not currently open. For a standby database, it is the checkpoint SCN of the mounted physical standby database during media recovery and is always less than the last applied SCN tracked in V\$RECOVERY_PROGRESS.
FLASHBACK_ON	VARCHAR2(18)	<p>Possible values are as follows:</p> <ul style="list-style-type: none"> • YES - Flashback is on • NO - Flashback is off • RESTORE POINT ONLY - Flashback is on but one can only flashback to guaranteed restore points
SUPPLEMENTAL_LOG_DATA_FK	VARCHAR2(3)	<p>For all tables with a foreign key, indicates whether all other columns belonging to the foreign key are placed into the redo log if any foreign key columns are modified (YES) or not (NO).</p> <p>When a value of YES appears in a CDB, it means that foreign key supplemental logging is enabled in all of the PDBs in the CDB.</p> <p>When a value of NO appears in a CDB, query the FOREIGN_KEY column in the DBA_SUPPLEMENTAL_LOGGING view for each PDB in the CDB to see whether foreign key supplemental logging is enabled in the PDB.</p> <p>See Also: Oracle Database SQL Language Reference for more information about the ALTER DATABASE ADD SUPPLEMENTAL LOG supplemental_id_key_clause statement</p>

Column	Datatype	Description
SUPPLEMENTAL_LOG_DATA_ALL	VARCHAR2(3)	<p>For all columns, indicates whether all the fixed-length maximum size columns of that row are placed into the redo log (YES) or not (NO).</p> <p>When a value of YES appears in a CDB, it means that all column supplemental logging is enabled in all of the PDBs in the CDB.</p> <p>When a value of NO appears in a CDB, query the ALL_COLUMN column in the DBA_SUPPLEMENTAL_LOGGING view for each PDB in the CDB to see whether all column supplemental logging is enabled in the PDB.</p> <p>See Also: Oracle Database SQL Language Reference for more information about the ALTER DATABASE ADD SUPPLEMENTAL LOG supplemental_id key clause statement</p>
DB_UNIQUE_NAME	VARCHAR2(30)	Unique database name
STANDBY_BECAME_PRIMARY SCN	NUMBER	SCN at which a physical standby database became a primary database. This SCN is useful for converting a failed primary database into a physical standby database after a forced failover.
FS_FAILOVER_MODE ¹	VARCHAR2(19)	<p>Displays the current fast-start failover mode. Possible values are:</p> <ul style="list-style-type: none"> • DISABLED - Fast-start failover is disabled. • OBSERVE-ONLY - Fast-start failover is enabled in test drive mode. • ZERO DATA LOSS - Fast-start failover is enabled and a fast-start failover cannot incur any data loss. • POTENTIAL DATA LOSS - Fast-start failover is enabled and a fast-start failover can incur data loss within FastStartFailoverLagLimit seconds. <p>See Also: Oracle Data Guard Concepts and Administration for more information about Oracle Data Guard.</p>
FS_FAILOVER_STATUS	VARCHAR2(22)	<p>Fast-start failover status:</p> <ul style="list-style-type: none"> • DISABLED • BYSTANDER • SYNCHRONIZED • UNSYNCHRONIZED • SUSPENDED • STALLED • LOADING DICTIONARY • PRIMARY UNOBSERVED • REINSTATE REQUIRED • REINSTATE FAILED • TARGET OVER LAG LIMIT • TARGET UNDER LAG LIMIT <p>See Also: Oracle Data Guard Broker for detailed descriptions of these values</p> <p>Note: If the value of this column is DISABLED, then the values for the FS_FAILOVER_CURRENT_TARGET, FS_FAILOVER_THRESHOLD, FS_FAILOVER_OBSERVER_PRESENT, and FS_FAILOVER_OBSERVER_HOST columns in this table are not meaningful.</p>
FS_FAILOVER_CURRENT_TARGET	VARCHAR2(30)	DB_UNIQUE_NAME of the standby that is the current fail-safe failover observer target standby for the Data Guard configuration
FS_FAILOVER_THRESHOLD	NUMBER	Time (in seconds) that the observer will attempt to reconnect with a disconnected primary before attempting fail-safe failover observer with the target standby

Column	Datatype	Description
FS_FAILOVER_OBSERVER_PRE_SENT	VARCHAR2(7)	<p>Indicates whether the master observer is currently connected to the local database (YES) or not (NO)</p> <p>Note: This column is consistent throughout an Oracle RAC environment; that is, if the observer is connected to any instance, then all instances will show a value of YES.</p>
FS_FAILOVER_OBSERVER_HOST	VARCHAR2(512)	<p>Machine name that is currently hosting the master observer process, if fast-start failover is enabled. If fast-start failover is not enabled, this column returns a NULL string.</p>
CONTROLFILE_CONVERTED	VARCHAR2(3)	<p>Indicates whether the control file was implicitly converted from its original type during restore (YES) or not (NO)</p> <p>This column will be set to YES when RMAN restores a standby control file from a backup of the control file taken at the primary database or restores a backup control file from a backup taken at the physical standby database.</p> <p>This column will change to NO when the file names are fixed using information in the recovery catalog schema.</p>
PRIMARY_DB_UNIQUE_NAME	VARCHAR2(30)	<p>For any Standby database (Physical, Logical, or Snapshot), this column will contain the DB_UNIQUE_NAME of the Primary database that this Standby last received current redo from.</p> <p>If this standby has not received any current redo since last being started, then this column will be null.</p> <p>For a Primary database that had previously been a Standby, this column will contain the DB_UNIQUE_NAME of the last Primary that this database received current redo from while acting as a Standby.</p> <p>For a Primary database that has never been a Standby, this column will be null.</p>
SUPPLEMENTAL_LOG_DATA_PI	VARCHAR2(3)	<p>Indicates whether additional information is logged in the redo log (YES) or not (NO) during invocation of procedures in Oracle-supplied packages for which procedural replication is supported.</p> <p>When a value of YES appears in a CDB, it means that supplemental logging for procedural replication is enabled in all of the PDBs in the CDB.</p> <p>When a value of NO appears in a CDB, query the PROCEDURAL column in the DBA_SUPPLEMENTAL_LOGGING view for each PDB in the CDB to see whether supplemental logging for procedural replication is supported in the PDB.</p> <p>See Also: <i>Oracle Data Guard Concepts and Administration</i> for a list of Oracle-supplied packages that are procedurally replicated to a logical standby database</p>
MIN_REQUIRED_CAPTURE_CHECKPOINT_SCN	NUMBER	Minimum REQUIRED_CHECKPOINT_SCN for all local capture processes on the database
CDB	VARCHAR2(3)	<p>Possible values are:</p> <ul style="list-style-type: none"> • YES if the database is a CDB • NO if the database is not a CDB

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
PENDING_ROLE_CHANGE_TASK ¹	VARCHAR2(512)	Tasks remaining after an Oracle Data Guard role change. Possible values: <ul style="list-style-type: none"> • NONE: No pending tasks remain • NOT_APPLICABLE: The database is either standby or is not a DG_CONFIG member • BUILD_PENDING: The database was formerly a logical standby and has not yet taken a snapshot of its data dictionary into the redo stream • SRL_ARCHIVE_PENDING: The database was formerly a logical standby and the standby redo logs associated with the earlier failover operation have not yet been archived • ERROR: The database was formerly a logical standby and the snapshot of the dictionary failed • UNKNOWN: The database is not open or the query failed
CON_DBID	NUMBER	The database ID of the PDB
FORCE_FULL_DB_CACHING	VARCHAR2(3)	Indicates the status of the force full database caching feature in the database. Possible values: <ul style="list-style-type: none"> • YES - The database is in force full database caching mode. • NO - The database is not in force full database caching mode. <p>See Also: <i>Oracle Database SQL Language Reference</i> for information about the FORCE FULL DATABASE CACHING clause for the ALTER DATABASE statement</p>
SUPPLEMENTAL_LOG_DATA_SR ¹	VARCHAR2(3)	Indicates whether the database is enabled for subset database replication (YES) or not (NO). If the database is enabled for subset database replication, then redo overhead and feature restriction for tables without column data supplemental logging will be reduced.

¹ This column is available starting with Oracle Database 19c.

See Also:

"[DBA_SUPPLEMENTAL_LOGGING](#)" for more information about supplemental logging in a PDB

7.160 V\$DATABASE_BLOCK_CORRUPTION

V\$DATABASE_BLOCK_CORRUPTION displays information about database blocks that were corrupted after the last backup.

Column	Datatype	Description
FILE#	NUMBER	Absolute file number of the data file that contains the corrupt blocks
BLOCK#	NUMBER	Block number of the first corrupt block in the range of corrupted blocks
BLOCKS	NUMBER	Number of corrupted blocks found starting with BLOCK#
CORRUPTION_CHANGE#	NUMBER	Change number at which the logical corruption was detected. Set to 0 to indicate media corruption.
CORRUPTION_TYPE	VARCHAR2 (9)	Type of block corruption in the data file: <ul style="list-style-type: none"> • ALL_ZERO - Block header on disk contained only zeros. The block may be valid if it was never filled and if it is in an Oracle7 file. The buffer will be reformatted to the Oracle8 standard for an empty block. • FRACTURED - Block header looks reasonable, but the front and back of the block are different versions. • CHECKSUM - optional check value shows that the block is not self-consistent. It is impossible to determine exactly why the check value fails, but it probably fails because sectors in the middle of the block are from different versions. • CORRUPT - Block is wrongly identified or is not a data block (for example, the data block address is missing) • LOGICAL - Block is logically corrupt
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

["V\\$NONLOGGED_BLOCK"](#) for information about nonlogged blocks

7.161 V\$DATABASE_INCARNATION

V\$DATABASE_INCARNATION displays information about all database incarnations.

Oracle creates a new incarnation whenever a database is opened with the RESETLOGS option. Records about the current and immediately previous incarnation are also contained in the V\$DATABASE view.

Column	Datatype	Description
INCARNATION#	NUMBER	Record ID for the branch record in the control file
RESETLOGS_CHANGE#	NUMBER	Resetlogs system change number (SCN) for the incarnation of the current row
RESETLOGS_TIME	DATE	Resetlogs timestamp for the incarnation of the current row
PRIOR_RESETLOGS_CHANGE#	NUMBER	Resetlogs SCN for the previous incarnation

Column	Datatype	Description
PRIOR_RESETLOGS_TIME	DATE	Resetlogs timestamp for the previous incarnation
STATUS	VARCHAR2 (7)	Incarnation status: <ul style="list-style-type: none">• ORPHAN - Orphan incarnation• CURRENT - Current incarnation of the database• PARENT - Parent of the current incarnation
RESETLOGS_ID	NUMBER	Branch ID for the incarnation of the current row (used by user-managed recovery/RMAN restore to get unique names for archived logs across incarnations)
PRIOR_INCARNATION#	NUMBER	Parent incarnation record ID if nonzero
FLASHBACK_DATABASE_ALLOW	VARCHAR2 (26) ED	Indicate whether or not Flashback Database can be performed into SCNs or timestamps in the incarnation. A value of YES means that you can flashback to some point in that incarnation. A value of NO indicates that you cannot flashback into the incarnation.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

"[V\\$DATABASE](#)"

7.162 V\$DATABASE_KEY_INFO

V\$DATABASE_KEY_INFO provides the information of the default database key used to encrypt data blocks. Oracle uses the database key to encrypt sensitive information in SYSTEM, UNDO, and TEMP tablespaces when such data has dependency from encrypted tablespaces or encrypted columns

V\$DATABASE_KEY_INFO reflects the database key information stored in the control file. Generally it is the same as the system tablespace key recorded in the system tablespace. If the system tablespace is encrypted, it will also appear in V\$ENCRYPTED_TABLESPACES. If the system tablespace is not encrypted, this is the only view providing this information.

Column	Datatype	Description
ENCRYPTIONALG	VARCHAR2 (7)	Encryption algorithm: <ul style="list-style-type: none">• NONE• 3DES168• AES128• AES192• AES256 AES128 is the default encryption algorithm.
ENCRYPTEDKEY	RAW (48)	Encrypted version of the database key

Column	Datatype	Description
MASTERKEYID	RAW(16)	ID of the master key that was used to encrypt the database key
MASTER_ACTIVATED	VARCHAR2(3)	Indicates whether the master key has been set (YES) or not (NO) for this database or container in the Oracle Key Store. In other words, indicates whether Transparent Data Encryption (TDE) has been activated for this database or container
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$ENCRYPTED_TABLESPACES"](#)

7.163 V\$DATAFILE

V\$DATAFILE displays datafile information from the control file.

 See Also:["V\\$DATAFILE_HEADER"](#), which displays information from data file headers

Column	Datatype	Description
FILE#	NUMBER	Absolute file number
CREATION_CHANGE#	NUMBER	Change number at which the data file was created
CREATION_TIME	DATE	Timestamp of the data file creation
TS#	NUMBER	Tablespace number
RFILE#	NUMBER	Tablespace relative data file number
STATUS	VARCHAR2(7)	Type of file (system or user) and its status. Values: OFFLINE, ONLINE, SYSTEM, RECOVER, SYSOFF (an offline file from the SYSTEM tablespace)
ENABLED	VARCHAR2(10)	Describes how accessible the file is from SQL: <ul style="list-style-type: none"> • DISABLED - No SQL access allowed • READ ONLY - No SQL updates allowed • READ WRITE - Full access allowed • UNKNOWN - Unknown whether SQL updates would be allowed or not
CHECKPOINT_CHANGE#	NUMBER	SCN at last checkpoint
CHECKPOINT_TIME	DATE	Timestamp of the checkpoint#

Column	Datatype	Description
UNRECOVERABLE_CHANGE#	NUMBER	Last unrecoverable change number made to this data file. If the database is in ARCHIVELOG mode, then this column is updated when an unrecoverable operation completes. If the database is not in ARCHIVELOG mode, this column does not get updated.
UNRECOVERABLE_TIME	DATE	Timestamp of the last unrecoverable change. This column is updated only if the database is in ARCHIVELOG mode.
LAST_CHANGE#	NUMBER	Last change number made to this data file (null if the data file is being changed)
LAST_TIME	DATE	Timestamp of the last change
OFFLINE_CHANGE#	NUMBER	Offline change number of the last offline range. This column is updated only when the data file is brought online.
ONLINE_CHANGE#	NUMBER	Online change number of the last offline range
ONLINE_TIME	DATE	Online timestamp of the last offline range
BYTES	NUMBER	Current data file size (in bytes); 0 if inaccessible
BLOCKS	NUMBER	Current data file size (in blocks); 0 if inaccessible
CREATE_BYTES	NUMBER	Size when created (in bytes)
BLOCK_SIZE	NUMBER	Block size of the data file
NAME	VARCHAR2(513)	Name of the data file
PLUGGED_IN	NUMBER	Describes whether the tablespace is plugged in. The value is 1 if the tablespace is plugged in and has not been made read/write, 0 if not.
BLOCK1_OFFSET	NUMBER	Offset from the beginning of the file to where the Oracle generic information begins. The exact length of the file can be computed as follows: BYTES + BLOCK1_OFFSET.
AUX_NAME	VARCHAR2(513)	Auxiliary name that has been set for this file via CONFIGURE_AUXNAME
FIRST_NONLOGGED_SCN	NUMBER	First nonlogged SCN (check in standby database)
FIRST_NONLOGGED_TIME	DATE	First nonlogged time (check in standby database)
FOREIGN_DBID	NUMBER	Foreign DBID from which this data file came from. The value is 0 if this file is not a foreign database file.
FOREIGN_CREATION_CHANGE#	NUMBER	Creation SCN of a foreign data file. The value is 0 if this file is not a foreign database file.
FOREIGN_CREATION_TIME	DATE	Creation time of a foreign data file. The value is 0 if this file is not a foreign database file.
PLUGGED_READONLY	VARCHAR2(3)	YES if this is a transported read-only foreign file; otherwise NO.
PLUGIN_CHANGE#	NUMBER	SCN at which the foreign data file was transported into the database. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_CHANGE#	NUMBER	The SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_TIME	DATE	The time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.164 V\$DATAFILE_COPY

V\$DATAFILE_COPY displays data file copy information from the control file.

Column	Datatype	Description
RECID	NUMBER	Data file copy record ID
STAMP	NUMBER	Data file copy record stamp
NAME	VARCHAR2 (513)	File name of the data file copy. The maximum length of the name is operating system dependent.
TAG	VARCHAR2 (32)	Data file copy tag
FILE#	NUMBER	Absolute data file number
RFILE#	NUMBER	Tablespace relative data file number
CREATION_CHANGE#	NUMBER	Data file creation change#
CREATION_TIME	DATE	Data file creation timestamp
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the data file when the copy was made
RESETLOGS_TIME	DATE	Resetlogs timestamp of the data file when the copy was made
INCREMENTAL_LEVEL	NUMBER	Normal full backups have a NULL value, level 0 incremental backups have a value of 0, and level 1 incremental backups have a value of 1
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change number of the data file when the copy was made
CHECKPOINT_TIME	DATE	Checkpoint timestamp of the data file when the copy was made
ABSOLUTE_FUZZY_CHANGE#	NUMBER	Highest change seen when the data file was copied
RECOVERY_FUZZY_CHANGE#	NUMBER	Highest change written to the file by media recovery
RECOVERY_FUZZY_TIME	DATE	Timestamp of the highest change written to the file by media recovery
ONLINE_FUZZY	VARCHAR2 (3)	(YES NO) If set to YES, this is a copy taken using an operating system utility after a crash or offline immediate (or an invalid copy taken while data file was online and the database open). Recovery will need to apply all redo up to the next crash recovery marker to make the file consistent.
BACKUP_FUZZY	VARCHAR2 (3)	(YES NO) If set to YES, this is a copy taken using the BEGIN BACKUP/END BACKUP technique. Recovery will need to apply all redo up to the end backup marker to make this copy consistent.
MARKED_CORRUPT	NUMBER	Number of blocks marked corrupt by this copy operation. That is, blocks that were not marked corrupted in the source data file, but were detected and marked as corrupted during the copy operation.
MEDIA_CORRUPT	NUMBER	Total number of media corrupt blocks. For example, blocks with checksum errors are marked media corrupt.

Column	Datatype	Description
LOGICALLY_CORRUPT	NUMBER	Total number of logically corrupt blocks. For example, applying redo for unrecoverable operations will mark affected blocks logically corrupt.
BLOCKS	NUMBER	Size of the data file copy in blocks (also the size of the data file when the copy was made)
BLOCK_SIZE	NUMBER	Block size of the data file
OLDEST_OFFLINE_RANGE	NUMBER	RECID of the oldest offline range record in this control file copy; 0 for data file copies
DELETED	VARCHAR2 (3)	(YES NO) If set to YES the data file copy has been deleted or overwritten
STATUS	VARCHAR2 (1)	Identifies the status of this data file copy. Possible values are: A - Available D - Deleted U - Unavailable X - Expired
COMPLETION_TIME	DATE	Time when the copy was completed
CONTROLFILE_TYPE	VARCHAR2 (1)	B indicates normal copies S indicates standby copies
KEEP	VARCHAR2 (3)	(YES/NO) Indicates whether or not this backup set has a retention policy that is different than the value for the configure retention policy
KEEP_UNTIL	DATE	If KEEP_UNTIL is specified, this is the date after which the backup becomes obsolete. If this column is null, then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (11)	Lists additional retention options for this backup set. Possible values are: LOGS - The logs need to recover this backup are kept NOLOGS - The logs needed to recover this backup will not be kept
SCANNED	VARCHAR2 (3)	Indicates whether RMAN scanned the file (YES) or not (NO)
IS_RECOVERY_DEST_FILE	VARCHAR2 (3)	Indicates whether the file was created in the fast recovery area (YES) or not (NO)
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS record stamp
CONVERTED_FILE	VARCHAR2 (3)	(YES/NO) Indicates whether or not the data file copy was created using the RMAN CONVERT command
SAME_ENDIAN	VARCHAR2 (3)	If the value of the CONVERTED_FILE column is YES, then this column indicates whether the data file copy has the same endianness as the source data file (YES) or not (NO); otherwise NULL
FOREIGN_DBID	NUMBER	Foreign DBID from which this data file came from. The value is 0 if this file is not a foreign database file.
PLUGGED_READONLY	VARCHAR2 (3)	YES if this is a transported read-only foreign file; otherwise NO.
PLUGIN_CHANGE#	NUMBER	SCN at which the foreign data file was transported into the database. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_CHANGE#	NUMBER	The SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_TIME	DATE	The time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.

Column	Datatype	Description
BACKED_BY_VSS	VARCHAR2(3)	Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
BACKED_BY_PDB	VARCHAR2(3)	Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none"> • YES: The backup was taken when connected to the PDB • NO: The backup was taken when connected to the root container
SPARSE_BACKUP	VARCHAR2(3)	Indicates whether the file is sparse (YES) or not (NO)
GUID	RAW(16)	The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.

7.165 V\$DATAFILE_HEADER

V\$DATAFILE_HEADER displays data file information from the data file headers.

Column	Datatype	Description
FILE#	NUMBER	Data file number (from control file)
STATUS	VARCHAR2(7)	ONLINE OFFLINE (from control file)
ERROR	VARCHAR2(18)	NULL if the data file header read and validation were successful. If the read failed then the rest of the columns are NULL. If the validation failed then the rest of columns may display invalid data. If there is an error then usually the data file must be restored from a backup before it can be recovered or used.
FORMAT	NUMBER	Indicates the format for the header block. The possible values are 6, 7, 8, 10 or 0. 6 - indicates Oracle Version 6 7 - indicates Oracle Version 7 8 - indicates Oracle Version 8 10 - indicates Oracle Version 10 0 - indicates the format could not be determined (for example, the header could not be read)
RECOVER	VARCHAR2(3)	File needs media recovery (YES NO)
FUZZY	VARCHAR2(3)	File is fuzzy (YES NO)
CREATION_CHANGE#	NUMBER	Data file creation change#
CREATION_TIME	DATE	Data file creation timestamp
TABLESPACE_NAME	VARCHAR2(30)	Tablespace name
TS#	NUMBER	Tablespace number
RFILE#	NUMBER	Tablespace relative data file number
RESETLOGS_CHANGE#	NUMBER	Resetlogs change#

Column	Datatype	Description
RESETLOGS_TIME	DATE	Resetlogs timestamp
CHECKPOINT_CHANGE#	NUMBER	Data file checkpoint change#
CHECKPOINT_TIME	DATE	Data file checkpoint timestamp
CHECKPOINT_COUNT	NUMBER	Data file checkpoint count
BYTES	NUMBER	Current data file size in bytes
BLOCKS	NUMBER	Current data file size in blocks
NAME	VARCHAR2 (513)	Data file name
SPACE_HEADER	VARCHAR2 (40)	Represents the block address of a space file header block of a locally managed data file
LAST DEALLOC_CHANGE#	VARCHAR2 (16)	Last deallocated SCN
UNDO_OPT_CURRENT_CHANGE#	VARCHAR2 (40)	For internal use only
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
IS_SPARSE	VARCHAR2 (3)	Indicates whether the file is sparse (YES) or not (NO)
ENCRYPTED	VARCHAR2 (3)	After file encryption is completed, this column indicates whether the file is encrypted (YES) or not (NO). When file encryption is still in progress, this column has a value of NO.

7.166 V\$DATAGUARD_CONFIG

V\$DATAGUARD_CONFIG displays the unique database names defined with the DB_UNIQUE_NAME and LOG_ARCHIVE_CONFIG initialization parameters, providing a view of the Oracle Data Guard environment from any database in the configuration.

The first row of the view lists the unique database name of the current database that was specified with the DB_UNIQUE_NAME initialization parameter. Additional rows reflect the unique database names of the other databases in the configuration that were specified with the DG_CONFIG keyword of the LOG_ARCHIVE_CONFIG initialization parameter.

Column	Datatype	Description
DB_UNIQUE_NAME	VARCHAR2 (30)	Unique database name
PARENT_DBUN	VARCHAR2 (30)	DB_UNIQUE_NAME of the parent database, also known as the database that supplies live redo to the destination. For example, suppose Boston is the DB_UNIQUE_NAME of the primary database, Chicago is the DB_UNIQUE_NAME of the Far Sync Instance, and Seattle is the DB_UNIQUE_NAME of the terminal standby database. Since Boston is the primary database, it has no parent database so the PARENT_DBUN for Boston will be NULL. Since Boston services Chicago, the PARENT_DBUN of Chicago will be Boston. Since Chicago services Seattle, Chicago will be the PARENT_DBUN for Seattle.

Column	Datatype	Description
DEST_ROLE	VARCHAR2 (17)	Type of archival destination database: <ul style="list-style-type: none">• LOCAL - Local to primary database• PHYSICAL - Physical standby• FAR SYNC INSTANCE - Far Sync Instance• CROSS-INSTANCE - An instance of the primary• LOGICAL - Logical standby• SNAPSHOT - Snapshot standby database• DOWNSTREAM - Streams downstream capture database
CURRENT_SCN	NUMBER	The SCN up to which the specified database has applied redo
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[DB_UNIQUE_NAME](#)"
- "[LOG_ARCHIVE_CONFIG](#)"

7.167 V\$DATAGUARD_PROCESS

V\$DATAGUARD_PROCESS displays one row for each Oracle Data Guard process that is currently running.

Column	Datatype	Description
NAME	VARCHAR2 (5)	Name of the process whose information is being reported. Some of the possible values include: <ul style="list-style-type: none">• ARC<i>n</i> - Archiver process• DTS - Data transport process• FAL - File/announce process• LGWR - Log Writer Process• MRP0 - Detached recovery server process• NSS<i>n</i> - SYNC Redo Transport process• ORA - Foreground process• RFS - Remote file server• RMI - Remote message process• TMON - Redo Transport Process monitor• TT<i>n</i> - Redo Transport Slave Process
PID	VARCHAR2 (24)	Operating system process identifier of the process

Column	Datatype	Description
TYPE	VARCHAR2 (3)	Indicates which Oracle subsystem created the process. Possible values: <ul style="list-style-type: none">• KSB• KSV• NET• UNK

Column	Datatype	Description
ROLE	VARCHAR2 (24)	<p>Role of the process. Possible values:</p> <ul style="list-style-type: none"> • test • async ORL multi • async ORL single • async SRL multi • async SRL single • log writer • sync • archive redo • archive local • archive gap • RFS async • RFS sync • RFS archive • RFS gap • RFS SMON • data transport • data receive • redo transport monitor • heartbeat redo informer • process kill • post role transition • gap manager • update TMI • RFS ping • FAL GAP • FAL announce • failover • switchover • remote failover • remote switchover • redo transport timer • announce request • managed recovery • recovery • controlfile update • broker monitor • broker worker • broker net slave • broker instance slave • fast-start failover ping • recovery coordinator • recovery logmerger • recovery apply slave • recovery sending slave • recovery receiving slave • redo transport test • temporary • datafile pre-create • redo log management • UNKNOWN

Column	Datatype	Description
PROC_TIME	TIMESTAMP (0)	Timestamp of when the process started or registered for inclusion in this fixed view
TASK_TIME	TIMESTAMP (0)	Timestamp of when the first task of the process was requested
TASK_DONE	VARCHAR2 (1)	Indicates whether the task performed by the process is done (Y) or not (N)
ACTION	VARCHAR2 (12)	<p>Current action of the process. Possible values can include:</p> <ul style="list-style-type: none"> • ANNOUNCING • APPLYING_LOG • ATTACHED • CLOSING • CONNECTED • ERROR • IDLE • OPENING • PROCESSING • RECEIVING • REGISTERING • STARTING • TERMINATING • UNKNOWN • UNUSED • WAIT_FOR_GAP • WAIT_FOR_LOG • WRITING
CLIENT_PID	NUMBER	For RFS and DTS processes, the PID of the process communicating with this process
CLIENT_ROLE	VARCHAR2 (16)	<p>For RFS and DTS processes, the role of the process communicating with this process.</p> <p>Possible values can include:</p> <ul style="list-style-type: none"> • none • async ORL multi • async ORL single • async SRL multi • async SRL single • log writer • sync • archive redo • archive gap • data transport • gap manager • failover • switchover • announce request • managed recovery • recovery • UNKNOWN
GROUP#	NUMBER	Group number of the log that the process is operating upon
RESETLOG_ID	NUMBER	Resetlog ID (branch) of the log that the process is operating upon
THREAD#	NUMBER	Thread number that the process is operating upon

Column	Datatype	Description
SEQUENCE#	NUMBER	Sequence number that the process is operating upon
BLOCK#	NUMBER	Starting block number that the process is operating upon
BLOCK_COUNT	NUMBER	Number of blocks that the process is operating upon
DELAY_MINS	NUMBER	Archived redo log delay interval in minutes
DEST_ID	NUMBER	Destination ID that the process is currently operating upon
DEST_MASK	NUMBER	Mask of all destination IDs that the process will operate upon, where: Bit 0 is LOG_ARCHIVE_DEST1 Bit 1 is LOG_ARCHIVE_DEST2 Bit 2 is LOG_ARCHIVE_DEST3 and so on.
DBID	NUMBER	Database ID of the redo that the process is operating upon
DGID	NUMBER	Data Guard ID that the process must communicate with
INSTANCE	NUMBER	Instance number that the process must communicate with at the specified DGID
STOP_STATE	VARCHAR2 (7)	Indicates the method by which the process has been requested to stop: <ul style="list-style-type: none">• NOW - Requested to stop immediately and exit• SOON - Requested to stop on next log and exit• COMMIT - Requested to write remaining redo and exit• N/A - No request to stop
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

 Note:

Oracle recommends that you use this view instead of V\$MANAGED_STANDBY.

7.168 V\$DATAGUARD_STATS

V\$DATAGUARD_STATS displays information about Oracle Data Guard metrics when queried on a target database. No rows are returned when queried on a primary database. In the descriptions in this section, the originating database that is generating the redo is either a primary database or a logical standby database.

Column	Datatype	Description
SOURCE_DBID	NUMBER	Database ID of the originating database
SOURCE_DB_UNIQUE_NAME	VARCHAR2 (32)	DB unique name of the originating database

Column	Datatype	Description
NAME	VARCHAR2 (32)	<p>Name of the metric:</p> <ul style="list-style-type: none"> • APPLY FINISH TIME - An estimate of the time needed to apply all received, but unapplied redo from the originating database. If there are one or more redo gaps on the target database, an estimate of the time needed to apply all received, but unapplied redo up to the end of the last archived redo log before the beginning of the earliest redo gap. • APPLY LAG - Apply lag is a measure of the degree to which the data in a target database lags behind the data in the originating database, due to delays in propagating and applying redo to the target database. This value is relevant only to the applying instance. • TRANSPORT LAG - Transport lag is a measure of the degree to which the transport of redo to the target database lags behind the generation of redo on the originating database. If there are one or more redo gaps on the target database, the transport lag is calculated as if no redo has been received after the beginning of the earliest redo gap. • ESTIMATED STARTUP TIME - An estimate of the time needed to start and open the database.
VALUE	VARCHAR2 (64)	Value of the metric
UNIT	VARCHAR2 (30)	Unit of measurement
TIME_COMPUTED	VARCHAR2 (30)	Local time at the target database when the metric was computed
DATUM_TIME	VARCHAR2 (30)	Local time at the target database when the data used to compute the metric was received
		The APPLY LAG and TRANSPORT LAG metrics are computed based on data that is periodically received from the source database. An unchanging value in this column across multiple queries indicates that the target database is not receiving data from the source database.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.169 V\$DATAGUARD_STATUS

V\$DATAGUARD_STATUS displays messages recently written to the alert log or server process trace files that concern physical standby databases or redo transport services for all standby database types.

Column	Datatype	Description
FACILITY	VARCHAR2 (24)	<p>Facility that encountered the event:</p> <ul style="list-style-type: none"> • Crash Recovery • Log Transport Services • Log Apply Services • Role Management Services • Remote File Server • Fetch Archive Log • Data Guard • Network Services
SEVERITY	VARCHAR2 (13)	<p>Severity of the event:</p> <ul style="list-style-type: none"> • Informational - Informational message • Warning - Warning message • Error - Indicates the process has failed • Fatal • Control - An expected change in state such as the start or completion of an archival, log recovery, or switchover operation
DEST_ID	NUMBER	Destination ID number to which the event pertains. If the event does not pertain to a particular destination, then the value is 0.
MESSAGE_NUM	NUMBER	A chronologically increasing number giving each event a unique number
ERROR_CODE	NUMBER	Error ID pertaining to the event
CALLOUT	VARCHAR2 (3)	Reserved for future use
TIMESTAMP	DATE	Message date
MESSAGE	VARCHAR2 (256)	A text message describing the event
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.170 V\$DB_CACHE_ADVICE

V\$DB_CACHE_ADVICE contains rows that predict the number of physical reads for the cache size corresponding to each row.

The rows also compute a "physical read factor," which is the ratio of the number of estimated reads to the number of reads actually performed by the real buffer cache during the measurement interval.

 **See Also:**

["DB_CACHE_ADVICE"](#)

Column	Datatype	Description
ID	NUMBER	Buffer pool identifier (ranges from 1 to 8)
NAME	VARCHAR2 (20)	Buffer pool name
BLOCK_SIZE	NUMBER	Block size in bytes for buffers in this pool. Possible values: the standard block size, the power of 2 nonstandard block sizes, 2048, 4096, 8192, 16384, 32768.
ADVICE_STATUS	VARCHAR2 (3)	Status of the advisory. ON indicates it is currently running; OFF indicates it is disabled (in this case the estimates are historical and calculated when last enabled).
SIZE_FOR_ESTIMATE	NUMBER	Cache size for prediction (in megabytes)
SIZE_FACTOR	NUMBER	Size factor with respect to the current cache size
BUFFERS_FOR_ESTIMATE	NUMBER	Cache size for prediction (in terms of buffers)
ESTD_PHYSICAL_READ_FACTO R	NUMBER	Physical read factor for this cache size, which is the ratio of the number of estimated physical reads to the number of reads in the real cache. If there are no physical reads in the real cache, the value of this column is null.
ESTD_PHYSICAL_READS	NUMBER	Estimated number of physical reads for this cache size
ESTD_PHYSICAL_READ_TIME	NUMBER	Estimated disk read time (in seconds)
ESTD_PCT_OF_DB_TIME_FOR _READS	NUMBER	Estimated disk time as a percentage of the total time
ESTD_CLUSTER_READS	NUMBER	Estimated total number of blocks foreground processes read from the global cache (Oracle Real Application Clusters only)
ESTD_CLUSTER_READ_TIME	NUMBER	Estimated total amount of time, in seconds, foreground processes read from global cache (Oracle Real Application Clusters only)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.171 V\$DB_OBJECT_CACHE

V\$DB_OBJECT_CACHE displays database objects that are cached in the library cache. Objects include tables, indexes, clusters, synonym definitions, PL/SQL procedures and packages, and triggers.

Column	Datatype	Description
OWNER	VARCHAR2 (64)	Owner of the object
NAME	VARCHAR2 (1000)	Name of the object
DB_LINK	VARCHAR2 (64)	Database link name, if any
NAMESPACE	VARCHAR2 (64)	Library cache namespace of the object: TABLE/PROCEDURE, BODY, TRIGGER, INDEX, CLUSTER, OBJECT
TYPE	VARCHAR2 (64)	Type of the object: INDEX, TABLE, CLUSTER, VIEW, SET, SYNONYM, SEQUENCE, PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, CLASS, OBJECT, USER, DBLINK

Column	Datatype	Description
SHARABLE_MEM	NUMBER	Amount of sharable memory in the shared pool consumed by the object
LOADS	NUMBER	Number of times the object has been loaded. This count also increases when an object has been invalidated.
EXECUTIONS	NUMBER	Not used
		See Also: " V\$SQLAREA " to see actual execution counts
LOCKS	NUMBER	Number of users currently locking this object
PINS	NUMBER	Number of users currently pinning this object
KEPT	VARCHAR2 (3)	(YES NO) Depends on whether this object has been "kept" (permanently pinned in memory) with the PL/SQL procedure <code>DBMS_SHARED_POOL.KEEP</code>
CHILD_LATCH	NUMBER	Child latch number that is protecting the object. This column is obsolete and maintained for backward compatibility.
INVALIDATIONS	NUMBER	Total number of times objects in the namespace were marked invalid because a dependent object was modified
HASH_VALUE	NUMBER	Hash value of the object
LOCK_MODE	VARCHAR2 (9)	Current lock mode of the object
PIN_MODE	VARCHAR2 (9)	Current pin mode of the object
STATUS	VARCHAR2 (19)	Status of the object
TIMESTAMP	VARCHAR2 (19)	Timestamp for the specification of the object
PREVIOUS_TIMESTAMP	VARCHAR2 (19)	Previous timestamp for the specification of the object
LOCKED_TOTAL	NUMBER	Total number of times the object has been locked
PINNED_TOTAL	NUMBER	Total number of times the object has been pinned
PROPERTY	VARCHAR2 (80)	Property of the object. Possible values include HOT or HOTCOPY when the library cache hot copy feature is used using <code>DBMS_SHARED_POOL.MARKHOT</code> .
FULL_HASH_VALUE	VARCHAR2 (32)	Full hash value of the object
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
CON_NAME	VARCHAR2 (64)	Container name of the object. The value of this column is NULL in non-CDBs.
ADDR	RAW (8)	Address of the handle for this object
EDITION	VARCHAR2 (138)	Edition name

 See Also:

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_SHARED_POOL.KEEP` procedure
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_SHARED_POOL.MARKHOT` procedure

7.172 V\$DB_PIPES

`V$DB_PIPES` displays the pipes that are currently represented in the shared pool for this instance.

Column	Datatype	Description
OWNERID	NUMBER	Owner ID of the owner (if this is a private pipe), else NULL
NAME	VARCHAR2 (1000)	Name of the pipe (for example, <code>SCOTT.PIPE</code>)
TYPE	VARCHAR2 (7)	Type of the pipe: <ul style="list-style-type: none"> • PUBLIC • PRIVATE
PIPE_SIZE	NUMBER	Amount of memory the pipe uses
		Note: The value of this column may be larger than <code>maxpipesize</code> because of an internal algorithm.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
CON_NAME	VARCHAR2 (64)	Container name of the object. The value of this column is <code>NULL</code> in non-CDBs.

7.173 V\$DB_TRANSPORTABLE_PLATFORM

`V$DB_TRANSPORTABLE_PLATFORM` displays all platforms to which the database can be transported using the `RMAN CONVERT DATABASE` command.

The transportable database feature only supports transports of the same endian platform. Therefore, `V$DB_TRANSPORTABLE_PLATFORM` displays fewer rows than `V$TRANSPORTABLE_PLATFORM`.

Column	Datatype	Description
PLATFORM_ID	NUMBER	Platform identification number
PLATFORM_NAME	VARCHAR2 (101)	Platform name

Column	Datatype	Description
ENDIAN_FORMAT	VARCHAR2 (14)	Platform endian format: <ul style="list-style-type: none">• Big• Little• UNKNOWN FORMAT
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$TRANSPORTABLE_PLATFORM"](#)

7.174 V\$DBFILE

V\$DBFILE displays all data files making up the database. This view is retained for historical compatibility. Use of V\$DATAFILE is recommended instead.

Column	Datatype	Description
FILE#	NUMBER	File identifier
NAME	VARCHAR2 (513)	Name of the file
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$DATAFILE"](#)

7.175 V\$DBLINK

V\$DBLINK describes all database links (links with IN_TRANSACTION = YES) opened by the session issuing the query on V\$DBLINK. These database links must be committed or rolled back before being closed.

Column	Datatype	Description
DB_LINK	VARCHAR2 (128)	Name of the database link
OWNER_ID	NUMBER	Owner of the database link UID
LOGGED_ON	VARCHAR2 (3)	Whether the database link is currently logged on
HETEROGENEOUS	VARCHAR2 (3)	Whether the database link is heterogeneous
PROTOCOL	VARCHAR2 (6)	Communication protocol for the database link
OPEN_CURSORS	NUMBER	Whether there are open cursors for the database link
IN_TRANSACTION	VARCHAR2 (3)	Whether the database link is currently in a transaction
UPDATE_SENT	VARCHAR2 (3)	Whether there has been an update on the database link
COMMIT_POINT_STRENGTH	NUMBER	Commit point strength of the transactions on the database link
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.176 V\$DEAD_CLEANUP

V\$DEAD_CLEANUP shows the dead processes and killed sessions present in the instance and their cleanup status.

Column	Datatype	Description
TYPE	VARCHAR2 (64)	Indicates whether a row contains a DEAD PROCESS or KILLED SESSION
PADDR	RAW (8)	Process pointer. Can be joined with V\$PROCESS. For a killed session, this is the owner of the session, which can be NULL.
SADDR	RAW (8)	Session pointer. Can be joined with V\$SESSION. For a dead process, this is the user session.
ROOT_ADDR	RAW (8)	Pointer to the root of the tree
CLEANUP_OWNER	VARCHAR2 (64)	Indicates which process is responsible for cleanup of this tree: <ul style="list-style-type: none"> • CLEANUP PROCESS - a cleanup process is responsible • OWNER PROCESS - the root owner is responsible
STATE	VARCHAR2 (64)	Cleanup state: <ul style="list-style-type: none"> • CLEANUP PENDING - Occurs for a dead process / killed session that can be cleaned up, but PMON has not yet made an attempt • IN PROGRESS - A cleanup attempt is currently in progress • RESOURCES FREED - Occurs for a dead process / killed session where all children have been freed, but the process / killed session itself is not yet freed • PARTIAL CLEANUP - Occurs if some of the children have been cleaned up
DEAD_TIME	NUMBER	Time since the process was marked dead or the session was marked killed (in seconds)
CLEANUP_ATTEMPTS	NUMBER	Number of times PMON has attempted cleanup
LAST_ATTEMPT	NUMBER	How long ago the last cleanup attempt occurred (in seconds)

Column	Datatype	Description
CLEANUP_PROCESS	RAW (8)	Process pointer for the cleanup process currently cleaning up this tree (can join with V\$CLEANUP_PROCESS). It will be NULL if cleanup is not currently in progress or if the owner is responsible for cleanup.
CLEANUP_TIME	NUMBER	Total amount of time PMON has spent on cleanup of the process/session (in seconds)
NUM_BLOCKED	NUMBER	Number of sessions blocked on cleanup of this session
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$CLEANUP_PROCESS"](#)

7.177 V\$DELETED_OBJECT

V\$DELETED_OBJECT displays information about deleted archived logs, data file copies and backup pieces from the control file.

The only purpose of this view is to optimize the recovery catalog resync operation. When an archived log, data file copy, or backup piece is deleted, the corresponding record is marked deleted.

Column	Datatype	Description
RECID	NUMBER	Deleted object record ID
STAMP	NUMBER	Deleted object record stamp

Column	Datatype	Description
TYPE	VARCHAR2 (26)	<p>Identifies the type of deleted object:</p> <ul style="list-style-type: none"> • ARCHIVED LOG • BACKUP PIECE • DATAFILE COPY • PROXY COPY • BACKUP PIECE AVAILABLE • BACKUP PIECE EXPIRED • PROXY COPY AVAILABLE • PROXY COPY EXPIRED • BACKUP PIECE UNAVAILABLE • PROXY COPY UNAVAILABLE • DATAFILE COPY AVAILABLE • DATAFILE COPY EXPIRED • DATAFILE COPY UNAVAILABLE • ARCHIVED LOG AVAILABLE • ARCHIVED LOG EXPIRED • ARCHIVED LOG UNAVAILABLE • BACKUP SET KEEP OPTIONS • BACKUP SET KEEP UNTIL • PROXY COPY KEEP OPTIONS • PROXY COPY KEEP UNTIL • DATAFILE COPY KEEP OPTIONS • DATAFILE COPY KEEP UNTIL • DATAFILE RENAME ON RESTORE
OBJECT_RECID	NUMBER	Record ID of the deleted object
OBJECT_STAMP	NUMBER	Record timestamp of the deleted object
OBJECT_DATA	NUMBER	Displays additional internal information related to this deleted object. For internal Oracle use only.
SET_STAMP	NUMBER	Set stamp of the deleted object
SET_COUNT	NUMBER	Set count of the deleted object
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.178 V\$DG_BROKER_CONFIG

V\$DG_BROKER_CONFIG provides a summary of an Oracle Data Guard broker configuration.

This is similar to the DGMGRL CLI's SHOW CONFIGURATION command. It provides a view of the entire Oracle Data Guard broker configuration from any database in the configuration.

Column	Datatype	Description
DATABASE	VARCHAR2 (512)	Database unique name
CONNECT_IDENTIFIER	VARCHAR2 (512)	Net connect identifier used to reach the database

Column	Datatype	Description
DATAGUARD_ROLE	VARCHAR2(27)	Oracle Data Guard role of the database: <ul style="list-style-type: none"> • PRIMARY • PHYSICAL STANDBY • LOGICAL STANDBY • SNAPSHOT STANDBY • FAR SYNC INSTANCE • RECOVERY APPLIANCE
REDO_SOURCE	VARCHAR(30)	The database unique name of the redo source
ENABLED	VARCHAR2(5)	TRUE or FALSE to denote whether or not the database is managed by Oracle Data Guard broker
STATUS	NUMBER	An Oracle error number denoting the database's current status
VERSION	VARCHAR2(30)	Version of the broker configuration
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.179 V\$DIAG_ALERT_EXT

V\$DIAG_ALERT_EXT shows the contents of the XML-based alert log in the Automatic Diagnostic Repository (ADR) for the current container (PDB).

Column	Datatype	Description
ORIGINATING_TIMESTAMP	TIMESTAMP(9) WITH TIME ZONE	Date and time when the message was generated
NORMALIZED_TIMESTAMP	TIMESTAMP(9) WITH TIME ZONE	Date and time when the message originated, normalized for clock drift to the Oracle Enterprise Manager repository time
ORGANIZATION_ID	VARCHAR2(67)	ID of the organization that wrote the originating component, usually the domain of the organization
COMPONENT_ID	VARCHAR2(67)	ID of the product or component that originated the message
HOST_ID	VARCHAR2(67)	DNS hostname of originating host
HOST_ADDRESS	VARCHAR2(49)	IP of other network address of the originating host for the message

Column	Datatype	Description
MESSAGE_TYPE	NUMBER	<p>Type of the message, indicating that a different type of response is required. Possible values include:</p> <ul style="list-style-type: none"> • 1: UNKNOWN - Essentially the NULL type • 2: INCIDENT_ERROR - The program has encountered an error for some internal or unexpected reason, and it must be reported to Oracle Support • 3: ERROR - An error of some kind has occurred • 4: WARNING: An action occurred or a condition was discovered that should be reviewed and may require action • 5: NOTIFICATION: reports a normal action or event. This could be a user action such as "logon completed" • 6: TRACE: Output of a diagnostic trace
MESSAGE_LEVEL	NUMBER	<p>Level the message belongs to. Lower level values imply higher severity for errors. Possible values include:</p> <ul style="list-style-type: none"> • 1: CRITICAL: critical errors • 2: SEVERE: severe errors • 8: IMPORTANT: important message • 16: NORMAL: normal message
MESSAGE_ID	VARCHAR2(67)	ID of the message
MESSAGE_GROUP	VARCHAR2(67)	Name of the group to which the message belongs
CLIENT_ID	VARCHAR2(67)	ID of the client or security group that the message relates to
MODULE_ID	VARCHAR2(67)	ID of the module that originated the message. This value is unique within a component.
PROCESS_ID	VARCHAR2(35)	ID of the process that originated the message
THREAD_ID	VARCHAR2(67)	ID of the thread of the process that originated the message
USER_ID	VARCHAR2(131)	ID of the user that originated the message
INSTANCE_ID	VARCHAR2(67)	For internal use only
DETAILED_LOCATION	VARCHAR2(163)	Absolute pathname of supplemental detail file on the originating host
UPSTREAM_COMP_ID	VARCHAR2(103)	ID of a component that the originating component is working with on the upstream (client) side
DOWNSTREAM_COMP_ID	VARCHAR2(103)	ID of a component that the originating component is working with on the downstream (server) side
EXECUTION_CONTEXT_ID	VARCHAR2(103)	Identifies the thread of execution that the originating component participates in
EXECUTION_CONTEXT_SEQUENCE	NUMBER	Execution sequence of the thread that the originating component participates in
ERROR_INSTANCE_ID	NUMBER	ID of the instance where error occurred
ERROR_INSTANCE_SEQUENCE	NUMBER	Instance sequence where error occurred
MESSAGE_TEXT	VARCHAR2(2051)	Fully formed and localized text of the message
MESSAGE_ARGUMENTS	VARCHAR2(515)	Arguments to be bound with the generic text of the message
SUPPLEMENTAL_ATTRIBUTES	VARCHAR2(515)	Supplemental attributes that are specific to a message. This field contains the impacts for an incident type error message.
SUPPLEMENTAL_DETAILS	VARCHAR2(515)	Supplemental data that is specific to a particular program and error message required to complete the diagnosis. Similar to the extra detail referred to in DETAILED_LOCATION but short enough to simply provide in the message itself
PARTITION	NUMBER	Segment number of physical file

Column	Datatype	Description
RECORD_ID	NUMBER	Record number for the message (this value is same as the row number)
FILENAME	VARCHAR2 (515)	Physical file on disk
LOG_NAME	VARCHAR2 (67)	For internal use only
PROBLEM_KEY	VARCHAR2 (553)	Describes the key for the current problem that the message is associated with
VERSION	NUMBER	ARB version number for the message
CON_UID	NUMBER	The unique ID of the container to which the data pertains
CONTAINER_ID	NUMBER	The ID of the container to which the data pertains
CONTAINER_NAME	VARCHAR2 (33)	The name of the container to which the data pertains
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.180 V\$DIAG_APP_TRACE_FILE

V\$DIAG_APP_TRACE_FILE contains information about all trace files present in the Automatic Diagnostic Repository (ADR) for the current container (PDB) which contain application trace data (SQL_TRACE or OPTIMIZER_TRACE event data). This view also supports GV\$ global views.

Column	Datatype	Description
ADR_HOME	VARCHAR2 (444)	Path to the current ADR home
TRACE_FILENAME	VARCHAR2 (68)	Displays the name of the process trace file
CHANGE_TIME	TIMESTAMP (3) WITH TIMEZONE	Displays the change time timestamp of the process trace file
MODIFY_TIME	TIMESTAMP (3) WITH TIMEZONE	Displays the last modification timestamp of the process trace file
SQL_TRACE	VARCHAR2 (1)	Identifies if the process trace file contains SQL_TRACE data. Possible values include: <ul style="list-style-type: none"> • Y: This value is used when the process trace file contains SQL_TRACE event data • N: This value indicates that the process trace does not contain SQL_TRACE data
OPTIMIZER_TRACE	VARCHAR2 (1)	Identifies if the process trace file contains OPTIMIZER_TRACE data. Possible values include: <ul style="list-style-type: none"> • Y: This value is used when the process trace file contains OPTIMIZER_TRACE event data • N: This value indicates that the process trace does not contain OPTIMIZER_TRACE data

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.181 V\$DIAG INCIDENT

V\$DIAG INCIDENT contains information about all incident metadata records present in the Automatic Diagnostic Repository (ADR) for the current container (PDB).

Column	Datatype	Description
INCIDENT_ID	NUMBER	ID for the current incident
PROBLEM_ID	NUMBER	ID for the problem that the incident is associated with
CREATE_TIME	TIMESTAMP(9) WITH TIME ZONE	Displays the date and time when the incident was created
CLOSE_TIME	TIMESTAMP(9) WITH TIME ZONE	Displays the date and time when the incident was closed
STATUS	NUMBER	<p>Describes the current status for the incident. Possible values include:</p> <ul style="list-style-type: none"> • 1: Incident is inflight • 2: Incident is ready • 3: Incident is tracked • 4: Incident is closed • 5: Incident data is removed • 6: Incident has been purged • 7: Incident is incomplete
FLAGS	NUMBER	For internal use only
FLOOD_CONTROLLED	NUMBER	<p>Describes the flood control status for the current incident. Possible values include:</p> <ul style="list-style-type: none"> • 0: Incident is not flood-controlled • 1: Incident is fully flood controlled (no dumps)
ERROR_FACILITY	VARCHAR2(12)	Displays the error facility for the current incident
ERROR_NUMBER	NUMBER	Displays the error number for the current incident
ERROR_ARG1	VARCHAR2(66)	Displays error-arguments associated with the given incident
ERROR_ARG2	VARCHAR2(66)	Displays error-arguments associated with the given incident
ERROR_ARG3	VARCHAR2(66)	Displays error-arguments associated with the given incident
ERROR_ARG4	VARCHAR2(66)	Displays error-arguments associated with the given incident
ERROR_ARG5	VARCHAR2(66)	Displays error-arguments associated with the given incident
ERROR_ARG6	VARCHAR2(66)	Displays error-arguments associated with the given incident
ERROR_ARG7	VARCHAR2(66)	Displays error-arguments associated with the given incident
ERROR_ARG8	VARCHAR2(66)	Displays error-arguments associated with the given incident
SIGNALLING_COMPONENT	VARCHAR2(66)	Signalling component for the given incident

Column	Datatype	Description
SIGNALLING_SUBCOMPONENT	VARCHAR2 (66)	Signalling sub-component for the given incident
SUSPECT_COMPONENT	VARCHAR2 (66)	Displays the suspect component for the given incident
SUSPECT_SUBCOMPONENT	VARCHAR2 (66)	Displays the suspect sub-component for the given incident
ECID	VARCHAR2 (66)	Execution context ID for the current incident
IMPACT	NUMBER	Describes the internal representation of the incident impact for the given incident
ERROR_ARG9	VARCHAR2 (66)	Displays error-arguments associated with the given incident
ERROR_ARG10	VARCHAR2 (66)	Displays error-arguments associated with the given incident
ERROR_ARG11	VARCHAR2 (66)	Displays error-arguments associated with the given incident
ERROR_ARG12	VARCHAR2 (66)	Displays error-arguments associated with the given incident
CON_UID	NUMBER	Describes the container unique ID to which the data pertains
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.182 V\$DIAG_INFO

V\$DIAG_INFO describes the state of Automatic Diagnostic Repository (ADR) functionality using NAME=VALUE pairs.

Column	Datatype	Description
INST_ID	NUMBER	Instance ID
NAME	VARCHAR2 (64)	Identifies a piece of data that reflects the state of ADR, such as whether it is enabled, where the directories and files are located, and how many ongoing issues (incidents and problems) there are. Possible values include: <ul style="list-style-type: none"> • Diag Enabled: Indicates whether ADR is enabled or not • ADR Base through Health Monitor: Display different directories (ADR base, ADR home, and then subdirectories within the ADR home) • Default Trace File: Specifies the current default trace file for the current process • Active Problem Count and Active Incident Count: Specify how many problems/incidents there are in this ADR that either happened in the last 24 hours or have a piece of metadata set indicating that it is a persistent error (like a disk corruption)
VALUE	VARCHAR2 (512)	Describes the current state of the piece of data identified in the NAME column

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.183 V\$DIAG_OPT_TRACE_RECORDS

V\$DIAG_OPT_TRACE_RECORDS contains all optimizer trace event data that is present in the trace files that are part of the current Automatic Diagnostic Repository (ADR). This view also supports GV\$ global views.

Column	Datatype	Description
ADR_HOME	VARCHAR2 (444)	Path to current ADR home
TRACE_FILENAME	VARCHAR2 (68)	Displays the name of the process trace file
RECORD_LEVEL	NUMBER	Displays the level of the trace record
PARENT_LEVEL	NUMBER	Displays the top parent level of the trace record
RECORD_TYPE	NUMBER	<p>Displays the type of the trace record. Possible values include:</p> <ul style="list-style-type: none"> • 1: Regular trace record • 2: Freeform trace record • 3: Begin Section trace record • 4: Begin Dump trace record • 5: Bucket Dump Begin trace record • 6: Section End trace record • 7: Dump End trace record • 8: Bucket Dump End trace record
TIMESTAMP	TIMESTAMP (3) WITH TIMEZONE	Displays the timestamp when the trace record was produced
PAYOUT	VARCHAR2 (4000)	Describes the trace record payload (contents)
SECTION_ID	NUMBER	Displays the section ID / dump ID of the trace record
SECTION_NAME	VARCHAR2 (64)	Displays the section name / dump name of the trace record
COMPONENT_NAME	VARCHAR2 (64)	Displays the component name which produced the trace record
OPERATION_NAME	VARCHAR2 (64)	Displays the operation name which produced the trace record
FILE_NAME	VARCHAR2 (64)	Displays the name of the code file where this trace record is produced
FUNCTION_NAME	VARCHAR2 (64)	Displays the function which produced this trace record
LINE_NUMBER	NUMBER	Displays the line number in the code file which produced this trace record
THREAD_ID	VARCHAR2 (64)	Displays the operating system thread ID of the process which produced the trace record
SESSION_ID	NUMBER	Displays the user session ID which generated the trace record
SERIAL#	NUMBER	Displays the user session serial number which produced the trace record

Column	Datatype	Description
CON_UID	NUMBER	Displays the container unique ID where the trace record was produced
CONTAINER_NAME	VARCHAR2(64)	Displays the container name where the trace record was produced
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.184 V\$DIAG_PROBLEM

V\$DIAG_PROBLEM contains information about all problem metadata records present in the Automatic Diagnostic Repository (ADR) for the current container (PDB).

Column	Datatype	Description
PROBLEM_ID	NUMBER	Displays the ID for the current problem
PROBLEM_KEY	VARCHAR2(552)	Displays the problem key for the current problem
FIRST INCIDENT	NUMBER	Displays the first incident ID for the current problem
FIRSTINC_TIME	TIMESTAMP(9) WITH TIME ZONE	Displays the timestamp when the first incident occurred for the current problem
LAST INCIDENT	NUMBER	Displays the last incident ID for the current problem
LASTINC_TIME	TIMESTAMP(9) WITH TIME ZONE	Displays the timestamp when the last incident occurred for the current problem
IMPACT1	NUMBER	Displays the first impact for the current problem
IMPACT2	NUMBER	Displays the second impact for the current problem
IMPACT3	NUMBER	Displays the third impact for the current problem
IMPACT4	NUMBER	Displays the fourth impact for the current problem
SERVICE_REQUEST	VARCHAR2(66)	Displays the service request number for the current problem, if a number has been entered in Support Workbench
BUG_NUMBER	VARCHAR2(66)	Displays the bug number for the current problem, if a number has been entered in Support Workbench
CON_UID	NUMBER	Displays the container unique ID to which the data pertains
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.185 V\$DIAG_SESS_OPT_TRACE_RECORDS

V\$DIAG_SESS_OPT_TRACE_RECORDS contains all optimizer trace event data that is present in the trace files for the current user session that is part of the current Automatic Diagnostic Repository (ADR).

Column	Datatype	Description
ADR_HOME	VARCHAR2(444)	Path to current ADR home
TRACE_FILENAME	VARCHAR2(68)	Displays the name of the process trace file
RECORD_LEVEL	NUMBER	Displays the level of the trace record
PARENT_LEVEL	NUMBER	Displays the top parent level of the trace record
RECORD_TYPE	NUMBER	Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> • 1: Regular trace record • 2: Freeform trace record • 3: Begin Section trace record • 4: Begin Dump trace record • 5: Bucket Dump Begin trace record • 6: Section End trace record • 7: Dump End trace record • 8: Bucket Dump End trace record
TIMESTAMP	TIMESTAMP(3) WITH TIME ZONE	Displays the timestamp when the trace record was produced
PAYOUT	VARCHAR2(4000)	Displays the trace record payload (contents)
SECTION_ID	NUMBER	Displays the section ID / dump ID of the trace record
SECTION_NAME	VARCHAR2(64)	Displays the section name / dump name of the trace record
COMPONENT_NAME	VARCHAR2(64)	Displays the component name which produced the trace record
OPERATION_NAME	VARCHAR2(64)	Displays the operation name which produced the trace record
FILE_NAME	VARCHAR2(64)	Displays the name of the code file where this trace record is produced
FUNCTION_NAME	VARCHAR2(64)	Displays the function which produced this trace record
LINE_NUMBER	NUMBER	Displays the line number in the code file which produced this trace record
THREAD_ID	VARCHAR2(64)	Displays the operating system thread ID of the process which produced the trace record
SESSION_ID	NUMBER	Displays the user session ID which generated the trace record
SERIAL#	NUMBER	Displays the user session serial number which produced the trace record
CON_UID	NUMBER	Displays the container unique ID where the trace record was produced
CONTAINER_NAME	VARCHAR2(64)	Displays the container name where the trace record was produced
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.186 V\$DIAG_SESS_SQL_TRACE_RECORDS

V\$DIAG_SESS_SQL_TRACE_RECORDS contains all SQL_TRACE data that is present in the trace files for the current user session that is part of the current Automatic Diagnostic Repository (ADR).

Column	Datatype	Description
ADR_HOME	VARCHAR2(444)	Path to current ADR home
TRACE_FILENAME	VARCHAR2(68)	Displays the name of the process trace file
RECORD_LEVEL	NUMBER	Displays the level of the trace record
PARENT_LEVEL	NUMBER	Displays the top parent level of the trace record
RECORD_TYPE	NUMBER	Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> • 1: Regular trace record • 2: Freeform trace record • 3: Begin Section trace record • 4: Begin Dump trace record • 5: Bucket Dump Begin trace record • 6: Section End trace record • 7: Dump End trace record • 8: Bucket Dump End trace record
TIMESTAMP	TIMESTAMP(3) WITH TIME ZONE	Displays the timestamp when the trace record was produced
PAYOUT	VARCHAR2(4000)	Displays the trace record payload (contents)
SECTION_ID	NUMBER	Displays the section ID / dump ID of the trace record
SECTION_NAME	VARCHAR2(64)	Displays the section name / dump name of the trace record
COMPONENT_NAME	VARCHAR2(64)	Displays the component name which produced the trace record
OPERATION_NAME	VARCHAR2(64)	Displays the operation name which produced the trace record
FILE_NAME	VARCHAR2(64)	Displays the name of the code file where this trace record is produced
FUNCTION_NAME	VARCHAR2(64)	Displays the function which produced this trace record
LINE_NUMBER	NUMBER	Displays the line number in the code file which produced this trace record
THREAD_ID	VARCHAR2(64)	Displays the operating system thread ID of the process which produced the trace record
SESSION_ID	NUMBER	Displays the user session ID which generated the trace record
SERIAL#	NUMBER	Displays the user session serial number which produced the trace record
CON_UID	NUMBER	Displays the container unique ID where the trace record was produced
CONTAINER_NAME	VARCHAR2(64)	Displays the container name where the trace record was produced
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.187 V\$DIAG_SQL_TRACE_RECORDS

V\$DIAG_SQL_TRACE_RECORDS contains all SQL_TRACE data that is present in the trace files that are part of the current Automatic Diagnostic Repository (ADR). This view also supports GV\$ global views.

Column	Datatype	Description
ADR_HOME	VARCHAR2(444)	Path to current ADR home
TRACE_FILENAME	VARCHAR2(68)	Displays the name of the process trace file
RECORD_LEVEL	NUMBER	Displays the level of the trace record
PARENT_LEVEL	NUMBER	Displays the top parent level of the trace record
RECORD_TYPE	NUMBER	Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> • 1: Regular trace record • 2: Freeform trace record • 3: Begin Section trace record • 4: Begin Dump trace record • 5: Bucket Dump Begin trace record • 6: Section End trace record • 7: Dump End trace record • 8: Bucket Dump End trace record
TIMESTAMP	TIMESTAMP(3) WITH TIME ZONE	Displays the timestamp when the trace record was produced
PAYOUT	VARCHAR2(4000)	Displays the trace record payload (contents)
SECTION_ID	NUMBER	Displays the section ID / dump ID of the trace record
SECTION_NAME	VARCHAR2(64)	Displays the section name / dump name of the trace record
COMPONENT_NAME	VARCHAR2(64)	Displays the component name which produced the trace record
OPERATION_NAME	VARCHAR2(64)	Displays the operation name which produced the trace record
FILE_NAME	VARCHAR2(64)	Displays the name of the code file where this trace record is produced
FUNCTION_NAME	VARCHAR2(64)	Displays the function which produced this trace record
LINE_NUMBER	NUMBER	Displays the line number in the code file which produced this trace record
THREAD_ID	VARCHAR2(64)	Displays the operating system thread ID of the process which produced the trace record
SESSION_ID	NUMBER	Displays the user session ID which generated the trace record
SERIAL#	NUMBER	Displays the user session serial number which produced the trace record
CON_UID	NUMBER	Displays the container unique ID where the trace record was produced
CONTAINER_NAME	VARCHAR2(64)	Displays the container name where the trace record was produced
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.188 V\$DIAG_TRACE_FILE

V\$DIAG_TRACE_FILE contains information about all trace files present in the Automatic Diagnostic Repository (ADR) for the current container (PDB). This view also supports GV\$ global views.

Column	Datatype	Description
ADR_HOME	VARCHAR2(444)	Path to the current ADR home
TRACE_FILENAME	VARCHAR2(68)	Displays the name of the process trace file
CHANGE_TIME	TIMESTAMP(3) WITH TIME ZONE	Displays the change time timestamp of the process trace file
MODIFY_TIME	TIMESTAMP(3) WITH TIME ZONE	Displays the last modification timestamp of the process trace file
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.189 V\$DIAG_TRACE_FILE_CONTENTS

V\$DIAG_TRACE_FILE_CONTENTS contains trace data that is present in the trace files that are part of the current Automatic Diagnostic Repository (ADR). This view also supports GV\$ global views.

Column	Datatype	Description
ADR_HOME	VARCHAR2(444)	Path to the current ADR home
TRACE_FILENAME	VARCHAR2(68)	Displays the name of the process trace file
RECORD_LEVEL	NUMBER	Displays the level of the trace record
PARENT_LEVEL	NUMBER	Displays the top parent level of the trace record
RECORD_TYPE	NUMBER	Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> • 1: Regular trace record • 2: Freeform trace record • 3: Begin Section trace record • 4: Begin Dump trace record • 5: Bucket Dump Begin trace record • 6: Section End trace record • 7: Dump End trace record • 8: Bucket Dump End trace record
TIMESTAMP	TIMESTAMP(3) WITH TIME ZONE	Displays the timestamp when the trace record was produced
PAYOUT	VARCHAR2(4000)	Displays the trace record payload (contents)
SECTION_ID	NUMBER	Displays the section ID / dump ID of the trace record

Column	Datatype	Description
SECTION_NAME	VARCHAR2(64)	Displays the section name / dump name of the trace record
COMPONENT_NAME	VARCHAR2(64)	Displays the component name which produced the trace record
OPERATION_NAME	VARCHAR2(64)	Displays the operation name which produced the trace record
FILE_NAME	VARCHAR2(64)	Displays the name of the code file where this trace record is produced
FUNCTION_NAME	VARCHAR2(64)	Displays the function which produced this trace record
LINE_NUMBER	NUMBER	Displays the line number in the code file which produced this trace record
THREAD_ID	VARCHAR2(64)	Displays the operating system thread ID of the process which produced the trace record
SESSION_ID	NUMBER	Displays the user session ID which generated the trace record
SERIAL#	NUMBER	Displays the user session serial number which produced the trace record
CON_UID	NUMBER	Displays the container unique ID where the trace record was produced
CONTAINER_NAME	VARCHAR2(64)	Displays the container name where the trace record was produced
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.190 V\$DISPATCHER

V\$DISPATCHER displays information about the dispatcher processes.

Column	Datatype	Description
NAME	VARCHAR2(4)	Name of the dispatcher process
NETWORK	VARCHAR2(1024)	Network address of the dispatcher
PADDR	RAW(4 8)	Process address
STATUS	VARCHAR2(16)	Status of the dispatcher: <ul style="list-style-type: none"> • WAIT - Idle • SEND - Sending a message • RECEIVE - Receiving a message • CONNECT - Establishing a connection • DISCONNECT - Handling a disconnect request • BREAK - Handling a break • TERMINATE - In the process of terminating • ACCEPT - Accepting connections (no further information available) • REFUSE - Rejecting connections (no further information available)
ACCEPT	VARCHAR2(3)	Indicates whether the dispatcher is accepting new connections (YES) or not (NO)
MESSAGES	NUMBER	Number of messages processed by the dispatcher
BYTES	NUMBER	Size (in bytes) of messages processed by the dispatcher

Column	Datatype	Description
BREAKS	NUMBER	Number of breaks occurring in the connection
OWNED	NUMBER	Number of circuits owned by the dispatcher
CREATED	NUMBER	Number of circuits created by the dispatcher
IDLE	NUMBER	Total idle time for the dispatcher (in hundredths of a second)
BUSY	NUMBER	Total busy time for the dispatcher (in hundredths of a second)
CPU	NUMBER	Total CPU time for the dispatcher (in millionths of a second)
LISTENER	NUMBER	Most recent Oracle error number the dispatcher received from the listener
CONF_INDX	NUMBER	Zero-based index of the DISPATCHERS configuration used by the dispatcher
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.191 V\$DISPATCHER_CONFIG

V\$DISPATCHER_CONFIG displays information about the dispatcher configurations and their attributes.

Column	Datatype	Description
CONF_INDX	NUMBER	Zero-based index of the DISPATCHERS configuration
NETWORK	VARCHAR2 (1024)	Network protocol or listening address of dispatchers (may be truncated)
DISPATCHERS	NUMBER	Number of dispatchers to maintain for the configuration
CONNECTIONS	NUMBER	Maximum number of concurrent connections per dispatcher
SESSIONS	NUMBER	Maximum number of concurrent sessions per dispatcher
MULTIPLEX	VARCHAR2 (4)	Indicates whether Session Multiplexing is on: <ul style="list-style-type: none"> • IN • OUT • BOTH • OFF
LISTENER	VARCHAR2 (1200)	Listeners to register dispatchers with (may be truncated)
SERVICE	VARCHAR2 (512)	Service names supported (may be truncated)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.192 V\$DISPATCHER_RATE

V\$DISPATCHER_RATE displays rate statistics for a number of activities performed by the dispatcher processes.

Collected samples have an activity-specific "time-to-live" (TTL_* columns). Statistics are reported over the following two types of time intervals:

- Current statistics (CUR_ columns)

Current statistics use samples collected over the most recent time-to-live interval.

- Historical statistics (AVG_ and most of the MAX_ columns)

Historical statistics make use of all samples that are no longer current.

At the time of collection, a sample is current. After the time-to-live has elapsed, the sample becomes historical. Each type of activity has a specific scale (represented by the SCALE_* columns) at which the statistics are reported.

Column	Datatype	Description
NAME	VARCHAR2 (4)	Name of the dispatcher process
PADDR	RAW (4 8)	Address of the dispatcher process
CUR_LOOP_RATE	NUMBER	Rate at which the dispatcher has been iterating through its dispatching loop, reported over the past TTL_LOOPS, in iterations/SCALE_LOOPS
CUR_EVENT_RATE	NUMBER	Rate at which the dispatcher has been processing dispatcher events, reported over the past TTL_LOOPS, in events/SCALE_LOOPS. Such dispatcher events include network events and shared server requests.
CUR_EVENTS_PER_LOOP	NUMBER	Average number of events the dispatcher has been processing in each iteration through its dispatching loop, reported over the past TTL_LOOPS, in events/iteration
CUR_MSG_RATE	NUMBER	Rate at which the dispatcher has been relaying messages between clients and shared servers, reported over the past TTL_MSG, in messages/SCALE_MSG
CUR_SVR_BUF_RATE	NUMBER	Rate at which the dispatcher has been relaying buffers to shared servers, reported over the past TTL_SVR_BUF, in messages/SCALE_SVR_BUF
CUR_SVR_BYTE_RATE	NUMBER	Rate at which the dispatcher has been relaying data to shared servers, reported over the past TTL_SVR_BUF, in bytes/SCALE_SVR_BUF
CUR_SVR_BYTE_PER_BUF	NUMBER	Average number of data types in each buffer relayed to shared servers, reported over the past TTL_SVR_BUF, in bytes/buffer
CUR_CLT_BUF_RATE	NUMBER	Rate at which the dispatcher has been relaying buffers to clients, reported over the past TTL_CLT_BUF, in buffers/SCALE_CLT_BUF
CUR_CLT_BYTE_RATE	NUMBER	Rate at which the dispatcher has been relaying data to clients, reported over the past TTL_CLT_BUF, in bytes/SCALE_CLT_BUF
CUR_CLT_BYTE_PER_BUF	NUMBER	Average number of data bytes in each buffer relayed to clients, reported over the past TTL_CLT_BUF, in bytes/buffer
CUR_BUF_RATE	NUMBER	Rate at which the dispatcher has been relaying buffers to either clients or shared servers, reported over the past TTL_BUF, in bytes/SCALE_BUF
CUR_BYTE_RATE	NUMBER	Rate at which the dispatcher has been relaying data to either clients or shared servers, reported over the past TTL_BUF, in bytes/SCALE_BUF

Column	Datatype	Description
CUR_BYTE_PER_BUF	NUMBER	Average number of data bytes in each buffer relayed to either clients or shared servers, reported over the past TTL_BUF, in bytes/buffer
CUR_IN_CONNECT_RATE	NUMBER	Rate at which the dispatcher has been accepting incoming client connections, reported over the past TTL_IN_CONNECT, in connections/SCALE_IN_CONNECT
CUR_OUT_CONNECT_RATE	NUMBER	Rate at which the dispatcher has been establishing outbound connections, reported over the past TTL_OUT_CONNECT, in connections/SCALE_OUT_CONNECT
CUR_RECONNECT_RATE	NUMBER	In a connection pooling setup, the rate at which clients have been reconnecting to the dispatcher, reported over the past TTL_RECONNECT, in reconnections/SCALE_RECONNECT
MAX_LOOP_RATE	NUMBER	Maximum rate at which the dispatcher has ever iterated through its dispatching loop, reported in iterations/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS
MAX_EVENT_RATE	NUMBER	Maximum rate at which the dispatcher has ever processed dispatcher events, reported in events/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS
MAX_EVENTS_PER_LOOP	NUMBER	Maximum number of events the dispatcher has ever processed in one iteration through its dispatching loop, reported in events/iteration, over the dispatcher's lifetime
MAX_MSG_RATE	NUMBER	Maximum rate at which the dispatcher has ever relayed messages between clients and shared servers, reported in messages/SCALE_MSG, over the dispatcher's lifetime excluding the past TTL_MSG
MAX_SVR_BUF_RATE	NUMBER	Maximum rate at which the dispatcher has ever relayed buffers to shared servers, reported in buffers/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF
MAX_SVR_BYTE_RATE	NUMBER	Maximum rate at which the dispatcher has ever relayed data to shared servers, reported in bytes/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF
MAX_SVR_BYTE_PER_BUF	NUMBER	Maximum number of data bytes the dispatcher has ever relayed in one buffer to a client, reported in bytes/buffer, over the dispatcher's lifetime
MAX_CLT_BUF_RATE	NUMBER	Maximum rate at which the dispatcher has ever relayed buffers to either clients or shared servers, reported in buffers/SCALE_CLT_BUF, over the dispatcher's life time excluding the past TTL_CLT_BUF
MAX_CLT_BYTE_RATE	NUMBER	Maximum rate at which the dispatcher has ever relayed buffers to clients, reported in bytes/SCALE_CLT_BUF, over the dispatcher's lifetime excluding the last TTL_CLT_BUF
MAX_CLT_BYTE_PER_BUF	NUMBER	Maximum number of data bytes the dispatcher has ever relayed in one buffer to a client, reported in bytes/buffer, over the dispatcher's lifetime
MAX_BUF_RATE	NUMBER	Maximum rate at which the dispatcher has ever relayed buffers to either clients or shared servers, reported in buffers/SCALE_BUF, over the dispatcher's lifetime, excluding the past TTL_BUF
MAX_BYTE_RATE	NUMBER	Maximum rate at which the dispatcher has ever relayed data to either clients or shared servers, reported in bytes/SCALE_BUF, over the dispatcher's lifetime excluding the past TTL_BUF
MAX_BYTE_PER_BUF	NUMBER	Maximum number of data bytes the dispatcher has ever relayed in one buffer to either a client or a shared server, reported in bytes/buffer, over the dispatcher's lifetime

Column	Datatype	Description
MAX_IN_CONNECT_RATE	NUMBER	Maximum rate at which the dispatcher has ever accepted incoming client connections, reported in connections/SCALE_IN_CONNECT, over the dispatcher's lifetime excluding the past TTL_IN_CONNECT
MAX_OUT_CONNECT_RATE	NUMBER	Maximum rate at which the dispatcher has ever established outbound connections, reported in connections/SCALE_OUT_CONNECT, over the dispatcher's lifetime excluding the past TTL_OUT_CONNECT
MAX_RECONNECT_RATE	NUMBER	In a connection pooling setup, the maximum rate at which clients have ever reconnected to this dispatcher, reported in reconnections/SCALE_RECONNECT, over the dispatcher's lifetime excluding the past TTL_RECONNECT
AVG_LOOP_RATE	NUMBER	Historical average rate at which the dispatcher has iterated through its dispatching loop, reported in iterations/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS
AVG_EVENT_RATE	NUMBER	Historical average rate at which the dispatcher has processed dispatcher events, reported in events/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS
AVG_EVENTS_PER_LOOP	NUMBER	Historical average number of events the dispatcher has processed in one iteration through its dispatching loop, reported in events/iteration, over the dispatcher's lifetime excluding the past TTL_LOOPS
AVG_MSG_RATE	NUMBER	Historical average rate at which the dispatcher has relayed messages between clients and shared servers, reported in messages/SCALE_MSG, over the dispatcher's lifetime excluding the past TTL_MSG
AVG_SVR_BUF_RATE	NUMBER	Historical average rate at which the dispatcher has relayed buffers to shared servers, reported in buffers/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF
AVG_SVR_BYTE_RATE	NUMBER	Historical average rate at which the dispatcher has relayed data to shared servers, reported in bytes/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF
AVG_SVR_BYTE_PER_BUF	NUMBER	Historical average number of data bytes per buffer the dispatcher has relayed to shared servers, reported in bytes/buffer, over the dispatcher's lifetime excluding the past TTL_SVR_BUF
AVG_CLT_BUF_RATE	NUMBER	Historical average rate at which the dispatcher has relayed buffers to clients, reported in buffers/SCALE_CLT_BUF, over the dispatcher's lifetime excluding the past TTL_CLT_BUF
AVG_CLT_BYTE_RATE	NUMBER	Historical average rate at which the dispatcher has relayed data to clients, reported in bytes/SCALE_CLT_BUF, over the dispatcher's lifetime excluding the past TTL_CLT_BUF
AVG_CLT_BYTE_PER_BUF	NUMBER	Historical average number of data bytes per buffer the dispatcher has relayed to clients, reported in bytes/buffer, over the dispatcher's lifetime excluding the past TTL_CLT_BUF
AVG_BUF_RATE	NUMBER	Historical average rate at which the dispatcher has relayed buffers to either clients or shared servers, reported in buffers/SCALE_BUF, over the dispatcher's lifetime excluding the past TTL_BUF
AVG_BYTE_RATE	NUMBER	Historical average rate at which the dispatcher has relayed data to either clients or shared servers, reported in bytes/SCALE_BUF, over the dispatcher's lifetime excluding the past TTL_BUF
AVG_BYTE_PER_BUF	NUMBER	Historical average number of data bytes per buffer the dispatcher has relayed to either clients or shared servers, reported in bytes/buffer, over the dispatcher's lifetime excluding the past TTL_BUF

Column	Datatype	Description
AVG_IN_CONNECT_RATE	NUMBER	Historical average rate at which the dispatcher has accepted incoming client connections, reported in connections/ <u>SCALE_IN_CONNECT</u> , over the dispatcher's lifetime excluding the past <u>TTL_IN_CONNECT</u>
AVG_OUT_CONNECT_RATE	NUMBER	Historical average rate at which the dispatcher has established outbound connections, reported in connections/ <u>SCALE_OUT_CONNECT</u> , over the dispatcher's lifetime excluding the past <u>TTL_OUT_CONNECT</u>
AVG_RECONNECT_RATE	NUMBER	In a connection pooling setup, the historical average rate at which clients have reconnected to this dispatcher, reported in reconnections/ <u>SCALE_RECONNECT</u> , over the dispatcher's lifetime excluding the past <u>TTL_RECONNECT</u>
TTL_LOOPS	NUMBER	Time-to-live for "loops" samples, reported in hundredths of a second. Default is 10 minutes.
TTL_MSG	NUMBER	Time-to-live for "messages" samples, reported in hundredths of a second. Default is 10 seconds.
TTL_SVR_BUF	NUMBER	Time-to-live for "buffers to servers" samples, reported in hundredths of a second. Default is 1 second.
TTL_CLT_BUF	NUMBER	Time-to-live for "buffers to clients" samples, reported in hundredths of a second. Default is 1 second.
TTL_BUF	NUMBER	Time-to-live for "buffers to clients/servers" samples, reported in hundredths of a second. Default is 1 second.
TTL_IN_CONNECT	NUMBER	Time-to-live for "inbound connections" samples, reported in hundredths of a second. Default is 10 minutes.
TTL_OUT_CONNECT	NUMBER	Time-to-live for "outbound connections" samples, reported in hundredths of a second. Default is 10 minutes.
TTL_RECONNECT	NUMBER	Time-to-live for "reconnections" samples, reported in hundredths of a second. Default is 10 minutes.
SCALE_LOOPS	NUMBER	Scale for "loops" statistics, reported in hundredths of a second. Default is 1 minute.
SCALE_MSG	NUMBER	Scale for "messages" statistics, reported in hundredths of a second. Default is 1 second.
SCALE_SVR_BUF	NUMBER	Scale for "buffers to servers" statistics, reported in hundredths of a second. Default is 1/10 second.
SCALE_CLT_BUF	NUMBER	Scale for "buffers to clients" statistics, reported in hundredths of a second. Default is 1/10 second.
SCALE_BUF	NUMBER	Scale for "buffers to clients/servers" statistics, reported in hundredths of a second. Default is 1/10 second.
SCALE_IN_CONNECT	NUMBER	Scale for "inbound connections" statistics, reported in hundredths of a second. Default is 1 minute.
SCALE_OUT_CONNECT	NUMBER	Scale for "outbound connections" statistics, reported in hundredths of a second. Default is 1 minute.
SCALE_RECONNECT	NUMBER	Scale for "reconnections" statistics, reported in hundredths of a second. Default is 1 minute.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.193 V\$DNFS_CHANNELS

V\$DNFS_CHANNELS displays information about the Oracle process connections (channels) open to NFS servers.

Column	Datatype	Description
PNUM	NUMBER	Oracle process number
SVRNAME	VARCHAR2 (255)	NFS server name
PATH	VARCHAR2 (255)	Network path to the NFS server specified by IP address or by name
LOCAL	VARCHAR2 (255)	Local path on the database host specified by IP address or by name
CH_ID	NUMBER	Direct NFS channel identifier
SVR_ID	NUMBER	Direct NFS server identifier
SENDS	NUMBER	Send operations over the channel since the last select
RECVS	NUMBER	Receive operations over the channel since the last select
PINGS	NUMBER	Ping operations over the channel since the last select
SPRECO	NUMBER	Reconnects for the channel on the same port since the last select, given that the reconnect occurred during the first series of reconnect attempts. If the first series of reconnect attempts fails and the reconnect process on that channel times out for 5 minutes, the next reconnect on that channel will not increment either the SPRECO or DPRECO columns, regardless of the port connected to.
DPRECO	NUMBER	Reconnects for the channel on a different port since the last select, given that the reconnect occurred during the first series of reconnect attempts. If the first series of reconnect attempts fails and the reconnect process on that channel times out for 5 minutes, the next reconnect on that channel will not increment either the SPRECO or DPRECO columns, regardless of the port connected to.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
RDMA	NUMBER	Indicates whether RDMA is enabled for the channel or not. Possible values: <ul style="list-style-type: none"> • 0: RDMA is not enabled for the channel • 1: RDMA is enabled for the channel

Column	Datatype	Description
RDMA_CREDITS	NUMBER	The number of RDMA credits supported by the server
CLIENTPORT	NUMBER	The client port to which the channel is bounded
ACTIVE_SPEED	NUMBER	The active speed of the HCA card present (in Gb/second)
PEAK_FMR	NUMBER	The size of fast memory registration (FMR) memory registered by the channel (in bytes)
CURRENT_FMR	NUMBER	The current FMR memory registered (in bytes)
FMRREG_COUNT	NUMBER	The number of FMR memory registration calls for the channel

Note:

RDMA functionality is enabled only for the Exadata environment

7.194 V\$DNFS_FILES

V\$DNFS_FILES displays information about the Oracle process files open through Direct NFS.

Column	Datatype	Description
FILENAME	VARCHAR2 (513)	File name
FILESIZE	NUMBER	File Size
PNUM	NUMBER	Oracle process number which opened the file
SVR_ID	NUMBER	Direct NFS server identifier which identifies the server the file is open on
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.195 V\$DNFS_SERVERS

V\$DNFS_SERVERS displays information about the Direct NFS servers accessed by Direct NFS.

Column	Datatype	Description
ID	NUMBER	Direct NFS server identifier
SVRNAME	VARCHAR2 (255)	NFS server name
DIRNAME	VARCHAR2 (1024)	Mounted directory
MNTPORT	NUMBER	NFS mount port
NFSPORT	NUMBER	NFS port
NFSVERSION	VARCHAR2 (8)	NFS version

Column	Datatype	Description
WTMAX	NUMBER	WTMAX exported by the NFS server
RTMAX	NUMBER	RTMAX exported by the NFS server
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
RDMAENABLE	VARCHAR2 (16)	Indicates whether the server is RDMA enabled. Possible values: <ul style="list-style-type: none"> • YES: The server is RDMA enabled. • NO: The server is not RDMA enabled.
RDMAPORT	NUMBER	The port number for RDMA communications on the server. The value is always 20049.
SECURITY	VARCHAR2 (32)	NFS RPC authentication method used for the given NFS export

 **Note:**

RDMA functionality is enabled only for the Exadata environment

7.196 V\$DNFS_STATS

V\$DNFS_STATS displays information about the Oracle process NFS operation statistics issued by Direct NFS.

Column	Datatype	Description
PNUM	NUMBER	Oracle process number that statistics are relevant to
NFS_NULL	NUMBER	Null
NFS_GETATTR	NUMBER	Get attributes
NFS_SETATTR	NUMBER	Set attributes
NFS_LOOKUP	NUMBER	Lookup object
NFS_ACCESS	NUMBER	Access object
NFS_READLINK	NUMBER	Read link
NFS_READ	NUMBER	Read file
NFS_WRITE	NUMBER	Write file
NFS_CREATE	NUMBER	Create file
NFS_MKDIR	NUMBER	Make directory
NFS_SYMLINK	NUMBER	Symbolic link
NFS_MKNOD	NUMBER	Make node
NFS_REMOVE	NUMBER	Remove file
NFS_RMDIR	NUMBER	Remove directory

Column	Datatype	Description
NFS_RENAME	NUMBER	Rename
NFS_LINK	NUMBER	Link
NFS_READDIR	NUMBER	Read directory
NFS_READDIRPLUS	NUMBER	Read directory plus
NFS_FSSTAT	NUMBER	File system status
NFS_FSVINFO	NUMBER	File system information
NFS_PATHCONF	NUMBER	Path configuration
NFS_COMMIT	NUMBER	Commit
NFS_MOUNT	NUMBER	Mount
NFS_READBYTES	NUMBER	Number of bytes read from NFS server
NFS_WRITEBYTES	NUMBER	Number of bytes written to NFS server
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.197 V\$DYNAMIC_REMASTER_STATS

V\$DYNAMIC_REMASTER_STATS displays statistical information about the dynamic remastering process of object affinity and read-mostly. All times are given in hundredths of a second, and total values reflect what has been collected since instance startup.

Column	Datatype	Description
REMASTER_TYPE	VARCHAR2 (11)	Remaster process type. Possible values: <ul style="list-style-type: none"> • AFFINITY: This value is used for the row containing statistics that pertain to dynamic remastering activity on object affinity. • READ-MOSTLY: This value is used for the row containing statistics that pertain to dynamic remastering activity on read-mostly objects.
REMASTER_OPS	NUMBER	Total number of dynamic remastering operations
REMASTER_TIME	NUMBER	Total dynamic remastering time
REMASTERED_OBJECTS	NUMBER	Total number of objects dynamically remastered due to affinity
PERSISTENT_OBJECTS ¹	NUMBER	Current number of objects that are marked persistent read-mostly in the cluster
QUIESCE_TIME	NUMBER	Total quiesce step time
FREEZE_TIME	NUMBER	Total freeze step time
CLEANUP_TIME	NUMBER	Total cleanup step time
REPLAY_TIME	NUMBER	Total replay step time
FIXWRITE_TIME	NUMBER	Total fixwrite step time
SYNC_TIME	NUMBER	Total synchronization step time
RESOURCES_CLEANED	NUMBER	Total number of resources cleaned in the cleanup steps

Column	Datatype	Description
REPLAYED_LOCKS_SENT	NUMBER	Total number of locks replayed to other instances in the replay steps
REPLAYED_LOCKS_RECEIVED	NUMBER	Total number of locks received from other instances in the replay steps
CURRENT_OBJECTS	NUMBER	Current number of objects remastered on this instance due to affinity or the current number of objects that are marked read-mostly in the cluster
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

¹ This column is available starting with Oracle Database 19c.

7.198 V\$EDITIONABLE_TYPES

V\$EDITIONABLE_TYPES lists all the editionable types based on the current compatibility setting. The SELECT privilege on V\$EDITIONABLE_TYPES will be granted to PUBLIC.

The database compatibility setting will determine the set of editionable types.

With compatibility set to 11.2 or 12, this set includes FUNCTION, LIBRARY, PACKAGE, PACKAGE BODY, PROCEDURE, SYNONYM, TRIGGER, TYPE, TYPE BODY, and VIEW. With compatibility set to 12, the set will include these types as well as the SQL TRANSLATION PROFILE.

Column	Datatype	Description
EDITIONABLE_TYPE	VARCHAR2 (64)	The name of the type that is editionable
TYPE#	NUMBER	The number of the type that is editionable
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

See Also:

For more information about edition-based redefinitions, see *Oracle Database Development Guide*.

7.199 V\$EMON

V\$EMON displays performance statistics per event monitor (EMON) slave for diagnosability of notifications. All processing time and latency is in seconds.

Column	Datatype	Description
EMON#	NUMBER	EMON identifier (0 - 9)
SID	NUMBER	Session identifier
STARTUP_TIME	TIMESTAMP(3) WITH TIME_ZONE	Time when this EMON slave was started
SERVER_TYPE	VARCHAR2(8)	Notification quality of the service provided by EMON: <ul style="list-style-type: none"> • REGULAR • RELIABLE
STATUS	VARCHAR2(6)	EMON status: <ul style="list-style-type: none"> • IDLE • ACTIVE
STATUS_CHANGE_TIME	TIMESTAMP(3) WITH TIME_ZONE	Time at which EMON switched to the current STATUS
NUM_NTFNS	NUMBER	Total number of notifications (including grouping notifications)
NUM_GROUPING_NTFNS	NUMBER	Number of grouping notifications
NUM_NTFNS_ALL_GROUPS	NUMBER	Total number of events in all notification groups
NUM_OCI_NTFNS	NUMBER	Number of OCI notifications
NUM_PLSQL_NTFNS	NUMBER	Number of PL/SQL notifications
NUM_EMAIL_NTFNS	NUMBER	Number of E-mail notifications
NUM_HTTP_NTFNS	NUMBER	Number of HTTP notifications
NUM_EVENTS_PROCESSED	NUMBER	Number of events posted by a publisher for which notifications have been delivered
NUM_EVENTS_PENDING	NUMBER	Number of events posted by a publisher for which notifications are not yet delivered
NUM_ANONYMOUS_NTFNS	NUMBER	Number of anonymous notifications
NUM_AQ_NTFNS	NUMBER	Number of AQ notifications
NUM_DBCHANGE_NTFNS	NUMBER	Number of DBChange notifications
TOTAL_ANONYMOUS_NTFN_TIME	NUMBER	Total time to process Anonymous notifications
TOTAL_AQ_NTFN_TIME	NUMBER	Total time to process AQ notifications
TOTAL_DBCHANGE_NTFN_TIME	NUMBER	Total time to process dbchange notifications
TOTAL_PLSQL_NTFN_TIME	NUMBER	Total time to process PL/SQL notifications
TOTAL_OCI_NTFN_TIME	NUMBER	Total time to process OCI notifications
TOTAL_EMAIL_NTFN_TIME	NUMBER	Total time to process E-mail notifications
TOTAL_HTTP_NTFN_TIME	NUMBER	Total time to process HTTP notifications
TOTAL_EMON_LATENCY	NUMBER	Total latency in processing events
REGISTRATIONS_EXPIRED	NUMBER	Number of expired registrations
REGISTRATIONS_PURGED	NUMBER	Number of purged registrations
REGISTRATIONS_INVALID	NUMBER	Number of registrations invalidated due to notification delivery failure

Column	Datatype	Description
LAST_UPDATE_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when statistics were last updated
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

7.200 V\$EMX_USAGE_STATS

V\$EMX_USAGE_STATS is used to track how often each report in Oracle Enterprise Manager Database Express (EM Express) is used and how long the EM Express servlet takes to serve these reports to the client.

This view contains statistics such as the number of requests captured in the EM Express servlet for each report, total elapsed time for the EM Express servlet to render each report, as well as a detailed time breakdown including database login time, request initialization time, time to run the SQL query, and time to stream and send the query result back to the client.

All statistics are accumulated over all requests for each EM Express report since the last time the database instance was restarted.

It also includes the timestamp of the last request for each report.

Column	Datatype	Description
REPORT	VARCHAR2(400)	Name of the EM Express report. All EM Express reports are XML reports with this format: %/orarep/component/report
COUNT	NUMBER	Number of requests captured by the EM Express servlet for this report since the last time the database instance was restarted
LOGIN_ELAPSED_TIME	NUMBER	Accumulated elapsed time for logging into the database across all requests for this report since the last time the database instance was restarted
INITREQ_ELAPSED_TIME	NUMBER	Accumulated elapsed time for initializing and preparing requests across all requests for this report since the last time the database instance was restarted
SQL_ELAPSED_TIME	NUMBER	Accumulated elapsed time for all requests that ran SQL queries for this report since the last time the database instance was restarted
SEND_ELAPSED_TIME	NUMBER	Accumulated elapsed time for streaming and sending the query result back to the client browser across all requests for this report since the last time the database instance was restarted
TOTAL_ELAPSED_TIME	NUMBER	Accumulated total elapsed time across all requests for this report since the last time the database instance was restarted
LAST_REQ_TIME	DATE	Timestamp of the last request for this report since the last time the database instance was restarted
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.201 V\$ENABLEDPRIVS

V\$ENABLEDPRIVS displays the system privileges that have been granted to the current user directly or through the currently enabled roles.

Column	Datatype	Description
PRIV_NUMBER	NUMBER	Numeric identifier of the system privilege The matching privilege name for each PRIV_NUMBER can be found in the table SYSTEM_PRIVILEGE_MAP.
SCOPE	VARCHAR2(11)	Indicates the scope with which a privilege was granted. Possible values: <ul style="list-style-type: none">• COMMON• APPLICATION• LOCAL• NULL (if connected to a non-CDB)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

["SYSTEM_PRIVILEGE_MAP"](#)

7.202 V\$ENCRYPTED_TABLESPACES

V\$ENCRYPTED_TABLESPACES displays information about tablespaces that are encrypted.

In a non-CDB, the information displayed by this view is meaningful only when the database is open and for data files that are online. In a CDB, the information displayed by this view is meaningful only for tablespaces in open containers. This is because the information is derived after the file headers making up a tablespace have been examined during the open operation.

During an encryption or decryption operation, the encryption or decryption progress can be obtained by comparing the values of the BLOCKS_ENCRYPTED and BLOCKS_DECRYPTED columns in this view with the value of the BLOCKS column in the DBA_DATA_FILES view.

Column	Datatype	Description
TS#	NUMBER	Tablespace number
ENCRYPTIONALG	VARCHAR2(7)	Encryption algorithm: <ul style="list-style-type: none">• NONE• 3DES168• AES128• AES192• AES256

Column	Datatype	Description
ENCRYPTEDTS	VARCHAR2 (3)	Indicates whether the tablespace is encrypted (YES) or not (NO)
ENCRYPTEDKEY	RAW (32)	Encrypted version of the tablespace key for the encrypted tablespace
MASTERKEYID	RAW (16)	ID of the master key that was used to encrypt the tablespace key
BLOCKS_ENCRYPTED	NUMBER	Number of tablespace blocks that have been encrypted during the lifetime of this instance
BLOCKS_DECRYPTED	NUMBER	Number of tablespace blocks that have been decrypted during the lifetime of this instance
KEY_VERSION	NUMBER	Every encrypt/decrypt/rekey of a tablespace adds a carnation/version of the tablespace key, and the key version is incremented. A decrypted tablespace could still have a none-zero key version. In certain scenarios, however, the tablespace key version might reset to 0; for example, when a tablespace or a pluggable database (PDB) is plugged into a foreign database, or if the control file is recreated.
STATUS	VARCHAR2 (10)	<p>Shows the status of a tablespace. Possible values:</p> <ul style="list-style-type: none"> • NORMAL: Used when the tablespace is not in one of the other statuses. • REKEYING: Used when a rekey operation is taking place • ENCRYPTING: Used when an encrypt operation is taking place • DECRYPTING: Used when a decrypt operation is taking place • UNKNOWN: Used when the database is mounted but not open (before the datafile is online and the key is known to the database) <p>Note: The REKEYING, ENCRYPTING, and DECRYPTING values can also be reported after a datafile, whose encryption state is different from the tablespace definition, is restored. In such cases, the value represents the operation that is required to make all datafiles in the tablespace consistent by using the FINISH clause of the ALTER TABLESPACE ENCRYPTION statement. See <i>Oracle Database Advanced Security Guide</i> for information about changing the encryption state of a tablespace.</p>
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

["V\\$DATABASE_KEY_INFO"](#)

7.203 V\$ENCRYPTION_KEYS

V\$ENCRYPTION_KEYS displays master key description attributes.

Note that, even if Transparent Data Encryption (TDE) is not configured in the database, a query of V\$ENCRYPTION_KEYS checks for TDE configuration validity and may print warnings in alert log.

Column	Datatype	Description
KEY_ID	VARCHAR2(78)	Master key identifier
TAG	VARCHAR2(4000)	Associated user-defined Information with the master key
CREATION_TIME	TIMESTAMP(6) WITH TIME ZONE	Time that the master key was created
ACTIVATION_TIME	TIMESTAMP(6) WITH TIME ZONE	Time that the master key was put into use
CREATOR	VARCHAR2(128)	User that created the master key
CREATOR_ID	NUMBER	User ID that created the master key
USER	VARCHAR2(128)	User that activated the master key
USER_ID	NUMBER	User ID that activated the master key
KEY_USE	VARCHAR2(10)	Indicates whether the master key is used for TDE operations in a PDB or not
KEYSTORE_TYPE	VARCHAR2(17)	<p>Master key is in:</p> <ul style="list-style-type: none"> • OKV - Oracle Key Vault • SOFTWARE KEYSTORE • UNDEFINED - This value is shown if the database has no information about the type of keystore where the master key resides
ORIGIN	VARCHAR2(41)	<p>Provides information about the origin of the master key:</p> <ul style="list-style-type: none"> • LOCAL - The master key was created locally in this database • IMPORTED - The master key was imported from another database • IMPORTED BUT KEY METADATA CREATED LOCALLY - The master key was imported from another database, but the key metadata was created locally due to activation • UNKNOWN BUT KEY METADATA CREATED LOCALLY - It is unknown whether the master key was imported from another database or created locally, but the key metadata was created locally due to activation • UNDEFINED - The status of the master key is unknown
BACKED_UP	VARCHAR2(9)	Indicates whether the key has been backed up or not
CREATOR_DBNAME	VARCHAR2(128)	Database that created the key
CREATOR_DBID	NUMBER	Database ID where the key was created
CREATOR_INSTANCE_NAME	VARCHAR2(30)	Instance name of the instance where the key was created
CREATOR_INSTANCE_NUMBER	NUMBER	Instance number of the instance where the key was created
CREATOR_INSTANCE_SERIAL	NUMBER	Serial number of the instance where the key was created
CREATOR_PDBNAME	VARCHAR2(128)	PDB where the key was created
CREATOR_PDBID	NUMBER	PDB ID where the key was created
CREATOR_PDBUID	NUMBER	PDB UID where the key was created
CREATOR_PDBGUID	RAW(16)	PDB GUID where the key was created
ACTIVATING_DBNAME	VARCHAR2(128)	Database that activated the key
ACTIVATING_DBID	NUMBER	Database ID where the key was activated
ACTIVATING_INSTANCE_NAME	VARCHAR2(30)	Instance name of the instance where the key was activated
ACTIVATING_INSTANCE_NUMBER	NUMBER	Instance number of the instance where the key was activated
ACTIVATING_INSTANCE_SERIAL	NUMBER	Serial number of the instance where the key was activated
ACTIVATING_PDBNAME	VARCHAR2(128)	PDB where the key was activated

Column	Datatype	Description
ACTIVATING_PDBID	NUMBER	PDB ID where the key was activated
ACTIVATING_PDBUID	NUMBER	PDB UID where the key was activated
ACTIVATING_PDBGUID	RAW(16)	PDB GUID where the key was activated
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

Oracle Database Advanced Security Guide for information about keystore management

7.204 V\$ENCRYPTION_WALLET

V\$ENCRYPTION_WALLET displays information on the status of the wallet and the wallet location for Transparent Data Encryption (TDE).

In a multitenant container database (CDB), this view displays information on the wallets for all pluggable database (PDBs) when queried from CDB\$ROOT. When queried from a PDB, this view only displays wallet details of that PDB.

Note that, even if TDE is not configured in the database, a query of V\$ENCRYPTION_WALLET checks for TDE configuration validity and may print warnings in alert log.

Column	Datatype	Description
WRL_TYPE	VARCHAR2(20)	Type of the wallet resource locator (for example, FILE)
WRL_PARAMETER	VARCHAR2(4000)	Parameter of the wallet resource locator (for example, absolute directory location of the wallet or keystore, if WRL_TYPE = FILE)
STATUS	VARCHAR2(30)	Status of the wallet. Possible values: <ul style="list-style-type: none"> • CLOSED: The wallet is closed • NOT_AVAILABLE: The wallet is not available in the location specified by the WALLET_ROOT initialization parameter • OPEN: The wallet is open • OPEN_NO_MASTER_KEY: The wallet is open, but no master key is set • OPEN_UNKNOWN_MASTER_KEY_STATUS: The wallet is open, but the database could not determine whether the master key is set. This situation can occur when the database is in the mounted state and cannot check if the master key for a hardware keystore is set because the data dictionary is not available. • UNDEFINED: The database could not determine the status of the wallet

Column	Datatype	Description
WALLET_TYPE	VARCHAR2 (20)	<p>Displays the type of keystore being used, FILE or OKV</p> <p>If the keystore was created with the <code>mkstore</code> utility, then the <code>WALLET_TYPE</code> is UNKNOWN. Oracle recommends that you create keystores with the ADMINISTER KEY MANAGEMENT statement.</p>
WALLET_ORDER	VARCHAR2 (9)	<p>Possible values:</p> <ul style="list-style-type: none"> • SINGLE - When only a single wallet is configured, this is the value in the column. • PRIMARY - When more than one wallet is configured, this value indicates that the wallet is primary (holds the current master key). • SECONDARY - When more than one wallet is configured, this value indicates that the wallet is secondary (holds old keys). <p>The lookup of master keys happens in the primary keystore first, and then in the secondary keystore, if required.</p> <p>If there is only one type of keystore (Hardware Security Module or Software Keystore) being used, then SINGLE will appear.</p> <p>If both types are used, then the value in this column shows the order in which each keystore will be looked up.</p>
KEYSTORE_MODE	VARCHAR2 (8)	<p>Displays the keystore mode:</p> <ul style="list-style-type: none"> • NONE: This value is seen when this column is queried from the <code>CDB\$ROOT</code>, or when the database is a non-CDB. The keystore mode does not apply in these cases. • UNITED: The PDB is configured to use the wallet of the <code>CDB\$ROOT</code>. To open the wallet in this configuration, the password of the wallet of the <code>CDB\$ROOT</code> must be used. • ISOLATED: The PDB is configured to use its own wallet. To open the wallet in this configuration, the password of the isolated wallet must be used.
FULLY_BACKED_UP	VARCHAR2 (9)	Indicates whether all the keys in the keystore have been backed up
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.205 V\$ENQUEUE_LOCK

V\$ENQUEUE_LOCK displays all locks owned by enqueue state objects. The columns in this view are identical to the columns in V\$LOCK.

 **See Also:**

"V\$LOCK"

Column	Datatype	Description
ADDR	RAW(4 8)	Address of lock state object
KADDR	RAW(4 8)	Address of lock
SID	NUMBER	Identifier for session holding or acquiring the lock
TYPE	VARCHAR2(2)	Type of lock. Lists user and system types that can have locks.
ID1	NUMBER	Lock identifier #1 (depends on type)
ID2	NUMBER	Lock identifier #2 (depends on type)
LMODE	NUMBER	Lock mode in which the session holds the lock: <ul style="list-style-type: none"> • 0 - none • 1 - null (NULL) • 2 - row-S (SS) • 3 - row-X (SX) • 4 - share (S) • 5 - S/Row-X (SSX) • 6 - exclusive (X)
REQUEST	NUMBER	Lock mode in which the process requests the lock: <ul style="list-style-type: none"> • 0 - none • 1 - null (NULL) • 2 - row-S (SS) • 3 - row-X (SX) • 4 - share (S) • 5 - S/Row-X (SSX) • 6 - exclusive (X)
CTIME	NUMBER	Time since current mode was granted
BLOCK	NUMBER	The lock is blocking another lock
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.206 V\$ENQUEUE_STAT

V\$ENQUEUE_STAT displays statistics on the number of enqueue (lock) requests for each type of lock.

Column	Datatype	Description
INST_ID	NUMBER	ID of the instance
EQ_TYPE	VARCHAR2 (2)	Type of enqueue requested
TOTAL_REQ#	NUMBER	Total number of enqueue requests or enqueue conversions for this type of enqueue
TOTAL_WAIT#	NUMBER	Total number of times an enqueue request or conversion resulted in a wait
SUCC_REQ#	NUMBER	Number of times an enqueue request or conversion was granted
FAILED_REQ#	NUMBER	Number of times an enqueue request or conversion failed
CUM_WAIT_TIME	NUMBER	Total amount of time (in milliseconds) spent waiting for the enqueue or enqueue conversion
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.207 V\$ENQUEUE_STATISTICS

V\$ENQUEUE_STATISTICS displays statistics on the number of enqueue (lock) requests for each type of lock.

V\$ENQUEUE_STATISTICS encompasses V\$ENQUEUE_STAT and gives more detailed information (several rows for same queues with different reasons).

Column	Datatype	Description
EQ_NAME	VARCHAR2 (64)	Name of the enqueue request
EQ_TYPE	VARCHAR2 (2)	Type of enqueue requested
REQ_REASON	VARCHAR2 (64)	Reason for the enqueue request
TOTAL_REQ#	NUMBER	Total number of enqueue requests or enqueue conversions for this type of enqueue
TOTAL_WAIT#	NUMBER	Total number of times an enqueue request or conversion resulted in a wait
SUCC_REQ#	NUMBER	Number of times an enqueue request or conversion was granted
FAILED_REQ#	NUMBER	Number of times an enqueue request or conversion failed
CUM_WAIT_TIME	NUMBER	Total amount of time (in milliseconds) spent waiting for the enqueue or enqueue conversion
REQ_DESCRIPTION	VARCHAR2 (4000)	Description of the enqueue request
EVENT#	NUMBER	Event number

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$ENQUEUE_STAT"](#)

7.208 V\$EVENT_HISTOGRAM

V\$EVENT_HISTOGRAM displays a histogram of the number of waits, the maximum wait, and total wait time on an event basis, in milliseconds. The histogram has buckets of time intervals from < 1 ms, < 2 ms, < 4 ms, < 8 ms, ... < 2^{21} ms, < 2^{22} ms, and $\geq 2^{22}$ ms.

The histogram will not be filled unless the `TIMED_STATISTICS` initialization parameter is set to true.

Column	Datatype	Description
EVENT#	NUMBER	Event number
EVENT	VARCHAR2 (64)	Name of the event
WAIT_TIME_MILLI	NUMBER	Amount of time the bucket represents (in milliseconds). If the duration = num , then this column represents waits of duration < num that are not included in any smaller bucket.
WAIT_COUNT	NUMBER	Number of waits of the duration belonging to the bucket of the histogram
LAST_UPDATE_TIME	VARCHAR2 (64)	Indicates the last time the bucket was updated (the ending timestamp of the last wait falling into the bucket's duration)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["TIMED_STATISTICS"](#)

7.209 V\$EVENT_HISTOGRAM_MICRO

V\$EVENT_HISTOGRAM_MICRO displays a histogram of the number of waits, the maximum wait, and total wait time on an event basis, in microseconds. The histogram has buckets of time intervals from < 1 us, < 2 us, < 4 us, < 8 us, ... < 2^{31} us, < 2^{32} us, and $\geq 2^{32}$ us.

The histogram will not be filled unless the `TIMED_STATISTICS` initialization parameter is set to true.

Column	Datatype	Description
EVENT#	NUMBER	Event number
EVENT	VARCHAR2 (64)	Name of the event
WAIT_TIME_FORMAT	VARCHAR2 (30)	A human readable time string which is converted from WAIT_TIME_MICRO. When WAIT_TIME_MICRO < 1 millisecond, WAIT_TIME_FORMAT is shown in microseconds. When WAIT_TIME_MICRO < 1 second, WAIT_TIME_FORMAT is shown in milliseconds. When WAIT_TIME_MICRO < 1 minute, WAIT_TIME_FORMAT is shown in seconds. When WAIT_TIME_MICRO > 1 minute, WAIT_TIME_FORMAT is shown in minutes and seconds.
WAIT_TIME_MICRO	NUMBER	Amount of time the bucket represents (in microseconds). If the duration = num, then this column represents waits of duration < num that are not included in any smaller bucket.
WAIT_COUNT	NUMBER	Number of waits of the duration belonging to the bucket of the histogram
LAST_UPDATE_TIME	VARCHAR2 (64)	Indicates the last time the bucket was updated (the ending timestamp of the last wait falling into the bucket's duration)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.210 V\$EVENT_NAME

V\$EVENT_NAME displays information about wait events.

Column	Datatype	Description
EVENT#	NUMBER	Number of the wait event
EVENT_ID	NUMBER	Identifier of the wait event
NAME	VARCHAR2 (64)	Name of the wait event. Names that appear in this column remain stable across Oracle Database releases, and they can be relied on by customer scripts.
PARAMETER1	VARCHAR2 (64)	Description of the first parameter for the wait event
PARAMETER2	VARCHAR2 (64)	Description of the second parameter for the wait event
PARAMETER3	VARCHAR2 (64)	Description of the third parameter for the wait event
WAIT_CLASS_ID	NUMBER	Identifier of the class of the wait event

Column	Datatype	Description
WAIT_CLASS#	NUMBER	Number of the class of the wait event
WAIT_CLASS	VARCHAR2 (64)	Name of the class of the wait event
		See Also: " Classes of Wait Events " for a description of the different wait event classes
DISPLAY_NAME	VARCHAR2 (64)	A clearer and more descriptive name for the wait event that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.211 V\$EVENTMETRIC

V\$EVENTMETRIC displays values of wait event metrics for the most recent 60-second interval.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
EVENT#	NUMBER	Number of the event
EVENT_ID	NUMBER	Identifier of the event
NUM_SESS_WAITING	NUMBER	Number of sessions waiting at the end of the interval
TIME_WAITED	NUMBER	Time waited (in hundredths of a second)
WAIT_COUNT	NUMBER	Number of times waited
TIME_WAITED_FG	NUMBER	Time waited (in hundredths of a second), from foreground sessions
WAIT_COUNT_FG	NUMBER	Number of times waited, from foreground sessions
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.212 V\$EXADIRECT_ACL

V\$EXADIRECT_ACL monitors current ACLs propagated to the database instance.

Column	Datatype	Description
SERVICE_NAME	VARCHAR2 (512)	Database service name
SGID	VARCHAR2 (39)	Identifier of the VM allowed access to the specified service name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.213 V\$EXECUTION

V\$EXECUTION displays information on parallel execution.

Column	Datatype	Description
PID	NUMBER	Session ID
DEPTH	NUMBER	The depth
FUNCTION	VARCHAR2 (10)	Session serial number
TYPE	VARCHAR2 (7)	Name of the OBJECT_NODE in plan table
NVALS	NUMBER	Elapsed time for OBJECT_NODE
VAL1	NUMBER	The value for number 1
VAL2	NUMBER	The value for number 2
SEQH	NUMBER	A sequence
SEQL	NUMBER	A sequence
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.214 V\$EXP_STATS

V\$EXP_STATS stores the expression tracking statistics of recently executed queries.

Column	Datatype	Description
EXPID	NUMBER	Expression ID of the current expression
OBJNUM	NUMBER	The object number contained in the expression
DYN COST	NUMBER	Optimizer dynamic cost of evaluating the expression
EVALCNT	NUMBER	Number of times the expression has been evaluated

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

- "[ALL_EXPRESSION_STATISTICS](#)"

- "[ALL_EXPRESSION_STATISTICS](#)"

7.215 V\$FALSE_PING

V\$FALSE_PING is deprecated. The information that was provided in this view is now provided in the `V$INSTANCE_CACHE_TRANSFER` and `V$SEGMENT_STATISTICS` views.

Column	Datatype	Description
FILE#	NUMBER	Data file identifier number (to find the file name, query <code>DBA_DATA_FILES</code> or <code>V\$DBFILE</code>)
BLOCK#	NUMBER	Block number
STATUS	VARCHAR2(10)	<p>Status of the block:</p> <ul style="list-style-type: none"> • free - Not currently in use • xcur - Exclusive • scur - Shared current • cr - Consistent read • read - Being read from disk • mrec - In media recovery mode • irec - In instance recovery mode
XNC	NUMBER	Number of PCM lock conversions from Exclusive mode due to contention with another instance. This column is obsolete and maintained for backward compatibility.
FORCED_READS	NUMBER	Number of times the block had to be reread from the cache because another instance has forced it out of this instance's cache by requesting the lock on the block in exclusive mode
FORCED_WRITES	NUMBER	Number of times GCS had to write this block to cache because this instance had used the block and another instance had requested the lock on the block in a conflicting mode
NAME	VARCHAR2(128)	Name of the database object containing the block
PARTITION_NAME	VARCHAR2(128)	NULL for nonpartitioned objects
KIND	VARCHAR2(15)	Type of database object

Column	Datatype	Description
OWNER#	NUMBER	Owner number
LOCK_ELEMENT_ADDR	RAW (4 8)	Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.
LOCK_ELEMENT_NAME	NUMBER	Name of the lock that contains the PCM lock that is covering the buffer
CLASS#	NUMBER	Lock element class
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "[V\\$INSTANCE_CACHE_TRANSFER](#)"
- "[V\\$SEGMENT_STATISTICS](#)"

7.216 V\$FAST_START_SERVERS

V\$FAST_START_SERVERS provides information about all the recovery slaves performing parallel transaction recovery.

Column	Datatype	Description
STATE	VARCHAR2 (11)	State of the server (IDLE or RECOVERING)
UNDOBLOCKSDONE	NUMBER	Number of undo blocks done so far
PID	NUMBER	Process ID
XID	RAW (8)	Transaction ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.217 V\$FAST_START_TRANSACTIONS

V\$FAST_START_TRANSACTIONS displays information about the progress of the transactions that Oracle is recovering.

This view displays only transactions recovered in parallel. Recovery progress for serial transactions is not displayed.

Column	Datatype	Description
USN	NUMBER	Undo segment number of the transaction
SLT	NUMBER	Slot within the rollback segment
SEQ	NUMBER	Incarnation number of the slot
STATE	VARCHAR2(16)	State of the transaction (may be TO_BE_RECOVERED, RECOVERED, or RECOVERING)
UNDOBLOCKSDONE	NUMBER	Number of undo blocks completed on the transaction
UNDOBLOCKSTOTAL	NUMBER	Total number of undo blocks that need recovery
PID	NUMBER	ID of the current server it has been assigned to
CPUTIME	NUMBER	Time for which recovery has progressed (in seconds)
PARENTUSN	NUMBER	Undo segment number of the parent transaction in PDML
PARENTSLT	NUMBER	Slot of the parent transaction in PDML
PARENTSEQ	NUMBER	Sequence number of the parent transaction in PDML
XID	RAW(8)	Transaction ID
PXID	RAW(8)	Parent transaction ID
RCVSERVERS	NUMBER	Number of servers used in the last recovery
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.218 V\$FILE_CACHE_TRANSFER

V\$FILE_CACHE_TRANSFER is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE_CACHE_TRANSFER and V\$SEGMENT_STATISTICS views.

Column	Datatype	Description
FILE_NUMBER	NUMBER	Number of the data file
X_2_NULL	NUMBER	Number of blocks with Exclusive-to-NULL conversions; always 0
X_2_NULL_FORCED_WRITE	NUMBER	Number of Exclusive-to-NULL forced writes; always 0
X_2_NULL_FORCED_STALE	NUMBER	Number of Exclusive-to-NULL blocks converted to CR; always 0
X_2_S	NUMBER	Number of blocks with Exclusive-to-Shared conversions; always 0

Column	Datatype	Description
X_2_S_FORCED_WRITE	NUMBER	Number of Exclusive-to-Shared forced writes; always 0
S_2_NULL	NUMBER	Number of blocks with Shared-to-NULL conversions; always 0
S_2_NULL_FORCED_STALE	NUMBER	Number of Shared-to-NULL blocks converted to CR; always 0
RBR	NUMBER	Number of reuse blocks cross-instance calls; always 0
RBR_FORCED_WRITE	NUMBER	Number of blocks written due to reuse blocks cross-instance calls; always 0
RBR_FORCED_STALE	NUMBER	Number of blocks marked as flushed due to reuse blocks cross-instance calls; always 0
NULL_2_X	NUMBER	Number of blocks with NULL-to-Exclusive conversions; always 0
S_2_X	NUMBER	Number of blocks with Shared-to-Exclusive conversions; always 0
NULL_2_S	NUMBER	Number of blocks with NULL-to-Shared conversions; always 0
CR_TRANSFERS	NUMBER	Number of CR blocks received; always 0
CUR_TRANSFERS	NUMBER	Number of current blocks received; always 0
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "[V\\$INSTANCE_CACHE_TRANSFER](#)"
- "[V\\$SEGMENT_STATISTICS](#)"

7.219 V\$FILE_HISTOGRAM

V\$FILE_HISTOGRAM displays a histogram of all synchronous single block reads on a per-file basis (for data files). The histogram has buckets of time intervals from < 1 ms, < 2 ms, < 4 ms, < 8 ms, ... < 2^{21} ms, < 2^{22} ms, and $\geq 2^{22}$ ms.

The histogram will not be filled unless the STATISTICS_LEVEL initialization parameter is set to ALL.

Column	Datatype	Description
FILE#	NUMBER	File number
SINGLEBLKRDTIM_MILLI	NUMBER	Amount of time the bucket represents (in milliseconds). If the duration = <i>num</i> , then this column represents waits of duration < <i>num</i> that are not included in any smaller bucket.
SINGLEBLKRDS	NUMBER	Number of waits of the duration belonging to the bucket of the histogram

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.220 V\$FILEMETRIC

V\$FILEMETRIC displays values of file metrics for the most recent 10-minute interval. A history of the last one hour will be kept in the system.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
FILE_ID	NUMBER	File number
CREATION_TIME	NUMBER	Timestamp of the file creation
AVERAGE_READ_TIME	NUMBER	Average file read time (in hundredths of a second)
AVERAGE_WRITE_TIME	NUMBER	Average file write time (in hundredths of a second)
PHYSICAL_READS	NUMBER	Number of physical reads
PHYSICAL_WRITES	NUMBER	Number of physical writes
PHYSICAL_BLOCK_READS	NUMBER	Number of physical block reads
PHYSICAL_BLOCK_WRITES	NUMBER	Number of physical block writes
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.221 V\$FILEMETRIC_HISTORY

V\$FILEMETRIC_HISTORY displays values of file metrics for all intervals in the last one hour.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
FILE_ID	NUMBER	File number
CREATION_TIME	NUMBER	Timestamp of the file creation

Column	Datatype	Description
AVERAGE_READ_TIME	NUMBER	Average file read time (in hundredths of a second)
AVERAGE_WRITE_TIME	NUMBER	Average file write time (in hundredths of a second)
PHYSICAL_READS	NUMBER	Number of physical reads
PHYSICAL_WRITES	NUMBER	Number of physical writes
PHYSICAL_BLOCK_READS	NUMBER	Number of physical block reads
PHYSICAL_BLOCK_WRITES	NUMBER	Number of physical block writes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.222 V\$FILESPACE_USAGE

V\$FILESPACE_USAGE summarizes space allocation information of each data file and temp file.

Column	Datatype	Description
TABLESPACE_ID	NUMBER	ID of the tablespace to which the file belongs
RFNO	NUMBER	Relative file number of the file
ALLOCATED_SPACE	NUMBER	Total allocated space in the file
FILE_SIZE	NUMBER	Current file size
FILE_MAXSIZE	NUMBER	Maximum file size
CHANGESCN_BASE	NUMBER	SCN base of the last change to the file
CHANGESCN_WRAP	NUMBER	SCN wrap of the last change to the file
CHANGESCN8	NUMBER	The 8-byte representation of the SCN at which the last change happened to the file
FLAG	NUMBER	Flags for file attributes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.223 V\$FILESTAT

V\$FILESTAT displays the number of physical reads and writes done and the total number of single-block and multiblock I/Os done at file level.

As of Oracle Database 10g Release 2 (10.2), this view also includes reads done by RMAN processes for backup operations.

Column	Datatype	Description
FILE#	NUMBER	Number of the file
PHYRDS	NUMBER	Number of physical reads done
PHYWRITS	NUMBER	Number of times DBWR is required to write
PHYBLKRD	NUMBER	Number of physical blocks read
OPTIMIZED_PHYBLKRD	NUMBER	Number of physical reads from Database Smart Flash Cache blocks
PHYBLKWRT	NUMBER	Number of blocks written to disk, which may be the same as PHYWRITS if all writes are single blocks
SINGLEBLKRDS	NUMBER	Number of single block reads
READTIM	NUMBER	Time (in hundredths of a second) spent doing reads if the TIMED_STATISTICS parameter is true; 0 if false
WRITETIM	NUMBER	Time (in hundredths of a second) spent doing writes if the TIMED_STATISTICS parameter is true; 0 if false
SINGLEBLKRDTIM	NUMBER	Cumulative single block read time (in hundredths of a second)
AVGIOTIM	NUMBER	Average time (in hundredths of a second) spent on I/O, if the TIMED_STATISTICS parameter is true; 0 if false
LSTIOTIM	NUMBER	Time (in hundredths of a second) spent doing the last I/O, if the TIMED_STATISTICS parameter is true; 0 if false
MINIOTIM	NUMBER	Minimum time (in hundredths of a second) spent on a single I/O, if the TIMED_STATISTICS parameter is true; 0 if false
MAXIORTM	NUMBER	Maximum time (in hundredths of a second) spent doing a single read, if the TIMED_STATISTICS parameter is true; 0 if false
MAXIOWTM	NUMBER	Maximum time (in hundredths of a second) spent doing a single write, if the TIMED_STATISTICS parameter is true; 0 if false
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.224 V\$FIXED_TABLE

V\$FIXED_TABLE displays all dynamic performance tables, views, and derived tables in the database.

Some V\$ tables (for example, V\$ROLLNAME) refer to real tables and are therefore not listed.

Column	Datatype	Description
NAME	VARCHAR2(128)	Name of the object
OBJECT_ID	NUMBER	Identifier of the fixed object
TYPE	VARCHAR2(5)	Object type (TABLE VIEW)
TABLE_NUM	NUMBER	Number that identifies the dynamic performance table if it is of type TABLE

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.225 V\$FIXED_VIEW_DEFINITION

V\$FIXED_VIEW_DEFINITION contains the definitions of all the fixed views (views beginning with V\$).

Use this table with caution. Oracle tries to keep the behavior of fixed views the same from release to release, but the definitions of the fixed views can change without notice. Use these definitions to optimize your queries by using indexed columns of the dynamic performance tables.

Column	Datatype	Description
VIEW_NAME	VARCHAR2 (128)	Name of the fixed view
VIEW_DEFINITION	VARCHAR2 (4000)	Definition of the fixed view
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.226 V\$FLASHBACK_DATABASE_LOG

V\$FLASHBACK_DATABASE_LOG displays information about the flashback data. Use this view to help estimate the amount of flashback space required for the current workload.

Column	Datatype	Description
OLDEST_FLASHBACK_SCN	NUMBER	Lowest system change number (SCN) in the flashback data, for any incarnation
OLDEST_FLASHBACK_TIME	DATE	Time of the lowest SCN in the flashback data, for any incarnation
RETENTION_TARGET	NUMBER	Target retention time (in minutes)
FLASHBACK_SIZE	NUMBER	Current size (in bytes) of the flashback data
ESTIMATED_FLASHBACK_SIZE	NUMBER	Estimated size of flashback data needed (in bytes) for the current target retention

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.227 V\$FLASHBACK_DATABASE_LOGFILE

V\$FLASHBACK_DATABASE_LOGFILE displays information about the flashback log files.

Column	Datatype	Description
NAME	VARCHAR2 (513)	Name of the log file
LOG#	NUMBER	Log file number
THREAD#	NUMBER	Log file thread number
SEQUENCE#	NUMBER	Log file sequence number
BYTES	NUMBER	Log file size (in bytes)
FIRST_CHANGE#	NUMBER	Lowest system change number (SCN) in the log file
FIRST_TIME	DATE	Time of the first SCN in the log file
TYPE	VARCHAR2 (9)	<p>Log type:</p> <ul style="list-style-type: none"> • NORMAL • RESERVED • FREE • TO DELETE
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.228 V\$FLASHBACK_DATABASE_STAT

V\$FLASHBACK_DATABASE_STAT displays statistics for monitoring the I/O overhead of logging flashback data. This view also displays the estimated flashback space needed based on previous workloads.

Column	Datatype	Description
BEGIN_TIME	DATE	Beginning of the time interval
END_TIME	DATE	End of the time interval
FLASHBACK_DATA	NUMBER	Number of bytes of flashback data written during the interval
DB_DATA	NUMBER	Number of bytes of database data read and written during the interval

Column	Datatype	Description
REDO_DATA	NUMBER	Number of bytes of redo data written during the interval
ESTIMATED_FLASHBACK_SIZE	NUMBER	Value of ESTIMATED_FLASHBACK_SIZE in V\$FLASHBACK_DATABASE_LOG at the end of the time interval
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.229 V\$FLASHBACK_TXN_GRAPH

V\$FLASHBACK_TXN_GRAPH displays a tabular representation of the transaction dependency graph. For each dependency edge, there could be multiple rows, one for each conflicting operation.

This view is relevant AFTER a compensating transaction has been started through the DBMS_FLASHBACK.TRANSACTION_BACKOUT() set of functions, and is no longer relevant once the compensating transaction is either committed or rolled back. It also provides a tabular representation of the undo SQL that is not available through the CLOB XML construct in the DBA_FLASHBACK_TXN_REPORT view.

Column	Datatype	Description
COMPENSATING_XID	RAW(8)	Transaction ID of the compensating transaction
COMPENSATING_TXN_NAME	VARCHAR2(255)	Name of the compensating transaction
XID	RAW(8)	Transaction ID of a relevant transaction found in memory
TXN_NAME	VARCHAR2(255)	Name of the transaction with XID as the transaction ID; NULL if none
PARENT_XID	RAW(8)	Parent transaction ID (for a PDML transaction)
INTERESTING	NUMBER	If the transaction is in the transaction dependency graph
ORIGINAL	NUMBER	If the transaction is part of the input set provided
BACKOUT_SEQ	NUMBER	Order in which the transaction has been backed out
NUM_PREDS	NUMBER	Number of predecessors of the transaction specified by XID in the transaction graph
NUM_SUCCS	NUMBER	Number of successors of the transaction specified by XID in the transaction graph
DEP_XID	RAW(8)	One dependent transaction ID of the transaction specified by XID. This is a particular child of XID.
DEP_TXN_NAME	VARCHAR2(255)	Transaction name, if any, for the transaction specified by DEP_XID
TXN_CONF_SQL_ID	NUMBER	SQL ID of undo SQL executed in the context of XID which conflicts with the dependent transaction
DEP_TXN_CONF_SQL_ID	NUMBER	SQL ID of undo SQL executed in the context of DEP_XID which conflicts with XID
CONFLICT_TYPE	VARCHAR2(32)	The type of conflict that the conflict resolution method is used to resolve: delete, uniqueness, or update

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

7.230 V\$FLASHBACK_TXN_MODS

V\$FLASHBACK_TXN_MODS displays the individual modifications of all the transactions in memory.

This view is relevant AFTER a compensating transaction has been started through the `DBMS_FLASHBACK.TRANSACTION_BACKOUT()` set of functions, and is no longer relevant once the compensating transaction is either committed or rolled back. It also provides a tabular representation of the undo SQL that is not available through the CLOB XML construct in the `DBA_FLASHBACK_TXN_REPORT` view.

Column	Datatype	Description
COMPENSATING_XID	RAW(8)	Transaction ID of the compensating transaction
COMPENSATING_TXN_NAME	VARCHAR2(255)	Name of the compensating transaction
XID	RAW(8)	Transaction ID of a relevant transaction found in memory
TXN_NAME	VARCHAR2(255)	Name of the transaction with XID as the transaction ID; NULL if none
PARENT_XID	RAW(8)	Parent transaction ID (for a PDML transaction)
INTERESTING	NUMBER	If the transaction is in the transaction dependency graph
ORIGINAL	NUMBER	If the transaction is part of the input set provided
BACKOUT_SEQ	NUMBER	Order in which the transaction has been backed out
UNDO_SQL	VARCHAR2(4000)	Undo SQL for the modification
UNDO_SQL_SQN	NUMBER	Order in which the given SQL has been executed to back out this transaction
UNDO_SQL_SUB_SQN	NUMBER	If the undo SQL is greater than 4000 bytes, then a sequence number, starting from 1, of a 4000-byte division of the undo SQL
BACKOUT_SQL_ID	NUMBER	SQL ID of the undo SQL (used only for this compensating transaction)
OPERATION	VARCHAR2(128)	Operation (such as insert/update/delete) performed by the forward-going operation
BACKEDOUT	NUMBER	Indicates whether the transaction has been backed out as of now
CONFLICT_MOD	NUMBER	If the concerned modification is causing a conflict

Column	Datatype	Description
MODS_PER_LCR	NUMBER	Sometimes an LCR could cause multiple modifications (for example, an update of an IOT could actually be a delete followed by an insert)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

- "[DBA_FLASHBACK_TXN_REPORT](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_FLASHBACK.TRANSACTION_BACKOUT` procedures

7.231 V\$FLASHFILESTAT

V\$FLASHFILESTAT displays statistics about Database Smart Flash Cache.

By taking snapshots of `SINGLEBLKRDS` and `SINGLEBLKRDTIM_MICRO`, you can easily calculate the average latency of all the flash files in a given time period

Column	Datatype	Description
FLASHFILE#	NUMBER	The file number of the flash file
NAME	VARCHAR2 (513)	Name and path of the flash file
BYTES	NUMBER	Size of the flash file, in bytes
ENABLED	NUMBER	Indicates whether this flash file is enabled or not
SINGLEBLKRDS	NUMBER	Number of reads to the flash file
SINGLEBLKRDTIM_MICRO	NUMBER	Cumulative latency of reading blocks from this particular flash file/device, in microseconds
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

Oracle Database Administrator's Guide for more information about configuring Database Smart Flash Cache

7.232 V\$FOREIGN_ARCHIVED_LOG

V\$FOREIGN_ARCHIVED_LOG can be queried on a logical standby database to find out the list of foreign archived logs received by a database.

No rows are returned for this view on a physical standby database.

Column	Datatype	Description
RECID	NUMBER	Archived log record ID
STAMP	NUMBER	Archived log record stamp
NAME	VARCHAR2 (513)	Archived log file name. If set to NULL, either the log file was cleared before it was archived or an RMAN BACKUP command with the delete input option was executed to back up archivelog all (RMAN> backup archivelog all delete input;).
DEST_ID	NUMBER	Original destination from which the archive log was generated. The value is 0 if the destination identifier is not available
THREAD#	NUMBER	Redo thread number
SEQUENCE#	NUMBER	Redo log sequence number
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the database when the log was written
RESETLOGS_TIME	DATE	Resetlogs time of the database when the log was written
RESETLOGS_ID	NUMBER	Resetlogs identifier associated with the archived redo log
FIRST_CHANGE#	NUMBER	First change number in the archived log
FIRST_TIME	DATE	Timestamp of the first change
NEXT_CHANGE#	NUMBER	First change in the next log
NEXT_TIME	DATE	Timestamp of the next change
BLOCKS	NUMBER	Size of the archived log (in blocks)
BLOCK_SIZE	NUMBER	Redo log block size. This is the logical block size of the archived log, which is the same as the logical block size of the online log from which the archived log was copied. The online log logical block size is a platform-specific value that is not adjustable by the user.
CREATOR	VARCHAR2 (7)	Creator of the archive log: ARCH - Archiver process FGRD - Foreground process RMAN - Recovery Manager SRMN - RMAN at standby LGWR - Logwriter process

Column	Datatype	Description
REGISTRAR	VARCHAR2 (7)	<p>Registrar of the entry:</p> <p>RFS - Remote File Server process</p> <p>ARCH - Archiver process</p> <p>FGRD - Foreground process</p> <p>RMAN - Recovery Manager</p> <p>SRMN - RMAN at standby</p> <p>LGWR - Logwriter process</p>
ARCHIVED	VARCHAR2 (3)	Indicates whether the online redo log was archived (YES) or whether RMAN only inspected the log and created a record for future application of redo logs during recovery (NO).
APPLIED	VARCHAR2 (3)	<p>Indicates whether the archivelog has been applied to its corresponding standby database (YES) or not (NO). The value is always NO for local destinations.</p> <p>This column is meaningful at the standby site for the ARCHIVED_LOG entries with REGISTRAR='RFS' (which means this log is shipped from the primary to the standby database). If REGISTRAR='RFS' and APPLIED is NO, then the log has arrived at the standby but has not yet been applied. If REGISTRAR='RFS' and APPLIED is YES, the log has arrived and been applied at the standby database.</p> <p>You can use this field to identify archivelogs that can be backed up and removed from disk.</p>
DELETED	VARCHAR2 (3)	Indicates whether an RMAN DELETE command has physically deleted the archived log file from disk, as well as logically removing it from the control file of the target database and from the recovery catalog (YES) or not (NO)
STATUS	VARCHAR2 (1)	<p>Status of the archived log:</p> <p>A - Available</p> <p>D - Deleted</p> <p>U - Unavailable</p> <p>X - Expired</p>
COMPLETION_TIME	DATE	Time when the archiving completed
DICTIONARY_BEGIN	VARCHAR2 (3)	Indicates whether the log contains the start of a LogMiner dictionary (YES) or not (NO)
DICTIONARY_END	VARCHAR2 (3)	Indicates whether the log contains the end of a LogMiner dictionary (YES) or not (NO)
END_OF_REDO	VARCHAR2 (3)	Indicates whether the archived redo log contains the end of all redo information from the primary database () or not ()
ARCHIVAL_THREAD#	NUMBER	Redo thread number of the instance that performed the archival operation. This column differs from the THREAD# column only when a closed thread is archived by another instance.
IS_RECOVERY_DEST_FILE	VARCHAR2 (3)	Indicates whether the file was created in the fast recovery area (YES) or not (NO)
COMPRESSED	VARCHAR2 (3)	Reserved for internal use
FAL	VARCHAR2 (3)	Indicates whether the archive log was generated as the result of a FAL request (YES) or not (NO)

Column	Datatype	Description
END_OF_REDO_TYPE	VARCHAR2(10)	<p>Possible values are as follows:</p> <p>SWITCHOVER - Shows archived redo log files that are produced at the end of a switchover</p> <p>TERMINAL - Shows archived redo log files produced after a failover</p> <p>RESETLOGS - Shows online redo log files archived on the primary database after an ALTER DATABASE OPEN RESETLOGS statement is issued</p> <p>ACTIVATION - Shows any log files archived on a physical standby database after an ALTER DATABASE ACTIVATE STANDBY DATABASE statement is issued</p> <p>"empty string" - Any empty string implies that the log is just a normal archival and was not archived due to any of the other events</p>
SOURCE_DBID	NUMBER	Database ID of the source database that generated this archived log
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.233 V\$FS_FAILOVER_OBSERVERS

V\$FS_FAILOVER_OBSERVERS provides information about fast-start failover observers.

If you are querying on the primary database, this view returns three rows, each describing one observer. However, only a row having a non-empty value in column NAME corresponds to a started observer. If you are querying on a non-primary database, the behavior of this view is not defined.

Column	Datatype	Description
NAME	VARCHAR2(513)	The fast-start failover observer name
REGISTERED	VARCHAR2(4)	Indicates if this observer is registered (YES) or not (NO). Note that the observer is registered <i>only</i> if HOST is not NULL.
HOST	VARCHAR2(513)	The name of the host where this observer is running
ISMMASTER	VARCHAR2(4)	Indicates if this observer is the master observer (YES) or not (NO)
TIME_SELECTED	TIMESTAMP(9)	Shows when this observer became master observer, if ISMASTER is YES; otherwise the following constant appears: 1990-01-01 00:00:00.00
PINGING_PRIMARY	VARCHAR2(4)	<p>Possible values:</p> <ul style="list-style-type: none"> • YES: Observer is currently connected to the primary database • NO: Observer is not connected to the primary database <p>Note: This field is consistent throughout an Oracle Real Application Clusters (Oracle RAC) environment; that is, if the observer is connected to any instance of the primary database in the Oracle RAC environment, all instances will show a value of YES.</p>

Column	Datatype	Description
PINGING_TARGET	VARCHAR2 (4)	<p>Possible values:</p> <ul style="list-style-type: none"> YES: Observer is currently connected to the target standby database NO: Observer is not connected to the target standby database <p>Note: This field is consistent throughout an Oracle Real Application Clusters (Oracle RAC) environment; that is, if the observer is connected to any instance of the target standby database in the Oracle RAC environment, all instances will show a value of YES.</p>
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.234 V\$FS_FAILOVER_STATS

V\$FS_FAILOVER_STATS displays statistics about fast-start failovers occurring on the system.

Column	Datatype	Description
LAST_FAILEOVER_TIME	VARCHAR2 (20)	Timestamp of the last fast-start failover
LAST_FAILEOVER_REASON	VARCHAR2 (255)	Reason for the last fast-start failover
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.235 V\$FS_OBSERVER_HISTOGRAM

V\$FS_OBSERVER_HISTOGRAM displays statistics that are based on the frequency of successful pings between the observer and primary database for different time intervals. The wait event in this histogram is the observer's wait until pings to the primary succeed.

The histogram displays only when there were ping failures between the observer and the primary database.

No rows are shown in this view for unregistered observers.

These statistics can be used to select an appropriate value for the `FastStartFailoverThreshold` configuration property for your environment.

Column	Datatype	Description
OBSERVER_NAME	VARCHAR2 (513)	The Fast-Start Failover observer name

Column	Datatype	Description
OBSERVER_HOST	VARCHAR2(513)	The name of the host where this observer is running
WAIT_TIME	NUMBER	The time interval between a pair of successful observer pings (ping-pairs) to this instance. Note that the values in this column are the upper bound of the inter-ping interval samples represented by a given histogram bucket. If <code>WAIT_TIME = number</code> , then this column represents inter-ping intervals $\leq number$ that are not included in any smaller bucket.
WAIT_COUNT	NUMBER	The value in this column is the time (in seconds) that a ping failure lasted.
LAST_UPDATE_TIME	VARCHAR2(20)	The number of ping-pairs with an inter-ping interval that corresponds with this histogram bucket. If all pings have been successful so far, this column has a value of 0.
CON_ID	NUMBER	The last time this row was updated The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

 **See Also:**

[Oracle Data Guard Broker](#) for more information about the `FastStartFailoverThreshold` configuration property

Example

Assume that the following shows the status of observer's pings to the primary:

Ping time	Ping result
1:00:00	SUCCESS
1:00:03	FAIL
1:00:06	FAIL
1:00:09	SUCCESS => Wait time of 6 seconds
1:00:12	SUCCESS
1:00:15	FAIL
1:00:18	FAIL
1:00:21	SUCCESS => Wait time of 6 seconds
1:00:24	SUCCESS
1:00:27	FAIL
1:00:30	SUCCESS => Wait time of 3 seconds

These ping results will result in the histogram view below:

WAIT_TIME	WAIT_COUNT	LAST_UPDATE_TIME
3	1	1:00:30
6	2	1:00:21

9	0
12	0
...	

In this case, the `FastStartFailoverThreshold` value should be set to larger than 6 because communication between the observer and the primary sometimes fails for 6 seconds.

7.236 V\$GC_ELEMENT

`V$GC_ELEMENT` displays one entry for each global cache resource that is used by the buffer cache. The name of the global cache resource that corresponds to a lock element is {'BL', `indx`, `class`}. This is an Oracle Real Application Clusters view.

Column	Datatype	Description
<code>GC_ELEMENT_ADDR</code>	<code>RAW(4 8)</code>	Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.
<code>INDX</code>	<code>NUMBER</code>	Platform specific lock manager identifier
<code>CLASS</code>	<code>NUMBER</code>	Platform specific lock manager identifier
<code>GC_ELEMENT_NAME</code>	<code>NUMBER</code>	Name of the lock that contains the PCM lock that is covering the buffer
<code>MODE_HELD</code>	<code>NUMBER</code>	Platform dependent value for lock mode held; often: 3 = share; 5 = exclusive
<code>BLOCK_COUNT</code>	<code>NUMBER</code>	Number of blocks covered by PCM lock
<code>RELEASING</code>	<code>NUMBER</code>	Nonzero if PCM lock is being downgraded
<code>ACQUIRING</code>	<code>NUMBER</code>	Nonzero if PCM lock is being upgraded
<code>WRITING</code>	<code>NUMBER</code>	If the <code>GC_ELEMENT</code> is being written, the write status
<code>RECOVERING</code>	<code>NUMBER</code>	If the <code>GC_ELEMENT</code> is being recovered, the recovery status
<code>LOCAL</code>	<code>NUMBER</code>	Zero if the <code>GC_ELEMENT</code> is local, one if it is global
<code>FLAGS</code>	<code>NUMBER</code>	Process level flags for the lock element
<code>CON_ID</code>	<code>NUMBER</code>	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.237 V\$GC_ELEMENTS_WITH_COLLISIONS

`V$GC_ELEMENTS_WITH_COLLISIONS` is deprecated. The information that was provided in this view is now provided in the `V$INSTANCE_CACHE_TRANSFER` and `V$SEGMENT_STATISTICS` views.

Column	Datatype	Description
<code>GC_ELEMENT_ADDR</code>	<code>RAW(4 8)</code>	Address of the lock element that contains the PCM lock covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

- "[V\\$INSTANCE_CACHE_TRANSFER](#)"
- "[V\\$SEGMENT_STATISTICS](#)"

7.238 V\$GCR_ACTIONS

V\$GCR_ACTIONS displays information about the current status of the actions defined to the GCR component that runs under the LMHB background process to detect and mitigate potential issues in the cluster instances.

Column	Datatype	Description
ACTION_ID	NUMBER	Action identification number as used internally to refer to the metric
ACTION_NAME	VARCHAR2 (40)	Name of the action
ENVIRONMENT	NUMBER	<p>Environment that the action should run in:</p> <ul style="list-style-type: none"> • 0: Nowhere (do not run) • 1: Oracle ASM instance only • 2: Oracle Database instance only • 3: Oracle ASM and Oracle Database instance • 4: Standby instance • 5: Oracle ASM and Standby instance • 6: Oracle Database and Standby instance • 7: Oracle Database, Oracle ASM, and Standby instance • 15: All instance types
FLAGS	NUMBER	Various flags describing the action. Used only by Oracle for diagnosis.
ACTIVE	VARCHAR2 (9)	<p>Whether the action is active or not:</p> <ul style="list-style-type: none"> • ACTIVE: Action is active. • INACTIVE: Action is disabled.
STATUS_CHANGE_TIME	TIMESTAMP (6)	Time of last action change of status
LAST_RAN_ITERATION	NUMBER	Iteration of the last time the action ran
LAST_RAN_TIME	TIMESTAMP (6)	Time of last run

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.239 V\$GCR_LOG

V\$GCR_LOG provides information on the last 30 significant events that have occurred in GCR in the recent past.

Column	Datatype	Description
INST_ID	NUMBER	Instance identifier
ITERATION	NUMBER	GCR internal iteration count
TIME	TIMESTAMP(6)	Timestamp of record
TYPE	VARCHAR2(14)	<p>Type of record:</p> <ul style="list-style-type: none"> • METRIC • METRIC ENABLE • METRIC DISABLE • GLOBAL METRIC • ACTION RAN • RESET RAN
DESCRIPTION	VARCHAR2(40)	Description of function
RESULT	VARCHAR2(7)	<p>Result:</p> <ul style="list-style-type: none"> • OK • FAIL
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data.

7.240 V\$GCR_METRICS

V\$GCR_METRICS displays information about the current status of the metrics defined to the GCR component that runs under the LMHB background process to detect and mitigate potential issues in the cluster instances.

Column	Datatype	Description
METRIC_ID	NUMBER	Metric identification number as used internally to refer to the metric

Column	Datatype	Description
METRIC_NAME	VARCHAR2(40)	Name of the metric
ENVIRONMENT	NUMBER	Environment that the metric should run in: <ul style="list-style-type: none"> • 0: Nowhere (do not run) • 1: Oracle ASM instance only • 2: Oracle Database instance only • 3: Oracle ASM and Oracle Database instance • 4: Standby instance • 5: Oracle ASM and Standby instance • 6: Oracle Database and Standby instance • 7: Oracle Database, Oracle ASM, and Standby instance • 15: All instance types
FREQUENCY	NUMBER	How often the metric runs, in seconds
SCOPE	NUMBER	The scope of sharing of the metric: <ul style="list-style-type: none"> • 0: The metric does not have associated data • 1: Global - shared with all other instances in the cluster • 2: Local - used only locally (not shared) • 4: Node Global - shared with other instances in the cluster on the same node only • 8: DB Only - Shared with other instances of the same database only
DATA_TYPE	VARCHAR2(7)	The type of the data associated with this metric: <ul style="list-style-type: none"> • 0: None • 1: Boolean • 2: Numeric • 3: Process
STATUS	VARCHAR2(9)	Indicates the status of the metric: <ul style="list-style-type: none"> • ACTIVE: Indicates that the metric is active. • INACTIVE: Indicates that the metric is turned off.
STATUS_CHANGE_TIME	TIMESTAMP(6)	Time of last metric change of status
LAST_RAN_ITERATION	NUMBER	Iteration of the last time the metric ran
LAST_RAN_TIME	TIMESTAMP(6)	Time of last run
LAST_PASS_ITERATION	NUMBER	Iteration of last time the metric passed
LAST_PASS_TIME	TIMESTAMP(6)	Time of last metric pass
TOTAL_PASSES	NUMBER	Total number of times the metric passed since start of LMHB
LAST_FAIL_ITERATION	NUMBER	Iteration of last time the metric failed
LAST_FAIL_TIME	TIMESTAMP(6)	Time of last metric failure
TOTAL_FAILS	NUMBER	Total number of times the metric has failed since start of LMHB
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.241 V\$GCR_STATUS

V\$GCR_STATUS provides information on the current GCR status, what metrics ran and their result. It records the last 100 events.

Column	Datatype	Description
INST_ID	NUMBER	Instance identifier
ITERATION	NUMBER	GCR internal iteration count
TIME	TIMESTAMP (6)	Timestamp of record
TYPE	VARCHAR2 (14)	Type of record: <ul style="list-style-type: none"> • METRIC • GLOBAL METRIC • ACTION RAN • RESET RAN
DESCRIPTION	VARCHAR2 (40)	Description of function
RESULT	VARCHAR2 (7)	Result: <ul style="list-style-type: none"> • OK • FAIL
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data.

7.242 V\$GCSHVMMASTER_INFO

V\$GCSHVMMASTER_INFO describes the current and previous master instances and the number of re-masterings of Global Cache Service resources except those belonging to files mapped to a particular master.

Column	Datatype	Description
HV_ID	NUMBER	PCM hash value ID
CURRENT_MASTER	NUMBER	Master instance of this PCM hash value ID
PREVIOUS_MASTER	NUMBER	Previous master instance of this PCM hash value ID
REMASTER_CNT	NUMBER	Number of times this has been remastered
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.243 V\$GCSPFMASTER_INFO

V\$GCSPFMASTER_INFO describes the current and previous master instances and the number of re-masterings of Global Cache Service resources belonging to files mapped to instances.

Column	Datatype	Description
FILE_ID	NUMBER	File number
DATA_OBJECT_ID	NUMBER	Data object ID
GC_MASTERING_POLICY	VARCHAR2(11)	Data object type. The possible values are Affinity or Read mostly.
CURRENT_MASTER	NUMBER	Master instance of this file
PREVIOUS_MASTER	NUMBER	Previous master instance of this file
REMASTER_CNT	NUMBER	Number of times this has been remastered
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.244 V\$GES_BLOCKING_ENQUEUE

V\$GES_BLOCKING_ENQUEUE describes all locks currently known to lock manager that are being blocked or blocking others.

The output of this view is a subset of the output from V\$GES_ENQUEUE. This is an Oracle Real Application Clusters view.

See Also:

"V\$GES_ENQUEUE" for a description of all locks known to the lock manager

Column	Datatype	Description
HANDLE	RAW(4 8)	Lock pointer
GRANT_LEVEL	VARCHAR2(9)	Granted level of the lock
REQUEST_LEVEL	VARCHAR2(9)	Requested level of the lock
RESOURCE_NAME1	VARCHAR2(30)	Resource name for the lock
RESOURCE_NAME2	VARCHAR2(30)	Resource name for the lock
PID	NUMBER	Process identifier which holds the lock
TRANSACTION_ID0	NUMBER	Lower 4 bytes of the transaction identifier where the lock belongs to
TRANSACTION_ID1	NUMBER	Upper 4 bytes of the transaction identifier where the lock belongs to
GROUP_ID	NUMBER	Group identifier for the lock

Column	Datatype	Description
OPEN_OPT_DEADLOCK	NUMBER	1 if DEADLOCK open option is set, otherwise 0
OPEN_OPT_PERSISTENT	NUMBER	1 if PERSISTENT open option is set, otherwise 0
OPEN_OPT_PROCESS OWNED	NUMBER	1 if PROCESS OWNED open option is set, otherwise 0
OPEN_OPT_NO_XID	NUMBER	1 if NO_XID open option is set, otherwise 0
CONVERT_OPT_GETVALUE	NUMBER	1 if GETVALUE convert option is set, otherwise 0
CONVERT_OPT_PUTVALUE	NUMBER	1 if PUTVALUE convert option is set, otherwise 0
CONVERT_OPT_NOVALUE	NUMBER	1 if NOVALUE convert option is set, otherwise 0
CONVERT_OPT_DUBVALUE	NUMBER	1 if DUBVALUE convert option is set, otherwise 0
CONVERT_OPT_NOQUEUE	NUMBER	1 if NOQUEUE convert option is set, otherwise 0
CONVERT_OPT_EXPRESS	NUMBER	1 if EXPRESS convert option is set, otherwise 0
CONVERT_OPT_NODEADLOCKWA IT	NUMBER	1 if NODEADLOCKWAIT convert option is set, otherwise 0
CONVERT_OPT_NODEADLOCKBL OCK	NUMBER	1 if NODEADLOCKBLOCK convert option is set, otherwise 0
WHICH_QUEUE	NUMBER	Which queue the lock is currently located. 0 for NULL queue; 1 for GRANTED queue; 2 for CONVERT queue.
STATE	VARCHAR2(64)	State of lock as owner sees it
AST_EVENT0	NUMBER	Last AST event
OWNER_NODE	NUMBER	Node identifier
BLOCKED	NUMBER	1 if this lock request is blocked by others, otherwise 0
BLOCKER	NUMBER	1 if this lock is blocking others, otherwise 0
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.245 V\$GES_CONVERT_LOCAL

V\$GES_CONVERT_LOCAL displays statistics for local GES enqueue operations. This view records average convert times, count information, and timed statistics for global enqueue requests.

Column	Datatype	Description
INST_ID	NUMBER	ID of the instance

Column	Datatype	Description
CONVERT_TYPE	VARCHAR2(16)	<p>Conversion type:</p> <ul style="list-style-type: none"> • NULL -> SS - NULL mode to subshared mode • NULL -> SX - NULL mode to shared exclusive mode • NULL -> S - NULL mode to shared mode • NULL -> SSX - NULL mode to subshared exclusive mode • NULL -> X - NULL mode to exclusive mode • SS -> SX - Subshared mode to shared exclusive mode • SS -> S - Subshared mode to shared mode • SS -> SSX - Subshared mode to subshared exclusive mode • SS -> X - Subshared mode to exclusive mode • SX -> S - Shared exclusive mode to shared mode • SX -> SSX - Shared exclusive mode to subshared exclusive mode • SX -> X - Shared exclusive mode to exclusive mode • S -> SX - Shared mode to shared exclusive mode • S -> SSX - Shared mode to subshared exclusive mode • S -> X - Shared mode to exclusive mode • SSX -> X - Sub-shared exclusive mode to exclusive mode
AVERAGE_CONVERT_TIME	NUMBER	Average conversion time for each type of lock operation (in hundredths of a second)
CONVERT_COUNT	NUMBER	Number of operations
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.246 V\$GES_CONVERT_REMOTE

V\$GES_CONVERT_REMOTE displays values for remote GES enqueue conversions. This view records average convert times, count information, and timed statistics for global enqueue requests.

Column	Datatype	Description
INST_ID	NUMBER	ID of the instance

Column	Datatype	Description
CONVERT_TYPE	VARCHAR2(16)	<p>Conversion type:</p> <ul style="list-style-type: none"> • NULL -> SS - NULL mode to subshared mode • NULL -> SX - NULL mode to shared exclusive mode • NULL -> S - NULL mode to shared mode • NULL -> SSX - NULL mode to subshared exclusive mode • NULL -> X - NULL mode to exclusive mode • SS -> SX - Subshared mode to shared exclusive mode • SS -> S - Subshared mode to shared mode • SS -> SSX - Subshared mode to subshared exclusive mode • SS -> X - Subshared mode to exclusive mode • SX -> S - Shared exclusive mode to shared mode • SX -> SSX - Shared exclusive mode to subshared exclusive mode • SX -> X - Shared exclusive mode to exclusive mode • S -> SX - Shared mode to shared exclusive mode • S -> SSX - Shared mode to subshared exclusive mode • S -> X - Shared mode to exclusive mode • SSX -> X - Sub-shared exclusive mode to exclusive mode
AVERAGE_CONVERT_TIME	NUMBER	Average conversion time for each type of lock operation (in hundredths of a second)
CONVERT_COUNT	NUMBER	Number of operations
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.247 V\$GES_ENQUEUE

V\$GES_ENQUEUE describes all locks currently known to lock manager. This is an Oracle Real Application Clusters view.

See Also:

"[V\\$GES_BLOCKING_ENQUEUE](#)" for a description of all such locks that are currently blocking or being blocked

Column	Datatype	Description
HANDLE	RAW(4 8)	Lock pointer
GRANT_LEVEL	VARCHAR2(9)	Granted level of the lock
REQUEST_LEVEL	VARCHAR2(9)	Requested level of the lock
RESOURCE_NAME1	VARCHAR2(30)	Resource name for the lock
RESOURCE_NAME2	VARCHAR2(30)	Resource name for the lock

Column	Datatype	Description
PID	NUMBER	Process identifier which holds the lock
TRANSACTION_ID0	NUMBER	Lower 4 bytes of the transaction identifier to which the lock belongs
TRANSACTION_ID1	NUMBER	Upper 4 bytes of the transaction identifier to which the lock belongs
GROUP_ID	NUMBER	Group identifier for the lock
OPEN_OPT_DEADLOCK	NUMBER	1 if DEADLOCK open option is set, otherwise 0
OPEN_OPT_PERSISTENT	NUMBER	1 if PERSISTENT open option is set, otherwise 0
OPEN_OPT_PROCESS OWNED	NUMBER	1 if PROCESS OWNED open option is set, otherwise 0
OPEN_OPT_NO_XID	NUMBER	1 if NO_XID open option is set, otherwise 0
CONVERT_OPT_GETVALUE	NUMBER	1 if GETVALUE convert option is set, otherwise 0
CONVERT_OPT_PUTVALUE	NUMBER	1 if PUTVALUE convert option is set, otherwise 0
CONVERT_OPT_NOVALUE	NUMBER	1 if NOVALUE convert option is set, otherwise 0
CONVERT_OPT_DUBVALUE	NUMBER	1 if DUBVALUE convert option is set, otherwise 0
CONVERT_OPT_NOQUEUE	NUMBER	1 if NOQUEUE convert option is set, otherwise 0
CONVERT_OPT_EXPRESS	NUMBER	1 if EXPRESS convert option is set, otherwise 0
CONVERT_OPT_NODEADLOCKWAIT	NUMBER	1 if NODEADLOCKWAIT convert option is set, otherwise 0
CONVERT_OPT_NODEADLOCKBLOCK	NUMBER	1 if NODEADLOCKBLOCK convert option is set, otherwise 0
WHICH_QUEUE	NUMBER	Which queue the lock is currently located. 0 for NULL queue; 1 for GRANTED queue; 2 for CONVERT queue.
STATE	VARCHAR2(64)	State of the lock as the owner sees it
AST_EVENT0	NUMBER	Last AST event
OWNER_NODE	NUMBER	Node identifier
BLOCKED	NUMBER	1 if this lock request is blocked by others, otherwise 0
BLOCKER	NUMBER	1 if this lock is blocking others, otherwise 0
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.248 V\$GES_LATCH

V\$GES_LATCH is deprecated.

See Also:

"V\$LATCH" for statistics about GES latch performance

7.249 V\$GES_RESOURCE

V\$GES_RESOURCE is an Oracle Real Application Clusters view. It displays information of all resources currently known to the lock manager.

Column	Datatype	Description
RESP	RAW(4 8)	Resource pointer
RESOURCE_NAME	VARCHAR2(30)	Resource name in hexadecimal for the lock
ON_CONVERT_Q	NUMBER	1 if on convert queue, 0 otherwise
ON_GRANT_Q	NUMBER	1 if on granted queue, 0 otherwise
PERSISTENT_RES	NUMBER	1 if it is a persistent resource, 0 otherwise
MASTER_NODE	NUMBER	Master node ID
NEXT_CVT_LEVEL	VARCHAR2(9)	Next lock level to convert on global convert queue
VALUE_BLK_STATE	VARCHAR2(32)	State of the value block
VALUE_BLK	VARCHAR2(64)	First 64 bytes of the value block
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.250 V\$GES_STATISTICS

V\$GES_STATISTICS displays miscellaneous GES statistics.

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number
NAME	VARCHAR2(38)	Name of the statistic
VALUE	NUMBER	Value associated with the statistic
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.251 V\$GG_APPLY_COORDINATOR

V\$GG_APPLY_COORDINATOR displays information about each GoldenGate apply process coordinator.

The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process used by Oracle GoldenGate Integrated Replicat.

Column	Datatype	Description
SID	NUMBER	Session ID of the coordinator's session
SERIAL#	NUMBER	Serial number of the coordinator's session
STATE	VARCHAR2(21)	State of the coordinator: <ul style="list-style-type: none"> • INITIALIZING - Starting up • IDLE - Performing no work • APPLYING - Passing transactions to apply servers • SHUTTING DOWN CLEANLY - Stopping without an error • ABORTING - Stopping because of an apply error
APPLY#	NUMBER	Apply process number. An apply process coordinator is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
TOTAL_APPLIED	NUMBER	Total number of transactions applied by the apply process since the apply process was last started
TOTAL_WAIT_DEPS	NUMBER	Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions
TOTAL_WAIT_COMMITS	NUMBER	Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits
TOTAL_ADMIN	NUMBER	Number of administrative jobs issued since the apply process was last started
TOTAL_ASSIGNED	NUMBER	Number of transactions assigned to apply servers since the apply process was last started
TOTAL_RECEIVED	NUMBER	Total number of transactions received by the coordinator process since the apply process was last started
TOTAL_IGNORED	NUMBER	Number of transactions which were received by the coordinator but were ignored because they had been previously applied
TOTAL_ROLLBACKS	NUMBER	Number of transactions which were rolled back due to unexpected contention
TOTAL_ERRORS	NUMBER	Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started
UNASSIGNED_COMPLETE_TXNS	NUMBER	Total number of complete transactions that the coordinator has not assigned to any apply servers
LWM_TIME	DATE	Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.

Column	Datatype	Description
LWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.
LWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.
HWM_TIME	DATE	Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.
HWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.
HWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.
STARTUP_TIME	DATE	Time when the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started
ELAPSED_IDLE_TIME	NUMBER	Elapsed idle time
LWM_POSITION	RAW (64)	Position of the low-watermark LCR
HWM_POSITION	RAW (64)	Position of the high-watermark LCR
PROCESSED_MESSAGE_NUMBER	NUMBER	Message number currently processed by the apply coordinator
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
ACTIVE_SERVER_COUNT	NUMBER	Active server count

 **Note:**

The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

 **See Also:**

- "[TIMED_STATISTICS](#)"
- "[STATISTICS_LEVEL](#)"

7.252 V\$GG_APPLY_READER

V\$GG_APPLY_READER displays information about each GoldenGate apply reader.

The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process used by Oracle GoldenGate Integrated Replicat.

Column	Datatype	Description
SID	NUMBER	Session ID of the reader's session
SERIAL#	NUMBER	Serial number of the reader's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2 (128)	Name of the apply process
STATE	VARCHAR2 (36)	Shows the state of the apply reader and the hash server. The possible values include: <ul style="list-style-type: none"> • INITIALIZING - Starting up • IDLE - Performing no work • DEQUEUE MESSAGES - Dequeueing messages from the queue • SCHEDULE MESSAGES - Computing dependencies between messages and assembling messages into transactions • SPILLING - Spilling unapplied messages from memory to hard disk • PAUSED - WAITING FOR DDL TO COMPLETE - Waiting for a data definition language (DDL) logical change record (LCR) to be applied The state of the apply reader is displayed first, followed by the state of the hash server. A semicolon separates the apply reader state from the hash server state.
TOTAL_MESSAGES_DEQUEUED	NUMBER	Total number of messages dequeued since the apply process was last started
TOTAL_MESSAGES_SPILLED	NUMBER	Number of messages spilled by the reader since the apply process was last started
DEQUEUE_TIME	DATE	Time when the last message was received
DEQUEUED_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the last message received. For user-enqueued messages, time when the message was enqueued into the queue at the local database.
SGA_USED	NUMBER	Amount (in bytes) of SGA memory used by the apply process since it was last started
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started. Scheduling includes computing dependencies between messages and assembling messages into transactions.
ELAPSED_SPILL_TIME	NUMBER	Elapsed time (in hundredths of a second) spent spilling messages since the apply process was last started
SPILL_LWM_SCN	NUMBER	Spill low-watermark SCN

Column	Datatype	Description
PROXY_SID	NUMBER	When the apply process uses combined capture and apply, the session ID of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
PROXY_SERIAL	NUMBER	When the apply process uses combined capture and apply, the serial number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
PROXY_SPID	VARCHAR2 (12)	When the apply process uses combined capture and apply, the process identification number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
BYTES_RECEIVED	NUMBER	When the apply process uses combined capture and apply, the number of bytes received by the apply process from the capture process since the apply process last started. If the apply process does not use combined capture and apply, then this column is not populated.
DEQUEUED_POSITION	RAW (64)	Dequeued position. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.
SPILL_LWM_POSITION	RAW (64)	Spill low-watermark position. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.
OLDEST_TRANSACTION_ID	VARCHAR2 (128)	Oldest transaction ID
TOTAL_LCRS_WITH_DEP	NUMBER	Total number of LCRs with row-level dependencies since the apply process last started
TOTAL_LCRS_WITH_WMDEP	NUMBER	Total number of LCRs with watermark dependencies since the apply process last started. A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.
TOTAL_IN_MEMORY_LCRS	NUMBER	Total number of LCRs currently in memory
SGA_ALLOCATED	NUMBER	The total amount of shared memory (in bytes) allocated from the GoldenGate pool for the apply process since the apply process last started
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **Note:**

The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

 See Also:

- "[TIMED_STATISTICS](#)"
- "[STATISTICS_LEVEL](#)"

7.253 V\$GG_APPLY_RECEIVER

V\$GG_APPLY_RECEIVER displays information about the message receiver of the Replicat process.

The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts and when the Replicat process is stopped.

Column	Datatype	Description
SID	NUMBER	Session ID of the apply receiver
SERIAL#	NUMBER	Serial number of the apply receiver
APPLY_NAME	VARCHAR2 (128)	Name of the apply process
STARTUP_TIME	DATE	Startup time of the apply process
SOURCE_DATABASE_NAME	VARCHAR2 (128)	Name of the source database
ACKNOWLEDGEMENT	NUMBER	acknowledgment of the messages received by the receiver
LAST_RECEIVED_MSG	NUMBER	Last received message
TOTAL_MESSAGES RECEIVED	NUMBER	Total number of messages received
TOTAL_AVAILABLE_MESSAGES	NUMBER	Number of available messages
STATE	VARCHAR2 (46)	State of the apply receiver: <ul style="list-style-type: none"> • Initializing • Sending unapplied txns • Waiting for message from client • Receiving LCRs • Evaluating rules • Enqueueing LCNS • Waiting for memory • Waiting for apply to read • Waiting for message from Replicat • Waiting for Replicat flush request to complete • Waiting for Replicat commit to complete
LAST_RECEIVED_MSG_POSITION	VARCHAR2 (64)	Last received message position
ON		
ACKNOWLEDGEMENT_POSITION	VARCHAR2 (64)	acknowledgment position of the messages received by the receiver. Corresponds to ACKNOWLEDGEMENT, except the value is in position rather than SCN.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Column	Datatype	Description
OS_PROCESS_ID ¹	VARCHAR2(12)	The OS process ID of the apply receiver process
CURRENT_POSITION ¹	VARCHAR2(81)	The trail position of the current record processed by the apply receiver
TOTAL_TRANSACTIONS ¹	NUMBER	The total number of transactions processed by the apply receiver
TOTAL_COMMITS ¹	NUMBER	The total number of commits executed by the apply receiver
TOTAL_ERRORS ¹	NUMBER	The total number of errors encountered by the apply receiver

¹ This column is available starting with Oracle Database 19c.

7.254 V\$GG_APPLY_SERVER

V\$GG_APPLY_SERVER displays information about each GoldenGate apply server and its activities.

An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process used by Oracle GoldenGate Integrated Replicat.

Column	Datatype	Description
SID	NUMBER	Session ID of the apply server's session
SERIAL#	NUMBER	Serial number of the apply server's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
SERVER_ID	NUMBER	Parallel execution server number of the apply server

Column	Datatype	Description
STATE	VARCHAR2 (20)	<p>State of the apply server:</p> <ul style="list-style-type: none"> • INITIALIZING - Starting up • IDLE - Performing no work • RECORD LOW-WATERMARK - Performing an administrative job that maintains information about the apply progress, which is used in the ALL_APPLY_PROGRESS and DBA_APPLY_PROGRESS data dictionary views • ADD PARTITION - Performing an administrative job that adds a partition that is used for recording information about in-progress transactions • DROP PARTITION - Performing an administrative job that purges rows that were used to record information about in-progress transactions • EXECUTE TRANSACTION - Applying a transaction • WAIT COMMIT - Waiting to commit a transaction until all other transactions with a lower commit SCN are applied. This state is possible only if the COMMIT_SERIALIZATION apply process parameter is set to a value other than DEPENDENT_TRANSACTIONS and the PARALLELISM apply process parameter is set to a value greater than 1. • WAIT DEPENDENCY - Waiting to apply a logical change record (LCR) in a transaction until another transaction, on which it has a dependency, is applied. This state is possible only if the PARALLELISM apply process parameter is set to a value greater than 1. • ROLLBACK TRANSACTION - Rolling back a transaction • TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the apply process's queue • WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs • WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction currently being applied
XIDSLT	NUMBER	Transaction ID slot number of the transaction currently being applied
XIDSQN	NUMBER	Transaction ID sequence number of the transaction currently being applied
COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction currently being applied
DEP_XIDUSN	NUMBER	Transaction ID undo segment number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSLT	NUMBER	Transaction ID slot number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSQN	NUMBER	Transaction ID sequence number of a transaction on which the transaction being applied by this apply server depends
DEP_COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction on which this apply server depends
MESSAGE_SEQUENCE	NUMBER	Number of the current message being applied by the apply server. This value is reset to 1 at the beginning of each transaction.
TOTAL_ASSIGNED	NUMBER	Total number of transactions assigned to the apply server since the apply process was last started

Column	Datatype	Description
TOTAL_ADMIN	NUMBER	Total number of administrative jobs done by the apply server since the apply process was last started. See the STATE information in this view for the types of administrative jobs.
TOTAL_ROLLBACKS	NUMBER	Number of transactions assigned to this server which were rolled back
TOTAL_MESSAGES_APPLIED	NUMBER	Total number of messages applied by this apply server since the apply process was last started
APPLY_TIME	DATE	Time the last message was applied
ELAPSED_APPLY_TIME	NUMBER	Time elapsed (in hundredths of a second) applying messages since the apply process was last started
COMMIT_POSITION	RAW(64)	Commit position of the transaction. This column is populated only for an apply process that is functioning as a GoldenGate Integrated Replicat.
DEP_COMMIT_POSITION	RAW(64)	Commit position of the transaction the slave depends on. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.
LAST_APPLY_POSITION	RAW(64)	For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as a GoldenGate outbound server or inbound server.
TRANSACTION_ID	VARCHAR2(128)	Transaction ID that the slave is applying. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.
DEP_TRANSACTION_ID	VARCHAR2(128)	Transaction ID of the transaction the slave depends on. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
TOTAL_LCRS_RETRYED	NUMBER	Total number of LCRs retried by this server
LCR_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RETRYED	NUMBER	Total transactions retried by this server
TXN_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RECORDED	NUMBER	Total transactions recorded in error queue by this server

 **Note:**

The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

 **See Also:**

- "[TIMED_STATISTICS](#)"
- "[STATISTICS_LEVEL](#)"

7.255 V\$GLOBAL_BLOCKED_LOCKS

V\$GLOBAL_BLOCKED_LOCKS displays global blocked locks.

Column	Datatype	Description
ADDR	RAW(4 8)	Address of lock state object
KADDR	RAW(4 8)	Address of lock
SID	NUMBER	Identifier of session holding the lock (number)
TYPE	VARCHAR2(2)	Resource type (char)
ID1	NUMBER	Resource identifier #1 (number)
ID2	NUMBER	Resource identifier #2 (number)
LMODE	NUMBER	Lock mode held (number)
REQUEST	NUMBER	Lock mode requested (number)
CTIME	NUMBER	Time since current mode was granted
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.256 V\$GLOBAL_TRANSACTION

V\$GLOBAL_TRANSACTION displays information on the currently active global transactions.

Column	Datatype	Description
FORMATID	NUMBER	Format identifier of the global transaction
GLOBALID	RAW(64)	Global transaction identifier of the global transaction
BRANCHID	RAW(64)	Branch qualifier of the global transaction
BRANCHES	NUMBER	Total number of branches in the global transaction
REFCOUNT	NUMBER	Number of siblings for the global transaction (must be the same as branches)
PREPARECOUNT	NUMBER	Number of branches of the global transaction that have prepared

Column	Datatype	Description
STATE	VARCHAR2 (38)	<p>State of the branch of the global transaction:</p> <ul style="list-style-type: none"> • ACTIVE • COLLECTING • FINALIZED • FAILED • RECOVERING • UNASSOCIATED • FORGOTTEN • READY FOR RECOVERY • NO-READONLY FAILED • SIBLING INFO WRITTEN • [ORACLE COORDINATED]ACTIVE • [ORACLE COORDINATED]COLLECTING • [ORACLE COORDINATED]FINALIZED • [ORACLE COORDINATED]FAILED • [ORACLE COORDINATED]RECOVERING • [ORACLE COORDINATED]UNASSOCIATED • [ORACLE COORDINATED]FORGOTTEN • [ORACLE COORDINATED]READY FOR RECOVERY • [ORACLE COORDINATED]NO-READONLY FAILED • [MULTINODE]ACTIVE • [MULTINODE]COLLECTING • [MULTINODE]FINALIZED • [MULTINODE]FAILED • [MULTINODE]RECOVERING • [MULTINODE]UNASSOCIATED • [MULTINODE]FORGOTTEN • [MULTINODE]READY FOR RECOVERY • [MULTINODE]NO-READONLY FAILED • [MULTINODE]SIBLING INFO WRITTEN • COMBINATION
FLAGS	NUMBER	The numeric representation of the state
COUPLING	VARCHAR2 (15)	Indicates whether the branches are free (FREE), loosely coupled (LOOSELY COUPLED), or tightly coupled (TIGHTLY COUPLED)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.257 V\$GOLDENGATE_CAPABILITIES

V\$GOLDENGATE_CAPABILITIES displays information about the usage of various Oracle GoldenGate features, as well as database features used by Oracle GoldenGate.

Column	Datatype	Description
NAME	VARCHAR2 (22)	<p>Feature name. Possible values:</p> <ul style="list-style-type: none"> • AUTOCDR • DBENCRYPTION • DBLOGREADER • DDLTRIGGEROPTIMIZATION • DELETECASCADEHINT • GGSESSION • PROCREPLICATION • SUPPLEMENTALLOG • TRANSIENTDUPLICATE • TRIGGERSUPPRESSION
COUNT	NUMBER	Number of times the feature has been used since instance startup
LAST_USED	DATE	Date on which the feature was last used
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.258 V\$GOLDENGATE_CAPTURE

V\$GOLDENGATE_CAPTURE displays information about each capture process that sends LCRs to an Oracle GoldenGate outbound server.

Column	Datatype	Description
SID	NUMBER	Session identifier of the capture process
SERIAL#	NUMBER	Session serial number of the capture process session
CAPTURE#	NUMBER	Capture process number. A capture process is an Oracle background process prefixed by cp
CAPTURE_NAME	VARCHAR2 (128)	Name of the capture process
LOGMINER_ID	NUMBER	Session ID of the Oracle LogMiner session associated with the capture process
STARTUP_TIME	DATE	Time when the capture process was last started

Column	Datatype	Description
STATE	VARCHAR2 (589)	<p>State of the capture process and state of the network. The two states are separated by a semicolon. The possible values are:</p> <ul style="list-style-type: none"> • INITIALIZING - Starting up. • WAITING FOR DICTIONARY REDO - Waiting for redo log files containing the dictionary build related to the first SCN to be added to the capture process session. A capture process cannot begin to scan the redo log files until all of the log files containing the dictionary build have been added. • DICTIONARY INITIALIZATION - Processing a dictionary build. • MINING (PROCESSED SCN = <i>scn_value</i>) - Mining a dictionary build at the SCN <i>scn_value</i>. • LOADING (step <i>X</i> of <i>Y</i>) - Processing information from a dictionary build and currently at step <i>X</i> in a process that involves <i>Y</i> steps, where <i>X</i> and <i>Y</i> are numbers. • CAPTURING CHANGES - Scanning the redo log for changes that satisfy the capture process rule sets. • WAITING FOR REDO - Waiting for new redo log files to be added to the capture process session. The capture process has finished processing all of the redo log files added to its session. This state is possible if there is no activity at a source database. For a downstream capture process, this state is possible if the capture process is waiting for new log files to be added to its session. • EVALUATING RULE - Evaluating a change against a capture process rule set. • CREATING LCR - Converting a change into an LCR. • ENQUEUEING MESSAGE - Enqueuing an LCR that satisfies the capture process rule sets into the capture process queue. • PAUSED FOR FLOW CONTROL - Unable to enqueue LCRs either because of low memory or because propagations and outbound servers are consuming messages slower than the capture process is creating them. This state indicates flow control that is used to reduce spilling of captured LCRs when propagation or apply has fallen behind or is unavailable. • WAITING FOR THE BUFFERED QUEUE TO SHRINK - Waiting for the buffered queue to change to a smaller size. The buffered queue shrinks when there is a memory limitation or when an administrator reduces its size. • WAITING FOR <i>n</i> SUBSCRIBER(S) INITIALIZING - Waiting for outbound servers that receive LCRs from the capture process to start, where <i>n</i> is the number of apply processes. • WAITING FOR TRANSACTION - Waiting for LogMiner to provide more transactions. • WAITING FOR INACTIVE DEQUEUERS - Waiting for the capture process's queue subscribers to start. The capture process stops enqueueing LCRs if there are no active subscribers to the queue. • SUSPENDED FOR AUTO SPLIT/MERGE - Waiting for a merge operation to complete. • SHUTTING DOWN - Stopping. • ABORTING - Aborting.
TOTAL_PREFILTER_DISCARDED	NUMBER	Total number of prefiltered messages discarded
TOTAL_PREFILTER_KEPT	NUMBER	Total number of prefiltered messages kept
TOTAL_PREFILTER_EVALUATIONS	NUMBER	Total number of prefilter evaluations

Column	Datatype	Description
TOTAL_MESSAGES_CAPTURED	NUMBER	Total number of redo entries passed by LogMiner to the capture process for detailed rule evaluation since the capture process last started. A capture process converts a redo entry into a message and performs detailed rule evaluation on the message when capture process prefiltering cannot discard the change.
CAPTURE_TIME	DATE	Time when the most recent message was captured
CAPTURE_MESSAGE_NUMBER	NUMBER	Number of the most recently captured message
CAPTURE_MESSAGE_CREATE_TIME	DATE	Creation time of the most recently captured message
TOTAL_MESSAGES_CREATED	NUMBER	Count associated with ELAPSED_LCR_TIME to calculate rate
TOTAL_FULL_EVALUATIONS	NUMBER	Count associated with ELAPSED_RULE_TIME to calculate rate
TOTAL_MESSAGES_ENQUEUED	NUMBER	Total number of messages enqueued since the capture process was last started
ENQUEUE_TIME	DATE	Time when the last message was enqueued
ENQUEUE_MESSAGE_NUMBER	NUMBER	Number of the last enqueued message
ENQUEUE_MESSAGE_CREATE_TIME	DATE	Creation time of the last enqueued message
AVAILABLE_MESSAGE_NUMBER	NUMBER	For local capture, the last redo SCN flushed to the log files. For downstream capture, the last SCN added to LogMiner through the archived redo log files.
AVAILABLE_MESSAGE_CREATE_TIME	DATE	For local capture, the time the SCN was written to the log file. For downstream capture, the time the most recent archived redo log file (containing the most recent SCN) was added to LogMiner.
ELAPSED_CAPTURE_TIME	NUMBER	Elapsed time (in hundredths of a second) scanning for changes in the redo log since the capture process was last started
ELAPSED_RULE_TIME	NUMBER	Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started
ELAPSED_ENQUEUE_TIME	NUMBER	Elapsed time (in hundredths of a second) enqueueing messages since the capture process was last started
ELAPSED_LCR_TIME	NUMBER	Elapsed time (in hundredths of a second) creating LCRs since the capture process was last started
ELAPSED_REDO_WAIT_TIME	NUMBER	Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state
ELAPSED_PAUSE_TIME	NUMBER	Elapsed flow control pause time (in hundredths of a second)
STATE_CHANGED_TIME	DATE	Time at which the state of the capture process changed
SGA_USED	NUMBER	The total amount of shared memory used (in bytes) by the capture process
SGA_ALLOCATED	NUMBER	The total amount of shared memory (in bytes) allocated from the Streams pool for the capture process
BYTES_OF_REDOD_MINED	VARCHAR2(64)	The total amount of redo data mined (in bytes) since the capture process last started
SESSION_RESTART_SCN	VARCHAR2(64)	The SCN from which the capture process started mining redo data when it was last started

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
SPID	VARCHAR2(12)	Operating system process identifier of the capture process
EXTRACT_NAME	VARCHAR2(128)	Name of the extract process
SERVER_SID	NUMBER	Session ID of the capture server
SERVER_SERIAL#	NUMBER	Session serial number of the capture server
SERVER_SPID	VARCHAR2(12)	Operating system process identifier of the capture server
TOTAL_MESSAGES_SENT	NUMBER	Total number of LCRs sent by the capture process to the GoldenGate extract process since the last time the extract attached to the capture
SEND_TIME	DATE	Time the last LCR was sent by the capture process to the extract process
LAST_SENT_MESSAGE_NUMBER	NUMBER	Message number of the last LCR sent by the capture process to the extract process
LAST_SENT_MESSAGE_CREATE_TIME	DATE	Creation time at the source database of the last LCR sent by the capture process to the extract process
ELAPSED_SEND_TIME	NUMBER	Time elapsed (in hundredths of a second) sending LCRs to the extract process since the last time the extract process attached to the capture process
BYTES_SENT	NUMBER	Total number of bytes sent by the capture process to the extract process since the last time the extract process attached to the capture process

7.259 V\$GOLDENGATE_MESSAGE_TRACKING

V\$GOLDENGATE_MESSAGE_TRACKING displays information about LCRs tracked through the stream that are processed by Oracle GoldenGate components.

You can track an LCR through a stream using one of the following methods:

- Set the `message_tracking_frequency` `apply` process parameter to 1 or another relatively low value via the Oracle GoldenGate `DBOPTIONS INTEGRATEDPARAMS` parameter.
- Use the `DBMS_XSTREAM_ADMIN.SET_MESSAGE_TRACKING` procedure to specify a tracking label that becomes part of each LCR generated by the current session.

When the `actions` parameter in the `DBMS_XSTREAM_ADMIN.SET_MESSAGE_TRACKING` procedure is set to `DBMS_XSTREAM_ADMIN.ACTION_MEMORY`, information about the LCRs is tracked in memory, and this view is populated with information about the LCRs. Currently, `DBMS_XSTREAM_ADMIN.ACTION_MEMORY` is the only valid setting for the `actions` parameter in the procedure.

Column	Datatype	Description
TRACKING_LABEL	VARCHAR2(128)	User-specified tracking label

Column	Datatype	Description
TAG	RAW(128)	First 128 bytes of the tag of the LCR
COMPONENT_NAME	VARCHAR2(128)	Name of the component that processed the LCR
COMPONENT_TYPE	VARCHAR2(128)	Type of the component that processed the LCR
ACTION	VARCHAR2(50)	Action performed on the LCR
ACTION_DETAILS	VARCHAR2(312)	Details of the action
TIMESTAMP	TIMESTAMP(9) WITH TIME ZONE	Time when the action was performed
MESSAGE_CREATION_TIME	DATE	Time when the message was created
MESSAGE_NUMBER	NUMBER	SCN of the message
TRACKING_ID	RAW(16)	Globally unique OID of the LCR
SOURCE_DATABASE_NAME	VARCHAR2(128)	Name of the source database
OBJECT_OWNER	VARCHAR2(128)	Owner of the object
OBJECT_NAME	VARCHAR2(128)	Name of the object
XID	VARCHAR2(128)	Transaction ID
COMMAND_TYPE	VARCHAR2(128)	Command type of the LCR
MESSAGE_POSITION	RAW(64)	Position of the message
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

7.260 V\$GOLDENGATE_PROCEDURE_STATS

V\$GOLDENGATE_PROCEDURE_STATS displays procedural replication statistics processed by each Oracle GoldenGate apply server.

Column	Datatype	Description
APPLY_NAME	VARCHAR2(128)	Name of the apply process
SERVER_ID	NUMBER	Parallel apply server slave ID
PROCEDURE_OWNER	VARCHAR2(128)	Owner of the replicated procedure
PACKAGE_NAME	VARCHAR2(128)	Replicated procedure package
PROCEDURE_NAME	VARCHAR2(128)	Replicated procedure name
LAST_UPDATE	DATE	Time of the last update of the statistics

Column	Datatype	Description
TOTAL_EXECUTIONS	NUMBER	Number of executions of the procedure by this apply server
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

7.261 V\$GOLDENGATE_TABLE_STATS

V\$GOLDENGATE_TABLE_STATS displays table statistics for all the tables used by each Oracle GoldenGate apply server.

Column	Datatype	Description
APPLY_NAME	VARCHAR2(128)	Name of the apply process
SERVER_ID	NUMBER	Parallel apply server slave ID
SOURCE_TABLE_OWNER	VARCHAR2(128)	Source owner of the captured or replicated table
SOURCE_TABLE_NAME	VARCHAR2(128)	Source name of the captured or replicated table
DESTINATION_TABLE_OWNER	VARCHAR2(128)	Target owner of the captured or replicated table
DESTINATION_TABLE_NAME	VARCHAR2(30)	Target name of the captured or replicated table
LAST_UPDATE	DATE	Time of the last update of the statistics
TOTAL_INSERTS	NUMBER	Number of insert operations on this table processed by this apply server
TOTAL_UPDATES	NUMBER	Number of update operations on this table processed by this apply server
TOTAL_DELETES	NUMBER	Number of delete operations on this table processed by this apply server
INSERT_COLLISIONS	NUMBER	Number of insert collisions on this table encountered by this apply server
UPDATE_COLLISIONS	NUMBER	Number of update collisions on this table encountered by this apply server
DELETE_COLLISIONS	NUMBER	Number of delete collisions on this table encountered by this apply server
REPERROR_RECORDS	NUMBER	Number of change records that resulted in an error that were recorded on this table by this apply server
REPERROR IGNORES	NUMBER	Number of change records that resulted in an error that were ignored on this table by this apply server
WAIT_DEPENDENCIES	NUMBER	Number of waits for this table due to dependency

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
CDR_INSERT_ROW_EXISTS	NUMBER	Number of conflicts where an insert gets an ORA-00001 error
CDR_UPDATE_ROW_EXISTS	NUMBER	Number of conflicts where an update gets an ORA-26786 error
CDR_UPDATE_ROW_MISSING	NUMBER	Number of conflicts where an update gets an ORA-26787 error
CDR_DELETE_ROW_EXISTS	NUMBER	Number of conflicts where a delete gets an ORA-26786 error
CDR_DELETE_ROW_MISSING	NUMBER	Number of conflicts where a delete gets an ORA-26787 error
CDR_SUCCESSFUL_RESOLUTIONS	NUMBER	Number of successfully resolved conflicts
CDR_FAILED_RESOLUTIONS	NUMBER	Number of conflicts that could not be resolved due to an error during resolution
LOB_OPERATIONS	NUMBER	The number of LOB updates (LOB writes, LOB trims, and LOB erases) applied by the inbound server.

7.262 V\$GOLDENGATE_TRANSACTION

V\$GOLDENGATE_TRANSACTION displays information about transactions that are being processed by Oracle GoldenGate capture processes, outbound servers, and inbound servers.

This view can identify long running transactions and display how many LCRs are being processed in each transaction. This view only contains information about captured LCRs. It does not contain information about user-enqueued LCRs or user messages.

This view only shows information about LCRs that are being processed because they satisfied the rule sets for the component at the time of the query. For capture processes, this view only shows information about changes in transactions that the capture process has converted into LCRs. It does not show information about all the active transactions present in the redo log.

For outbound servers, this view only shows information about LCRs that the outbound server has dequeued. It does not show information about LCRs in the outbound server's queue. For outbound servers, information about a transaction remains in the view until the transaction is sent to the Oracle GoldenGate client application.

For inbound servers, information about a transaction remains in the view until the transaction commits or until the entire transaction is rolled back.

Column	Datatype	Description
COMPONENT_NAME	VARCHAR2 (138)	Name of the component
COMPONENT_TYPE	VARCHAR2 (20)	Type of component <ul style="list-style-type: none"> • CAPTURE - Capture process • APPLY - Apply reader subcomponent in an outbound server or inbound server • PROPAGATION_SENDER - Propagation sender that sends LCRs from a capture process to an outbound server

Column	Datatype	Description
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction
XIDSLT	NUMBER	Transaction ID slot number of the transaction
XIDSQN	NUMBER	Transaction ID sequence number of the transaction
BATCH_XIDUSN	NUMBER	Transaction ID undo segment number of the batch parent transaction. When using BATCHSQL mode in Oracle GoldenGate Integrated Replicat the BATCH_XID columns identify the parent transaction of the batch the current transaction belongs to. The parent transaction is the first transaction of each batch.
		This column is populated only if COMPONENT_TYPE is APPLY and BATCHSQL mode is enabled.
BATCH_XIDSLT	NUMBER	Transaction ID slot number of the batch parent transaction. When using BATCHSQL mode in Oracle GoldenGate Integrated Replicat the BATCH_XID columns identify the parent transaction of the batch the current transaction belongs to. The parent transaction is the first transaction of each batch.
		This column is populated only if COMPONENT_TYPE is APPLY and BATCHSQL mode is enabled.
BATCH_XIDSQN	NUMBER	Transaction ID sequence number of the batch parent transaction. When using BATCHSQL mode in Oracle GoldenGate Integrated Replicat the BATCH_XID columns identify the parent transaction of the batch the current transaction belongs to. The parent transaction is the first transaction of each batch.
		This column is populated only if COMPONENT_TYPE is APPLY and BATCHSQL mode is enabled.
CUMULATIVE_MESSAGE_COUNT	NUMBER	Number of LCRs processed in the transaction. If a component is restarted while the transaction is being processed, then this column shows the number of LCRs processed in the transaction since the component was started.
TOTAL_MESSAGE_COUNT	NUMBER	Total number of LCRs processed in the transaction by an outbound server or inbound server. This column does not pertain to capture processes.
FIRST_MESSAGE_TIME	DATE	Time stamp of the first LCR processed in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the time stamp of the first LCR processed after the capture process was started.
FIRST_MESSAGE_NUMBER	NUMBER	SCN of the first message in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the SCN of the first message processed after the capture process was started.
LAST_MESSAGE_TIME	DATE	Time stamp of the last LCR processed in the transaction
LAST_MESSAGE_NUMBER	NUMBER	SCN of the most recent message encountered for the transaction
FIRST_MESSAGE_POSITION	RAW(64)	Position of the first message seen by an XStream inbound server This column is populated only for an apply process that is functioning as an Oracle GoldenGate inbound server.
LAST_MESSAGE_POSITION	RAW(64)	Position of the last message seen by an Oracle GoldenGate inbound server This column is populated only for an apply process that is functioning as an Oracle GoldenGate inbound server.

Column	Datatype	Description
TRANSACTION_ID	VARCHAR2(128)	Transaction ID for an Oracle GoldenGate inbound server This column is populated only for an apply process that is functioning as an Oracle GoldenGate inbound server.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.263 V\$HANG_INFO

V\$HANG_INFO displays information about hangs found on the cluster.

A hang can be an open wait chain or closed wait chain (cycle or deadlock). A wait chain is a series of sessions that are blocking one another. Each row represents a hang and describes how severe the hang is. This view also includes the victim or final blocker of the hang.

Column	Datatype	Description
HANG_ID	NUMBER	A number identifying the hang
HANG_CHAIN_SESSIONS	NUMBER	Indicates how many sessions are in the main wait chain of the hang
TOTAL_HUNG_SESSIONS	NUMBER	Indicates how many total sessions are affected by the hang, including the main wait chain and any wait chains branching off of the main wait chain
HANG_TYPE	VARCHAR2(18)	Is set to Hang if this is an open wait chain or Deadlock if this is a cycle or closed wait chain
HANG_CREATE_TIME	VARCHAR2(20)	Date and time that the hang was detected
HANG_RESOLVE_TIME	VARCHAR2(20)	Time that the hang may be automatically resolved
IGNORED_HANG	VARCHAR2(1)	Y - Hang was ignored and will not be automatically resolved at this time N - The hang has not yet been verified
RESOLUTION_ATTEMPTED	VARCHAR2(1)	Y - An attempt was made to resolve the hang N - No attempt was made to resolve the hang
GLOBAL_HANG	VARCHAR2(1)	Y - The hang spans multiple nodes in the cluster N - All of the sessions in the hang reside on a single instance
ESCALATED_HANG	VARCHAR2(1)	Y - An attempt was made to resolve the hang but was unsuccessful, and the hang is becoming more severe. Another resolution attempt will be made. N - The first resolution attempt was successful and it was not necessary to escalate the hang to a higher resolution level.
RESOLUTION_STATUS	VARCHAR2(45)	Contains the reason why the hang was resolved or ignored
VICTIM_INSTANCE	NUMBER	Instance number of the instance on which the victim or final blocker session resides
VICTIM_SESSION_ID	NUMBER	Victim or final blocker's Oracle session ID
VICTIM_SERIAL#	NUMBER	Victim or final blocker's Oracle session serial number

Column	Datatype	Description
VICTIM_OSPID	VARCHAR2(24)	Victim or final blocker's operating system process ID
FATAL_BACKGROUND	VARCHAR2(1)	Y - Victim or final blocker is a critical background process N - Victim or final blocker is not a critical background process
PNAME	VARCHAR2(5)	Name of the victim or final blocker process
WAIT_EVENT_TEXT	VARCHAR2(64)	Resource or event for which the victim or final blocker is waiting; set to not in a wait if the session is not waiting on a resource
VICTIM_QOS_PC_RANK	VARCHAR2(12)	Oracle Database Quality of Service (QoS) Management Performance Class rank of the victim or final blocker of the hang.
VICTIM_QOS_PC_ITT	NUMBER	Oracle Database QoS Management Performance Class In-Trouble Threshold of the victim or final blocker of the hang
VICTIM_QOS_PC_RTT	NUMBER	Oracle Database QoS Management Performance Class Root Termination allowed Threshold of the victim or final blocker of the hang
VICTIM_QOS_PC_KEY	NUMBER	Oracle Database QoS Management Performance Class Key of the victim or final blocker of the hang
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

- "[V\\$HANG_STATISTICS](#)"
- "[DBA_HANG_MANAGER_PARAMETERS](#)"

7.264 V\$HANG_SESSION_INFO

V\$HANG_SESSION_INFO displays information about sessions involved in hangs described by V\$HANG_INFO.

Each row with the same HANG_ID describes a session that is in the hang wait chain described by the row with the same HANG_ID in V\$HANG_INFO. This session is blocked by the victim or final blocker of that hang.

Column	Datatype	Description
HANG_ID	NUMBER	A number identifying the hang including this session. This column can be used to join V\$HANG_INFO with V\$HANG_SESSION_INFO.
INSTANCE	NUMBER	Instance number of the instance on which this session resides
SID	NUMBER	Oracle session ID of this session
SERIAL#	NUMBER	Oracle session serial number of this session

Column	Datatype	Description
OSPID	VARCHAR2(24)	Operating system process ID of this session
FATAL_BACKGROUND	VARCHAR2(1)	Y - Session is a critical background process N - Session is not a critical background process
ROOT	VARCHAR2(1)	Y - This session is the victim or final blocker of the hang N - This session is not the victim or final blocker of the hang
PNAME	VARCHAR2(5)	Name of the victim or final blocker process
WAIT_EVENT_TEXT	VARCHAR2(64)	Resource or event for which this session is waiting; set to not in a wait if the session is not waiting on a resource
QOS_PC_RANK	VARCHAR2(12)	Session's Oracle Database Quality of Service (QoS) Management Performance Class rank
QOS_PC_ITT	NUMBER	Session's Oracle Database Quality of Service (QoS) Management Performance Class In-Trouble Threshold
QOS_PC_RTT	NUMBER	Session's Oracle Database Quality of Service (QoS) Management Performance Class Root Termination allowed Threshold
QOS_PC_KEY	NUMBER	Session's Oracle Database Quality of Service (QoS) Management Performance Class Key
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

- "[V\\$HANG_INFO](#)"
- "[V\\$HANG_STATISTICS](#)"
- "[DBA_HANG_MANAGER_PARAMETERS](#)"

7.265 V\$HANG_STATISTICS

V\$HANG_STATISTICS displays statistics about hangs found on the cluster.

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number
NAME	VARCHAR2(45)	Name of the statistic
VALUE	NUMBER	Value associated with the statistic

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

- "[V\\$HANG_INFO](#)"
- "[V\\$HANG_SESSION_INFO](#)"
- "[DBA_HANG_MANAGER_PARAMETERS](#)"

7.266 V\$HEAT_MAP_SEGMENT

V\$HEAT_MAP_SEGMENT displays real-time segment access information.

Column	Datatype	Description
OBJECT_NAME	VARCHAR2(128)	Name of the object
SUBOBJECT_NAME	VARCHAR2(128)	Name of the subobject
OBJ#	NUMBER	Object number
DATAOBJ#	NUMBER	Data object number
TS#	NUMBER	ID of the tablespace containing the segment whose heat map is tracked
TRACK_TIME	DATE	Timestamp of current activity tracking
SEGMENT_WRITE	VARCHAR2(3)	Indicates whether the segment has write access: (YES or NO)
SEGMENT_READ	VARCHAR2(3)	Indicates whether the segment has read access: (YES or NO)
FULL_SCAN	VARCHAR2(3)	Indicates whether the segment has full table scan: (YES or NO)
LOOKUP_SCAN	VARCHAR2(3)	Indicates whether the segment has lookup scan: (YES or NO)
N_SEGMENT_WRITE	NUMBER	Number of segment writes
N_FULL_SCAN	NUMBER	Number of table scans
N_LOOKUP_SCAN	NUMBER	Number of lookup scans
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["ALL_HEAT_MAP_SEGMENT"](#)

7.267 V\$HM_CHECK

V\$HM_CHECK displays information about all the checks registered with Health Monitor. Each check is uniquely identified by a name or an ID.

Column	Datatype	Description
ID	NUMBER	Health check ID
NAME	VARCHAR2 (64)	Health check name
NAME_NLS	VARCHAR2 (1024)	Internationalized names of the health checks
CLSID	NUMBER	Class ID to which this check belongs
CLS_NAME	VARCHAR2 (15)	Class name of the check: <ul style="list-style-type: none"> • GENERIC • PERSISTENT_DATA
FLAGS	NUMBER	Reserved for internal use
INTERNAL_CHECK	VARCHAR2 (1)	Internal check
OFFLINE_CAPABLE	VARCHAR2 (1)	Ability to run when database is not open yet (Y or N)
DESCRIPTION	VARCHAR2 (1024)	Description of what the check does
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.268 V\$HM_CHECK_PARAM

V\$HM_CHECK_PARAM displays information about the input parameters of all Health Monitor checks.

Column	Datatype	Description
ID	NUMBER	Parameter ID
NAME	VARCHAR2 (64)	Parameter name
CHECK_ID	NUMBER	ID of the check to which this parameter belongs

Column	Datatype	Description
TYPE	VARCHAR2 (20)	Data type of the input parameter: <ul style="list-style-type: none"> • DBKH_PARAM_UB4 • DBKH_PARAM_UB8 • DBKH_PARAM_TEXT • DBKH_PARAM_DATE • DBKH_PARAM_UB4_LIST • DBKH_PARAM_UB8_LIST • DBKH_PARAM_TEXT_LIST • DBKH_PARAM_DATE_LIST
DEFAULT_VALUE	VARCHAR2 (64)	Default value for this parameter
FLAGS	NUMBER	Reserved for internal use
DESCRIPTION	VARCHAR2 (1024)	Description of the parameter
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.269 V\$HM_FINDING

V\$HM_FINDING displays information about all the findings of various Health Monitor runs.

Column	Datatype	Description
FINDING_ID	NUMBER	Unique ID to represent the finding
RUN_ID	NUMBER	ID of the run that created this finding
NAME	VARCHAR2 (32)	Name of the finding
PARENT_ID	NUMBER	Parent finding ID for this finding
CHILD_COUNT	NUMBER	Number of active (open) child findings, if this finding is a parent finding type
CLASS_NAME	VARCHAR2 (32)	Name of the class to which this finding belongs
TIME_DETECTED	TIMESTAMP (6)	Time this finding was detected
MODIFIED	TIMESTAMP (6)	Time that this finding was last modified
PRIORITY	VARCHAR2 (8)	Priority of the finding: <ul style="list-style-type: none"> • LOW, • HIGH • CRITICAL
STATUS	VARCHAR2 (12)	Status of the finding: <ul style="list-style-type: none"> • OPEN • CLOSED
TYPE	VARCHAR2 (13)	Type of the finding: <ul style="list-style-type: none"> • INFORMATIONAL • FAILURE
DESCRIPTION	VARCHAR2 (1024)	Description of the finding

Column	Datatype	Description
DAMAGE_DESCRIPTION	VARCHAR2 (1024)	Possible damage description of the finding
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.270 V\$HM_INFO

V\$HM_INFO displays information about Health Monitor runs, findings, and recommendations.

The information for a run/finding/recommendation is organized as a name, value pair.

If the type of information is RUN, then the data represents the input parameters for that run. If the type of information is FINDING or RECOMMENDATION, then the data represents the information about that particular finding/recommendation.

Column	Datatype	Description
ID	NUMBER	Unique identifier of the information
TYPE	VARCHAR2 (14)	Type of the information: <ul style="list-style-type: none"> • RUN • RUN-RESUME • FINDING • RECOMMENDATION
NAME	VARCHAR2 (32)	Information parameter name
VALUE	VARCHAR2 (513)	Information parameter value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

7.271 V\$HM_RECOMMENDATION

V\$HM_RECOMMENDATION displays information about all the recommendations made to various Health Monitor findings.

Column	Datatype	Description
RECOMMENDATION_ID	NUMBER	Unique ID to represent the recommendation
FDG_ID	NUMBER	Unique ID to represent either the finding ID or the finding set ID for which the recommendation was made

Column	Datatype	Description
RUN_ID	NUMBER	ID of the run that may have generated the recommendation If the ID is 0, then the recommendations were generated by RMAN.
NAME	VARCHAR2 (32)	Name of the recommendation
TYPE	VARCHAR2 (7)	Type of the recommendation: <ul style="list-style-type: none"> • MANUAL • REPAIR
RANK	NUMBER	Rank of the recommendation
TIME_DETECTED	TIMESTAMP (6)	Time that the recommendation was made
EXECUTED	TIMESTAMP (6)	Time that the recommendation (repair) was implemented
STATUS	VARCHAR2 (7)	Status of the recommendation (repair) execution: <ul style="list-style-type: none"> • NOT RUN • RUNNING • SUCCESS • FAILED
DESCRIPTION	VARCHAR2 (1024)	Description of the recommendation
REPAIR_SCRIPT	VARCHAR2 (512)	Location of the repair script file
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.272 V\$HM_RUN

V\$HM_RUN displays information about all Health Monitor checks and their status.

Column	Datatype	Description
RUN_ID	NUMBER	Unique ID to represent the run
NAME	VARCHAR2 (32)	Unique name used to identify the run
CHECK_NAME	VARCHAR2 (32)	Name of the check
RUN_MODE	VARCHAR2 (8)	Mode of the run: <ul style="list-style-type: none"> • MANUAL • REACTIVE • AUTO
TIMEOUT	NUMBER	Number of seconds allowed for this run to complete before it is aborted
START_TIME	TIMESTAMP (6)	Start time of the run
LAST_RESUME_TIME	TIMESTAMP (6)	Last resumed time for the run
END_TIME	TIMESTAMP (6)	End time of the run
MODIFIED_TIME	TIMESTAMP (6)	Last modified time of the run record

Column	Datatype	Description
STATUS	VARCHAR2 (11)	Status of the run: <ul style="list-style-type: none"> • INITIAL • EXECUTING • INTERRUPTED • TIMEDOUT • CANCELLED • COMPLETED • ERROR
SRC INCIDENT	NUMBER	Source incident ID that activated this run
NUM INCIDENT	NUMBER	Number of incidents created by this run
ERROR NUMBER	NUMBER	Error number if the run failed to complete because of an error
PROBLEM ID	NUMBER	Problem ID of the source incident ID that may have activated this Run
CON ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.273 V\$HS_AGENT

V\$HS_AGENT displays the set of HS agents currently running on a given host. There is one row per agent process.

Column	Datatype	Description
AGENT_ID	NUMBER	Oracle Net session identifier used for connections to the agent (the identifier used in the LISTENER.ORA file)
MACHINE	VARCHAR2 (64)	Operating system machine name
PROCESS	VARCHAR2 (9)	Operating system process identifier of the agent
PROGRAM	VARCHAR2 (48)	Program name of the agent
OSUSER	VARCHAR2 (128)	Operating system user
STARTTIME	DATE	Starting time
AGENT_TYPE	NUMBER	Type of the agent
FDS_CLASS_ID	NUMBER	ID of the Foreign Data Store class
FDS_INST_ID	NUMBER	Instance name of the Foreign Data Store
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.274 V\$HS_PARAMETER

V\$HS_PARAMETER describes the initialization parameters in use by the server and agent.

Column	Datatype	Description
HS_SESSION_ID	NUMBER	Unique HS session identifier (maps to the HS_SESSION_ID column of V\$HS_SESSION)
PARAMETER	VARCHAR2(128)	Name of the parameter
VALUE	VARCHAR2(64)	Value of the parameter
SOURCE	VARCHAR2(1)	Indicates whether the parameter was defined in the agent (A) or server (S)
ENV	VARCHAR2(1)	Indicates whether the parameter was set as an environment variable in the agent (T) or elsewhere (F)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.275 V\$HS_SESSION

V\$HS_SESSION describes the current HS session.

Column	Datatype	Description
HS_SESSION_ID	NUMBER	Unique HS session identifier
AGENT_ID	NUMBER	Oracle Net session identifier used for connections to the agent (maps to the AGENT_ID column of V\$HS_AGENT)
SID	NUMBER	User session identifier (maps to the SID column of V\$SESSION)
DB_LINK	VARCHAR2(128)	Server database link name used to access the agent; blank if no database link is used (for example, when using external procedures)
DB_LINK_OWNER	NUMBER	Owner of the database link in DB_LINK
STARTTIME	DATE	Time the connection was initiated
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

7.276 V\$HVMMASTER_INFO

V\$HVMMASTER_INFO describes the current and previous master instances and the number of remasterings of Global Enqueue Service resources.

Column	Datatype	Description
HV_ID	NUMBER	Hash value ID
CURRENT_MASTER	NUMBER	Master instance of this hash value ID
PREVIOUS_MASTER	NUMBER	Previous master instance of this hash value ID
REMASTER_CNT	NUMBER	Number of times this has been remastered
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

Dynamic Performance (V\$) Views: V\$IM_COLUMN_LEVEL to V\$RULE_SET_AGGREGATE_STATS

This chapter contains the dynamic performance views V\$IM_COLUMN_LEVEL to V\$RULE_SET_AGGREGATE_STATS.

8.1 V\$IM_COLUMN_LEVEL

V\$IM_COLUMN_LEVEL presents the selective column compression levels that are defined using the `inmemory_memcompress` clause of the `inmemory_column` clause of the CREATE TABLE statement.

This view returns no rows for a table which has no associated selective column compression levels.

Column	Datatype	Description
INST_ID	NUMBER	Instance ID
OWNER	VARCHAR2(31)	Username of the table owner
OBJ_NUM	NUMBER	Table object number
TABLE_NAME	VARCHAR2(31)	Table name
SEGMENT_COLUMN_ID	NUMBER	Segment column number
COLUMN_NAME	VARCHAR2(31)	Column name
INMEMORY_COMPRESSION	VARCHAR2(26)	Column compression level. Possible values: <ul style="list-style-type: none"> • DEFAULT: This value appears for physical columns of a table that do not have a selective column clause. It also appears when a virtual column has been explicitly enabled for in-memory storage using <code>ALTER TABLE table-name INMEMORY (VC)</code>. • UNSPECIFIED: This value appears for virtual columns of a table that do not have a selective column clause. If the <code>INMEMORY_VIRTUAL_COLUMNS</code> initialization parameter is set to <code>MANUAL</code> , a virtual column with a <code>DEFAULT INMEMORY_COMPRESSION</code> clause will be materialized while a virtual column with an <code>UNSPECIFIED</code> value will not be.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

Note:

The SYS_IME hidden virtual columns automatically added by the In-Memory Expression (IME) infrastructure will not be shown in this view.

8.2 V\$IM_SEGMENTS

`V$IM_SEGMENTS` presents information about all the in-memory segments in the database.

Only segments that have an in-memory representation are displayed. If a segment is marked for the In-Memory Column Store (IM column store) but is not populated, no corresponding row for that segment is displayed in this view.

Column	Datatype	Description
OWNER	VARCHAR2(128)	User name of the segment owner
SEGMENT_NAME	VARCHAR2(128)	Name of the segment, if any
PARTITION_NAME	VARCHAR2(128)	Object partition name (set to NULL for non-partitioned objects)
SEGMENT_TYPE	VARCHAR2(18)	Type of segment: <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION
TABLESPACE_NAME	VARCHAR2(30)	Name of the tablespace containing the segment
INMEMORY_SIZE	NUMBER	Size of the in-memory version of the segment, in bytes
BYTES	NUMBER	Number of on-disk data bytes for the segment that could be represented in memory (no space metadata blocks)
BYTES_NOT_POPULATED	NUMBER	Size of the portion of the on-disk segment that is not populated in memory, in bytes.
POPULATE_STATUS	VARCHAR2(13)	Status of segment population: <ul style="list-style-type: none"> • STARTED: A populate task for the segment has started • COMPLETED: There are no populate tasks pending for the segment • OUT OF MEMORY: A populate task for the segment failed due to lack of space in the IM column store

Column	Datatype	Description
INMEMORY_PRIORITY	VARCHAR2(8)	Indicates the priority for IM column store population: <ul style="list-style-type: none"> LOW MEDIUM HIGH CRITICAL NONE
INMEMORY_DISTRIBUTE	VARCHAR2(15)	Indicates how the IM column store is distributed in an Oracle Real Application Clusters (Oracle RAC) environment: <ul style="list-style-type: none"> AUTO BY ROWID RANGE BY PARTITION BY SUBPARTITION
INMEMORY_DUPLICATE	VARCHAR2(13)	Indicates the duplicate setting for the IM column store in an Oracle RAC environment: <ul style="list-style-type: none"> NO DUPLICATE DUPLICATE DUPLICATE ALL
INMEMORY_COMPRESSION	VARCHAR2(17)	Compression level for the IM column store: <ul style="list-style-type: none"> NO MEMCOMPRESS FOR DML FOR QUERY [LOW HIGH] FOR CAPACITY [LOW HIGH]
INMEMORY_SERVICE	VARCHAR2(12)	Specifies how the IM-enabled table is populated on various instances: <ul style="list-style-type: none"> DEFAULT: Pre-Oracle Database 12c Release 2 (12.2.0.1) behavior NONE: Do not populate on any instance ALL: Populate on all instances USER_DEFINED: Populate only on the instances on which the user-specified service is active. The service name corresponding to this is stored in the INMEMORY_SERVICE_NAME column.
INMEMORY_SERVICE_NAME	VARCHAR2(129)	Specifies the service name on which the IM-enabled table should be populated. This column has a value only when the corresponding INMEMORY_SERVICE column has a value of USER_DEFINED.
IS_EXTERNAL	VARCHAR2(5)	Indicates whether the IM segment is for an external table. Possible values: <ul style="list-style-type: none"> TRUE: The IM segment is for an external table. FALSE: The IM segment is not for an external table.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.3 V\$IM_USER_SEGMENTS

V\$IM_USER_SEGMENTS presents information about the in-memory segments for the current user in the database.

Only segments that have an in-memory representation are displayed. If a segment is marked for the In-Memory Column Store (IM column store) but is not populated, no corresponding row for that segment is displayed in this view.

Column	Datatype	Description
SEGMENT_NAME	VARCHAR2(128)	Name of the segment, if any
PARTITION_NAME	VARCHAR2(128)	Object partition name (set to NULL for non-partitioned objects)
SEGMENT_TYPE	VARCHAR2(18)	Type of segment: <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION
TABLESPACE_NAME	VARCHAR2(30)	Name of the tablespace containing the segment
INMEMORY_SIZE	NUMBER	Size of the in-memory version of the segment, in bytes
BYTES	NUMBER	Total size of the on-disk segment, in bytes
BYTES_NOT_POPULATED	NUMBER	Size of the portion of the on-disk segment that is not populated in memory, in bytes
POPULATE_STATUS	VARCHAR2(13)	Status of segment population: <ul style="list-style-type: none"> • STARTED: A populate task for the segment has started • COMPLETED: There are no populate tasks pending for the segment • OUT OF MEMORY: A populate task for the segment failed due to lack of space in the IM column store
INMEMORY_PRIORITY	VARCHAR2(8)	Indicates the priority for IM column store population: <ul style="list-style-type: none"> • LOW • MEDIUM • HIGH • CRITICAL • NONE
INMEMORY_DISTRIBUTE	VARCHAR2(15)	Indicates how the IM column store is distributed in an Oracle Real Application Clusters (Oracle RAC) environment: <ul style="list-style-type: none"> • AUTO • BY ROWID RANGE • BY PARTITION • BY SUBPARTITION

Column	Datatype	Description
INMEMORY_DUPLICATE	VARCHAR2(13)	Indicates the duplicate setting for the IM column store in an Oracle RAC environment: <ul style="list-style-type: none">• NO DUPLICATE• DUPLICATE• DUPLICATE ALL
INMEMORY_COMPRESSION	VARCHAR2(17)	Compression level for the IM column store: <ul style="list-style-type: none">• NO MEMCOMPRESS• FOR DML• FOR QUERY [LOW HIGH]• FOR CAPACITY [LOW HIGH]
INMEMORY_SERVICE	VARCHAR2(12)	Specifies how the IM-enabled table is populated on various instances: <ul style="list-style-type: none">• DEFAULT: Pre-Oracle Database 12c Release 2 (12.2.0.1) behavior• NONE: Do not populate on any instance• ALL: Populate on all instances• USER_DEFINED: Populate only on the instances on which the user-specified service is active. The service name corresponding to this is stored in the INMEMORY_SERVICE_NAME column.
INMEMORY_SERVICE_NAME	VARCHAR2(129)	Specifies the service name on which the IM-enabled table should be populated. This column has a value only when the corresponding INMEMORY_SERVICE column has a value of USER_DEFINED.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

8.4 V\$INDEX_USAGE_INFO

V\$INDEX_USAGE_INFO keeps track of index usage since the last flush. A flush occurs every 15 minutes. After each flush, ACTIVE_ELEM_COUNT is reset to 0 and LAST_FLUSH_TIME is updated to the current time.

Column	Datatype	Description
INDEX_STATS_ENABLED	NUMBER	Indicates whether the index usage statistics are enabled. Possible values: <ul style="list-style-type: none">• 0: Index statistics are disabled• 1: Index statistics are enabled
INDEX_STATS_COLLECTION_TYPE	NUMBER	Indicates the type of collection used for the index usage statistics. Possible values: <ul style="list-style-type: none">• 0: Indicates the ALL collection type. With this type of collection, the statistics are collected for each execution that has index access. Selecting this statistics collection type may have some impact on performance.• 1: Indicates the SAMPLED collection type. With this type of collection, the statistics are collected based on sampling (only a few of the executions are considered when collecting the statistics). This is the default statistics collection type. Index statistics collected with the SAMPLED collection type are less accurate than index statistics collected with the ALL collection type.
ACTIVE_ELEM_COUNT	NUMBER	The number of active indexes since the last flush
ALLOC_ELEM_COUNT	NUMBER	The number of index entries allocated
MAX_ELEM_COUNT	NUMBER	The maximum number of active indexes that can be tracked
FLUSH_COUNT	NUMBER	Number of successful flushes since the database started
TOTAL_FLUSH_DURATION	NUMBER	Cumulative elapsed time taken to complete the index usage statistics flush since the database start
LAST_FLUSH_TIME	TIMESTAMP (3)	The time of the last flush
STATUS_MSG	VARCHAR2 (256)	Status messages, if any. Flush errors are reported here.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This row is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

 See Also:["DBA_INDEX_USAGE"](#)

8.5 V\$INDEXED_FIXED_COLUMN

V\$INDEXED_FIXED_COLUMN displays the columns in dynamic performance tables that are indexed (X\$ tables).

The X\$ tables can change without notice. Use this view only to write queries against fixed views (V\$ views) more efficiently.

Column	Datatype	Description
TABLE_NAME	VARCHAR2(128)	Name of the dynamic performance table that is indexed
INDEX_NUMBER	NUMBER	Number that distinguishes to which index a column belongs
COLUMN_NAME	VARCHAR2(128)	Name of the column that is being indexed
COLUMN_POSITION	NUMBER	Position of the column in the index key (this is mostly relevant for multicolumn indexes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.6 V\$INMEMORY_AREA

V\$INMEMORY_AREA contains information on the space allocation inside the In-Memory area.

The In-Memory area is sub-divided into two pools: a 1MB pool used to store the actual column formatted data populated into memory, and a 64K pool used to store metadata about the objects that are populated into the In-Memory Column Store (IM column store). The amount of available memory in each pool is visible in the V\$INMEMORY_AREA view. The relative size of the two pools is determined by internal heuristics. The majority of the In-Memory area memory is allocated to the 1MB pool.

Column	Datatype	Description
POOL	VARCHAR2(26)	Name of the pools in the In-Memory area
ALLOC_BYTES	NUMBER	Total amount of memory allocated to this pool
USED_BYTES	NUMBER	Amount of memory currently used in this pool
POPULATE_STATUS	VARCHAR2(26)	Shows the status of the IM column store, for example, whether it is currently being populated or if it is done
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

- "[V\\$IM_COLUMN_LEVEL](#)"
- "[V\\$IM_SEGMENTS](#)"
- "[V\\$IM_USER_SEGMENTS](#)"
- *Oracle Database In-Memory Guide* for an introduction to the IM column store

8.7 V\$INMEMORY_FASTSTART_AREA

`V$INMEMORY_FASTSTART_AREA` provides information about the In-Memory FastStart (IM FastStart) area.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
TABLESPACE_NAME	VARCHAR2 (128)	IM FastStart tablespace name. When IM FastStart is not enabled, the value of <code>TABLESPACE_NAME</code> is <code>INVALID_TABLESPACE</code> and the value of <code>STATUS</code> is <code>DISABLE</code> .
STATUS	VARCHAR2 (10)	IM FastStart status. Possible values include: <ul style="list-style-type: none"> • <code>ENABLE</code>: An IM FastStart tablespace has been specified and the content of the IM column is being periodically checkpointed to disk. • <code>ENABLING</code>: An IM FastStart tablespace has been specified and the database is creating the IM FastStart area. • <code>DISABLE</code>: An IM FastStart tablespace has not been specified. This is the default. • <code>MIGRATING</code>: A user has requested the IM FastStart area be migrated from one tablespace to another. • <code>DISABLING</code>: A user has requested IM FastStart to be disabled.
ALLOCATED_SIZE	NUMBER	The allocated size of an IM FastStart tablespace in bytes
USED_SIZE	NUMBER	The currently used size of an IM FastStart area (in bytes) within the tablespace.
LAST_CHECKPOINT_TIME	TIMESTAMP (6)	The time when the last IMCU was checkpointed to the IM FastStart area
LAST_POPULATE_TIME	TIMESTAMP (6)	The time of the last population from the IM FastStart area
NUM_DEFERRED_WRITES	NUMBER	The number of pending deferred writes to the IM FastStart area

8.8 V\$INSTANCE

V\$INSTANCE displays the state of the current instance.

Column	Datatype	Description
INSTANCE_NUMBER	NUMBER	Instance number used for instance registration (corresponds to the INSTANCE_NUMBER initialization parameter) See Also: " INSTANCE_NUMBER "
INSTANCE_NAME	VARCHAR2(16)	Name of the instance
HOST_NAME	VARCHAR2(64)	Name of the host machine
VERSION	VARCHAR2(17)	Database version
VERSION_LEGACY	VARCHAR2(17)	The legacy database version used before Oracle Database 18c. This column displays the same value as the VERSION column
VERSION_FULL	VARCHAR2(17)	The version string with the new Oracle Database version scheme introduced in Oracle Database 18c.
STARTUP_TIME	DATE	Time when the instance was started
STATUS	VARCHAR2(12)	Status of the instance: <ul style="list-style-type: none">• STARTED - After STARTUP NOMOUNT• MOUNTED - After STARTUP MOUNT or ALTER DATABASE CLOSE• OPEN - After STARTUP or ALTER DATABASE OPEN• OPEN MIGRATE - After ALTER DATABASE OPEN { UPGRADE DOWNGRADE }
PARALLEL	VARCHAR2(3)	Indicates whether the instance is mounted in cluster database mode (YES) or not (NO)
THREAD#	NUMBER	Redo thread opened by the instance
ARCHIVER	VARCHAR2(7)	Automatic archiving status: <ul style="list-style-type: none">• STOPPED• STARTED• FAILED - Archiver failed to archive a log last time but will try again within 5 minutes
LOG_SWITCH_WAIT	VARCHAR2(15)	Event that log switching is waiting for: <ul style="list-style-type: none">• ARCHIVE LOG• CLEAR LOG• CHECKPOINT• NULL - ALTER SYSTEM SWITCH LOGFILE is hung but there is room in the current online redo log
LOGINS	VARCHAR2(10)	Indicates whether the instance is in unrestricted mode, allowing logins by all users (ALLOWED, or in restricted mode, allowing logins by database administrators only (RESTRICTED))
SHUTDOWN_PENDING	VARCHAR2(3)	Indicates whether a shutdown is pending (YES) or not (NO)
DATABASE_STATUS	VARCHAR2(17)	Status of the database: <ul style="list-style-type: none">• ACTIVE• SUSPENDED• INSTANCE RECOVERY
INSTANCE_ROLE	VARCHAR2(18)	Indicates whether the instance is an active instance (PRIMARY_INSTANCE) or an inactive secondary instance (SECONDARY_INSTANCE), or UNKNOWN if the instance has been started but not mounted

Column	Datatype	Description
ACTIVE_STATE	VARCHAR2(9)	<p>Quiesce state of the instance:</p> <ul style="list-style-type: none"> • NORMAL - Database is in a normal state. • QUIESCING - ALTER SYSTEM QUIESCE RESTRICTED has been issued: no new user transactions, queries, or PL/SQL statements are processed in this instance. User transactions, queries, or PL/SQL statements issued before the ALTER SYSTEM QUIESCE RESTRICTED statement are unaffected. DBA transactions, queries, or PL/SQL statements are also unaffected. • QUIESCED - ALTER SYSTEM QUIESCE RESTRICTED has been issued: no user transactions, queries, or PL/SQL statements are processed. DBA transactions, queries, or PL/SQL statements are unaffected. User transactions, queries, or PL/SQL statements issued after the ALTER SYSTEM QUIESCE RESTRICTED statement are not processed. <p>A single ALTER SYSTEM QUIESCE RESTRICTED statement quiesces all instances in an Oracle RAC environment. After this statement has been issued, some instances may enter into a quiesced state before other instances; the system is quiesced when all instances enter the quiesced state.</p>
BLOCKED	VARCHAR2(3)	Indicates whether all services are blocked (YES) or not (NO)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
INSTANCE_MODE	VARCHAR2(11)	<p>The instance mode of the current instance:</p> <ul style="list-style-type: none"> • REGULAR: A regular Oracle RAC instance. This value is also always used for any non-Oracle RAC instance. • READ MOSTLY: An Oracle RAC instance that performs very few database writes • READ ONLY: A read-only Oracle RAC instance
EDITION	VARCHAR2(7)	<p>The edition of the database:</p> <ul style="list-style-type: none"> • PO: Personal Edition • XE: Express Edition • SE2: Standard Edition or Standard Edition 2 • EE: Enterprise Edition • HP: Enterprise Edition - High Performance • XP: Enterprise Edition - Extreme Performance
FAMILY	VARCHAR2(80)	For internal use only.
DATABASE_TYPE	VARCHAR2(15)	<p>Database type:</p> <ul style="list-style-type: none"> • RAC: If the database is a regular Oracle RAC database which may have multiple instances. • RACONENODE: If the database is Oracle RAC, but allows only one instance to run at any time - the RAC One Node mode. • SINGLE: If the database is running as a single instance. • UNKNOWN: If the database's type can't be determined. This might happen when the database is registered as a DB resource with CRS but the CRS service has failed to return valid database type information. Typically, this indicates that either the CRS service is down or it is in a faulty state.

8.9 V\$INSTANCE_CACHE_TRANSFER

V\$INSTANCE_CACHE_TRANSFER displays statistics for the cache blocks transferred among instances.

Oracle keeps multiple versions of data buffered in the buffer cache. The current buffer (or block), CURRENT_BLOCK, is the most up-to-date copy, containing all recent modifications. A consistent read buffer (or block), CR_BLOCK, contains the version of the data at a particular time prior to the current buffer. It is read-consistent (that is, all the data shown in that buffer are consistent for the start time of a query).

Therefore, for the same data block there can be multiple copies in the buffer cache: one current copy, and one or more consistent read copies with data consistent as of different snapshot times.

Column	Datatype	Description
INSTANCE	NUMBER	Instance from which the blocks are transferred
CLASS	VARCHAR2 (18)	Class of the cache block
LOST	NUMBER	The number of blocks that were sent by a particular instance but that never arrived in this instance
LOST_TIME	NUMBER	The time waited for blocks that were sent by a particular instance but that never arrived in this instance
CR_BLOCK	NUMBER	CR Block transfers not affected by remote processing delays
CR_BLOCK_TIME	NUMBER	Total time waited for CR blocks from a particular instance (includes the other times)
CR_2HOP	NUMBER	The count of CR blocks which were received by this instance from a particular instance after a 2-way round-trip
CR_2HOP_TIME	NUMBER	The time waited for CR blocks which were received by this instance from a particular instance after a 2-way round-trip
CR_3HOP	NUMBER	The count of CR blocks which were received by this instance from a particular instance after a 3-way round-trip
CR_3HOP_TIME	NUMBER	The time waited for CR blocks which were received by this instance from a particular instance after a 3-way round-trip
CR_BUSY	NUMBER	CR Block transfers affected by remote contention
CR_BUSY_TIME	NUMBER	The time waited for CR blocks which were received by this instance from a particular instance and which were delayed by a log flushed on the sending instance
CR_CONGESTED	NUMBER	CR Block transfers affected by remote system load
CR_CONGESTED_TIME	NUMBER	The time waited for CR blocks which were received by this instance from a particular instance and which were delayed because LMS was busy
CURRENT_BLOCK	NUMBER	Current block transfers not affected by remote processing delays
CURRENT_BLOCK_TIME	NUMBER	Total time waited for current blocks from a particular instance (includes the other times)
CURRENT_2HOP	NUMBER	The count of current blocks which were received by this instance from a particular instance after a 2-way round-trip
CURRENT_2HOP_TIME	NUMBER	The time waited for current blocks which were received by this instance from a particular instance after a 2-way round-trip

Column	Datatype	Description
CURRENT_3HOP	NUMBER	The count of current blocks which were received by this instance from a particular instance after a 3-way round-trip
CURRENT_3HOP_TIME	NUMBER	The time waited for current blocks which were received by this instance from a particular instance after a 3-way round-trip
CURRENT_BUSY	NUMBER	Current block transfers affected by remote contention
CURRENT_BUSY_TIME	NUMBER	The time waited for current blocks which were received by this instance from a particular instance and which were delayed by a log flushed on the sending instance
CURRENT_CONGESTED	NUMBER	Current block transfers affected by remote system load
CURRENT_CONGESTED_TIME	NUMBER	The time waited for current blocks which were received by this instance from a particular instance and which were delayed because LMS was busy
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.10 V\$INSTANCE_PING

V\$INSTANCE_PING provides information about measured latency of the interconnect for all instances in an Oracle Real Application Clusters (Oracle RAC) environment.

In an Oracle RAC environment, every few seconds the PING process of each instance checks the response of the interconnect to all instances of the same database.

It sends two messages. One message is 500 bytes in size (referred to in the column descriptions as 500B), and the other is 8 kilobytes in size (referred to in column descriptions as 8K).

For each message sent to each instance, the amount of time it took to get a response back is measured (in microseconds). The view records the latest measurements as well as cumulative data since instance startup.

Column	Datatype	Description
INSTANCE	NUMBER	The instance communicated with. In the V\$ view for each instance, there is one row for that instance, and in the GV\$ view for each instance, there is also one row for that instance, so there are n^2 rows for n instances.
CURRENT_500B	NUMBER	The latest response time for the 500B message (in microseconds)
AVERAGE_500B	NUMBER	The average response time for the 500B messages since instance startup (in microseconds). Note that AVERAGE_500B should be the same as WAIT_TIME_500B/COUNT_500B.
MAX_500B	NUMBER	The maximal response time for the 500B messages since instance startup (in microseconds)
COUNT_500B	NUMBER	The number of measurements for the 500B messages since instance startup

Column	Datatype	Description
WAIT_TIME_500B	NUMBER	The sum of all response times for the 500B messages since instance startup (in microseconds)
WAIT_TIME_SQUARED_500B	NUMBER	The sum of the response time squared for 500B messages since instance startup. The unit is in microseconds squared and divided by 1000.
CURRENT_8K	NUMBER	The latest response time for the 8K message (in microseconds)
AVERAGE_8K	NUMBER	The average response time for the 8K messages since instance startup (in microseconds). Note that AVERAGE_8K should be the same as WAIT_TIME_8K/COUNT_8K.
MAX_8K	NUMBER	The maximal response time for the 8K messages since instance startup (in microseconds)
COUNT_8K	NUMBER	The number of measurements for the 8K messages since instance startup
WAIT_TIME_8K	NUMBER	The sum of all response times for the 8K messages since instance startup (in microseconds)
WAIT_TIME_SQUARED_8K	NUMBER	The sum of the response time squared for 8K messages since instance startup. The unit is in microseconds squared and divided by 16.
CON_ID	NUMBER	The ID of the container to which the data pertains. For this view, the possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.

8.11 V\$INSTANCE_RECOVERY

V\$INSTANCE_RECOVERY monitors the mechanisms available to users to limit recovery I/O. Those mechanisms are:

- Set the LOG_CHECKPOINT_TIMEOUT initialization parameter
- Set the LOG_CHECKPOINT_INTERVAL initialization parameter
- Set the FAST_START_MTTR_TARGET initialization parameter
- Set the size of the smallest redo log

Column	Datatype	Description
RECOVERY_ESTIMATED_IOS	NUMBER	Number of dirty buffers in the buffer cache.
ACTUAL_REDO_BLKS	NUMBER	Current actual number of redo blocks required for recovery
TARGET_REDO_BLKS	NUMBER	Current target number of redo blocks that must be processed for recovery. This value is the minimum value of the following 3 columns, and identifies which of the 3 user-defined limits determines checkpointing.
LOG_FILE_SIZE_REDO_BLKS	NUMBER	Maximum number of redo blocks required to guarantee that a log switch does not occur before the checkpoint completes.
LOG_CHKPT_TIMEOUT_REDO_B_LKS	NUMBER	Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_TIMEOUT parameter. The value displayed is not meaningful unless that parameter has been set.
LOG_CHKPT_INTERVAL_REDO_BLKS	NUMBER	Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_INTERVAL parameter. The value displayed is not meaningful unless that parameter has been set.

Column	Datatype	Description
FAST_START_IO_TARGET_RED_O_BLKS	NUMBER	This column is obsolete and maintained for backward compatibility. The value of this column is always null.
TARGET_MTTR	NUMBER	Effective MTTR (mean time to recover) target value in seconds. The TARGET_MTTR value is calculated based on the value of the FAST_START_MTTR_TARGET parameter (the TARGET_MTTR value is used internally), and is usually an approximation of the parameter's value. However, if the FAST_START_MTTR_TARGET parameter value is very small (for example, one second), or very large (for example, 3600 seconds), the calculation will produce a target value dictated by system limitations. In such cases, the TARGET_MTTR value will be the shortest calculated time, or the longest calculated time that recovery is expected to take.
ESTIMATED_MTTR	NUMBER	Current estimated mean time to recover (MTTR) based on the number of dirty buffers and log blocks. Basically, this value tells you how long you could expect recovery to take based on the work your system is doing right now.
CKPT_BLOCK_WRITES	NUMBER	Number of blocks written by checkpoint writes
OPTIMAL_LOGFILE_SIZE	NUMBER	Redo log file size (in megabytes) that is considered optimal based on the current setting of FAST_START_MTTR_TARGET. It is recommended that the user configure all online redo logs to be at least this value. Note that redo log files must be at least 4 megabytes in size; otherwise an error is generated.
ESTD_CLUSTER_AVAILABLE_TIME	NUMBER	Estimated time (in seconds) that the cluster would become partially available should this instance fail. This column is only meaningful in an Oracle Real Application Clusters (Oracle RAC) environment. In a non-Oracle RAC environment, the value of this column is null.
WRITES_MTTR	NUMBER	Number of writes driven by the FAST_START_MTTR_TARGET initialization parameter
WRITES_LOGFILE_SIZE	NUMBER	Number of writes driven by the smallest redo log file size
WRITES_LOG_CHECKPOINT_SETTINGS	NUMBER	Number of writes driven by the LOG_CHECKPOINT_INTERVAL or LOG_CHECKPOINT_TIMEOUT initialization parameter
WRITES_OTHER_SETTINGS	NUMBER	Number of writes driven by other reasons (such as the deprecated FAST_START_IO_TARGET initialization parameter)
WRITES_AUTOTUNE	NUMBER	Number of writes due to auto-tune checkpointing
WRITES_FULL_THREAD_CKPT	NUMBER	Number of writes due to full thread checkpoints
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.12 V\$IO_CALIBRATION_STATUS

V\$IO_CALIBRATION_STATUS displays the status of I/O calibration in the instance.

Column	Datatype	Description
STATUS	VARCHAR2 (13)	<p>Calibration status:</p> <ul style="list-style-type: none"> IN PROGRESS - Calibration in Progress (Results from a previous calibration run are displayed, if available) READY Results are ready and available from an earlier run NOT AVAILABLE Calibration results are not available
CALIBRATION_TIME	TIMESTAMP (3)	End time of the last calibration run
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.13 V\$IO_OUTLIER

V\$IO_OUTLIER contains entries corresponding to I/Os that have taken a long time (more than 500 ms) to complete. Use this view to see if there are any occasional delays in serving disk I/O requests by the storage subsystem.

Column	Datatype	Description
FUNCTION_NAME	VARCHAR2 (18)	I/O function name of the delayed I/O
IO_SIZE	NUMBER	Size of the I/O in bytes
WAIT_EVENT	VARCHAR2 (64)	Wait event name that was used to track the I/O
FILE_NAME	VARCHAR2 (513)	Name of the file to which the I/O was targeted
IO_LATENCY	NUMBER	Time taken to complete the I/O (in milliseconds)
DISK1_NAME	VARCHAR2 (255)	For Oracle ASM, the name of the first disk to which the I/O was issued
DISK1_LATENCY	NUMBER	Latency seen on the first disk (in milliseconds)
DISK2_NAME	VARCHAR2 (255)	For Oracle ASM, the name of the second disk to which the I/O was issued
DISK2_LATENCY	NUMBER	Latency seen on the second disk (in milliseconds)
DISK3_NAME	VARCHAR2 (255)	For Oracle ASM, the name of the third disk to which the I/O was issued
DISK3_LATENCY	NUMBER	Latency seen on the third disk (in milliseconds)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$KERNEL_IO_OUTLIER](#)"
- "[V\\$LGWRIO_OUTLIER](#)"

8.14 V\$IOFUNCMETRIC

V\$IOFUNCMETRIC displays I/O statistics information by database function for the most recent time interval period.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
FUNCTION_ID	NUMBER	Function ID
FUNCTION_NAME	VARCHAR2 (18)	Function name
SMALL_READ_MBPS	NUMBER	Single block megabytes read per second
SMALL_WRITE_MBPS	NUMBER	Single block megabytes written per second
LARGE_READ_MBPS	NUMBER	Multiblock megabytes read per second
LARGE_WRITE_MBPS	NUMBER	Multiblock megabytes written per second
SMALL_READ_IOPS	NUMBER	Single block read requests per second
SMALL_WRITE_IOPS	NUMBER	Single block write requests per second
LARGE_READ_IOPS	NUMBER	Multiblock read requests per second
LARGE_WRITE_IOPS	NUMBER	Multiblock write requests per second
AVG_WAIT_TIME	NUMBER	Average wait time (in milliseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.15 V\$IOFUNCMETRIC_HISTORY

V\$IOFUNCMETRIC_HISTORY displays a recent history of the I/O statistics information by database function for the most recent time interval period.

The columns for V\$IOFUNCMETRIC_HISTORY are the same as those for V\$IOFUNCMETRIC.

 See Also:["V\\$IOFUNCMETRIC"](#)

8.16 V\$IOS_CLIENT

V\$IOS_CLIENT provides more information about IO Server clients.

Column	Datatype	Description
CLIENT_ID	NUMBER	The unique ID for this client instance
CLUSTER_ID	VARCHAR2 (33)	The GUID of the cluster where the client instance is running
CLUSTER_NAME	VARCHAR2 (16)	When the query is executed on an Oracle IOServer (IOS) instance, this column shows the name of the cluster where the client (database) instance is running.
		When the query is executed on a database instance, this column shows the name of the cluster where the IOS instance that the database is connected to is running.
NODE	NUMBER	Number of the node within the cluster where the client instance is running
INSTANCE_NAME	VARCHAR2 (64)	Instance name of the database client instance
DB_NAME	VARCHAR2 (64)	Database name of the database client instance
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.17 V\$IOSTAT_CONSUMER_GROUP

V\$IOSTAT_CONSUMER_GROUP displays disk I/O statistics for consumer groups.

If the resource manager is enabled, then I/O statistics for all consumer groups that are part of the currently enabled resource plan are captured.

Column	Datatype	Description
CONSUMER_GROUP_ID	NUMBER	Consumer group ID
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQS	NUMBER	Number of single block read requests
SMALL_WRITE_REQS	NUMBER	Number of single block write requests

Column	Datatype	Description
LARGE_READ_REQS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQS	NUMBER	Number of multiblock write requests
NUMBER_OF_WAITS	NUMBER	Number of I/O waits by consumer group
WAIT_TIME	NUMBER	Total wait time (in milliseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.18 V\$IOSTAT_FILE

V\$IOSTAT_FILE displays information about disk I/O statistics of database files (including data files, temp files, and other types of database files).

I/O statistics for Data files and Temp files are provided for each file. All other file types (for example, control files, log files, archive logs, and so on) have their statistics consolidated into one entry in the view.

Column	Datatype	Description
FILE_NO	NUMBER	File identification number
FILETYPE_ID	NUMBER	Type of file (for example, log file, data file, and so on)
FILETYPE_NAME	VARCHAR2 (28)	Name of the file, in the case of a data file or temp file. For all other files, a corresponding string to be displayed (for example, ARCHIVELOG).
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQS	NUMBER	Number of single block read requests
SMALL_WRITE_REQS	NUMBER	Number of single block write requests
SMALL_SYNC_READ_REQS	NUMBER	Number of synchronous single block read requests
LARGE_READ_REQS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQS	NUMBER	Number of multiblock write requests
SMALL_READ_SERVICETIME	NUMBER	Total service time (in milliseconds) for single block read requests
SMALL_WRITE_SERVICETIME	NUMBER	Total service time (in milliseconds) for single block write requests
SMALL_SYNC_READ_LATENCY	NUMBER	Latency for single block synchronous reads (in milliseconds)
LARGE_READ_SERVICETIME	NUMBER	Total service time (in milliseconds) for multiblock read requests
LARGE_WRITE_SERVICETIME	NUMBER	Total service time (in milliseconds) for multiblock write requests
ASYNCH_IO	VARCHAR2 (9)	Indicates whether asynchronous I/O is available for the file (ASYNC_ON) or not (ASYNC_OFF)

Column	Datatype	Description
ACCESS_METHOD	VARCHAR2(11)	I/O library used to access the file. Possible values include: <ul style="list-style-type: none"> • OS_LIB - Operating system calls are used to access the file • ODM_LIB - Oracle Disk Manager library is used to access the file • ASM_MANAGED - The file is managed and accessed through ASM • DNFS_LIB - The file is accessed through Direct NFS library
RETRIES_ON_ERROR	NUMBER	Number of read retries on error
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.19 V\$IOSTAT_FUNCTION

V\$IOSTAT_FUNCTION displays disk I/O statistics for database functions (such as the LGWR and DBWR).

Column	Datatype	Description
FUNCTION_ID	NUMBER	Function ID
FUNCTION_NAME	VARCHAR2(18)	Function name: <ul style="list-style-type: none"> • RMAN • DBWR • LGWR • ARCH • XDB • Streams AQ • Data Pump • Recovery • Buffer Cache Reads • Direct Reads • Direct Writes • Smart Scan • Archive Manager • Others
SMALL_READ_MEGABYTES	NUMBER	Number of megabytes read via single block read requests
SMALL_WRITE_MEGABYTES	NUMBER	Number of megabytes written via single block write requests
LARGE_READ_MEGABYTES	NUMBER	Number of megabytes read via multiblock read requests
LARGE_WRITE_MEGABYTES	NUMBER	Number of megabytes written via multiblock write requests
SMALL_READ_REQS	NUMBER	Number of single block read requests
SMALL_WRITE_REQS	NUMBER	Number of single block write requests
LARGE_READ_REQS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQS	NUMBER	Number of multiblock write requests
NUMBER_OF_WAITS	NUMBER	Number of synchronous I/O waits by functionality

Column	Datatype	Description
WAIT_TIME	NUMBER	Total synchronous I/O wait time (in milliseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.20 V\$IOSTAT_FUNCTION_DETAIL

V\$IOSTAT_FUNCTION_DETAIL displays disk I/O statistics for database functions (such as the LGWR and DBWR), broken down by file type.

Column	Datatype	Description
FUNCTION_ID	NUMBER	Function ID
FUNCTION_NAME	VARCHAR2(18)	Function name: <ul style="list-style-type: none"> • RMAN • DBWR • LGWR • ARCH • XDB • Streams AQ • Data Pump • Recovery • Buffer Cache Reads • Direct Reads • Direct Writes • Smart Scan • Archive Manager • Others
FILETYPE_ID	NUMBER	File type ID
FILETYPE_NAME	VARCHAR2(28)	File type name: <ul style="list-style-type: none"> • Control File • Data File • Log File • Archive Log • Temp File • Data File Backup • Data File Incremental Backup • Archive Log Backup • Data File Copy • Flashback Log • Data Pump Dump File • Other
SMALL_READ_MEGABYTES	NUMBER	Number of megabytes read via single block read requests
SMALL_WRITE_MEGABYTES	NUMBER	Number of megabytes written via single block write requests

Column	Datatype	Description
LARGE_READ_MEGABYTES	NUMBER	Number of megabytes read via multiblock read requests
LARGE_WRITE_MEGABYTES	NUMBER	Number of megabytes written via multiblock write requests
SMALL_READ_REQS	NUMBER	Number of single block read requests
SMALL_WRITE_REQS	NUMBER	Number of single block write requests
LARGE_READ_REQS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQS	NUMBER	Number of multiblock write requests
NUMBER_OF_WAITS	NUMBER	Number of synchronous I/O waits by functionality
WAIT_TIME	NUMBER	Total synchronous I/O wait time (in milliseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.21 V\$IOSTAT_NETWORK

V\$IOSTAT_NETWORK displays information about network I/O statistics that were caused by accessing files on a remote database instance.

Column	Datatype	Description
CLIENT	VARCHAR2 (32)	Database client name initiating the network I/O (for example, RMAN or PL/SQL)
READS#	NUMBER	Number of read operations issued
WRITES#	NUMBER	Number of write operations issued
KBYTES_READ	NUMBER	Total number of kilobytes read
KBYTES_WRITTEN	NUMBER	Total number of kilobytes written
READ_LATENCY	NUMBER	Total read wait time (in milliseconds)
WRITE_LATENCY	NUMBER	Total write wait time (in milliseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.22 V\$IP_ACL

V\$IP_ACL provides information about access control to database services from network hosts.

Column	Datatype	Description
SERVICE_NAME	VARCHAR2 (512)	The database service name
HOST	VARCHAR2 (64)	The host being granted access to the SERVICE_NAME. The host can be a hostname, dotted-decimal IPv4 or heximal IPv6 address. Wildcard "*" for IPv4 and Classless Inter-Domain Routing (CIDR) format is allowed.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs • 1: This value is used for rows containing data that pertain only to the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.23 V\$JAVA_LIBRARY_CACHE_MEMORY

V\$JAVA_LIBRARY_CACHE_MEMORY displays information about memory allocated to library cache memory objects in different namespaces for Java objects.

A memory object is an internal grouping of memory for efficient management. A library cache object may consist of one or more memory objects.

Column	Datatype	Description
LC_NAMESPACE	VARCHAR2 (15)	Library cache namespace
LC_INUSE_MEMORY_OBJECTS	NUMBER	Number of library cache memory objects currently in use in the Java pool
LC_INUSE_MEMORY_SIZE	NUMBER	Total size of library cache in-use memory objects (in megabytes)
LC_FREEABLE_MEMORY_OBJEC TS	NUMBER	Number of freeable library cache memory objects in the Java pool
LC_FREEABLE_MEMORY_SIZE	NUMBER	Size of library cache freeable memory objects (in megabytes)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.24 V\$JAVA_POOL_ADVICE

V\$JAVA_POOL_ADVICE displays information about estimated parse time in the Java pool for different pool sizes.

The sizes range from 10% of the current Java pool size or the amount of pinned Java library cache memory (whichever is higher) to 200% of the current Java pool size, in equal intervals. The value of the interval depends on the current size of the Java pool.

Parse time saved refers to the amount of time saved by keeping library cache memory objects in the Java pool, as opposed to having to reload these objects.

Column	Datatype	Description
JAVA_POOL_SIZE_FOR_ESTIMATE	NUMBER	Java pool size for the estimate (in megabytes)
JAVA_POOL_SIZE_FACTOR	NUMBER	Size factor with respect to the current Java pool size
ESTD_LC_SIZE	NUMBER	Estimated memory in use by the library cache (in megabytes)
ESTD_LC_MEMORY_OBJECTS	NUMBER	Estimated number of library cache memory objects in the Java pool of the specified size
ESTD_LC_TIME_SAVED	NUMBER	Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a Java pool of the specified size. This is the time that would have been spent in reloading the required objects in the Java pool had they been aged out due to insufficient amount of available free memory.
ESTD_LC_TIME_SAVED_FACTOR	NUMBER	Estimated parse time saved factor with respect to the current Java pool size
ESTD_LC_LOAD_TIME	NUMBER	Estimated elapsed time (in seconds) for parsing in a Java pool of the specified size
ESTD_LC_LOAD_TIME_FACTOR	NUMBER	Estimated load time factor with respect to the current Java pool size
ESTD_LC_MEMORY_OBJECT_HI_TS	NUMBER	Estimated number of times a library cache memory object was found in a Java pool of the specified size
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.25 V\$KERNEL_IO_OUTLIER

V\$KERNEL_IO_OUTLIER contains entries corresponding to I/Os that have taken a long time (more than 500 ms) to complete.

Use this view to see the individual kernel components of I/Os for which there are any occasional delays in serving disk I/O requests by the storage subsystem.

 **Note:**

Although this view exists on all platforms in Oracle Database 12c, it is only populated on the Solaris platform.

Column	Datatype	Description
TIMESTAMP	NUMBER	Number of seconds elapsed since 00:00 UTC, January 1, 1970
IO_SIZE	NUMBER	Size of the I/O, in KB.
IO_OFFSET	NUMBER	Offset into the device of the I/O
DEVICE_NAME	VARCHAR2 (513)	Name of the device to which the I/O was targeted
PROCESS_NAME	VARCHAR2 (64)	Name of the process that issued the I/O

Column	Datatype	Description
TOTAL_LATENCY	NUMBER	Total time the I/O spent in the kernel (in milliseconds)
SETUP_LATENCY	NUMBER	Time spent during initial I/O setup before sending to SCSI target device driver (in milliseconds)
QUEUE_TO_HBA_LATENCY	NUMBER	Time spent in the SCSI target device driver before being sent to the Host Bus Adaptor (in milliseconds)
TRANSFER_LATENCY	NUMBER	Time spent in the Host Bus Adaptor and physically transferring the I/O to the storage device (in milliseconds)
CLEANUP_LATENCY	NUMBER	Time spent freeing resources used by the completed I/O (in milliseconds)
PID	NUMBER	Process ID that issued the I/O
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$IO_OUTLIER](#)"
- "[V\\$LGWRIO_OUTLIER](#)"

8.26 V\$KEY_VECTOR

V\$KEY_VECTOR provides debugging information related to the data structures used by in-memory aggregation for current and recent queries using key vectors.

Column	Datatype	Description
SESSION_ID	NUMBER	Session ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
TRANSLATE_ID	NUMBER	Translation vector ID
SQL_ID	VARCHAR2 (13)	SQL ID that uses the translation vector
SQL_EXEC_START	DATE	Time when the execution of the SQL started
SQL_EXEC_ID	NUMBER	SQL execution identifier
PROCESS	VARCHAR2 (64)	Operating system client process ID

Column	Datatype	Description
STATE	VARCHAR2 (9)	<p>State of the in-memory aggregation operation:</p> <ul style="list-style-type: none"> • BYPASS Refers to key vectors that are currently in use by queries that have undergone the vector transform. • BYPASSED This is a historical entry for key vectors whose queries have already finished. • FINISHED This is a historical entry for key vectors whose queries have already finished. • RUNNING Refers to key vectors that are currently in use by queries that have undergone the vector transform. <p>One query will probably have multiple key vectors if it has gone through the vector transform.</p> <p>Also, if the query is operating in parallel, there may be multiple entries per PQ slave.</p> <p>The <code>PROCESS</code> column can be joined to <code>V\$SESSION</code> to differentiate these cases.</p>
TYPE	VARCHAR2 (9)	<p>Type of translation vector created:</p> <ul style="list-style-type: none"> • DOUBLEIND • PAGED • SIMPLE • INDIRECT • HASH • OFFSET
WIDTH	NUMBER	<p>Width (number of bits) of DOUBLEIND, SIMPLE, INDIRECT, or OFFSETvector translation array:</p> <ul style="list-style-type: none"> • 1 • 4 • 8 • 16 • 32
KEY_DATA_TYPE	VARCHAR2 (13)	<p>The internal join column key data type of either DOUBLEIND, SIMPLE, INDIRECT, or OFFSET translation vectors:</p> <ul style="list-style-type: none"> • BINARY • BINARY_FLOAT • NUMBER • PACKED_BINARY • PACKED_DATE • PACKED_NUMBER <p>Also, a value of <code>NULL</code> is displayed for HASH translation vectors with non-numeric data types and for HASH translation vectors with more than one join key column.</p>
JOIN_COLUMN_COUNT	NUMBER	<p>Number of join columns. <code>PAGED</code> and <code>HASHED</code> are the only types which can have greater than one join column.</p>
JOIN_KEY_COUNT	NUMBER	<p>Number of join key values used to build translation vector</p>
DUP_JOIN_KEY_COUNT	NUMBER	<p>Indicates the number of key values in the key vector that have more than one parent value</p>
MIN_JOIN_KEY	NUMBER	<p>Min join key value in translation vector</p>

Column	Datatype	Description
MAX_JOIN_KEY	NUMBER	Max join key value in translation vector
GROUP_KEY_COUNT	NUMBER	Max dense grouping key value. This value is computed while the data that creates the translation vector is processed.
FILTERED	NUMBER	Number of rows filtered by translation vector
PROBED	NUMBER	Number of rows that probed the translation vector in key vector use row source
ACTIVE	NUMBER	Number of active translation vectors used as filters across all slaves
DISABLED	NUMBER	Number of translation vector filters across all slaves that were disabled
MEMORY_ALLOCATED	NUMBER	Amount of memory allocated for the key vector
JOIN_STRUCTURE_SIZE	NUMBER	Amount of memory used out of the allocated space
FACT_OWNER	VARCHAR2 (128)	The owner of the fact table. Null when the fact table is null.
FACT_NAME	VARCHAR2 (128)	The table that contains measure data. May be null if more than one fact table is used in the query.
DIMENSION_OWNER	VARCHAR2 (128)	When a single table is used to construct the key vector, the table owner will appear in this column. If multiple tables are joined to serve as the dimension (more of a snowflake than a star schema shape, for one example), then this column will be null.
DIMENSION_NAME	VARCHAR2 (128)	The table that contains attribute data and is joined to the fact table. May be null if two or more tables are used (for example, snowflake style dimension tables).
CREATION_DURATION	NUMBER	Records the total time in seconds that it took to create the key vector
PAYOUT_COLUMN_COUNT	NUMBER	The number of columns being carried from the dimension table to the fact table scan for processing without joinback

8.27 V\$LATCH

V\$LATCH displays aggregate latch statistics for both parent and child latches, grouped by latch name.

Individual parent and child latch statistics are broken down in the views V\$LATCH_PARENT and V\$LATCH_CHILDREN.

Column	Datatype	Description
ADDR	RAW (4 8)	Address of the latch object
LATCH#	NUMBER	Latch number
LEVEL#	NUMBER	Latch level
NAME	VARCHAR2 (64)	Latch name
HASH	NUMBER	Latch hash
GETS	NUMBER	Number of times the latch was requested in willing-to-wait mode

Column	Datatype	Description
MISSES	NUMBER	Number of times the latch was requested in willing-to-wait mode and the requester had to wait
SLEEPS	NUMBER	Number of times a willing-to-wait latch request resulted in a session sleeping while waiting for the latch
IMMEDIATE_GETS	NUMBER	Number of times a latch was requested in no-wait mode
IMMEDIATE_MISSES	NUMBER	Number of times a no-wait latch request did not succeed (that is, missed)
WAITERS_WOKEN	NUMBER	This column has been deprecated and is present only for compatibility with previous releases of Oracle. No data is accumulated for this column; it will always have a value of zero.
WAITS_HOLDING_LATCH	NUMBER	This column has been deprecated and is present only for compatibility with previous releases of Oracle. No data is accumulated for this column; it will always have a value of zero.
SPIN_GETS	NUMBER	Willing-to-wait latch requests which missed the first try but succeeded while spinning
SLEEP[1 2 3 4 5 6 7 8 9 10 11]	NUMBER	These columns have been deprecated and are present only for compatibility with previous releases of Oracle. No data is accumulated for these columns; they will always have a value of zero. As a substitute for these columns you can query the appropriate rows of the V\$EVENT_HISTOGRAM view where the EVENT column has a value of latch free or latch:%.
WAIT_TIME	NUMBER	Elapsed time spent waiting for the latch (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

- "[V\\$LATCH_PARENT](#)"

8.28 V\$LATCH_CHILDREN

V\$LATCH_CHILDREN displays statistics about child latches.

This view includes all columns of V\$LATCH plus the CHILD# column. Note that child latches have the same parent if their LATCH# columns match each other.

Column	Datatype	Description
ADDR	RAW(4 8)	Address of the latch object
LATCH#	NUMBER	Latch number of the parent latch

Column	Datatype	Description
CHILD#	NUMBER	Child latch number (unique only to each parent latch)
LEVEL#	NUMBER	Latch level
NAME	VARCHAR2 (64)	Latch name
HASH	NUMBER	Latch hash
GETS	NUMBER	Number of times the latch was requested in willing-to-wait mode
MISSES	NUMBER	Number of times the latch was requested in willing-to-wait mode and the requester had to wait
SLEEPS	NUMBER	Number of times a willing-to-wait latch request resulted in a session sleeping while waiting for the latch
IMMEDIATE_GETS	NUMBER	Number of times a latch was requested in no-wait mode
IMMEDIATE_MISSES	NUMBER	Number of times a no-wait latch request did not succeed (that is, missed)
WAITERS_WOKEN	NUMBER	This column has been deprecated and is present only for compatibility with previous releases of Oracle. No data is accumulated for this column; it will always have a value of zero.
WAITS_HOLDING_LATCH	NUMBER	This column has been deprecated and is present only for compatibility with previous releases of Oracle. No data is accumulated for this column; it will always have a value of zero.
SPIN_GETS	NUMBER	Willing-to-wait latch requests which missed the first try but succeeded while spinning
SLEEP[1 2 3 4 5 6 7 8 9 10 11]	NUMBER	These columns have been deprecated and are present only for compatibility with previous releases of Oracle. No data is accumulated for these columns; they will always have a value of zero. As a substitute for these columns you can query the appropriate rows of the V\$EVENT_HISTOGRAM view where the EVENT column has a value of latch free or latch:%.
WAIT_TIME	NUMBER	Elapsed time spent waiting for the latch (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$LATCH"](#)

8.29 V\$LATCH_MISSES

V\$LATCH_MISSES displays statistics about missed attempts to acquire a latch.

Column	Datatype	Description
PARENT_NAME	VARCHAR2(64)	Latch name of a parent latch
WHERE	VARCHAR2(80)	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in LOCATION.
NWFAIL_COUNT	NUMBER	Number of times that no-wait acquisition of the latch failed
SLEEP_COUNT	NUMBER	Number of times that acquisition attempts caused sleeps
WTR_SLP_COUNT	NUMBER	Number of times a waiter slept
LONGHOLD_COUNT	NUMBER	Number of times someone held a latch for the entire duration of someone else's sleep
LOCATION	VARCHAR2(80)	Location that attempted to acquire the latch
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.30 V\$LATCH_PARENT

V\$LATCH_PARENT displays statistics about parent latches.

\ The columns for V\$LATCH_PARENT are the same as those for V\$LATCH.

 **See Also:**

"V\$LATCH"

8.31 V\$LATCHHOLDER

V\$LATCHHOLDER displays information about the current latch holders.

Column	Datatype	Description
PID	NUMBER	Identifier of the process holding the latch
SID	NUMBER	Identifier of the session that owns the latch
LADDR	RAW(4 8)	Latch address
NAME	VARCHAR2(64)	Name of the latch being held
GETS	NUMBER	Number of times that the latch was obtained in either wait mode or no-wait mode

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.32 V\$LATCHNAME

V\$LATCHNAME displays information about decoded latch names for the latches shown in V\$LATCH.

The rows of V\$LATCHNAME have a one-to-one correspondence to the rows of V\$LATCH.

Column	Datatype	Description
LATCH#	NUMBER	Latch number
NAME	VARCHAR2 (64)	Latch name
DISPLAY_NAME	VARCHAR2 (64)	A clearer and more descriptive name for the latch that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.
HASH	NUMBER	Latch hash
TYPE	VARCHAR2 (4)	Type of the latch (SGA, PDB, or OSP):
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**
"V\$LATCH"

8.33 V\$LGWRIO_OUTLIER

V\$LGWRIO_OUTLIER contains entries corresponding to Log Writer (LGWR) process I/Os that have taken a long time (more than 500 ms) to complete. Use this view to see if there are any occasional delays in serving disk I/O requests by the storage subsystem.

Column	Datatype	Description
FUNCTION_NAME	VARCHAR2(18)	I/O function name of the delayed I/O
IO_SIZE	NUMBER	Size of the I/O in bytes
WAIT_EVENT	VARCHAR2(64)	Wait event name that was used to track the I/O
FILE_NAME	VARCHAR2(513)	Name of the file to which the I/O was targeted
IO_LATENCY	NUMBER	Time taken to complete the I/O (in milliseconds)
DISK1_NAME	VARCHAR2(255)	For Oracle ASM, the name of the first disk to which the I/O was issued
DISK1_LATENCY	NUMBER	Latency seen on the first disk (in milliseconds)
DISK2_NAME	VARCHAR2(255)	For Oracle ASM, the name of the second disk to which the I/O was issued
DISK2_LATENCY	NUMBER	Latency seen on the second disk (in milliseconds)
DISK3_NAME	VARCHAR2(255)	For Oracle ASM, the name of the third disk to which the I/O was issued
DISK3_LATENCY	NUMBER	Latency seen on the third disk (in milliseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

- "[V\\$KERNEL_IO_OUTLIER](#)"

8.34 V\$LIBCACHE_LOCKS

V\$LIBCACHE_LOCKS displays information about the library cache locks and pins. Locks and pins are distinguished based on the value of the TYPE column.

Column	Datatype	Description
TYPE	VARCHAR2(4)	LOCK or PIN
ADDR	RAW(4 8)	Address of the lock/pin
HOLDING_USER_SESSION	RAW(4 8)	User session holding this lock/pin
HOLDING_SESSION	RAW(4 8)	Session holding this lock/pin
OBJECT_HANDLE	RAW(4 8)	Handle address for which the lock/pin is acquired
LOCK_HELD	RAW(4 8)	If the type is LOCK, then LOCK_HELD represents the pin that is pinning the object. If the type is PIN, then LOCK_HELD represents the lock that is locking the object.
REFCOUNT	NUMBER	Reference count for this lock/pin

Column	Datatype	Description
MODE_HELD	NUMBER	Lock/pin mode held: <ul style="list-style-type: none"> • 0 - No lock/pin held • 1 - Null mode • 2 - Share mode • 3 - Exclusive mode
MODE_REQUESTED	NUMBER	Lock/pin mode requested: <ul style="list-style-type: none"> • 0 - No lock/pin requested • 1 - Null mode • 2 - Share mode • 3 - Exclusive mode
SAVEPOINT_NUMBER	NUMBER	Kernel transaction savepoint number at the time the lock/pin was acquired
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.35 V\$LIBRARY_CACHE_MEMORY

V\$LIBRARY_CACHE_MEMORY displays information about memory allocated to library cache memory objects in different namespaces.

A memory object is an internal grouping of memory for efficient management. A library cache object may consist of one or more memory objects.

Column	Datatype	Description
LC_NAMESPACE	VARCHAR2 (15)	Library cache namespace
LC_INUSE_MEMORY_OBJECTS	NUMBER	Number of library cache memory objects currently in use in the shared pool
LC_INUSE_MEMORY_SIZE	NUMBER	Total size of library cache in-use memory objects (in megabytes)
LC_FREEABLE_MEMORY_OBJECTS	NUMBER	Number of freeable library cache memory objects in the shared pool
LC_FREEABLE_MEMORY_SIZE	NUMBER	Size of library cache freeable memory objects (in megabytes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.36 V\$LIBRARYCACHE

V\$LIBRARYCACHE contains statistics about library cache performance and activity.

Column	Datatype	Description
NAMESPACE	VARCHAR2(64)	Library cache namespace
GETS	NUMBER	Number of times a lock was requested for objects of this namespace
GETHITS	NUMBER	Number of times an object's handle was found in memory
GETHITRATIO	NUMBER	Ratio of GETHITS to GETS
PINS	NUMBER	Number of times a PIN was requested for objects of this namespace
PINHITS	NUMBER	Number of times all of the metadata pieces of the library object were found in memory
PINHITRATIO	NUMBER	Ratio of PINHITS to PINS
RELOADS	NUMBER	Any PIN of an object that is not the first PIN performed since the object handle was created, and which requires loading the object from disk
INVALIDATIONS	NUMBER	Total number of times objects in this namespace were marked invalid because a dependent object was modified
DLM_LOCK_REQUESTS	NUMBER	Number of GET requests lock instance locks
DLM_PIN_REQUESTS	NUMBER	Number of PIN requests lock instance locks
DLM_PIN_RELEASES	NUMBER	Number of release requests PIN instance locks
DLM_INVALIDATION_REQUESTS	NUMBER	Number of GET requests for invalidation instance locks
DLM_INVALIDATIONS	NUMBER	Number of invalidation pings received from other instances
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.37 V\$LICENSE

V\$LICENSE displays information about license limits.

Column	Datatype	Description
SESSIONS_MAX	NUMBER	Maximum number of concurrent user sessions allowed for the instance
SESSIONS_WARNING	NUMBER	Warning limit for concurrent user sessions for the instance
SESSIONS_CURRENT	NUMBER	Current number of concurrent user sessions
SESSIONS_HIGHWATER	NUMBER	Highest number of concurrent user sessions since the instance started
USERS_MAX	NUMBER	Maximum number of named users allowed for the database
CPU_COUNT_CURRENT	NUMBER	Current number of logical CPUs or processors on the system
CPU_CORE_COUNT_CURRENT	NUMBER	Current number of CPU cores on the system (includes subcores of multicore CPUs, as well as single-core CPUs)

Column	Datatype	Description
CPU_SOCKET_COUNT_CURRENT	NUMBER	Current number of CPU sockets on the system (represents an absolute count of CPU chips on the system, regardless of multithreading or multicore architectures)
CPU_COUNT_HIGHWATER	NUMBER	Highest number of logical CPUs or processors on the system since the instance started
CPU_CORE_COUNT_HIGHWATER	NUMBER	Highest number of CPU cores on the system since the instance started (includes subcores of multicore CPUs, as well as single-core CPUs)
CPU_SOCKET_COUNT_HIGHWAT_ER	NUMBER	Highest number of CPU sockets on the system since the instance started (represents an absolute count of CPU chips on the system, regardless of multithreading or multicore architectures)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **Note:**

The availability of the CPU core count and CPU socket count statistics is subject to the operating system platform on which the Oracle Database is running. If a statistic is unavailable, the view will return NULL for the statistic value.

8.38 V\$LOADSTAT

V\$LOADSTAT contains errors that occurred when updating indexes on a table during a load using the Direct Path API.

Column	Datatype	Description
OWNER	VARCHAR2 (31)	Schema name
TABNAME	VARCHAR2 (31)	Table name
INDEXNAME	VARCHAR2 (31)	Index name
SUBNAME	VARCHAR2 (31)	Index sub name
MESSAGE_NUM	NUMBER	Error message number
MESSAGE	VARCHAR2 (4000)	Error message
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.39 V\$LOADPSTAT

V\$LOADPSTAT contains statistics about the number of rows loaded into a partition, or subpartition, during a load using the Direct Path API.

Column	Datatype	Description
OWNER	VARCHAR2 (31)	Schema name
TABNAME	VARCHAR2 (31)	Table name
PARTNAME	VARCHAR2 (31)	Partition name
LOADED	NUMBER	Number of rows loaded
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.40 V\$LOCK

V\$LOCK lists the locks currently held by the Oracle Database and outstanding requests for a lock or latch.

Column	Datatype	Description
ADDR	RAW (4 8)	Address of lock state object
KADDR	RAW (4 8)	Address of lock
SID	NUMBER	Identifier for session holding or acquiring the lock
TYPE	VARCHAR2 (2)	Type of user or system lock <p>The locks on the user types are obtained by user applications. Any process that is blocking others is likely to be holding one of these locks. The user type locks are:</p> <ul style="list-style-type: none"> TM - DML enqueue TX - Transaction enqueue UL - User supplied <p>The system type locks are listed in Table 8-1. Be aware that not all types of locks are documented. To find a complete list of locks for the current release, query the V\$LOCK_TYPE data dictionary view, described on "V\$LOCK_TYPE".</p>
ID1	NUMBER	Lock identifier #1 (depends on type)
ID2	NUMBER	Lock identifier #2 (depends on type)

Column	Datatype	Description
LMODE	NUMBER	<p>Lock mode in which the session holds the lock:</p> <ul style="list-style-type: none"> • 0 - none • 1 - null (NULL) • 2 - row-S (SS) • 3 - row-X (SX) • 4 - share (S) • 5 - S/Row-X (SSX) • 6 - exclusive (X)
REQUEST	NUMBER	<p>Lock mode in which the process requests the lock:</p> <ul style="list-style-type: none"> • 0 - none • 1 - null (NULL) • 2 - row-S (SS) • 3 - row-X (SX) • 4 - share (S) • 5 - S/Row-X (SSX) • 6 - exclusive (X)
CTIME	NUMBER	Time since current mode was granted
BLOCK	NUMBER	<p>Indicates whether the lock in question is blocking other processes. The possible values are:</p> <ul style="list-style-type: none"> • 0 - The lock is not blocking any other processes • 1 - The lock is blocking other processes • 2 - The lock is not blocking any blocked processes on the local node, but it may or may not be blocking processes on remote nodes. This value is used only in Oracle Real Application Clusters (Oracle RAC) configurations (not in single instance configurations).
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Table 8-1 Values for the TYPE Column: System Types

System Type	Description	System Type	Description
AE	Edition enqueue	MR	Media recovery
AT	Lock held for the ALTER TABLE statement	NA..NZ	Library cache pin instance (A..Z = namespace)
BL	Buffer hash table instance	PF	Password File
CF	Control file schema global enqueue	PI, PS	Parallel operation
CI	Cross-instance function invocation instance	PR	Process startup
CU	Cursor bind	QA..QZ	Row cache instance (A..Z = cache)
DF	datafile instance	RT	Redo thread global enqueue

Table 8-1 (Cont.) Values for the TYPE Column: System Types

System Type	Description	System Type	Description
DL	Direct loader parallel index create	SC	System change number instance
DM	Mount/startup db primary/secondary instance	SM	SMON
DR	Distributed recovery process	SN	Sequence number instance
DX	Distributed transaction entry	SQ	Sequence number enqueue
FS	File set	SS	Sort segment
HW	Space management operations on a specific segment	ST	Space transaction enqueue
IN	Instance number	SV	Sequence number value
IR	Instance recovery serialization global enqueue	TA	Generic enqueue
IS	Instance state	TS	Temporary segment enqueue (ID2=0)
IV	Library cache invalidation instance	TS	New block allocation enqueue (ID2=1)
JQ	Job queue	TT	Temporary table enqueue
KK	Thread kick	UN	User name
LA .. LP	Library cache lock instance lock (A..P = namespace)	US	Undo segment DDL
MM	Mount definition global enqueue	WL	Being-written redo log instance

8.41 V\$LOCK_ACTIVITY

V\$LOCK_ACTIVITY is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE_CACHE_TRANSFER and V\$SEGMENT_STATISTICS views.

Column	Datatype	Description
FROM_VAL	CHAR(4)	Global Cache Resource initial state; always NULL
TO_VAL	CHAR(1)	Global Cache Resource initial state; always S
ACTION_VAL	CHAR(21)	Description of the conversion; always Lock buffers for read
COUNTER	NUMBER	Number of times the lock operation executed
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$INSTANCE_CACHE_TRANSFER](#)"
- "[V\\$SEGMENT_STATISTICS](#)"

8.42 V\$LOCK_TYPE

V\$LOCK_TYPE describes the type of locks available.

Column	Datatype	Description
TYPE	VARCHAR2 (64)	A two-letter internal resource identifier
NAME	VARCHAR2 (64)	Resource type name. This is a short (less than 32 characters) enqueue type name.
ID1_TAG	VARCHAR2 (64)	Description of the enqueue type.
ID2_TAG	VARCHAR2 (64)	Further description of the enqueue type.
IS_USER	VARCHAR2 (3)	User enqueue. These are enqueues that are acquired as a direct result of a SQL statement. Applications may get deadlocks on these enqueues. Such deadlocks are considered application errors.
IS_RECYCLE	VARCHAR2 (3)	Indicates whether the enqueue requires caching of the associated resource in the DLM's resource cache. Possible values: <ul style="list-style-type: none"> • NO: Means the enqueue requires caching of the associated resource in the DLM's resource cache • YES: Means the enqueue does not require caching of the associated resource in the DLM's resource cache
DESCRIPTION	VARCHAR2 (4000)	Explanation of how or for what purpose the enqueue is used.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.43 V\$LOCKDOWN_RULES

V\$LOCKDOWN_RULES displays information about lockdown profile rules that are applicable in the pluggable database (PDB) where this view is queried.

Column	Datatype	Description
RULE_TYPE	VARCHAR2 (128)	Type of the rule: <ul style="list-style-type: none"> • STATEMENT • FEATURE • OPTION
RULE	VARCHAR2 (128)	Rule to be enabled or disabled

Column	Datatype	Description
CLAUSE	VARCHAR2(128)	Clause of the statement
CLAUSE_OPTION	VARCHAR2(128)	Option of the clause
STATUS	VARCHAR2(7)	Status of the lockdown profile: <ul style="list-style-type: none"> • ENABLE • DISABLE • EMPTY
USERS	VARCHAR2(6)	Type of users affected by the rule: <ul style="list-style-type: none"> • ALL • LOCAL • COMMON
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs • 1: This value is used for rows containing data that pertain to only the root. • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Security Guide for more information about PDB lockdown profiles

8.44 V\$LOCKED_OBJECT

V\$LOCKED_OBJECT lists all locks acquired by every transaction on the system. It shows which sessions are holding DML locks (that is, TM-type enqueues) on what objects and in what mode.

Column	Datatype	Description
XIDUSN	NUMBER	Undo segment number
XIDSLOT	NUMBER	Slot number
XIDSQN	NUMBER	Sequence number
OBJECT_ID	NUMBER	Object ID being locked
SESSION_ID	NUMBER	Session ID
ORACLE_USERNAME	VARCHAR2(128)	Oracle user name
OS_USER_NAME	VARCHAR2(128)	Operating system user name
PROCESS	VARCHAR2(24)	Operating system process ID

Column	Datatype	Description
LOCKED_MODE	NUMBER	<p>Lock mode. The numeric values for this column map to these text values for the lock modes for table locks:</p> <ul style="list-style-type: none"> • 0 - NONE: lock requested but not yet obtained • 1 - NULL • 2 - ROWS_S (SS): Row Share Lock • 3 - ROW_X (SX): Row Exclusive Table Lock • 4 - SHARE (S): Share Table Lock • 5 - S/ROW-X (SSX): Share Row Exclusive Table Lock • 6 - Exclusive (X): Exclusive Table Lock <p>See Also: <i>Oracle Database Concepts</i> for more information about lock modes for table locks</p>
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.45 V\$LOG

V\$LOG displays log file information from the control file.

Column	Datatype	Description
GROUP#	NUMBER	Log group number
THREAD#	NUMBER	Log thread number
SEQUENCE#	NUMBER	Log sequence number
BYTES	NUMBER	Size of the log (in bytes)
BLOCKSIZE	NUMBER	Block size of the logfile (512 or 4096)
MEMBERS	NUMBER	Number of members in the log group
ARCHIVED	VARCHAR2 (3)	Archive status (YES) or (NO)

Column	Datatype	Description
STATUS	VARCHAR2 (16)	<p>Log status:</p> <ul style="list-style-type: none"> • UNUSED - Online redo log has never been written to. This is the state of a redo log that was just added, or just after a <code>RESETLOGS</code>, when it is not the current redo log. • CURRENT - Current redo log. This implies that the redo log is active. The redo log could be open or closed. • ACTIVE - Log is active but is not the current log. It is needed for crash recovery. It may be in use for block recovery. It may or may not be archived. • CLEARING - Log is being re-created as an empty log after an <code>ALTER DATABASE CLEAR LOGFILE</code> statement. After the log is cleared, the status changes to UNUSED. • CLEARING_CURRENT - Current log is being cleared of a closed thread. The log can stay in this status if there is some failure in the switch such as an I/O error writing the new log header. • INACTIVE - Log is no longer needed for instance recovery. It may be in use for media recovery. It may or may not be archived.
FIRST_CHANGE#	NUMBER	Lowest system change number (SCN) in the log
FIRST_TIME	DATE	Time of the first SCN in the log
NEXT_CHANGE#	NUMBER	Highest change number (SCN) in the log
		When <code>STATUS=CURRENT</code> , <code>NEXT_CHANGE#</code> is set to the highest possible SCN. Starting with Oracle Database 19c, Release Update 19.5, the highest possible SCN is 9295429630892703743. In prior versions, the highest possible SCN is 18446744073709551615.
NEXT_TIME	DATE	Time of the highest SCN in the log. When <code>STATUS=CURRENT</code> , <code>NEXT_TIME</code> is set to NULL.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.46 V\$LOG_HISTORY

`V$LOG_HISTORY` displays log history information from the control file.

Column	Datatype	Description
RECID	NUMBER	Control file record ID
STAMP	NUMBER	Control file record stamp
THREAD#	NUMBER	Thread number of the archived log
SEQUENCE#	NUMBER	Sequence number of the archived log
FIRST_CHANGE#	NUMBER	Lowest system change number (SCN) in the log
FIRST_TIME	DATE	Time of the first entry (lowest SCN) in the log
NEXT_CHANGE#	NUMBER	Highest SCN in the log
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the database when the log was written

Column	Datatype	Description
RESETLOGS_TIME	DATE	Resetlogs time of the database when the log was written
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.47 V\$LOGFILE

V\$LOGFILE contains information about redo log files.

Column	Datatype	Description
GROUP#	NUMBER	Redo log group identifier number
STATUS	VARCHAR2 (7)	<p>Status of the log member:</p> <ul style="list-style-type: none"> • INVALID - File is inaccessible • STALE - File's contents are incomplete • DELETED - File is no longer used • null - File is in use
TYPE	VARCHAR2 (7)	<p>Type of the logfile:</p> <ul style="list-style-type: none"> • ONLINE • STANDBY
MEMBER	VARCHAR2 (513)	Redo log member name
IS_RECOVERY_DEST_FILE	VARCHAR2 (3)	Indicates whether the file was created in the fast recovery area (YES) or not (NO)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.48 V\$LOGHIST

V\$LOGHIST contains log history information from the control file. This view is retained for historical compatibility. Oracle recommends that you use V\$LOG_HISTORY instead.

See Also:

"V\$LOG_HISTORY"

Column	Datatype	Description
THREAD#	NUMBER	Log thread number
SEQUENCE#	NUMBER	Log sequence number
FIRST_CHANGE#	NUMBER	Lowest SCN in the log
FIRST_TIME	DATE	Time of first SCN in the log
SWITCH_CHANGE#	NUMBER	SCN at which the log switch occurred; one more than highest SCN in the log
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.49 V\$LOGMNR_CONTENTS

V\$LOGMNR_CONTENTS contains log history information. To query this view, you must have the LOGMINING privilege.

When a SELECT statement is executed against the V\$LOGMNR_CONTENTS view, the archive redo log files are read sequentially. Translated records from the redo log files are returned as rows in the V\$LOGMNR_CONTENTS view. This continues until either the filter criteria specified at startup (EndTime or endScn) are met or the end of the archive log file is reached.

When this view is queried from a PDB, it returns only redo generated by that PDB.

Column	Datatype	Description
SCN	NUMBER	System change number (SCN) when the database change was made
START_SCN	NUMBER	System change number (SCN) when the transaction that contains this change started; only meaningful if the COMMITTED_DATA_ONLY option was chosen in a DBMS_LOGMNR.START_LOGMNR() invocation, NULL otherwise. This column may also be NULL if the query is run over a time/SCN range that does not contain the start of the transaction.
COMMIT_SCN	NUMBER	System change number (SCN) when the transaction committed; only meaningful if the COMMITTED_DATA_ONLY option was chosen in a DBMS_LOGMNR.START_LOGMNR() invocation
TIMESTAMP	DATE	Timestamp when the database change was made
START_TIMESTAMP	DATE	Timestamp when the transaction that contains this change started; only meaningful if the COMMITTED_DATA_ONLY option was chosen in a DBMS_LOGMNR.START_LOGMNR() invocation, NULL otherwise. This column may also be NULL if the query is run over a time/SCN range that does not contain the start of the transaction.
COMMIT_TIMESTAMP	DATE	Timestamp when the transaction committed; only meaningful if the COMMITTED_DATA_ONLY option was chosen in a DBMS_LOGMNR.START_LOGMNR() invocation
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction that generated the change
XIDSLT	NUMBER	Transaction ID slot number of the transaction that generated the change

Column	Datatype	Description
XIDSQN	NUMBER	Transaction ID sequence number of the transaction that generated the change
XID	RAW (8)	Raw representation of the transaction identifier
PXIDUSN	NUMBER	Parent transaction ID undo segment number of a parallel transaction
PXIDSLT	NUMBER	Parent transaction ID slot number of a parallel transaction
PXIDSQN	NUMBER	Parent transaction ID sequence number of a parallel transaction
PXID	RAW (8)	Raw representation of the parent transaction identifier
TX_NAME	VARCHAR2 (256)	Name of the transaction that made the change; only meaningful if the transaction is a named transaction
OPERATION	VARCHAR2 (32)	<p>User level SQL operation that made the change:</p> <ul style="list-style-type: none"> • INTERNAL - Change was caused by internal operations initiated by the database • INSERT - Change was caused by an insert statement • DELETE - Change was caused by a delete statement • UPDATE - Change was caused by an update statement • DDL - Change was caused by a DDL statement • START - Change was caused by the start of a transaction • COMMIT - Change was caused by the commit of a transaction • SEL_LOB_LOCATOR - Operation was a SELECT statement that returned a LOB locator • LOB_WRITE - Change was caused by an invocation of DBMS_LOB.WRITE • LOB_TRIM - Change was caused by an invocation of DBMS_LOB.TRIM • SELECT_FOR_UPDATE - Operation was a SELECT FOR UPDATE statement • LOB_ERASE - Change was caused by an invocation of DBMS_LOB.ERASE • MISSING_SCN - LogMiner encountered a gap in the redo records. This is most likely because not all redo logs were registered with LogMiner. • ROLLBACK - Change was caused by a full rollback of a transaction • XML DOC BEGIN - Beginning of a change to an XMLType column or table • XML DOC WRITE - Data for an XML document • XML DOC END - End of the Data for an XML document • UNSUPPORTED - Change was caused by operations not currently supported by LogMiner (for example, changes made to nested tables) <p>The OPERATION and OPERATION_CODE columns in this view are available for top-level user operations, for example, DML and DDL. Values that are not documented for these columns are internal to LogMiner or the RDBMS and do not reflect user operations.</p>

Column	Datatype	Description
OPERATION_CODE	NUMBER	<p>Number of the operation code:</p> <ul style="list-style-type: none"> • 0 - INTERNAL • 1 - INSERT • 2 - DELETE • 3 - UPDATE • 5 - DDL • 6 - START • 7 - COMMIT • 9 - SELECT_LOB_LOCATOR • 10 - LOB_WRITE • 11 - LOB_TRIM • 25 - SELECT_FOR_UPDATE • 29 - LOB_ERASE • 34 - MISSING_SCN • 36 - ROLLBACK • 68 - XML DOC BEGIN • 70 = XML DOC WRITE • 71 = XML DOC END • 255 - UNSUPPORTED
ROLLBACK	NUMBER	<p>1 = if the redo record was generated because of a partial or a full rollback of the associated transaction</p> <p>0 = otherwise</p>
SEG_OWNER	VARCHAR2 (386)	Owner of the modified data segment
SEG_NAME	VARCHAR2 (256)	Name of the modified data segment
TABLE_NAME	VARCHAR2 (386)	Name of the modified table (in case the redo pertains to a table modification)
SEG_TYPE	NUMBER	<p>Type of the modified data segment:</p> <ul style="list-style-type: none"> • 0 - UNKNOWN • 1 - INDEX • 2 - TABLE • 19 - TABLE PARTITION • 20 - INDEX PARTITION • 34 - TABLE SUBPARTITION • All other values - UNSUPPORTED
SEG_TYPE_NAME	VARCHAR2 (32)	<p>Segment type name:</p> <ul style="list-style-type: none"> • UNKNOWN • INDEX • TABLE • TABLE PARTITION • INDEX PARTITION • TABLE SUBPARTITION • UNSUPPORTED
TABLE_SPACE	VARCHAR2 (92)	<p>Name of the tablespace containing the modified data segment. This column is not populated for rows where the value of the OPERATION column is DDL. This is because DDL may operate on more than one tablespace.</p>
ROW_ID	VARCHAR2 (18)	<p>Row ID of the row modified by the change (only meaningful if the change pertains to a DML). This will be NULL if the redo record is not associated with a DML.</p>
USERNAME	VARCHAR2 (384)	Name of the user who executed the transaction

Column	Datatype	Description
OS_USERNAME	VARCHAR2 (4000)	Name of the operating system user
MACHINE_NAME	VARCHAR2 (4000)	Machine from which the user connected to the database
AUDIT_SESSIONID	NUMBER	Audit session ID associated with the user session making the change
SESSION#	NUMBER	Session number of the session that made the change
SERIAL#	NUMBER	Serial number of the session that made the change
SESSION_INFO	VARCHAR2 (4000)	Information about the database session that executed the transaction. Contains process information, machine name from which the user logged in, and so on. A possible SESSION_INFO column may contain the following: <ul style="list-style-type: none"> • login_username = HR • client_info = • OS_username = jkundu • Machine_name = nirvan • OS_terminal = pts/31 • OS_program_name = sqlplus@nirvan (TNS V1-V3)
THREAD#	NUMBER	Number of the thread that made the change to the database
SEQUENCE#	NUMBER	Sequence number of the SQL statement within the transaction. If you are mining without the COMMITTED_DATA_ONLY option set, then this value is 1.
RBASQN	NUMBER	Sequence# associated with the Redo Block Address (RBA) of the redo record associated with the change
RBABLK	NUMBER	RBA block number within the log file
RBABYTE	NUMBER	RBA byte offset within the block
UBAFIL	NUMBER	Undo Block Address (UBA) file number identifying the file containing the undo block
UBABLK	NUMBER	UBA block number for the undo block
UBAREC	NUMBER	UBA record index within the undo block
UBASQN	NUMBER	UBA undo block sequence number
ABS_FILE#	NUMBER	Data block absolute file number of the block changed by the transaction
REL_FILE#	NUMBER	Data block relative file number. The file number is relative to the tablespace of the object.
DATA_BLK#	NUMBER	Data block number within the file
DATA_OBJ#	NUMBER	Data block object number identifying the object
DATA_OBJV#	NUMBER	Version number of the table being modified
DATA_OBJD#	NUMBER	Data block data object number identifying the object within the tablespace
SQL_REDO	VARCHAR2 (4000)	Reconstructed SQL statement that is equivalent to the original SQL statement that made the change. Refer to <i>Oracle Database Utilities</i> before executing SQL_REDO to your database. LogMiner does not generate SQL redo for temporary tables. In such a case, this column will contain the string /* No SQL_REDO for temporary tables */.

Column	Datatype	Description
SQL_UNDO	VARCHAR2(4000)	<p>Reconstructed SQL statement that can be used to undo the effect of the original statement that made the change. DDL statements have no corresponding <code>SQL_UNDO</code>. Refer to <i>Oracle Database Utilities</i> before executing <code>SQL_UNDO</code> to your database.</p> <p>LogMiner does not generate SQL undo for temporary tables. In such a case, this column will contain the string <code>/* No SQL_UNDO for temporary tables */</code>.</p>
RS_ID	VARCHAR2(32)	<p>Record set ID. The tuple (<code>RS_ID</code>, <code>SSN</code>) together uniquely identifies a logical row change. This will usually mean one row from <code>V\$LOGMNR_CONTENTS</code>, but could be more than one row if a single SQL statement for either the Redo or Undo would be too large to fit within the respective columns <code>SQL_UNDO</code> or <code>SQL_REDO</code>. <code>RS_ID</code> uniquely identifies the redo record that generated the row.</p>
SSN	NUMBER	<p>SQL sequence number. Used in conjunction with <code>RS_ID</code>, this uniquely identifies a logical row change, shown as one or more rows from the <code>V\$LOGMNR_CONTENTS</code> view.</p>
CSF	NUMBER	<p>Continuation SQL flag. Possible values are:</p> <ul style="list-style-type: none"> • 0 - Indicates <code>SQL_REDO</code> and <code>SQL_UNDO</code> is contained within the same row • 1 - Indicates that either <code>SQL_REDO</code> or <code>SQL_UNDO</code> is greater than 4000 bytes in size and is continued in the next row returned by the view
INFO	VARCHAR2(64)	<p>Informational message about the row. For instance, the string "USER DDL" indicates that the DDL statement returned in the <code>SQL_REDO</code> column was the top-level DDL executed by the user and the string "INTERNAL DDL" indicates that the DDL statement returned in the <code>SQL_REDO</code> column was executed internally by the RDBMS.</p>
STATUS	NUMBER	<p>A value of 0 indicates that the reconstructed SQL statements as shown in the <code>SQL_REDO</code> and <code>SQL_UNDO</code> columns are valid executable SQL statements. Otherwise, the reconstructed SQL statements are not executable. This may be because no data dictionary was provided to LogMiner for the analysis, or that the data dictionary provided did not have the definition of the object being mined.</p> <p>A value of 5 indicates that this row is part of a change to an XMLType column or table and the XML document must be assembled before being applied.</p>
REDO_VALUE	NUMBER	Used as input to the <code>DBMS_LOGMNR.MINE_VALUE()</code> and <code>DBMS_LOGMNR.COLUMN_PRESENT()</code> functions
UNDO_VALUE	NUMBER	Used as input to the <code>DBMS_LOGMNR.MINE_VALUE()</code> and <code>DBMS_LOGMNR.COLUMN_PRESENT()</code> functions
SAFE_RESUME_SCN	NUMBER	Reserved for future use
CSCN	NUMBER	This column is deprecated in favor of the <code>COMMIT_SCN</code> column
OBJECT_ID	RAW(16)	Object identifier for DMLs to XMLType tables. For changes to non-typed tables, this column is NULL.
EDITION_NAME	VARCHAR2(384)	Identifies the edition in which a DDL statement was executed
CLIENT_ID	VARCHAR2(64)	Client identifier in the session that performed the operation, if available.
SRC_CON_NAME	VARCHAR2(384)	Contains the pluggable database (PDB) name. This information will only be available when mining with a current LogMiner dictionary.
SRC_CON_ID	NUMBER	Contains the PDB ID (the <code>PDB_ID</code> column from the <code>DBA_PDDBS</code> view). This information will be available only with a current LogMiner dictionary.

Column	Datatype	Description
SRC_CON_UID	NUMBER	Contains the PDB UID (the CON_UID column from the DBA_PDBS view). This information will be available with or without a current LogMiner dictionary.
SRC_CON_DBID	NUMBER	Contains the PDB identifier (the DBID column from the DBA_PDBS view). This information will only be available when mining with a current LogMiner dictionary.
SRC_CON_GUID	RAW(16)	Contains the GUID associated with the PDB (the GUID column from the DBA_PDBS view). This information will only be available when mining with a current LogMiner dictionary.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root

 **See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_LOB package

8.50 V\$LOGMNR_DICTIONARY

V\$LOGMNR_DICTIONARY contains log history information.

Column	Datatype	Description
DB_NAME	VARCHAR2(9)	Name of the database
DB_ID	NUMBER	Database ID
DB_CREATED	DATE	Creation date of the source database (corresponds to the CREATED column in the V\$DATABASE view)
TIMESTAMP	DATE	Date when the dictionary was created
RESET_SCN	NUMBER	Reset log SCN when the dictionary was created
RESET_SCN_TIME	DATE	Timestamp of the reset log SCN when the dictionary was created
DB_VERSION_TIME	DATE	Version time for the source database (corresponds to the VERSION_TIME column in the V\$DATABASE view)
DB_CHARACTER_SET	VARCHAR2(30)	Character set of the source database
DB_VERSION	VARCHAR2(64)	This column is deprecated.
DB_STATUS	VARCHAR2(64)	This column is deprecated.
DICTIONARY_SCN	NUMBER	Database checkpoint SCN at which the dictionary was created
ENABLED_THREAD_MAP	RAW(16)	This column is deprecated.
DB_TXN_SCN	NUMBER	SCN at which the dictionary was created

Column	Datatype	Description
FILENAME	VARCHAR2 (512)	Dictionary file name
INFO	VARCHAR2 (32)	Informational/Status message
		BAD_DATE indicates that the SCN of the dictionary file does not match the SCN range of the log files
STATUS	NUMBER	A NULL indicates a valid dictionary file for the list of log files. A non-NULL value indicates further information is contained in the INFO column as a text string.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.51 V\$LOGMNR_DICTIONARY_LOAD

V\$LOGMNR_DICTIONARY_LOAD displays information about LogMiner dictionaries for all active LogMiner sessions on the system.

Each query of this view will return one row for each attached LogMiner session. This view will not show valid information for LogMiner adhoc query clients.

Column	Datatype	Description
SESSION_ID	NUMBER	LogMiner session ID
LOGMNR_UID	NUMBER	LogMiner dictionary UID
ACTION#	NUMBER	Reserved for internal use
OPCODE	NUMBER	Reserved for internal use
COMMAND	VARCHAR2 (161)	Current command being executed
CURRENT_STATE	VARCHAR2 (32)	Summary information if LOADED=ACTIVE
COMPLETED_ACTIONS	NUMBER	The steps completed so far
TOTAL_ACTIONS	NUMBER	Total steps to complete
LOADED	VARCHAR2 (7)	Status of the dictionary load: <ul style="list-style-type: none"> • YES - dictionary has been loaded • NO - dictionary has not been loaded • ACTIVE - dictionary is in the process of being loaded
PERCENT_DONE	NUMBER	Percentage of the dictionary that has been loaded
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.52 V\$LOGMNR_LATCH

V\$LOGMNR_LATCH can be joined with the V\$LATCH and the V\$LATCH_CHILDREN views to obtain statistics about different latches used by active LogMiner persistent sessions.

A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating a Replication capture.

Column	Datatype	Description
SESSION_ID	NUMBER	Unique identifier of the LogMiner persistent session
NAME	VARCHAR2 (32)	<p>Name of the Latch:</p> <ul style="list-style-type: none"> LogMiner internal state - Identifies the latch that protects communications between the LogMiner READER, PREPARER, and BUILDER processes LogMiner memory allocation - Identifies the latch that protects all memory allocation and deallocation inside LogMiner LogMiner transaction list - Identifies the latch that protects interaction between the LogMiner layer and its clients during Data Guard SQL Apply on a logical standby database
CHILD_ADDR	RAW (4 8)	Address of the child latch object. This column matches the corresponding ADDR column in the V\$LATCH_CHILDREN view
STATE	VARCHAR2 (6)	<p>State of the Latch:</p> <ul style="list-style-type: none"> UNINIT - The latch structure is uninitialized; that is, it is not currently assigned to any LogMiner persistent session READY - The latch structure is being used by a persistent LogMiner session
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

- "V\$LATCH"
- "V\$LATCH_CHILDREN"

8.53 V\$LOGMNR_LOGS

V\$LOGMNR_LOGS contains log information.

Column	Datatype	Description
LOG_ID	NUMBER	This column is deprecated.
FILENAME	VARCHAR2 (512)	Name of the log file

Column	Datatype	Description
LOW_TIME	DATE	Oldest date of any records in the file
HIGH_TIME	DATE	Most recent date of any records in the file
DB_ID	NUMBER	Database ID
DB_NAME	VARCHAR2 (8)	Name of the database
RESET_SCN	NUMBER	Resetlogs SCN of the database incarnation that generated the log file
RESET_SCN_TIME	DATE	Resetlogs timestamp of the database incarnation that generated the log file
COMPATIBLE	VARCHAR2 (17)	The setting of the database COMPATIBLE initialization parameter at the time the log file was generated
THREAD_ID	NUMBER	Thread number
THREAD_SQN	NUMBER	Thread sequence number
LOW_SCN	NUMBER	SCN allocated when log switched into
NEXT_SCN	NUMBER	SCN after this log. Low SCN of the next log.
DICTIONARY_BEGIN	VARCHAR2 (3)	Indicates whether dictionary dumped to redo logs starts in this redo log (YES) or not (NO)
DICTIONARY_END	VARCHAR2 (3)	Indicates whether dictionary dumped to redo logs ends in this redo log (YES) or not (NO)
TYPE	VARCHAR2 (7)	Redo log file type: <ul style="list-style-type: none">• ARCHIVED• ONLINE
BLOCKSIZE	NUMBER	Database block size
FILESIZE	NUMBER	Size of the redo file (in bytes)
INFO	VARCHAR2 (32)	Informational message. A value of MISSING_LOGFILE will be assigned to a row entry where a needed log file is missing from the list of log files.
STATUS	NUMBER	Status of the redo log file: <ul style="list-style-type: none">• 0 - Will be read• 1 - First to be read• 2 - Not needed• 4 - Missing log file
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.54 V\$LOGMNR_PARAMETERS

V\$LOGMNR_PARAMETERS contains log information.

Column	Datatype	Description
START_DATE	DATE	Date to start the search
REQUIRED_START_DATE	DATE	Required date to start the search if DDL tracking is enabled

Column	Datatype	Description
END_DATE	DATE	Date to end the search
START_SCN	NUMBER	System change number to start the search
REQUIRED_START_SCN	NUMBER	Required system change number to start the search if DDL tracking is enabled
END_SCN	NUMBER	System change number to end the search
OPTIONS	NUMBER	Options specified for the current LogMiner session
INFO	VARCHAR2 (32)	This column is always null.
STATUS	NUMBER	This column is always 0.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.55 V\$LOGMNR_PROCESS

V\$LOGMNR_PROCESS identifies all processes attached to an active LogMiner persistent session.

(A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.) This view can be joined with either the V\$SESSION view or the V\$PROCESS view to gather process-specific information.

Column	Datatype	Description
SESSION_ID	NUMBER	Unique identifier for the LogMiner persistent session
PID	NUMBER	Oracle process identifier for the SQL Apply or Replication capture process (same as the V\$PROCESS.PID)
SPID	VARCHAR2 (24)	Operating system process identifier (same as the V\$PROCESS.SPID)
ROLE	VARCHAR2 (32)	Identifies the role of the active LogMiner process: READER, PREPARER, BUILDER, COORDINATOR, or APPLY SERVER
USERNAME	VARCHAR2 (15)	Operating system process user name that is connected to the database
SID	NUMBER	Session identifier for the V\$SESSION.SID process
SERIAL#	NUMBER	Session serial number associated with the V\$SESSION.SERIAL process
LATCHWAIT	VARCHAR2 (16)	Address of the latch the process is waiting for; NULL if none
LATCHSPIN	VARCHAR2 (16)	This column is obsolete
WORK_MICROSEC	VARCHAR2 (21)	Microseconds spent by the process doing useful work
OVERHEAD_MICROSEC	VARCHAR2 (21)	Microseconds spent by the process doing overhead tasks or simply waiting/idling

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

- ["V\\$SESSION"](#)
- ["V\\$PROCESS"](#)

8.56 V\$LOGMNR_SESSION

V\$LOGMNR_SESSION displays information about active LogMiner persistent sessions.

(A LogMiner persistent session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.) Transient LogMiner sessions (those created as a result of querying the V\$LOGMNR_CONTENTS view) do not show up in the V\$LOGMNR_SESSION view. The statistics shown in this view correspond to snapshots of the system and are not cumulative in nature.

Column	Datatype	Description
SESSION_ID	NUMBER	Unique identifier for the LogMiner persistent session
SESSION_NAME	VARCHAR2 (32)	Unique session name
SESSION_STATE	VARCHAR2 (9)	<p>Current state of the LogMiner persistent session:</p> <ul style="list-style-type: none"> • READY - Client has created the LogMiner persistent session and added the relevant archived redo log files, but has not loaded the initial LogMiner dictionary • STARTED - The LogMiner dictionary has been loaded • ACTIVE - The LogMiner persistent session is mining the redo stream • DETACHED - The LogMiner persistent session is not currently active, and it is in the process of becoming inactive • DISCARDED - Client is about to destroy the LogMiner persistent session
DB_NAME	VARCHAR2 (128)	Global database name for the source database
DB_ID	NUMBER	Database identifier of the source database
RESET_SCN	NUMBER	System change number (SCN) when the session started
RESET_TIMESTAMP	NUMBER	Time of the RESETLOGS when the LogMiner persistent session started
RESET_TIME	DATE	The time when the session started
NUM_PROCESS	NUMBER	Number of processes allocated to this session
CHUNK_SIZE	NUMBER	Amount of memory allocated for this chunk

Column	Datatype	Description
START_SCN	NUMBER	System change number (SCN) at start of the session
END_SCN	NUMBER	System change number (SCN) at end of the session
SPILL_SCN	NUMBER	In the event of a restart, redo records with an SCN lower than this will not be read from the archived redo log files
PROCESSED_SCN	NUMBER	The BUILDER process has successfully mined redo records up to this SCN
PROCESSED_TIME	DATE	The BUILDER process has successfully mined redo records up to this time
PREPARED_SCN	NUMBER	The PREPARER processes have successfully transformed all redo records below this SCN into logical change records (LCRs). However the LCRs may not have been grouped into transactions or merged in case they pertain to chained rows or LOB updates.
READ_SCN	NUMBER	The READER process has read all redo records below this SCN
LOW_MARK_SCN	NUMBER	LogMiner has delivered all transactions that committed below this SCN to the client
CONSUMED_SCN	NUMBER	Client has consumed and released all transactions that committed below this SCN.
MAX_MEMORY_SIZE	NUMBER	Maximum amount of shared memory (in bytes) that LogMiner is allowed to consume
USED_MEMORY_SIZE	NUMBER	Amount of shared memory (in bytes) actually consumed by LogMiner
BUILDER_WORK_SIZE	NUMBER	Amount of redo (in bytes) in the current work unit being processed by the BUILDER process.
PREPARED_WORK_SIZE	NUMBER	Amount of redo (in bytes) that has been prepared by LogMiner
AVAILABLE_WORK_SIZE	NUMBER	Amount of redo records (in bytes) that are ready, but are yet to be consumed by the client
AVAILABLE_TXN	NUMBER	Number of transaction chunks ready for consumption
AVAILABLE_COMMITTED_TXN	NUMBER	Number of committed transactions ready for consumption. This is less than, or equal to, AVAILABLE_TXN.
DELIVERED_TXN	NUMBER	Number of transaction chunks that the client currently has in its possession
DELIVERED_COMMITTED_TXN	NUMBER	Number of committed transaction chunks that the client is currently working on. This is less than, or equal to, the value of the DELIVERED_TXN column.
PINNED_TXN	NUMBER	Number of transactions pinned (the client is actively working on)
PINNED_COMMITTED_TXN	NUMBER	Number of committed transactions pinned (the client is actively working on)
CHECKPOINT_INTERVAL	NUMBER	Checkpoint interval
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

["V\\$LOGMNR_CONTENTS"](#)

8.57 V\$LOGMNR_STATS

V\$LOGMNR_STATS displays the activity currently being performed by the active LogMiner persistent sessions.

Column	Datatype	Description
SESSION_ID	NUMBER	Unique identifier for the LogMiner persistent sessions

Column	Datatype	Description
NAME	VARCHAR2 (64)	<p>Name of the LogMiner statistic, state, or status, including:</p> <ul style="list-style-type: none"> • Bytes of Redo Processed - Cumulative count of bytes processed by SQL Apply • Redo Records Processed - Count of redo records processed by SQL Apply • Txns Delivered to Client - Count of SQL transactions processed by SQL Apply • DML txns delivered - Count of DML transactions processed by SQL Apply • DDL txns delivered - Count of DDL transactions processed by SQL Apply • CTAS txns delivered - Count of CREATE TABLE AS SELECT (CTAS) transactions processed by SQL Apply • Recursive txns delivered - Count of recursive transactions processed by SQL Apply • Rolled back txns seen • LCRs delivered to client - Number of logical change records (LCRs) processed by SQL Apply • Bytes paged out - Cumulative count of bytes that have been paged out. LogMiner pages out memory from the LCR cache to accommodate certain ill-behaved workloads or under-configured systems. The ratio of bytes paged out to bytes of redo processed should be low. If this ratio is high (10% or higher), try increasing the MAX_SGA allocated to SQL Apply. • Microsecs spent in pageout - Time spent by LogMiner paging out memory from the LCR cache • Bytes checkpointed - Keeps track of the amount of bytes checkpointed. The mining engine takes periodic checkpoints, whereby it writes out logical change records (LCRs) pertaining to long-running transactions. The ratio of Bytes Checkpointed to Bytes of Redo Processed should be low. A high ratio (10% or higher) indicates an ill-behaved workload. • Microsecs spent in checkpoint - Time spent by the mining engine taking checkpoints, whereby it writes out logical change records (LCRs) pertaining to long-running transactions. • Bytes rolled back - Cumulative value of the number of bytes rolled back by LogMiner. There are times that LogMiner needs to backtrack and reprocess a section of the redo stream. In this case, it will roll back work it has already done. The ratio of Bytes Rolled Back to Bytes of Redo Processed should be low. If this ratio is high (10% or higher), reduce the number of PREPARER processes allocated to SQL Apply. • Microsecs spent in rollback - Time spent rolling back transactions already applied to the logical standby database
VALUE	VARCHAR2 (64)	The corresponding metric value
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.58 V\$LOGSTDBY

V\$LOGSTDBY is deprecated.

Column	Datatype	Description
SERIAL#	NUMBER	SQL Session serial number. This data is used when joining this view with the V\$SESSION and V\$PX_SESSION views.
LOGSTDBY_ID	NUMBER	Parallel query slave ID
PID	VARCHAR2 (24)	Process ID of the SQL apply process
TYPE	VARCHAR2 (128)	Indicates the task being performed by the process (COORDINATOR, APPLIER, ANALYZER, READER, PREPARER, or BUILDER)
STATUS_CODE	NUMBER	Status number (or Oracle error code) belonging to the STATUS message
STATUS	VARCHAR2 (256)	Description of the current activity of the process
HIGH_SCN	NUMBER	Highest system change number (SCN) seen by the process. This column is used to confirm the progress of the individual process.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.59 V\$LOGSTDBY_PROCESS

V\$LOGSTDBY_PROCESS displays dynamic information about what is happening to the Data Guard log apply services.

This view is helpful when diagnosing performance problems during the logical application of archived redo logs to the standby database, and it can be helpful for other problems. This view is for logical standby databases only.

Column	Datatype	Description
SID	NUMBER	Session id of the associated session. This matches the SID column of the corresponding row in the V\$SESSION view.
SERIAL#	NUMBER	Serial number of the associated session. Together, (SID,SERIAL#) uniquely identify the session in the current database instance.
LOGSTDBY_ID	NUMBER	Parallel query slave ID
SPID	VARCHAR2 (24)	This corresponds to the SPID value of the row corresponding to this process in the V\$PROCESS view

Column	Datatype	Description
TYPE	VARCHAR2(128)	<p>Role that the process plays in the context of SQL Apply:</p> <ul style="list-style-type: none"> • COORDINATOR • APPLIER • ANALYZER • READER • PREPARER • BUILDER
STATUS_CODE	NUMBER	<p>Operation code identifying the current action of the process:</p> <ul style="list-style-type: none"> • 16111 - SQL Apply process is initializing • 16112 - SQL Apply process is cleaning up as apply and mining processes are stopping based on a user command • 16116 - SQL Apply process is idle • 16117 - SQL Apply process is busy and is not waiting on any interesting event • 16110 - APPLIER process has invoked a user-provided stored procedure in order to inspect a DDL statement prior to it being processed • 16113 - APPLIER process is applying DML changes to some user object or to a sequence • 16114 - APPLIER process is applying a DDL change • 16115 - COORDINATOR process is loading the LogMiner dictionary from the redo stream • 16243 - BUILDER process is paging out memory to free up space in lcr cache • 16240 - READER process idle waiting for additional logfile to be available • 16241 - READER process is idle waiting for the logfile to fill the log sequence gap • 16242 - READER process is processing a logfile
STATUS	VARCHAR2(256)	Description of the current action of the process
HIGH_SCN	NUMBER	Identifies the highest redo record/LCR processed by this process
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.60 V\$LOGSTDBY_PROGRESS

V\$LOGSTDBY_PROGRESS displays the progress of log apply services on the logical standby database. This view is for logical standby databases only.

Column	Datatype	Description
APPLIED_SCN	NUMBER	All the transactions with COMMIT SCN lower than or equal to this SCN have been applied
APPLIED_TIME	DATE	The time and date of APPLIED_SCN

Column	Datatype	Description
RESTART_SCN	NUMBER	During an apply restart, LogMiner does not read any log file with a NEXT_CHANGE# lower than this SCN.
RESTART_TIME	DATE	The time and date of RESTART_SCN
LATEST_SCN	NUMBER	The highest SCN of all redo records that Logical Standby has encountered
LATEST_TIME	DATE	The time and date of LATEST_SCN
MINING_SCN	NUMBER	The SCN of the latest redo record processed by the builder process
MINING_TIME	DATE	The time and date of MINING_SCN
RESETLOGS_ID	NUMBER	A redo branch is identified by resetlogs SCN and resetlogs timestamp. The RESETLOGS_ID column contents are the same as resetlogs timestamp converted to a number.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.61 V\$LOGSTDBY_STATE

V\$LOGSTDBY_STATE provides consolidated information from V\$LOGSTDBY and V\$LOGSTDBY_STATS about the running state of Logical Standby.

Column	Datatype	Description
PRIMARY_DBID	NUMBER	Database ID (DBID) of the primary database
PRIMARY_CON_DBID	NUMBER	This column indicates the DBID of the source database or source PDB corresponding to the database (or CDB) from which this column is queried. For a non-CDB and the root of a CDB, this column matches the PRIMARY_DBID column. For a maintained PDB, this column indicates the DBID for the corresponding PDB at the source. For a skipped PDB or a local PDB, this column would be NULL.
SESSION_ID	NUMBER	LogMiner session ID allocated to SQL Apply.
REALTIME_APPLY	VARCHAR2(64)	Y indicates that SQL Apply is running in real-time apply mode. If a standby redo log is configured, SQL Apply applies changes as they are written to the standby redo log files. N indicates that SQL Apply applies changes as each archived redo log file is received.

Column	Datatype	Description
STATE	VARCHAR2 (64)	<ul style="list-style-type: none"> INITIALIZING: LogMiner session has been created and coordinator has attached to it LOADING DICTIONARY: SQL Apply is loading the LogMiner dictionary WAITING ON GAP: SQL Apply is waiting for a log file to be sent from the primary database APPLYING: SQL Apply is actively mining or applying transactions WAITING FOR DICTIONARY LOGS: SQL Apply is waiting for the archived logs containing the LogMiner dictionary to be shipped from the primary database IDLE: SQL Apply has applied all changes available at the logical standby, and is caught up with the primary database
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

- "V\$LOGSTDBY"
- "V\$LOGSTDBY_STATS"

8.62 V\$LOGSTDBY_STATS

V\$LOGSTDBY_STATS displays statistics, current state, and status information related to SQL Apply.

No rows are returned from this view when SQL Apply is not running. This view is only meaningful in the context of a logical standby database.

All statistics shown in this view are reinitialized at each SQL Apply start.

Column	Datatype	Description
NAME	VARCHAR2 (64)	<p>Name of the statistic, state, or status:</p> <p>Note: Many of the following statistics are subject to change or deletion; programmers should write application code to tolerate missing or extra statistics.</p> <ul style="list-style-type: none"> • id of the logminer session used by SQL Apply to mine the redo logs. • number of preparers • number of appliers • server processes in use for SQL Apply • maximum SGA (in MBytes) for LCR cache • whether SQL Apply is preserving the commit order seen at the primary database while applying changes • maximum events recorded in the DBA_LOGSTDBY_EVENTS table • whether SQL Apply is logging errors that are skipped in the DBA_LOGSTDBY_EVENTS table • whether SQL Apply is logging DDLs that are skipped in the DBA_LOGSTDBY_EVENTS table • whether SQL Apply is logging DDLs that are applied in the DBA_LOGSTDBY_EVENTS table • whether SQL Apply is logging unsupported operations that are encountered in the DBA_LOGSTDBY_EVENTS table • whether or not real time apply is on • value of apply delay (in minutes) • coordinator state • coordinator uptime in seconds • time of the most recent start of SQL Apply • number of transactions mined and made available for apply • number of transactions applied • number of rolled back transactions mined • number of DDL txns mined • number of CTAS (Create Table as Select) txns mined • number of thread enable events encountered in the redo stream • number of thread disable events encountered in the redo stream • bytes of redo records mined • bytes paged out • seconds spent in pageout activity • bytes checkpointed • seconds spent in checkpointing activity • seconds SQL Apply is idle • number of times a complete standby redo logs are mined without having to mine the corresponding archived log • number of times SQL Apply had to switch from a standby redo log to the corresponding archived log • number of times SQL Apply mined redo from the archived logs • number of archived logs that arrived at the standby via gap fetch mechanism (gap fetched logs mined) • number of failed attempts to open a logfile • amount of time spent in waiting for the current gap to resolve if SQL Apply is running in real time mode (current logfile wait)¹ • time spent in waiting for gap to resolve if SQL Apply is running in real time mode (total logfile wait)²
VALUE	VARCHAR2 (64)	Value of the statistic or state information

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

- 1 In case SQL Apply is not running in real time mode, this may not reflect time spent in gap resolution, but simply the time spent waiting for the most recent archived log to show up at the logical standby.
- 2 In case SQL Apply is not running in real time mode, this will include time that SQL Apply spent every time it finished processing all archived logs registered with it, and waited for the next log to be archived.

8.63 V\$LOGSTDBY_TRANSACTION

V\$LOGSTDBY_TRANSACTION displays all transactions that are actively being processed by SQL Apply.

The transaction identifiers shown in this view are those mined from the redo stream and correspond to transaction identifiers assigned at the primary database, and do not correspond to the transactions that are active at the logical standby database. For information regarding transactions active in the logical standby database, including those created as part of SQL Apply, query the V\$TRANSACTION view at the logical standby database.

Column	Datatype	Description
PRIMARY_XIDUSN	NUMBER	Undo segment number of the transaction
PRIMARY_XIDSLT	NUMBER	Slot number of the transaction
PRIMARY_XIDSQN	NUMBER	Sequence number of the transaction
PRIMARY_XID	RAW (8)	Transaction ID
PRIMARY_START_SCN	NUMBER	Start system change number (SCN) base
PRIMARY_START_TIME	DATE	Start time
PRIMARY_PARENT_XIDUSN	NUMBER	Undo segment number of the parent transaction
PRIMARY_PARENT_XIDSLT	NUMBER	Slot number of the parent transaction
PRIMARY_PARENT_XIDSQN	NUMBER	Sequence number of the parent transaction
PRIMARY_PARENT_XID	RAW (8)	Transaction ID of the parent transaction (PDML)
TYPE	VARCHAR2 (32)	<p>Type:</p> <ul style="list-style-type: none"> • PL/SQL - Transaction was done as part of a supported PL/SQL procedure • Direct Path Load - Transaction is a direct path load • CTAS - Transaction contains at least one CREATE TABLE ... AS SELECT operation • DDL - Transaction contains one or more DDL operations • PDML Child - Transaction is a child transaction • DML - Transaction contains only DML operations

Column	Datatype	Description
MINING_STATUS	VARCHAR2 (32)	Mining status: <ul style="list-style-type: none"> ACTIVE - Transaction is still being mined by LogMiner. At least part of this transaction is ready to be applied or has already been applied. COMPLETE - Transaction is complete and ready to be applied. LogMiner has finished mining.
SRC_CON_ID	NUMBER	Contains the PDB ID (the <code>PDB_ID</code> column from the <code>DBA_PDBS</code> view) of the source database that generated the change for this transaction.
APPLY_STATUS	VARCHAR2 (6)	<ul style="list-style-type: none"> ACTIVE - Transaction has been assigned to an apply server. It is in one of the following states: <ul style="list-style-type: none"> The transaction is being actively applied The transaction is being held by an apply server waiting for certain events to occur The transaction is being held by an apply server waiting for subsequent parts of this transaction NONE - Transaction has not yet been assigned to an apply server
SID	NUMBER	Session ID of the apply server's session; Null if <code>APPLY_STATUS</code> is <code>NONE</code>
SERIAL#	NUMBER	Serial number of the apply server's session; Null if <code>APPLY_STATUS</code> is <code>NONE</code>
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$TRANSACTION"](#)

8.64 V\$MANAGED_STANDBY

`V$MANAGED_STANDBY` displays current status information for some Oracle Database processes related to physical standby databases in the Data Guard environment. This view does not persist after an instance shutdown.

Column	Datatype	Description
PROCESS	VARCHAR2 (9)	Type of the process whose information is being reported: <ul style="list-style-type: none"> • RFS - Remote file server • MRP0 - Detached recovery server process • MR(fg) - Foreground recovery session • ARCH - Archiver process • DGRD - Generic Oracle Data Guard process • FGRD • LGWR • RFS (FAL) • RFS (NEXP) • LNS - ASYNC Redo Transport process
PID	VARCHAR2 (24)	Operating system process identifier of the process
STATUS	VARCHAR2 (12)	Current process status: <ul style="list-style-type: none"> • ALLOCATED - Process is active but not currently connected to a primary database • ANNOUNCING - Process is announcing the existence of a potential dependent archived redo log • APPLYING_LOG - Process is actively applying the archived redo log to the standby database • ATTACHED - Process is actively attached and communicating to a primary database • CLOSING - Process has completed archival and is closing the archived redo log • CONNECTED - Network connection established to a primary database • ERROR - Process has failed • IDLE - Process is not performing any activities • OPENING - Process is opening the archived redo log • RECEIVING - Process is receiving network communication • REGISTERING - Process is registering the existence of a completed dependent archived redo log • UNUSED - No active process • WAIT_FOR_GAP - Process is waiting for the archive gap to be resolved • WAIT_FOR_LOG - Process is waiting for the archived redo log to be completed • WRITING - Process is actively writing redo data to the archived redo log
CLIENT_PROCESS	VARCHAR2 (8)	Identifies the corresponding primary database process: <ul style="list-style-type: none"> • Archival - Foreground (manual) archival process (SQL) • ARCH - Background ARCn process • LGWR - Background LGWR process
CLIENT_PID	VARCHAR2 (40)	Operating system process identifier of the client process
CLIENT_DBID	VARCHAR2 (40)	Database identifier of the primary database
GROUP#	VARCHAR2 (40)	Standby redo log group
RESETLOG_ID	NUMBER	Resetlogs identifier of the archived redo log
THREAD#	NUMBER	Archived redo log thread number
SEQUENCE#	NUMBER	Archived redo log sequence number
BLOCK#	NUMBER	Last processed archived redo log block number

Column	Datatype	Description
BLOCKS	NUMBER	Count (in 512-byte blocks) of the last write to a redo log, or for a recovery process, the expected final read count
DELAY_MINS	NUMBER	Archived redo log delay interval in minutes
KNOWN_AGENTS	NUMBER	Total number of standby database agents processing an archived redo log
ACTIVE_AGENTS	NUMBER	Number of standby database agents actively processing an archived redo log
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

Note:

This view is deprecated in Oracle Database 12c Release 2 (12.2.0.1) and may be desupported in a future release. The `V$DATAGUARD_PROCESS` view should be used, instead.

See Also:

["V\\$DATAGUARD_PROCESS"](#)

8.65 V\$MAP_COMP_LIST

`V$MAP_COMP_LIST` displays supplementary information for all element mapping structures.

Column	Datatype	Description
ELEM_IDX	NUMBER	Index corresponding to the element
NUM_COMP	NUMBER	Number of components (maximum is 5)
COMP1_NAME	VARCHAR2 (256)	Name of the first component
COMP1_VAL	VARCHAR2 (256)	Value of the first component
COMP2_NAME	VARCHAR2 (256)	Name of the second component
COMP2_VAL	VARCHAR2 (256)	Value of the second component
COMP3_NAME	VARCHAR2 (256)	Name of the third component
COMP3_VAL	VARCHAR2 (256)	Value of the third component
COMP4_NAME	VARCHAR2 (256)	Name of the fourth component
COMP4_VAL	VARCHAR2 (256)	Value of the fourth component
COMP5_NAME	VARCHAR2 (256)	Name of the fifth component

Column	Datatype	Description
COMP5_VAL	VARCHAR2 (256)	Value of the fifth component
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

8.66 V\$MAP_ELEMENT

V\$MAP_ELEMENT displays a list of all element mapping structures in the SGA of the instance.

Column	Datatype	Description
ELEM_NAME	VARCHAR2 (256)	Element name
ELEM_IDX	NUMBER	Index corresponding to the element
ELEM_CFGID	VARCHAR2 (256)	Configuration ID (N/A if configuration ID is not supported)
ELEM_TYPE	VARCHAR2 (12)	Element type: <ul style="list-style-type: none">• MIRROR• STRIPE• RAID5• CONCATENATED• PARTITION• DISK• NONE
ELEM_SIZE	NUMBER	Element Size in HKB
ELEM_NSUBELEM	NUMBER	Number of Subelements
ELEM_DESCR	VARCHAR2 (256)	Element Description
STRIPE_SIZE	NUMBER	Stripe Size in HKB for RAID-5 and STRIPE elements, 0 for the remaining types
LIB_IDX	NUMBER	Index of the library which claims ownership of the element
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

8.67 V\$MAP_EXT_ELEMENT

V\$MAP_EXT_ELEMENT displays supplementary information for all element mapping structures.

Column	Datatype	Description
ELEM_IDX	NUMBER	Index corresponding to the element
NUM_ATTRB	NUMBER	Number of Attributes (maximum is 5)
ATTRB1_NAME	VARCHAR2 (256)	Name of the first Attribute
ATTRB1_VAL	VARCHAR2 (256)	Value of the first attribute
ATTRB2_NAME	VARCHAR2 (256)	Name of the second attribute
ATTRB2_VAL	VARCHAR2 (256)	Value of the second attribute
ATTRB3_NAME	VARCHAR2 (256)	Name of the third attribute
ATTRB3_VAL	VARCHAR2 (256)	Value of the third attribute
ATTRB4_NAME	VARCHAR2 (256)	Name of the fourth attribute
ATTRB4_VAL	VARCHAR2 (256)	Value of the fourth attribute
ATTRB5_NAME	VARCHAR2 (256)	Name of the fifth attribute
ATTRB5_VAL	VARCHAR2 (256)	Value of the fifth attribute
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.68 V\$MAP_FILE

V\$MAP_FILE displays a list of all file mapping structures in the shared memory of the instance.

Column	Datatype	Description
FILE_MAP_IDX	NUMBER	Index corresponding to the file
FILE_CFGID	VARCHAR2 (256)	Configuration ID (N/A if configuration ID is not supported)
FILE_STATUS	VARCHAR2 (7)	Status of the mapping information: <ul style="list-style-type: none"> • VALID - File mapping information is latest • INVALID - Mapping must be refreshed
FILE_NAME	VARCHAR2 (256)	Absolute file name
FILE_TYPE	VARCHAR2 (11)	File type: <ul style="list-style-type: none"> • DATAFILE • SPFILE • TEMPFILE • CONTROLFILE • LOGFILE • ARCHIVEFILE
FILE_STRUCTURE	VARCHAR2 (9)	File structure: <ul style="list-style-type: none"> • FILE • RAWVOLUME • RAWDEVICE • NONE
FILE_SIZE	NUMBER	File size in HKB (half KB)

Column	Datatype	Description
FILE_NEXTS	NUMBER	Number of file extents in the file (not necessarily the same as the number of file extents mapped)
LIB_IDX	NUMBER	Index of mapping library claiming ownership of the file
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.69 V\$MAP_FILE_EXTENT

V\$MAP_FILE_EXTENT displays a list of all file extent mapping structures in the shared memory of the instance.

Column	Datatype	Description
FILE_MAP_IDX	NUMBER	File index (corresponds to FILE_MAP_IDX in V\$MAP_FILE)
EXT_NUM	NUMBER	File extent number
EXT_ELEM_OFF	NUMBER	Element offset in HKB
EXT_SIZE	NUMBER	File extent size in HKB
EXT_FILE_OFF	NUMBER	File Offset in HKB
EXT_TYPE	VARCHAR2(6)	File Extent Type: <ul style="list-style-type: none"> • DATA • PARITY • NONE
ELEM_IDX	NUMBER	Index in V\$MAP_ELEMENT corresponding to the element where the file extent resides
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.70 V\$MAP_FILE_IO_STACK

V\$MAP_FILE_IO_STACK displays the hierarchical arrangement of storage containers for files. Each row in the view represents a level in the hierarchy.

Column	Datatype	Description
FILE_MAP_IDX	NUMBER	File index (corresponds to FILE_MAP_IDX in V\$MAP_FILE)
DEPTH	NUMBER	Element depth within the I/O stack

Column	Datatype	Description
ELEM_IDX	NUMBER	Index corresponding to the element
CU_SIZE	NUMBER	Contiguous set of logical blocks of the file (in HKB units) that is resident contiguously on the element
STRIDE	NUMBER	Number of HKB between contiguous units (CU) in the file that are contiguous on this element. Used in RAID5 and striped files.
NUM_CU	NUMBER	Number of contiguous units that are adjacent to each other on this element that are separated by STRIDE HKB in the file. In RAID5, the number of contiguous units also include the parity stripes.
ELEM_OFFSET	NUMBER	Element offset in HKB units
FILE_OFFSET	NUMBER	Offset in HKB units from the start of the file to the first byte of the contiguous units
DATA_TYPE	VARCHAR2 (15)	Datatype: <ul style="list-style-type: none">• DATA• PARITY• DATA AND PARITY
PARITY_POS	NUMBER	Position of the parity. Only for RAID5. This column is needed to distinguish the parity from the data part.
PARITY_PERIOD	NUMBER	Parity period. Only for RAID5.
ID	NUMBER	Unique identifier
PARENT_ID	NUMBER	Parent identifier
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.71 V\$MAP_LIBRARY

V\$MAP_LIBRARY displays a list of all mapping libraries dynamically loaded by the external process.

Column	Datatype	Description
LIB_IDX	NUMBER	Index corresponding to the library
LIB_NAME	VARCHAR2 (256)	Absolute library name
VENDOR_NAME	VARCHAR2 (64)	Name of the vendor implementing the library
PROTOCOL_NUM	NUMBER	Mapping protocol that the library supports
VERSION_NUM	VARCHAR2 (32)	Version number
PATH_NAME	VARCHAR2 (4000)	Path name
MAP_FILE	VARCHAR2 (1)	Indicates whether the library supports mapping files (Y) or not (N)
FILE_CFGID	VARCHAR2 (13)	Type of configuration ID supported for files: <ul style="list-style-type: none">• NONE - Not supported• PERSISTENT• NONPERSISTENT

Column	Datatype	Description
MAP_ELEM	VARCHAR2(1)	Indicates whether the library supports mapping elements (Y) or not (N)
ELEM_CFGID	VARCHAR2(13)	Type of configuration id supported for elements: <ul style="list-style-type: none"> • NONE - Not supported • PERSISTENT • NONPERSISTENT
MAP_SYNC	VARCHAR2(1)	Indicates whether the library needs to be explicitly synchronized so that future mappings reflect the most recent changes (Y) or not (N). Note that configuration IDs cannot be supported if the library needs to be explicitly synced.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.72 V\$MAP_SUBELEMENT

V\$MAP_SUBELEMENT displays a list of all subelement mapping structures in the shared memory of the instance.

Column	Datatype	Description
CHILD_IDX	NUMBER	Index in V\$MAP_ELEMENT corresponding to the child element
PARENT_IDX	NUMBER	Index in V\$MAP_ELEMENT corresponding to the parent element
SUB_NUM	NUMBER	Subelement number
SUB_SIZE	NUMBER	Subelement size in HKB
ELEM_OFFSET	NUMBER	Offset in HKB on the child element
SUB_FLAGS	NUMBER	Subelement flags (currently unused)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.73 V\$MAPPED_SQL

V\$MAPPED_SQL lists the SQL statements that are translated and mapped in memory to a different SQL statement for execution.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	First 1000 characters of the original SQL text

Column	Datatype	Description
SQL_FULLTEXT	CLOB	Full text for the original SQL statement
SQL_ID	VARCHAR2 (13)	SQL identifier of the original SQL statement
HASH_VALUE	NUMBER	Hash value of the original SQL statement
MAPPED_SQL_TEXT	VARCHAR2 (1000)	First 1000 characters of the mapped SQL text
MAPPED_SQL_FULLTEXT	CLOB	Full text for the mapped SQL statement
MAPPED_SQL_ID	VARCHAR2 (13)	SQL identifier of the mapped SQL statement
MAPPED_HASH_VALUE	NUMBER	Hash value of the mapped SQL statement
SQL_TRANSLATION_PROFILE_ID	NUMBER	A non-NULL value specifies the object ID of the SQL translation profile used to translate the SQL statement into the mapped SQL statement
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
TRANSLATION_TIMESTAMP	DATE	Time this SQL statement was translated
TRANSLATION_CPU_TIME	NUMBER	CPU time used to translate this SQL statement
TRANSLATION_ELAPSED_TIME	NUMBER	Elapsed time used to translate this SQL statement
TRANSLATION_METHOD	VARCHAR2 (10)	Method used to translate this SQL statement
DICTIONARY_SQL_ID	VARCHAR2 (13)	SQL ID of SQL text in custom translation dictionary used to translate this SQL statement
USE_COUNT	NUMBER	Number of times this translation has been used

8.74 V\$MEMOPTIMIZE_WRITE_AREA

V\$MEMOPTIMIZE_WRITE_AREA displays information about fast ingest data in the large pool.

Column	Datatype	Description
TOTAL_SIZE	NUMBER	Total amount of memory allocated for fast ingest data in the large pool (in bytes)
USED_SPACE	NUMBER	Total amount of memory currently used by fast ingest data in the large pool (in bytes)
FREE_SPACE	NUMBER	Total amount of memory currently free for storing fast ingest data in the large pool (in bytes)
NUM_WRITES	NUMBER	Number of fast ingest insert operations for which data is still in the large pool and is yet to be written to disk
NUM_WRITERS	NUMBER	Number of clients currently using fast ingest for inserting data into the database

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **Note:**

This view is available starting with Oracle Database 19c.

8.75 V\$MEMORY_CURRENT_RESIZE_OPS

V\$MEMORY_CURRENT_RESIZE_OPS displays information about memory resize operations (both automatic and manual) which are currently in progress.

An operation can be a grow or a shrink of a dynamic memory component. All sizes are expressed in bytes.

Column	Datatype	Description
COMPONENT	VARCHAR2(64)	Component name
OPER_TYPE	VARCHAR2(13)	<p>Operation type:</p> <ul style="list-style-type: none"> • STATIC • INITIALIZING • DISABLED • GROW • SHRINK • SHRINK_CANCEL
OPER_MODE	VARCHAR2(9)	<p>Operation mode:</p> <ul style="list-style-type: none"> • MANUAL • DEFERRED • IMMEDIATE
PARAMETER	VARCHAR2(80)	Name of the parameter for the resize operation
INITIAL_SIZE	NUMBER	Parameter value at the start of the operation
TARGET_SIZE	NUMBER	Desired value of the parameter after the resize
CURRENT_SIZE	NUMBER	Current value of the parameter
START_TIME	DATE	Start time of the operation
LAST_UPDATE_TIME	DATE	Last time progress was made for the operation

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.76 V\$MEMORY_DYNAMIC_COMPONENTS

V\$MEMORY_DYNAMIC_COMPONENTS displays information about the dynamic SGA components.

This view summarizes information based on all completed SGA resize operations since instance startup. All sizes are expressed in bytes.

Column	Datatype	Description
COMPONENT	VARCHAR2 (64)	Component name
CURRENT_SIZE	NUMBER	Current size of the component
MIN_SIZE	NUMBER	Minimum size of the component since instance startup
MAX_SIZE	NUMBER	Maximum size of the component since instance startup
USER_SPECIFIED_SIZE	NUMBER	Value of the user parameter for the component
OPER_COUNT	NUMBER	Number of operations since instance startup
LAST_OPER_TYPE	VARCHAR2 (13)	<p>Last completed operation for the component:</p> <ul style="list-style-type: none"> • STATIC • INITIALIZING • DISABLED • GROW • SHRINK • SHRINK_CANCEL
LAST_OPER_MODE	VARCHAR2 (9)	<p>Mode of the last completed operation:</p> <ul style="list-style-type: none"> • MANUAL • DEFERRED • IMMEDIATE
LAST_OPER_TIME	DATE	Start time of the last completed operation
GRANULE_SIZE	NUMBER	Granularity of the GROW or SHRINK operation
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.77 V\$MEMORY_RESIZE_OPS

V\$MEMORY_RESIZE_OPS displays information about the last 800 completed memory resize operations (both automatic and manual). This does not include in-progress operations. All sizes are expressed in bytes.

Column	Datatype	Description
COMPONENT	VARCHAR2(64)	Component name
OPER_TYPE	VARCHAR2(13)	Operation type: <ul style="list-style-type: none">• STATIC• INITIALIZING• DISABLED• GROW• SHRINK• SHRINK_CANCEL
OPER_MODE	VARCHAR2(9)	Operation mode: <ul style="list-style-type: none">• MANUAL• DEFERRED• IMMEDIATE
PARAMETER	VARCHAR2(80)	Name of the parameter for the resize operation
INITIAL_SIZE	NUMBER	Parameter value at the start of the operation
TARGET_SIZE	NUMBER	Requested value of the parameter after the resize
FINAL_SIZE	NUMBER	Real value of the parameter after the resize
STATUS	VARCHAR2(9)	Completion status of the operation: <ul style="list-style-type: none">• INACTIVE• PENDING• COMPLETE• CANCELLED• ERROR
START_TIME	DATE	Start time of the operation
END_TIME	DATE	End time of the operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• n: Where n is the applicable container ID for the rows containing data

8.78 V\$MEMORY_TARGET_ADVICE

V\$MEMORY_TARGET_ADVICE provides information about how the MEMORY_TARGET parameter should be sized based on current sizing and satisfaction metrics.

Column	Datatype	Description
MEMORY_SIZE	NUMBER	If the MEMORY_SIZE_FACTOR column has a value of 1, then this column shows the current size of memory, as set by the MEMORY_TARGET initialization parameter. If the value of the MEMORY_SIZE_FACTOR column is less than or greater than 1, then this column shows a proposed memory size.
MEMORY_SIZE_FACTOR	NUMBER	A multiplier for the current memory size. Possible values are 0.25, 0.5, 0.75, 1, 1.5, 1.75, and 2. This multiplier times the current memory size equals the value of the MEMORY_SIZE column.
ESTD_DB_TIME	NUMBER	For current memory size (MEMORY_SIZE_FACTOR = 1), the amount of database time required to complete the current workload. For a proposed memory size, the estimated amount of database time that would be required if the MEMORY_TARGET parameter were changed to the proposed size.
ESTD_DB_TIME_FACTOR	NUMBER	For a proposed memory size, ratio of estimated database time to current database time
VERSION	NUMBER	Version number of this recommendation (this snapshot of the V\$MEMORY_TARGET_ADVICE view)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Table 8-2 shows how the information provided in V\$MEMORY_TARGET_ADVICE could be used to improve performance. The data indicates that if current memory size is 380M, and you were to increase it to 760M (2x), the current workload would take 80525 units of DBtime as opposed to 115475 units of DBtime, which is a significant improvement in performance.

Table 8-2 Example of Using V\$MEMORY_TARGET_ADVICE

MEMORY_SIZE	MEMORY_SIZE_FACT OR	ESTD_DB_TIME	ESTD_DB_TIME_FACT OR	VERSION
380	1	115475	1	3
95	.25	200500	1.7	3
190	.5	125600	1.1	3
760	2	80525	0.7	3

"MEMORY_TARGET"

8.79 V\$METRIC

V\$METRIC displays the most recent statistic values for the complete set of metrics captured by the Automatic Workload Repository (AWR) infrastructure.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric Group ID. Refer to the V\$METRICNAME view for the name of the group.
ENTITY_ID	NUMBER	Entity ID for the metric in question. The value of the Entity ID depends upon the metric group. (See the following table for an explanation of possible values.)
ENTITY_SEQUENCE	NUMBER	Entity Sequence number for the metric in question. The value of the Entity Sequence depends upon the metric group. (See the following table for an explanation of possible values.)
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2(64)	Metric Name. This is the statistic that is captured for the entity.
VALUE	NUMBER	Value of the statistic between BEGIN_TIME and END_TIME
METRIC_UNIT	VARCHAR2(64)	Unit for the VALUE
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

The following table describes what the ENTITY_ID and ENTITY_SEQUENCE are for each metric group:

GID	Group NAME	Entity ID	Entity Sequence
0	Event Metrics	Event#	N/A
1	Event Class Metrics	Wait Class ID	N/A
2	System Metrics Long Duration	N/A	N/A
3	System Metrics Short Duration	N/A	N/A
4	Session Metrics Long Duration	Session ID	Serial#
5	Session Metrics Short Duration	Session ID	Serial#
6	Service Metrics	N/A	Service Hash
7	File Metrics Long Duration	File#	Creation Change#
9	Tablespace Metrics Long Duration	Tablespace#	N/A
10	Service Metrics (Short)	N/A	Service Hash

8.80 V\$METRICGROUP

V\$METRICGROUP displays information about the metric group for each of the four major Replication components: capture, propagation, apply, and queue.

Column	Datatype	Description
GROUP_ID	NUMBER	Internal ID associated with each group
NAME	VARCHAR2 (64)	External name of the group
INTERVAL_SIZE	NUMBER	How often to collect statistics
MAX_INTERVAL	NUMBER	Total number of intervals over which statistics should be collected
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.81 V\$METRIC_HISTORY

V\$METRIC_HISTORY displays all the available statistic values for the complete set of metrics captured by the Automatic Workload Repository (AWR) infrastructure.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric Group ID. Refer to the V\$METRICNAME view for the name of the group.
ENTITY_ID	NUMBER	Entity ID for the metric in question. The value of the Entity ID depends upon the metric group. (See the table in the description of V\$METRIC for an explanation of possible values.)
ENTITY_SEQUENCE	NUMBER	Entity Sequence number for the metric in question. The value of the Entity Sequence depends upon the metric group. (See the table in the description of V\$METRIC for an explanation of possible values.)
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2 (64)	Metric Name. This is the statistic that is captured for the entity.
VALUE	NUMBER	Value of the statistic between BEGIN_TIME and END_TIME
METRIC_UNIT	VARCHAR2 (64)	Unit for the VALUE

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.82 V\$METRICNAME

V\$METRICNAME displays the mapping of the name of metrics to their metric ID.

Column	Datatype	Description
GROUP_ID	NUMBER	Metric group ID
GROUP_NAME	VARCHAR2 (64)	Metric group name
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2 (64)	Metric name
METRIC_UNIT	VARCHAR2 (64)	Unit of measurement
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.83 V\$MTTR_TARGET_ADVICE

V\$MTTR_TARGET_ADVICE displays rows that predict the number of physical I/Os for the MTTR corresponding to each row.

The rows also compute a physical I/O factor, which is the ratio of the number of estimated I/Os to the number of I/Os actually performed by the current MTTR setting during the measurement interval.

The content of the view is empty if MTTR advisory has not been turned on since database startup. Otherwise, it returns the advisory information collected. If advisory is currently off, then this information comes from the last time MTTR advisory was on. FAST_START_MTTR_TARGET must be set to a nonzero value if the STATISTICS_LEVEL parameter is dynamically modified to turn MTTR advisory on.

If the FAST_START_MTTR_TARGET parameter is changed while MTTR advisory is on, then MTTR advisory is temporarily turned off until the new FAST_START_MTTR_TARGET setting takes effect. During this transition period, the contents of V\$MTTR_TARGET_ADVICE reflect the simulation result for the old MTTR setting.

Column	Datatype	Description
MTTR_TARGET_FOR_ESTIMATE	NUMBER	MTTR setting being simulated. Equal to the current MTTR setting if this is the first row of the view.
ADVICE_STATUS	VARCHAR2 (5)	Current status of MTTR simulation: <ul style="list-style-type: none">• ON• READY• OFF
DIRTY_LIMIT	NUMBER	Dirty buffer limit derived from the MTTR being simulated
ESTD_CACHE_WRITES	NUMBER	Estimated number of cache physical writes under this MTTR
ESTD_CACHE_WRITE_FACTOR	NUMBER	Estimated cache physical write ratio under this MTTR. It is the ratio of the estimated number of cache writes to the number of cache writes under the current MTTR setting.
ESTD_TOTAL_WRITES	NUMBER	Estimated total number of physical writes under this MTTR
ESTD_TOTAL_WRITE_FACTOR	NUMBER	Estimated total physical write ratio under this MTTR. It is the ratio of the estimated total number of physical writes to the total number of physical writes under the current MTTR setting.
ESTD_TOTAL_IOS	NUMBER	Estimated total number of I/Os under this MTTR
ESTD_TOTAL_IO_FACTOR	NUMBER	Estimated total I/O ratio under this MTTR. It is the ratio of the estimated total number of I/Os to the total number of I/Os under the current MTTR setting.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

- "[STATISTICS_LEVEL](#)"

8.84 V\$MUTEX_SLEEP

V\$MUTEX_SLEEP shows the wait time, and the number of sleeps for each combination of mutex type and location.

Column	Datatype	Description
MUTEX_TYPE	VARCHAR2 (32)	Type of action/object the mutex protects
LOCATION	VARCHAR2 (40)	The code location where the waiter slept for the mutex
SLEEPS	NUMBER	Number of sleeps for this MUTEX_TYPE and LOCATION
WAIT_TIME	NUMBER	Wait time in microseconds

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.85 V\$MUTEX_SLEEP_HISTORY

V\$MUTEX_SLEEP_HISTORY displays time-series data.

Each row in this view is for a specific time, mutex type, location, requesting session and blocking session combination. That is, it shows data related to a specific session (requesting session) that slept while requesting a specific mutex type and location, because it was being held by a specific blocking session. The data in this view is contained within a circular buffer, with the most recent sleeps shown.

Column	Datatype	Description
MUTEX_IDENTIFIER	NUMBER	Mutex ID
SLEEP_TIMESTAMP	TIMESTAMP (6)	The last date/time this MUTEX_TYPE and LOCATION was slept for by the REQUESTING_SESSION, while being held by the BLOCKING_SESSION.
MUTEX_TYPE	VARCHAR2 (32)	Type of action/object the mutex protects
GETS	NUMBER	The total number of gets since the mutex was created and up until the time of the wait (and from all sessions past and present)
SLEEPS	NUMBER	The number of times the requester had to sleep before obtaining the mutex
REQUESTING_SESSION	NUMBER	The SID of a session requesting the mutex
BLOCKING_SESSION	NUMBER	The SID of a session holding the mutex
LOCATION	VARCHAR2 (40)	The code location where the waiter slept for the mutex
MUTEX_VALUE	RAW (4 8)	If the mutex is held in exclusive (X) mode, this column shows the SID of the blocking session, else it shows the number of sessions referencing the mutex in S mode.
P1	NUMBER	Reserved for internal use
P1RAW	RAW (4 8)	Reserved for internal use
P2	NUMBER	Reserved for internal use
P3	NUMBER	Reserved for internal use
P4	NUMBER	Reserved for internal use
P5	VARCHAR2 (64)	Reserved for internal use

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.86 V\$MVREFRESH

V\$MVREFRESH displays information about the materialized views currently being refreshed.

Column	Datatype	Description
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number, which is used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends with, and another session begins with, the same session ID.
CURRMOWNER	VARCHAR2 (31)	Owner of the materialized view currently being refreshed. The materialized view resides in this user's schema.
CURRMVNAME	VARCHAR2 (31)	Name of the materialized view currently being refreshed
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.87 V\$MYSTAT

V\$MYSTAT contains statistics on the current session.

Column	Datatype	Description
SID	NUMBER	ID of the current session
STATISTIC#	NUMBER	Number of the statistic
VALUE	NUMBER	Value of the statistic
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.88 V\$NFS_CLIENTS

V\$NFS_CLIENTS displays information about NFS clients currently connected to the XML DB NFS Server.

Column	Datatype	Description
CLIENTID	NUMBER	A number identifying the client
PRINCIPAL	VARCHAR2 (2000)	User string denoting the principal that set the client ID (<code>SetClientId</code>)
CLIENTOFAQUEIDENTIFIER	VARCHAR2 (1000)	Opaque string presented as identification by the client to the NFS server
VERIFIER	RAW (8)	Verifier presented by the client
LEASEEXPIRY	NUMBER	Number of seconds in which the lease expires for the client
CLIENTADDR	VARCHAR2 (2000)	Address of the client
CONFIRMED	VARCHAR2 (5)	TRUE if the client is confirmed; otherwise FALSE
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.89 V\$NFS_LOCKS

V\$NFS_LOCKS displays information about byte range locks held on different files by NFS clients.

Column	Datatype	Description
OPENSTATEID	RAW (16)	Open state ID of the open owner
OPENSEQUENCEID	NUMBER	Open Sequence ID of the open owner
LOCKSTATEID	RAW (16)	Lock state ID of the lock owner
LOCKSEQUENCEID	NUMBER	Lock sequence ID of the lock owner
LOCKOWNER	VARCHAR2 (2000)	Opaque string presented as identification by the lock owner to the NFS server
OFFSET	NUMBER	Byte Offset from which lock starts
LENGTH	NUMBER	Length of the lock
LOCKTYPE	VARCHAR2 (20)	Type of the lock
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.90 V\$NFS_OPEN_FILES

V\$NFS_OPEN_FILES displays information about all the files currently opened by clients at the NFS server.

Column	Datatype	Description
CLIENTID	NUMBER	Number identifying the client
OPENOWNEROPAQUE	VARCHAR2 (2000)	All the files currently opened by clients at the NFS server
OPENSTATEID	RAW (16)	Open state ID of the open owner
FILEHANDLE	RAW (32)	FileHandle of the file that has been opened
OPENSEQUENCEID	NUMBER	Open sequence ID of open owner
OPENREAD	VARCHAR2 (5)	TRUE if the file is open for READ operations; otherwise FALSE
OPENWRITE	VARCHAR2 (5)	TRUE if the file is open for WRITE operations; otherwise FALSE
SHAREACCESS	VARCHAR2 (15)	Sharing mode of the file (SharedReadWrite, SharedRead, SharedWrite)
SHAREDENY	VARCHAR2 (13)	Deny mode of the file (DenyReadWrite, DenyRead, DenyWrite)
CONFIRMED	VARCHAR2 (5)	TRUE if open is confirmed; otherwise FALSE
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.91 V\$NLS_PARAMETERS

V\$NLS_PARAMETERS contains current values of NLS parameters.

Column	Datatype	Description
PARAMETER	VARCHAR2 (64)	Parameter names are as follows: NLS_CALENDAR, NLS_CHARACTERSET, NLS_COMP, NLS_CURRENCY, NLS_DATE_FORMAT, NLS_DATE_LANGUAGE, NLS_DUAL_CURRENCY, NLS_ISO_CURRENCY, NLS_LANGUAGE, NLS_LENGTH_SEMANTICS, NLS_NCHAR_CHARACTERSET, NLS_NCHAR_CONV_EXCP, NLS_NUMERIC_CHARACTERS, NLS_SORT, NLS_TERRITORY, NLS_TIMESTAMP_FORMAT, NLS_TIMESTAMP_TZ_FORMAT Two additional parameters, NLS_TIME_FORMAT and NLS_TIME_TZ_FORMAT, are currently used for internal purposes only.
VALUE	VARCHAR2 (64)	NLS parameter value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.92 V\$NLS_VALID_VALUES

V\$NLS_VALID_VALUES lists all valid values for NLS parameters.

Column	Datatype	Description
PARAMETER	VARCHAR2(64)	Parameter name (LANGUAGE SORT TERRITORY CHARACTERSET)
VALUE	VARCHAR2(64)	NLS parameter value
ISDEPRECATED	VARCHAR2(5)	Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.93 V\$NONLOGGED_BLOCK

V\$NONLOGGED_BLOCK displays ranges of nonlogged datafile blocks recorded in the control file.

Prior to Oracle Database 12c, the presence of any nonlogged blocks in a data file was recorded in the file header via the FIRST_NONLOGGED_SCN column of the V\$DATAFILE view. Now with 12c, in addition to the file header data, the ranges themselves are recorded in the control file. A control file range is a superset of the actual nonlogged blocks, meaning that small ranges can be merged to form larger ranges, even when there are some valid blocks between the smaller ranges.

The information in the view is maintained by RMAN VALIDATE, RMAN RESTORE, RMAN RECOVER, and Flashback Database and Media Recovery. A non RMAN-based restore will cause the data to become invalid, and it will be purged the next time any of those tasks are invoked and involve the file. As a result of space reuse, it is possible for ranges to no longer contain any nonlogged blocks. An RMAN VALIDATE command can be used to synchronize the ranges with the actual nonlogged blocks found from a scan of the data file.

Column	Datatype	Description
FILE#	NUMBER	Absolute file number of the data file that contains the nonlogged blocks
BLOCK#	NUMBER	Block number of the first nonlogged block in the range of nologged blocks
BLOCKS	NUMBER	Number of nonlogged blocks found starting with BLOCK#
NONLOGGED_START_CHANGE#	NUMBER	The smallest SCN on which any block in this block range became nonlogged. NULL if unknown.
NONLOGGED_START_TIME	DATE	The time that corresponds to NONLOGGED_START_CHANGE#. NULL if unknown.
NONLOGGED_END_CHANGE#	NUMBER	The largest SCN on which any block in this block range became nonlogged. NULL if unknown.
NONLOGGED_END_TIME	DATE	The time that corresponds to NONLOGGED_END_CHANGE#. NULL if unknown.

Column	Datatype	Description
RESETLOGS_CHANGE#	NUMBER	The resetlogs SCN of the incarnation on which this block range was first marked as nonlogged. NULL if unknown.
RESETLOGS_TIME	DATE	The resetlogs time of the incarnation on which this block range was first marked as nologged. NULL if unknown.
OBJECT#	VARCHAR2(40)	The object ID this range belongs to. If this field is NULL, the object number is unknown.
REASON	VARCHAR2(9)	The reason why this block range appears in this list, for example, primary file offline, could not talk to primary, non-standby recovery, and so on. For Oracle Database 12c and later releases, it is always UNKNOWN.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.94 V\$OBJECT_DEPENDENCY

V\$OBJECT_DEPENDENCY displays the objects depended on by a package, procedure, or cursor that is currently loaded in the shared pool. For example, together with V\$SESSION and V\$SQL, this view can be used to determine which tables are used in the SQL statement that a user is currently executing.

See Also:

"V\$SESSION" and "V\$SQL"

Column	Datatype	Description
FROM_ADDRESS	RAW(4 8)	Address of a procedure, package, or cursor that is currently loaded in the shared pool
FROM_HASH	NUMBER	Hash value of a procedure, package, or cursor that is currently loaded in the shared pool
TO_OWNER	VARCHAR2(64)	Owner of the object that is depended on
TO_NAME	VARCHAR2(1000)	Name of the object that is depended on
TO_ADDRESS	RAW(4 8)	Address of the object that is depended on. These can be used to look up more information on the object in V\$DB_OBJECT_CACHE.
TO_HASH	NUMBER	Hash value of the object that is depended on. These can be used to look up more information on the object in V\$DB_OBJECT_CACHE.
TO_TYPE	NUMBER	Type of the object that is depended on

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.95 V\$OBJECT_PRIVILEGE

V\$OBJECT_PRIVILEGE displays information about privileges associated with an object.

Column	Datatype	Description
OBJECT_TYPE_NAME	VARCHAR2 (64)	Name of the object type
OBJECT_TYPE_ID	NUMBER	ID of the object type
PRIVILEGE_ID	NUMBER	ID of the privilege
PRIVILEGE_NAME	VARCHAR2 (64)	Name of the privilege
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.96 V\$OBJECT_USAGE

V\$OBJECT_USAGE displays statistics about index usage gathered from the database for the indexes owned by the current user. You can use this view to monitor index usage. All indexes that have been used at least once can be monitored and displayed in this view.

 **Note:**

The V\$OBJECT_USAGE view is deprecated in Oracle Database 12c Release 1 (12.1) and maintained for backward compatibility. Support for this view may be removed in a future release. Oracle recommends that you use the USER_OBJECT_USAGE view instead of the V\$OBJECT_USAGE view.

Column	Datatype	NULL	Description
INDEX_NAME	VARCHAR2	NOT NULL	Index name in sys.obj\$.name
TABLE_NAME	VARCHAR2	NOT NULL	Table name in sys.obj\$.name
MONITORING	VARCHAR2		YES NO

Column	Datatype	NULL	Description
USED	VARCHAR2		YES NO
START_MONITORING	VARCHAR2		Start monitoring time in sys.object_stats.start_monitoring
END_MONITORING	VARCHAR2		End monitoring time in sys.object_stats.end_monitoring

 **See Also:**

- "[USER_OBJECT_USAGE](#)"
- "[DBA_OBJECT_USAGE](#)"

8.97 V\$OBSOLETE_BACKUP_FILES

V\$OBSOLETE_BACKUP_FILES displays all obsolete backups, copies, and archived logs according to the current retention policy.

This view requires that the database is set using the `DBMS_RCMAN.SETDATABASE` procedure.

Column	Datatype	Description
PKEY	NUMBER	Primary key for the backup
BACKUP_TYPE	VARCHAR2 (32)	Type of the backup: <ul style="list-style-type: none"> • BACKUP SET • COPY • PROXY COPY
FILE_TYPE	VARCHAR2 (32)	Type of the file: <ul style="list-style-type: none"> • DATAFILE • CONTROLFILE • SPFILE • REDO LOG • PIECE
KEEP	VARCHAR2 (3)	Indicates whether the backup has a retention policy different from the value for <code>CONFIGURE RETENTION POLICY</code> (YES) or not (NO)
KEEP_UNTIL	DATE	If the <code>KEEP UNTIL TIME</code> clause of the <code>BACKUP</code> command was specified, then this column shows the date after which the backup becomes obsolete. If the column is null and <code>KEEP_OPTIONS</code> is not null, the backup never becomes obsolete.
KEEP_OPTIONS	VARCHAR2 (13)	KEEP options for the backup: <ul style="list-style-type: none"> • LOGS - RMAN keeps the logs needed to recover the backup • NOLOGS - RMAN does not keep the logs needed to recover the backup If this column is null, then the backup has no KEEP options and will be made obsolete based on the retention policy.

Column	Datatype	Description
STATUS	VARCHAR2 (16)	Status of the backup: <ul style="list-style-type: none">• AVAILABLE• UNAVAILABLE• EXPIRED• OTHER
FNAME	VARCHAR2 (1024)	Name of the file
TAG	VARCHAR2 (32)	Tag of the piece, copy, or proxy copy
MEDIA	VARCHAR2 (80)	Media ID of the piece or proxy copy
RECID	NUMBER	Recid of the record in the controlfile
STAMP	NUMBER	Stamp of the record in the controlfile
DEVICE_TYPE	VARCHAR2 (255)	Type of media device that stores the backup
BLOCK_SIZE	NUMBER	Block size for the backup (in bytes)
COMPLETION_TIME	DATE	Time when the backup completed
BS_KEY	NUMBER	Primary key of the backup set (valid only when BACKUP_TYPE is BACKUP_SET)
BS_COUNT	NUMBER	Count of the backup set from the controlfile record (valid only when BACKUP_TYPE is BACKUP_SET)
BS_STAMP	NUMBER	Stamp of the backup set from the controlfile record (valid only when BACKUP_TYPE is BACKUP_SET)
BS_TYPE	VARCHAR2 (32)	Type of the backup set (valid only when BACKUP_TYPE is BACKUP_SET): <ul style="list-style-type: none">• DATAFILE• ARCHIVED LOG
BS_INCR_TYPE	VARCHAR2 (32)	Incremental level of the backup set (valid only when BACKUP_TYPE is BACKUP_SET)
BS_PIECES	NUMBER	Number of backup pieces in the backup set (valid only when BACKUP_TYPE is BACKUP_SET)
BS_COMPLETION_TIME	DATE	Completion time of the backup set (valid only when BACKUP_TYPE is BACKUP_SET)
BP_PIECE#	NUMBER	Number of the backup piece (valid only when FILE_TYPE is PIECE and BACKUP_TYPE is BACKUP_SET)
BP_COPY#	NUMBER	Copy number of the backup piece (valid only when FILE_TYPE is PIECE and BACKUP_TYPE is BACKUP_SET)
DF_FILE#	NUMBER	Absolute file number of the datafile (valid only when FILE_TYPE is DATAFILE)
DF_RESETLOGS_CHANGE#	NUMBER	System change number (SCN) of the most recent RESETLOGS when the control file or datafile was created (valid only when FILE_TYPE is DATAFILE)
DF_CREATION_CHANGE#	NUMBER	Creation SCN of the control file or datafile (valid only when FILE_TYPE is DATAFILE)
DF_CHECKPOINT_CHANGE#	NUMBER	System change number (SCN) of the most recent control file or datafile checkpoint (valid only when FILE_TYPE is DATAFILE)
DF_CKP_MOD_TIME	DATE	Modification time in case of SPFILE, otherwise time when the control file or datafile was checkpointed (valid only when FILE_TYPE is DATAFILE)
RL_THREAD#	NUMBER	Number of the redo thread (valid only when FILE_TYPE is REDO_LOG)

Column	Datatype	Description
RL_SEQUENCE#	NUMBER	Log sequence number (valid only when FILE_TYPE is REDO LOG)
RL_RESETLOGS_CHANGE#	NUMBER	System change number (SCN) of the most recent RESETLOGS when the record was created (valid only when FILE_TYPE is REDO LOG)
RL_FIRST_CHANGE#	NUMBER	First SCN of the redo log (valid only when FILE_TYPE is REDO LOG)
RL_FIRST_TIME	DATE	Time when Oracle switched into the redo log (valid only when FILE_TYPE is REDO LOG)
RL_NEXT_CHANGE#	NUMBER	First SCN of the next redo log in the thread (valid only when FILE_TYPE is REDO LOG)
RL_NEXT_TIME	DATE	First timestamp of the next redo log in the thread (valid only when FILE_TYPE is REDO LOG)

 **See Also:**

Oracle Database Backup and Recovery User's Guide for more information about the DBMS_RCMAN.SETDATABASE procedure

8.98 V\$OBsolete_PARAMETER

V\$OBsolete_PARAMETER displays information about obsolete initialization parameters. If any row of the view contains TRUE in the ISSPECIFIED column, then you should examine why.

Column	Datatype	Description
NAME	VARCHAR2 (64)	Name of the parameter
ISSPECIFIED	VARCHAR2 (5)	Indicates whether the parameter was specified in the parameter file (TRUE) or not (FALSE)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.99 V\$OFFLINE_RANGE

V\$OFFLINE_RANGE displays datafile offline information from the control file.

Note that the last offline range of each datafile is kept in the DATAFILE record.

An offline range is created for a datafile when its tablespace is first altered to be OFFLINE NORMAL or READ ONLY, and then subsequently altered to be ONLINE or read/write. Note that no offline range is created if the datafile itself is altered to be OFFLINE or if the tablespace is altered to be OFFLINE IMMEDIATE.

 See Also:["V\\$DATAFILE"](#)

Column	Datatype	Description
RECID	NUMBER	Record ID
STAMP	NUMBER	Record stamp
FILE#	NUMBER	Datafile number
OFFLINE_CHANGE#	NUMBER	SCN at which offline
ONLINE_CHANGE#	NUMBER	SCN at which onlined
ONLINE_TIME	DATE	Time of offline SCN
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the record
RESETLOGS_TIME	DATE	Resetlogs timestamp of the record
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.100 V\$OFS_STATS

V\$OFS_STATS displays performance statistics for various Oracle File System operations. These statistics are maintained at per mount level.

Column	Datatype	Description
OFS_MNTPNT	VARCHAR2 (4096)	Mount point
OFS_LOOKUP	NUMBER	Number of lookup operations performed
OFS_FORGET	NUMBER	Number of forget operations performed
OFS_GETATTR	NUMBER	Number of setattr operations
OFS_SETATTR	NUMBER	Number of setattr operations
OFS_READLINK	NUMBER	Number of readlink operations
OFS_SYMLINK	NUMBER	Number of symlink operations
OFS_MKNOD	NUMBER	Number of mknod operations
OFS_MKDIR	NUMBER	Number of mkdir operations
OFS_UNLINK	NUMBER	Number of remove file operations
OFS_RMDIR	NUMBER	Number of remove directory operations
OFS_RENAME	NUMBER	Number of file rename operations
OFS_LINK	NUMBER	Number of hard link operations
OFS_OPEN	NUMBER	Number of file open operations
OFS_READ	NUMBER	Number of file read operations

Column	Datatype	Description
OFS_WRITE	NUMBER	Number of file write operations
OFS_STATFS	NUMBER	Number of statfs operations performed
OFS_RELEASE	NUMBER	Number of release operations
OFS_FSYNC	NUMBER	Number of file sync operations
OFS_SETXATTR	NUMBER	Number of set extended attributes operations
OFS_GETXATTR	NUMBER	Number of get extended attributes
OFS_LISTXATTR	NUMBER	Number of list extended attributes
OFS_REMOVEXATTR	NUMBER	Number of remove extended attributes
OFS_FLUSH	NUMBER	Number of flush operations
OFS_INIT	NUMBER	Number of init operations
OFS_OPENDIR	NUMBER	Number of opendir operations
OFS_READDIR	NUMBER	Number of readdir operations
OFS_RELEASEDIR	NUMBER	Number of releasedir operations
OFS_FSYNCDIR	NUMBER	Number of directory sync operations
OFS_GETLCK	NUMBER	Number of file get lock operations
OFS_SETLCK	NUMBER	Number of file lock operations
OFS_SETLKW	NUMBER	Number of file lock operation with wait option
OFS_ACCESS	NUMBER	Number of access operations
OFS_CREATE	NUMBER	Number of create operations
OFS_INTERRUPT	NUMBER	Number of interrupt operations received on the mount
OFS_BMAP	NUMBER	Number of block map operations received
OFS_DESTROY	NUMBER	Number of destroy operations
OFS_BYTES_READ	NUMBER	Total number of bytes read on the mount point
OFS_BYTES_WROTTEN	NUMBER	Total number of bytes written to the mount point
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **Note:**

This database view is supported only on the Linux operating system.

 **See Also:**

"V\$OFSMOUNT"

8.101 V\$OFSMOUNT

V\$OFSMOUNT provides information about the file systems that are mounted by Oracle File System.

Column	Datatype	Description
OFS_MNTPATH	VARCHAR2 (1024)	Mount path where the file system is mounted
OFS_FSPATH	VARCHAR2 (1024)	File system path
OFS_MNTOPTS	VARCHAR2 (1024)	Mount options used to mount the file system
OFS_MNTFLAGS	VARCHAR2 (7)	Flags to specify if the file system is mounted. A value of 1 indicates that the file system is mounted.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
OFS_NODENM	VARCHAR2 (255)	Node name
OFS_FSID	NUMBER	Unique ID that identifies the mounted file system
OFS_FSTYPE	VARCHAR2 (255)	Oracle file system type. This is the value that is passed to the <code>dbms_fs.mount_oracle_fs()</code> procedure. Some of the expected values are <code>dbfs</code> and <code>ofs</code> .

Note:

This database view is supported only on the Linux operating system.

See Also:

- "[V\\$OFS_STATS](#)"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_FS.MOUNT_ORACLE_FS` procedure

8.102 V\$ONLINE_REDEF

V\$ONLINE_REDEF provides information about the status of currently running online redefinitions.

Column	Datatype	Description
SID	NUMBER	Session identifier

Column	Datatype	Description
SERIAL#	NUMBER	Session serial number, which is used to uniquely identify a session's objects
REDEFINITION_ID	NUMBER	Redefinition identifier
TABLE_OWNER	VARCHAR2(129)	Owner of the table currently being redefined. The table resides in this user's schema.
ORIGINAL_TABLE_NAME	VARCHAR2(129)	Name of the original table
INTERIM_TABLE_NAME	VARCHAR2(1024)	Interim table currently being redefined
PARTITION_NAME	VARCHAR2(1024)	Partition of the table currently being redefined. The table resides in this user's schema.
OPERATION	VARCHAR2(128)	Operations during the redefining process: <ul style="list-style-type: none"> • start_redef_table • sync_interim_table • copy_table_dependents • finish_redef_table • abort_redef_table
SUBOPERATION	VARCHAR2(128)	Sub operation during the redefining process
DETAILED_MESSAGE	VARCHAR2(1024)	Details of operations during redefining process. This can include details such as the number of DML being processed, execution start_time, and partition_name
PROGRESS	VARCHAR2(128)	Percentage of completion of each operation
REFRESH_STATEMENT_SQL_ID	VARCHAR2(128)	The SQL ID for the statement in the REFRESH_STATEMENT column
REFRESH_STATEMENT	VARCHAR2(4000)	A refresh statement executed during a refresh operation in some online redefinition procedures. When refresh is a sub operation in the SUBOPERATION column, there will be a refresh statement in this REFRESH_STATEMENT column.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.103 V\$OPEN_CURSOR

V\$OPEN_CURSOR lists cursors that each user session currently has opened and parsed, or cached.

Column	Datatype	Description
SADDR	RAW(4 8)	Session address
SID	NUMBER	Session identifier
USER_NAME	VARCHAR2(128)	User that is logged in to the session
ADDRESS	RAW(4 8)	Used with HASH_VALUE to uniquely identify the SQL statement being executed in the session

Column	Datatype	Description
HASH_VALUE	NUMBER	Used with ADDRESS to uniquely identify the SQL statement being executed in the session
SQL_ID	VARCHAR2 (13)	SQL identifier of the SQL statement being executed in the session
SQL_TEXT	VARCHAR2 (60)	First 60 characters of the SQL statement that is parsed into the open cursor
LAST_SQL_ACTIVE_TIME	DATE	Time when this cursor was last executed
SQL_EXEC_ID	NUMBER	If the open cursor is executing, then the SQL execution identifier for that execution (see V\$SQL_MONITOR)
CURSOR_TYPE	VARCHAR2 (64)	<p>Type of cursor:</p> <ul style="list-style-type: none"> • OPEN PL/SQL - Open PL/SQL cursors • OPEN - Other open cursors • SESSION CURSOR CACHED - Cursors cached in the generic session cursor cache • OPEN-RECURSIVE - Open recursive cursors • DICTIONARY LOOKUP CURSOR CACHED - Cursors cached in the dictionary lookup cursor cache • BUNDLE DICTIONARY LOOKUP CACHED - Cursors cached in the bundled dictionary lookup cursor cache • JAVA NAME TRANSLATION CURSOR CACHED - Cursors cached in the Java name translation cursor cache • REPLICATION TRIGGER CURSOR CACHED - Cursors cached in the replication trigger cursor cache • CONSTRAINTS CURSOR CACHED - Cursors cached in the constraints cursor cache • PL/SQL CURSOR CACHED - Cursors cached in the PL/SQL cursor cache
CHILD_ADDRESS	RAW (4 8)	Address of the child cursor
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.104 V\$OPTIMIZER_PROCESSING_RATE

V\$OPTIMIZER_PROCESSING_RATE displays the processing rates used by the optimizer to compute degree of parallelism.

 **Note:**

You can manipulate these rates using these procedures for the DBMS_STATS package:

- SET_PROCESSING_RATE
- DELETE_PROCESSING_RATE
- GATHER_PROCESSING_RATE

See *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_STATS package.

Column	Datatype	Description
ADDRESS	RAW (4 8)	Address of the handle to the parent for this cursor
OPERATION_NAME	VARCHAR2 (64)	Name of the operation. The possible values are AGGR, ALL, CPU, CPU_ACCESS, CPU_AGGR, CPU_BYTES_PER_SEC, CPU_FILTER, CPU_GBY, CPU_HASH_JOIN, CPU_JOIN, CPU_NL_JOIN, CPU_RANDOM_ACCESS, CPU_ROWS_PER_SEC, CPU_SEQUENTIAL_ACCESS, CPU_SM_JOIN, CPU_SORT, HASH, IO, IO_ACCESS, IO_BYTES_PER_SEC, IO_RANDOM_ACCESS, IO_ROWS_PER_SEC, IO_SEQUENTIAL_ACCESS, MEMCMP, MEMCPY
MANUAL_VALUE	VARCHAR2 (10)	Value of the operation set manually by the user
CALIBRATION_VALUE	VARCHAR2 (10)	Value of the operation obtained from calibration (by running the GATHER_PROCESSING_RATE procedure)
DEFAULT_VALUE	VARCHAR2 (10)	Default value of the operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.105 V\$OPTION

V\$OPTION displays Oracle Database options and features.

Typically, although not always, options must be separately licensed, whereas features come with the product and are enabled based on the product that is running (for example, Enterprise Edition).

Column	Datatype	Description
PARAMETER	VARCHAR2 (64)	Name of the option (or feature)

Column	Datatype	Description
VALUE	VARCHAR2 (64)	Indicates whether the option (or feature) is installed (TRUE) or not (FALSE)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Licensing Information User Manual for more information about Oracle Database options and features

8.106 V\$OSSTAT

V\$OSSTAT displays system utilization statistics from the operating system. One row is returned for each system statistic.

Column	Datatype	Description
STAT_NAME	VARCHAR2 (64)	Name of the statistic (see Table 8-3)
VALUE	NUMBER	Instantaneous statistic value
OSSTAT_ID	NUMBER	Statistic ID
COMMENTS	VARCHAR2 (64)	Any additional operating system-specific clarifications for the statistic
CUMULATIVE	VARCHAR2 (3)	Indicates whether the statistic is cumulative (that is, accumulates over time) (YES) or not (NO)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

Table 8-3 V\$OSSTAT Statistics

Statistic Name	Description
NUM_CPUS	Number of CPUs or processors available
IDLE_TIME	Number of hundredths of a second that a processor has been idle, totalled over all processors
BUSY_TIME	Number of hundredths of a second that a processor has been busy executing user or kernel code, totalled over all processors

Table 8-3 (Cont.) V\$OSSTAT Statistics

Statistic Name	Description
USER_TIME	Number of hundredths of a second that a processor has been busy executing user code, totalled over all processors
SYS_TIME	Number of hundredths of a second that a processor has been busy executing kernel code, totalled over all processors
IOWAIT_TIME	Number of hundredths of a second that a processor has been waiting for I/O to complete, totalled over all processors
NICE_TIME	Number of hundredths of a second that a processor has been busy executing low-priority user code, totalled over all processors
AVG_IDLE_TIME	Number of hundredths of a second that a processor has been idle, averaged over all processors
AVG_BUSY_TIME	Number of hundredths of a second that a processor has been busy executing user or kernel code, averaged over all processors
AVG_USER_TIME	Number of hundredths of a second that a processor has been busy executing user code, averaged over all processors
AVG_SYS_TIME	Number of hundredths of a second that a processor has been busy executing kernel code, averaged over all processors
AVG_IOWAIT_TIME	Number of hundredths of a second that a processor has been waiting for I/O to complete, averaged over all processors
AVG_NICE_TIME	Number of hundredths of a second that a processor has been busy executing low-priority user code, averaged over all processors
OS_CPU_WAIT_TIME	Total number of hundredths of a second that processes have been in a ready state, waiting to be selected by the operating system scheduler to run
RSRC_MGR_CPU_WAIT_TIME	Total number of hundredths of a second that Oracle processes have been in a ready state, waiting for CPU to be available for their consumer group in the currently active resource plan
VM_IN_BYTES	Total number of bytes of data that have been paged in due to virtual memory paging
VM_OUT_BYTES	Total number of bytes of data that have been paged out due to virtual memory paging
PHYSICAL_MEMORY_BYTES	Total number of bytes of physical memory
LOAD	Current number of processes that are either running or in the ready state, waiting to be selected by the operating-system scheduler to run. On many platforms, this statistic reflects the average load over the past minute.
NUM_CPU_CORES	Number of CPU cores available (includes subcores of multicore CPUs as well as single-core CPUs)
NUM_CPU_SOCKETS	Number of CPU sockets available (represents an absolute count of CPU chips on the system, regardless of multithreading or multi-core architectures)
NUM_VCPUS	Number of virtual CPUs available
NUM_LCPUS	Number of logical CPUs available (includes hardware threads if hardware threading is turned on)
TCP_SEND_SIZE_MIN	Minimum size of the TCP send buffer
TCP_SEND_SIZE_DEFAULT	Default size of the TCP send buffer
TCP_SEND_SIZE_MAX	Maximum size of the TCP send buffer
TCP_RECEIVE_SIZE_MIN	Minimum size of the TCP receive buffer
TCP_RECEIVE_SIZE_DEFAULT	Default size of the TCP receive buffer
TCP_RECEIVE_SIZE_MAX	Maximum size of the TCP receive buffer

Table 8-3 (Cont.) V\$OSSTAT Statistics

Statistic Name	Description
GLOBAL_SEND_SIZE_MAX	Maximum size of the global send buffer
GLOBAL_RECEIVE_SIZE_MAX	Maximum size of the global receive buffer

Note:

The availability of all statistics except for NUM_CPUS and RSRC_MGR_CPU_WAIT_TIME is subject to the operating system platform on which the Oracle Database is running.

8.107 V\$PARALLEL_DEGREE_LIMIT_MTH

V\$PARALLEL_DEGREE_LIMIT_MTH displays all available parallel degree limit resource allocation methods.

Column	Datatype	Description
NAME	VARCHAR2(40)	Name of the parallel degree limit resource allocation method
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.108 V\$PARAMETER

V\$PARAMETER displays information about the initialization parameters that are currently in effect for the session. A new session inherits parameter values from the instance-wide values displayed by the V\$SYSTEM_PARAMETER view.

Column	Datatype	Description
NUM	NUMBER	Parameter number
NAME	VARCHAR2(80)	Name of the parameter
TYPE	NUMBER	<p>Parameter type:</p> <ul style="list-style-type: none"> • 1 - Boolean • 2 - String • 3 - Integer • 4 - Parameter file • 5 - Reserved • 6 - Big integer
VALUE	VARCHAR2(4000)	Parameter value for the session (if modified within the session); otherwise, the instance-wide parameter value

Column	Datatype	Description
DISPLAY_VALUE	VARCHAR2(4000)	Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.
DEFAULT_VALUE	VARCHAR2(255)	The default value for this parameter. This is the value of the parameter if a value is not explicitly specified for the parameter.
ISDEFAULT	VARCHAR2(9)	Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE).
		The database sets the value of the ISDEFAULT column to TRUE for parameters that are not specified in the init.ora or server parameter file (SPFILE).
ISSES_MODIFIABLE	VARCHAR2(5)	Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)
ISSYS_MODIFIABLE	VARCHAR2(9)	Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: <ul style="list-style-type: none"> • IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately. • DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions. • FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.
ISPDB_MODIFIABLE	VARCHAR2(5)	Indicates whether the parameter can be modified inside a PDB (TRUE) or not (FALSE)
ISINSTANCE_MODIFIABLE	VARCHAR2(5)	For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.
ISMODIFIED	VARCHAR2(10)	Indicates whether the parameter has been modified after instance startup: <ul style="list-style-type: none"> • MODIFIED - Parameter has been modified with ALTER SESSION • SYSTEM_MOD - Parameter has been modified with ALTER SYSTEM (which causes all the currently logged in sessions' values to be modified) • FALSE - Parameter has not been modified after instance startup
ISADJUSTED	VARCHAR2(5)	Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)
ISDEPRECATED	VARCHAR2(5)	Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)
ISBASIC	VARCHAR2(5)	Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)
DESCRIPTION	VARCHAR2(255)	Description of the parameter
UPDATE_COMMENT	VARCHAR2(255)	Comments associated with the most recent update
HASH	NUMBER	Hash value for the parameter name

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

Examples

The following query returns the default value for the `ALLOW_GLOBAL_DBLINKS` initialization parameter:

```
SQL> SELECT name, default_value FROM v$parameter
  2 WHERE name = 'allow_global_dblinks';
```

NAME

DEFAULT_VALUE

```
allow_global_dblinks
FALSE
```

SQL>

The following query shows that the `ALLOW_GLOBAL_DBLINKS` initialization parameter is not modifiable in a PDB:

```
SQL> SELECT name, ispdb_modifiable FROM v$parameter
  2 WHERE name = 'allow_global_dblinks';
```

NAME

ISPDB

```
allow_global_dblinks
FALSE
```

SQL>

 **See Also:**

["V\\$SYSTEM_PARAMETER"](#)

8.109 V\$PARAMETER_VALID_VALUES

V\$PARAMETER_VALID_VALUES displays a list of valid values for list parameters.

Column	Datatype	Description
NUM	NUMBER	Parameter number
NAME	VARCHAR2 (64)	Parameter name
ORDINAL	NUMBER	Ordinal number in the list (1-based)
VALUE	VARCHAR2 (255)	Parameter value at ordinal
ISDEFAULT	VARCHAR2 (64)	Indicates whether the given ordinal value is the default value for the parameter
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.110 V\$PARAMETER2

V\$PARAMETER2 displays information about the initialization parameters that are currently in effect for the session, with each list parameter value appearing as a row in the view. A new session inherits parameter values from the instance-wide values displayed in the V\$SYSTEM_PARAMETER2 view.

Presenting the list parameter values in this format enables you to quickly determine the values for a list parameter. For example, if a parameter value is *a*, *b*, then the V\$PARAMETER view does not tell you if the parameter has two values (both *a* and *b*) or one value (*a*, *b*). V\$PARAMETER2 makes the distinction between the list parameter values clear.

Column	Datatype	Description
NUM	NUMBER	Parameter number
NAME	VARCHAR2 (80)	Name of the parameter
TYPE	NUMBER	Parameter type: <ul style="list-style-type: none"> • 1 - Boolean • 2 - String • 3 - Integer • 4 - Parameter file • 5 - Reserved • 6 - Big integer
VALUE	VARCHAR2 (4000)	Parameter value for the session (if modified within the session); otherwise, the instance-wide parameter value
DISPLAY_VALUE	VARCHAR2 (4000)	Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.
ISDEFAULT	VARCHAR2 (6)	Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE)

Column	Datatype	Description
ISSES_MODIFIABLE	VARCHAR2 (5)	Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)
ISSYS_MODIFIABLE	VARCHAR2 (9)	Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: <ul style="list-style-type: none"> IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately. DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions. FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.
ISPDB_MODIFIABLE	VARCHAR2 (5)	Indicates whether the parameter can be modified inside a PDB (TRUE) or not (FALSE). In a non-CDB, the value of this column is NULL.
ISINSTANCE_MODIFIABLE	VARCHAR2 (5)	For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.
ISMODIFIED	VARCHAR2 (10)	Indicates whether the parameter has been modified after instance startup: <ul style="list-style-type: none"> MODIFIED - Parameter has been modified with ALTER SESSION SYSTEM_MOD - Parameter has been modified with ALTER SYSTEM (which causes all the currently logged in sessions' values to be modified) FALSE - Parameter has not been modified after instance startup
ISADJUSTED	VARCHAR2 (5)	Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)
ISDEPRECATED	VARCHAR2 (5)	Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)
ISBASIC	VARCHAR2 (5)	Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)
DESCRIPTION	VARCHAR2 (255)	Description of the parameter
ORDINAL	NUMBER	Position (ordinal number) of the parameter value. Useful only for parameters whose values are lists of strings.
UPDATE_COMMENT	VARCHAR2 (255)	Comments associated with the most recent update
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "[V\\$SYSTEM_PARAMETER](#)"
- "[V\\$PARAMETER](#)"

8.111 V\$PASSWORDFILE_INFO

`V$PASSWORDFILE_INFO` provides information about the database password file.

This view can be queried from the root or from a pluggable database (PDB) in a multitenant container database (CDB). When queried, this view always returns one row.

Column	Datatype	Description
FILE_NAME	VARCHAR2 (513)	Fully qualified password file name/location.
FORMAT	VARCHAR2 (6)	Shows the format of the password file: <ul style="list-style-type: none"> • LEGACY • 12 • 12.2
IS_ASM	VARCHAR2 (5)	Indicates where the password file is stored. Possible values: <ul style="list-style-type: none"> • TRUE: The password file is stored in Oracle ASM. • FALSE: The password file is stored in the operating system file system.
CON_ID	NUMBER	The ID of the container to which the data pertains. Because there is only one password file for a CDB that is common for the entire CDB, the only value possible for <code>CON_ID</code> is 0 for this view.

 **Note:**

If the database password file name or location was recently changed, and you do not see the change reflected in this view, you can run the following SQL statement:

```
SQL> ALTER SYSTEM FLUSH PASSWORDFILE_METADATA_CACHE;
```

This statement flushes the metadata cache and updates the database to use the new password file. It also updates this view with the current password file information.

8.112 V\$PATCHES

`V$PATCHES` shows the patches applied on an Oracle ASM instance and the list of patches applied to an Oracle Grid infrastructure home directory.

 **Note:**

If this view is queried in an RDBMS instance, no patch information is returned.

Column	Datatype	Description
PATCH_ID	NUMBER	Patch identifier
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.113 V\$PDB_INCARNATION

V\$PDB_INCARNATION displays information about all PDB incarnations. Oracle creates a new PDB incarnation whenever a PDB is opened with the RESETLOGS option.

Column	Datatype	Description
DB_INCarnation#	NUMBER	Database incarnation number
PDB_INCarnation#	NUMBER	PDB incarnation number
STATUS	VARCHAR2(7)	Incarnation status: <ul style="list-style-type: none"> • ORPHAN: Orphan incarnation • CURRENT: Current incarnation of the PDB • PARENT: Parent of the current incarnation
INCarnation_SCN	NUMBER	The SCN to flashback or recover to for this PDB incarnation
INCarnation_TIME	DATE	The point in time recovered to for this PDB incarnation
BEGIN_RESETLOGS_SCN	NUMBER	The SCN at the beginning of PDB resetlogs
BEGIN_RESETLOGS_TIME	DATE	The time at the beginning of PDB resetlogs
END_RESETLOGS_SCN	NUMBER	The SCN at the end of PDB resetlogs
END_RESETLOGS_TIME	DATE	The time at the end of PDB resetlogs
PRIOR_DB_INCarnation#	NUMBER	Parent database incarnation number
PRIOR_PDB_INCarnation#	VARCHAR2(40)	Parent PDB incarnation number
FLASHBACK_DATABASE_ALLOW	VARCHAR2(3) ED	Indicates whether the PDB can be flashbacked to this incarnation as part of a flashback database operation for the CDB
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.114 V\$PDBS

V\$PDBS displays information about PDBs associated with the current instance.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
DBID	NUMBER	PDB identifier calculated when the PDB is created and stored in all file headers associated with the PDB
CON_UID	NUMBER	Unique identifier associated with the PDB
GUID	RAW (16)	Globally unique identifier (GUID) of this PDB
NAME	VARCHAR2 (128)	Name of the PDB
OPEN_MODE	VARCHAR2 (10)	Open mode information. Possible values: <ul style="list-style-type: none"> • MOUNTED • READ WRITE • READ ONLY • MIGRATE
RESTRICTED	VARCHAR2 (3)	Indicates whether only users possessing RESTRICTED SESSION privilege can connect to the PDB. Possible values: <ul style="list-style-type: none"> • YES • NO • NULL
OPEN_TIME	TIMESTAMP (3) WITH TIME ZONE	Date and time when the database was last opened
CREATE_SCN	NUMBER	System change number (SCN) for the creation of this PDB
TOTAL_SIZE	NUMBER	Shows the disk space (in bytes) used by the PDB, including both data and temp files.
BLOCK_SIZE	NUMBER	The current block size for the PDB
RECOVERY_STATUS	VARCHAR2 (8)	Shows whether recovery is enabled or disabled for the PDB. Possible values: <ul style="list-style-type: none"> • ENABLED • DISABLED
SNAPSHOT_PARENT_CON_ID	NUMBER	This column shows the container ID of the master PDB that this PDB is a snapshot clone of. This column shows a nonzero value only if the PDB is a snapshot clone. For all other cases, it shows a value of 0.
APPLICATION_ROOT	VARCHAR2 (3)	Indicates whether the PDB is an application root
APPLICATION_PDB	VARCHAR2 (3)	Indicates whether the PDB is an application PDB
APPLICATION_SEED	VARCHAR2 (3)	Indicates whether the PDB is an application seed (an application seed is also an application PDB)
APPLICATION_ROOT_CON_ID	NUMBER	If this PDB is an application PDB, the container ID of an application root to which this application PDB belongs. If this PDB is an application root clone, the container ID of an application root to which this application root clone belongs. Otherwise, NULL.
APPLICATION_ROOT_CLONE	VARCHAR2 (3)	Indicates whether this PDB is an application root clone (YES) or not (NO)
PROXY_PDB	VARCHAR2 (3)	Indicates whether this PDB is a proxy PDB (YES) or not (NO)

Column	Datatype	Description
LOCAL_UNDO	NUMBER	Shows whether the PDB is in local undo. Possible values: <ul style="list-style-type: none">• 1 – PDB is in local undo mode• 0 – PDB is in shared undo mode This column is not relevant for CDB\$ROOT.
UNDO_SCN	NUMBER	System change number (SCN) at which the PDB was last converted from shared to local undo, or from local to shared undo. This column is not relevant for CDB\$ROOT.
UNDO_TIMESTAMP	DATE	Date and time at which the PDB was last converted from shared to local undo, or from local to shared undo. This column is not relevant for CDB\$ROOT.
CREATION_TIME	DATE	Date and time at which the PDB was created.
DIAGNOSTICS_SIZE	NUMBER	Shows the current disk space usage (in bytes) of the diagnostic traces generated in the PDB, which is represented by the CON_ID column of the row
PDB_COUNT	NUMBER	The number of user-created PDBs belonging to a given application root or CDB\$ROOT. For all other containers, its value is 0.
AUDIT_FILES_SIZE	NUMBER	Shows the current disk space usage (in bytes) by Unified Audit files (.bin format) in the current PDB.
MAX_SIZE	NUMBER	Shows the maximum amount of disk space (in bytes) that can be used by data and temp files in the PDB
MAX_DIAGNOSTICS_SIZE	NUMBER	Shows the maximum amount of disk space (in bytes) that can be used by diagnostic traces generated in the PDB
MAX_AUDIT_SIZE	NUMBER	Shows the maximum amount of disk space (in bytes) that can be used by Unified Audit files (.bin format) in the PDB
LAST_CHANGED_BY	VARCHAR2(11)	Indicates what type of user last changed the PDB. Possible values: <ul style="list-style-type: none">• COMMON USER• LOCAL USER
TEMPLATE	VARCHAR2(3)	For internal use only
TENANT_ID	VARCHAR2(256)	Pluggable database tenant key
UPGRADE_LEVEL	NUMBER	For internal use only
GUID_BASE64	VARCHAR2(30)	The GUID of the PDB, encoded in base64

8.115 V\$PERSISTENT_PUBLISHERS

V\$PERSISTENT_PUBLISHERS displays information about all active publishers of the persistent queues in the database. There is one row per instance per queue per publisher. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QUEUE_ID	NUMBER	Identifier for the queue
QUEUE_SCHEMA	VARCHAR2(128)	Owner of the queue
QUEUE_NAME	VARCHAR2(128)	Name of the queue
PUBLISHER_NAME	VARCHAR2(128)	Name of the agent enqueueing the message
PUBLISHER_ADDRESS	VARCHAR2(1024)	Address of the publisher agent
PROTOCOL	NUMBER	Protocol used by the publisher's address

Column	Datatype	Description
ENQUEUED_MSGS	NUMBER	Number of messages that have been enqueued
ELAPSED_ENQUEUE_TIME	NUMBER	Total time spent doing enqueue (in hundredths of a second)
ENQUEUE_CPU_TIME	NUMBER	Total CPU time for enqueue (in hundredths of a second)
LAST_ENQUEUE_TIME	TIMESTAMP (6)	Last enqueue message timestamp
ENQUEUE_TRANSACTIONS	NUMBER	Number of enqueue transactions
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.116 V\$PERSISTENT_QMN_CACHE

V\$PERSISTENT_QMN_CACHE displays detailed information and statistics about the background activities for all queue tables in the system. There is one row per queue table. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QUEUE_TABLE_ID	NUMBER	Queue table object ID
TYPE	VARCHAR2 (32)	Type of the queue table's queue monitor cache
STATUS	NUMBER	Status of the queue table's queue monitor cache
NEXT_SERVICE_TIME	TIMESTAMP (3) WITH TIMEZONE	Time when the queue table should be serviced by QMON servers
WINDOW_END_TIME	TIMESTAMP (3) WITH TIMEZONE	Time manager activity period for non-owner queue table operations
TOTAL_RUNS	NUMBER	Total number of times this queue table is served
TOTAL_LATENCY	NUMBER	Cumulative latency in serving the queue table (in hundredths of a second)
TOTAL_ELAPSED_TIME	NUMBER	Total time spent in processing this queue table (in seconds)
TOTAL_CPU_TIME	NUMBER	Cumulative CPU time for serving the queue table (in hundredths of a second)
TMGR_ROWS_PROCESSED	NUMBER	Number of time manager entries processed
TMGR_ELAPSED_TIME	NUMBER	Cumulative time for time management activities (in hundredths of a second)
TMGR_CPU_TIME	NUMBER	Cumulative CPU time for time management activities (in hundredths of a second)
LAST_TMGR_PROCESSING_TIME	TIMESTAMP (3) WITH TIMEZONE	Last timer manager processing time
DEQLOG_ROWS_PROCESSED	NUMBER	Number of dequeue log entries processed
DEQLOG_PROCESSING_ELAPSE_DTIME	NUMBER	Total time for processing dequeue log entries (in hundredths of a second)
DEQLOG_PROCESSING_CPU_TIME	NUMBER	Total CPU time for processing dequeue log entries (in hundredths of a second)

Column	Datatype	Description
LAST_DEQLOG_PROCESSING_TIME	TIMESTAMP(3) WITH TIME ZONE	Last dequeue log processing time
DEQUEUE_INDEX_BLOCKS_FREED	NUMBER	Number of dequeue index blocks freed
HISTORY_INDEX_BLOCKS_FREED	NUMBER	Number of history index blocks freed
TIME_INDEX_BLOCKS_FREED	NUMBER	Number of time manager index blocks freed
INDEX_CLEANUP_COUNT	NUMBER	Number of times index block cleanup was attempted
INDEX_CLEANUP_ELAPSED_TIME	NUMBER	Total time for index block cleanup (in hundredths of a second)
INDEX_CLEANUP_CPU_TIME	NUMBER	Total CPU time for index block cleanup (in hundredths of a second)
LAST_INDEX_CLEANUP_TIME	TIMESTAMP(3) WITH TIME ZONE	Last index block cleanup time
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.117 V\$PERSISTENT_QUEUES

V\$PERSISTENT_QUEUES displays information about all active persistent queues in the database since the queues' first activity time. There is one row per queue. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QUEUE_ID	NUMBER	Identifier for the queue
QUEUE_TABLE_ID	NUMBER	Queue table identifier
QUEUE_SCHEMA	VARCHAR2(128)	Owner of the queue
QUEUE_NAME	VARCHAR2(128)	Name of the queue
FIRST_ACTIVITY_TIME	TIMESTAMP(6)	First queue activity time since database startup
ENQUEUED_MSGS	NUMBER	Number of messages enqueued
DEQUEUED_MSGS	NUMBER	Number of messages dequeued
		Note: This column will not be incremented until all the subscribers of the message have dequeued the message and its retention time has elapsed.
BROWSED_MSGS	NUMBER	Number of messages that have been browsed
ELAPSED_ENQUEUE_TIME	NUMBER	Total time (in hundredths of a second) spent doing enqueue
ELAPSED_DEQUEUE_TIME	NUMBER	Total time (in hundredths of a second) spent doing dequeue
ENQUEUE_CPU_TIME	NUMBER	Total CPU time for enqueue (in hundredths of a second)
DEQUEUE_CPU_TIME	NUMBER	Total CPU time for dequeue (in hundredths of a second)
AVG_MSG_AGE	NUMBER	Average age of messages in the queue
DEQUEUED_MSG_LATENCY	NUMBER	Last dequeued message latency (in seconds)

Column	Datatype	Description
ELAPSED_TRANSFORMATION_TIME	NUMBER	Total time (in hundredths of a second) spent doing transformation
ELAPSED_RULE_EVALUATION_TIME	NUMBER	Total time (in hundredths of a second) spent doing rule evaluation
ENQUEUED_EXPIRY_MSGS	NUMBER	Number of messages enqueued with expiry
ENQUEUED_DELAY_MSGS	NUMBER	Number of messages enqueued with delay
MSGs_MADE_EXPIRED	NUMBER	Number of messages expired by time manager
MSGs_MADE_READY	NUMBER	Number of messages made ready by time manager
LAST_ENQUEUE_TIME	TIMESTAMP (6)	Last message enqueue time
LAST_DEQUEUE_TIME	TIMESTAMP (6)	Last message dequeue time
LAST_TM_EXPIRY_TIME	TIMESTAMP (6)	Last time message was expired by time manager
LAST_TM_READY_TIME	TIMESTAMP (6)	Last time message was made ready by time manager
ENQUEUE_TRANSACTIONS	NUMBER	Number of enqueue transactions
DEQUEUE_TRANSACTIONS	NUMBER	Number of dequeue transactions
EXECUTION_COUNT	NUMBER	Number of executions of the dequeue cursor
OLDEST_MSGID	RAW (16)	Message ID of the oldest message in the queue
OLDEST_MSG_ENQTM	TIMESTAMP (6)	Enqueue time of the oldest message in the queue
MANDATORY_AFF_SWITCHES_OUT	NUMBER	An affinity switch is a change in dequeue instance for a shard-subscriber pair. A mandatory affinity switch is when there are local enqueues in the queue at the instance but no local dequeues present, so the dequeue affinity is switched to another instance for that shard-subscriber pair. This column shows the number of times mandatory affinity switches were needed from this instance to another for this queue.
OPTIONAL_AFF_SWITCHES_OUT	NUMBER	Optional affinity switches are affinity switches that are not mandatory. Optional affinity switches are done for global load balancing across the Oracle Real Application Clusters (Oracle RAC) database. This column shows the number of times optional affinity switches were needed from this instance to another for this queue.
AFF_SWITCHES_BACK_IN	NUMBER	The number of times dequeue affinities have come back from other instances to this instance. ($MANDATORY_AFF_SWITCHES_OUT + OPTIONAL_AFF_SWITCHES_OUT - AFF_SWITCHES_BACK_IN$) is the number of cross instance affinities present across all shard-subscriber pair for shards owned by this instance for this queue.
CROSS_STREAM_JOBS	NUMBER	The number of times a shard is being forwarded to another instance due to cross instance dequeues for this queue
RESTORE_BITMAP_JOBS	NUMBER	The number of times subscribers used existing shard forwarding to have cross instance dequeues for this queue
SHADOW_AFF_SWITCHES_IN	NUMBER	The number of affinity switches for this queue where this instance is the dequeue instance for a shard-subscriber pair where the shard is being enqueued at another instance
SHADOW_AFF_SWITCHES_OUT	NUMBER	The number of affinity switches for this queue where shadow affinity is switched back to source instance of the shard. ($SHADOW_AFF_SWITCHES_IN - SHADOW_AFF_SWITCHES_OUT$) is the number of dequeue affinities which are performing cross instance dequeues from non-local shards.
SHADOW_SHARDS RECEIVED	NUMBER	The number of times a shard is being forwarded from another instance to this instance due to cross instance dequeues for this queue

Column	Datatype	Description
SHADOW_SHARDS_FREED	NUMBER	The number of times a forwarded shard to this instance was stopped due to removal of cross instance dequeues for this queue
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

Note:

For sharded queues, only the following columns in this view contain accurate information: FIRST_ACTIVITY_TIME, BROWSED_MSGS, LAST_ENQUEUE_TIME, LAST_DEQUEUE_TIME, ENQUEUE_TRANSACTIONS, and DEQUEUE_TRANSACTIONS. The rest of the columns in this view should be ignored when querying information about sharded queues.

8.118 V\$PERSISTENT_SUBSCRIBERS

V\$PERSISTENT_SUBSCRIBERS displays information about all active subscribers of the persistent queues in the database.

There is one row per instance per queue per subscriber. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Note:

This view does not display information about sharded queues. For information about sharded queues, refer to the "[V\\$AQ_SHARDED_SUBSCRIBER_STAT](#)" view.

Column	Datatype	Description
QUEUE_ID	NUMBER	Identifier for the queue
QUEUE_SCHEMA	VARCHAR2(128)	Owner of the queue
QUEUE_NAME	VARCHAR2(128)	Name of the queue
SUBSCRIBER_ID	NUMBER	Internal subscriber number
SUBSCRIBER_NAME	VARCHAR2(512)	Name of the subscriber
SUBSCRIBER_ADDRESS	VARCHAR2(1024)	Address of the subscribing agent
PROTOCOL	NUMBER	Protocol of the subscribing agent
SUBSCRIBER_TYPE	VARCHAR2(128)	Type of the subscriber: <ul style="list-style-type: none"> • PROXY - Propagation subscriber • SUBSCRIBER - Normal subscriber • RECIPIENT - Recipient
FIRST_ACTIVITY_TIME	TIMESTAMP(6)	First subscriber activity time since database startup

Column	Datatype	Description
ENQUEUED_MSGS	NUMBER	Number of messages enqueued since FIRST_ACTIVITY_TIME
DEQUEUED_MSGS	NUMBER	Number of messages dequeued since FIRST_ACTIVITY_TIME
AVG_MSG_AGE	NUMBER	Average age of messages in the queue
BROWSED_MSGS	NUMBER	Number of messages that have been browsed
EXPIRED_MSGS	NUMBER	Number of messages expired since FIRST_ACTIVITY_TIME
DEQUEUED_MSG_LATENCY	NUMBER	Last dequeued message latency (in seconds)
LAST_ENQUEUE_TIME	TIMESTAMP(6)	Timestamp of the last enqueued message
LAST_DEQUEUE_TIME	TIMESTAMP(6)	Timestamp of the last dequeued message
ELAPSED_DEQUEUE_TIME	NUMBER	Total time spent in dequeue (in hundredths of a second)
DEQUEUE_CPU_TIME	NUMBER	Total CPU time for dequeue (in hundredths of a second)
DEQUEUE_TRANSACTIONS	NUMBER	Number of dequeue transactions
EXECUTION_COUNT	NUMBER	Number of executions of the dequeue index cursor
DEQUEUE_MEMORY_LOCKS	NUMBER	Number of dequeue transactions that obtained memory locks
DEQUEUE_DISK_LOCKS	NUMBER	Number of dequeue transactions that obtained disk locks
DEQUEUE_DISK_DELETES	NUMBER	Number of dequeue transactions that deleted index-organized table entries
OLDEST_MSGID	RAW(16)	Message ID of the oldest message
OLDEST_MSG_ENQTM	TIMESTAMP(6)	Enqueue time of the oldest message
PARENT_SUBSCRIBER_ID	NUMBER	Subscriber ID of the parent durable subscriber
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.119 V\$PGA_TARGET_ADVICE

V\$PGA_TARGET_ADVICE predicts how the cache hit percentage and over allocation count statistics displayed by the V\$PGASTAT performance view would be impacted if the value of the PGA_AGGREGATE_TARGET parameter is changed.

The prediction is performed for various values of the PGA_AGGREGATE_TARGET parameter, selected around its current value. The advice statistic is generated by simulating the past workload run by the instance.

The content of the view is empty if PGA_AGGREGATE_TARGET is not set. In addition, the content of this view is not updated if the STATISTICS_LEVEL parameter is set to BASIC. Base statistics for this view are reset at instance startup and when the value of the PGA_AGGREGATE_TARGET initialization parameter is dynamically modified.

Column	Datatype	Description
PGA_TARGET_FOR_ESTIMATE	NUMBER	Value of PGA_AGGREGATE_TARGET for this prediction (in bytes)

Column	Datatype	Description
PGA_TARGET_FACTOR	NUMBER	PGA_TARGET_FOR_ESTIMATE / the current value of the PGA_AGGREGATE_TARGET parameter
ADVICE_STATUS	VARCHAR2(3)	Indicates whether the advice is enabled (ON) or disabled (OFF) depending on the value of the STATISTICS_LEVEL parameter
BYTES_PROCESSED	NUMBER	Total bytes processed by all the work areas considered by this advice (in bytes)
ESTD_TIME	NUMBER	Time (in seconds) required to process the bytes
ESTD_EXTRA_BYTES_RW	NUMBER	Estimated number of extra bytes which would be read or written if PGA_AGGREGATE_TARGET was set to the value of the PGA_TARGET_FOR_ESTIMATE column. This number is derived from the estimated number and size of work areas which would run in one-pass (or multi-pass) for that value of PGA_AGGREGATE_TARGET.
ESTD_PGA_CACHE_HIT_PERCE_NTAGE	NUMBER	Estimated value of the cache hit percentage statistic when PGA_AGGREGATE_TARGET equals PGA_TARGET_FOR_ESTIMATE. This column is derived from the above two columns and is equal to BYTES_PROCESSED / (BYTES_PROCESSED + ESTD_EXTRA_BYTES_RW)
ESTD_OVERALLOC_COUNT	NUMBER	Estimated number of PGA memory over-allocations if the value of PGA_AGGREGATE_TARGET is set to PGA_TARGET_FOR_ESTIMATE. A nonzero value means that PGA_TARGET_FOR_ESTIMATE is not large enough to run the work area workload. Hence, the DBA should not set PGA_AGGREGATE_TARGET to PGA_TARGET_FOR_ESTIMATE since Oracle will not be able to honor that target.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.120 V\$PGA_TARGET_ADVICE_HISTOGRAM

V\$PGA_TARGET_ADVICE_HISTOGRAM predicts how statistics displayed by the V\$SQL_WORKAREA_HISTOGRAM dynamic view would be impacted if the value of the PGA_AGGREGATE_TARGET parameter is changed.

This prediction is performed for various values of the PGA_AGGREGATE_TARGET parameter, selected around its current value. The advice statistic is generated by simulating the past workload run by the instance.

The content of the view is empty if PGA_AGGREGATE_TARGET is not set. In addition, the content of this view is not updated when the STATISTICS_LEVEL initialization parameter is set to BASIC. Base statistics for this view are reset at instance startup or when the value of the PGA_AGGREGATE_TARGET initialization parameter is dynamically modified.

Column	Datatype	Description
PGA_TARGET_FOR_ESTIMATE	NUMBER	Value of PGA_AGGREGATE_TARGET for this prediction (in bytes)
PGA_TARGET_FACTOR	NUMBER	PGA_TARGET_FOR_ESTIMATE / the current value of the PGA_AGGREGATE_TARGET parameter
ADVICE_STATUS	VARCHAR2(3)	Indicates whether the advice is enabled (ON) or disabled (OFF) depending on the value of the STATISTICS_LEVEL parameter
LOW_OPTIMAL_SIZE	NUMBER	Lower bound for the optimal memory requirement of work areas included in this row (in bytes)
HIGH_OPTIMAL_SIZE	NUMBER	Upper bound for the optimal memory requirement of work areas included in this row (in bytes)
ESTD_OPTIMAL_EXECUTIONS	NUMBER	Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which are predicted to run optimal given a value of PGA_AGGREGATE_TARGET equal to PGA_TARGET_FOR_ESTIMATE
ESTD_ONEPASS_EXECUTIONS	NUMBER	Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which are predicted to run one-pass given a value of PGA_AGGREGATE_TARGET equal to PGA_TARGET_FOR_ESTIMATE
ESTD_MULTIPASSES_EXECUTIONS	NUMBER	Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which are predicted to run multi-pass given a value of PGA_AGGREGATE_TARGET equal to PGA_TARGET_FOR_ESTIMATE
ESTD_TOTAL_EXECUTIONS	NUMBER	Sum of ESTD_OPTIMAL_EXECUTIONS, ESTD_ONEPASS_EXECUTIONS, and ESTD_MULTIPASSES_EXECUTIONS
IGNORED_WORKAREAS_COUNT	NUMBER	Number of work areas with optimal memory requirement between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE ignored in the advice generation due to memory and CPU constraints
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.121 V\$PGASTAT

`V$PGASTAT` displays PGA memory usage statistics as well as statistics about the automatic PGA memory manager when it is enabled (that is, when `PGA_AGGREGATE_TARGET` is set). Cumulative values in `V$PGASTAT` are accumulated since instance startup.

Column	Datatype	Description
NAME	VARCHAR2 (64)	Name of the statistic (see Table 8-4)
VALUE	NUMBER	Statistic value
UNIT	VARCHAR2 (12)	Unit for the value: <ul style="list-style-type: none"> • bytes • microseconds • percent
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Table 8-4 V\$PGASTAT Statistics

Statistic Name	Description
aggregate PGA auto target	Amount of PGA memory the Oracle Database can use for work areas running in automatic mode. This amount is dynamically derived from the value of the <code>PGA_AGGREGATE_TARGET</code> initialization parameter and the current work area workload, and continuously adjusted by the Oracle Database. If this value is small compared to the value of <code>PGA_AGGREGATE_TARGET</code> , then a large amount of PGA memory is used by other components of the system (for example, PL/SQL or Java memory) and little is left for work areas. The DBA must ensure that enough PGA memory is left for work areas running in automatic mode.
aggregate PGA target parameter	Current value of the <code>PGA_AGGREGATE_TARGET</code> initialization parameter. If this parameter is not set, then its value is 0 and automatic management of PGA memory is disabled.
bytes processed	Number of bytes processed by memory intensive SQL operators, cumulated since instance startup.

Table 8-4 (Cont.) V\$PGASTAT Statistics

Statistic Name	Description
cache hit percentage	A metric computed by the Oracle Database to reflect the performance of the PGA memory component, cumulative since instance startup. A value of 100% means that all work areas executed by the system since instance startup have used an optimal amount of PGA memory.
	When a work area cannot run optimal, one or more extra passes is performed over the input data. This will reduce the cache hit percentage in proportion to the size of the input data and the number of extra passes performed.
extra bytes read/written	Number of bytes processed during extra passes of the input data, cumulated since instance startup. When a work area cannot run optimal, one or more of these extra passes is performed.
global memory bound	Maximum size of a work area executed in automatic mode. This value is continuously adjusted by the Oracle Database to reflect the current state of the work area workload. The global memory bound generally decreases when the number of active work areas is increasing in the system. If the value of the global bound decreases below 1 MB, then the value of <code>PGA_AGGREGATE_TARGET</code> should be increased.
max processes count	Maximum number of processes active at any one time since instance startup.
maximum PGA allocated	Maximum number of bytes of PGA memory allocated at one time since instance startup.
maximum PGA used for auto workareas	Maximum amount of PGA memory consumed at one time by work areas running under the automatic memory management mode since instance startup.
maximum PGA used for manual workareas	Maximum amount of PGA memory consumed at one time by work areas running under the manual memory management mode since instance startup.
over allocation count	This statistic is cumulative since instance startup. Over allocating PGA memory can happen if the value of <code>PGA_AGGREGATE_TARGET</code> is too small. When this happens, the Oracle Database cannot honor the value of <code>PGA_AGGREGATE_TARGET</code> and extra PGA memory needs to be allocated. If over allocation occurs, then increase the value of <code>PGA_AGGREGATE_TARGET</code> using the information provided by the <code>V\$PGA_TARGET_ADVICE</code> view.
PGA memory freed back to OS	Number of bytes of PGA memory freed back to the operating system, cumulated since instance startup.
process count	Number of processes active within up to the last 3 seconds.
recompute count (total)	Number of times the instance bound, which is a cap on the maximum size of each active work area, has been recomputed since instance startup. Generally, the instance bound is recomputed in the background every 3 seconds, but it could be recomputed by a foreground process when the number of work areas changes rapidly in a short period of time.
total freeable PGA memory	Number of bytes of PGA memory in all processes that could be freed back to the operating system.
total PGA allocated	Current amount of PGA memory allocated by the instance. The Oracle Database attempts to keep this number below the value of the <code>PGA_AGGREGATE_TARGET</code> initialization parameter. However, it is possible for the PGA allocated to exceed that value by a small percentage and for a short period of time when the work area workload is increasing very rapidly or when <code>PGA_AGGREGATE_TARGET</code> is set to a small value.
total PGA inuse	Indicates how much PGA memory is currently consumed by work areas. This number can be used to determine how much memory is consumed by other consumers of the PGA memory (for example, PL/SQL or Java).

Table 8-4 (Cont.) V\$PGASTAT Statistics

Statistic Name	Description
total PGA used for auto workareas	Indicates how much PGA memory is currently consumed by work areas running under the automatic memory management mode. This number can be used to determine how much memory is consumed by other consumers of the PGA memory (for example, PL/SQL or Java).
total PGA used for manual workareas	Indicates how much PGA memory is currently consumed by work areas running under the manual memory management mode. This number can be used to determine how much memory is consumed by other consumers of the PGA memory (for example, PL/SQL or Java).

["PGA_AGGREGATE_TARGET"](#)

8.122 V\$PLSQL_DEBUGGABLE_SESSIONS

V\$PLSQL_DEBUGGABLE_SESSIONS shows the current sessions of all users that the current user has privileges to debug with a PL/SQL debugger.

Column	Datatype	Description
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number
LOGON_TIME	DATE	Time of logon
USER#	NUMBER	Oracle user identifier
USERNAME	VARCHAR2 (128)	Oracle user name
OSUSER	VARCHAR2 (128)	Operating system client user name
PROCESS	VARCHAR2 (24)	Operating system client process ID
MACHINE	VARCHAR2 (64)	Operating system client machine name
PORT	NUMBER	Operating system client port number
TERMINAL	VARCHAR2 (30)	Operating system client terminal name
PROGRAM	VARCHAR2 (48)	Operating system client program name
TYPE	VARCHAR2 (10)	Session type
SERVICE_NAME	VARCHAR2 (64)	Service name of the session
PLSQL_DEBUGGER_CONNECTED	VARCHAR2 (5)	Indicates whether the session is connected to a PL/SQL debugger. Possible values: <ul style="list-style-type: none">• TRUE• FALSE

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.123 V\$PQ_SESSTAT

V\$PQ_SESSTAT lists session statistics for parallel queries. After you have run a query or DML operation, you can use the information derived from V\$PQ_SESSTAT to view the number of slave processes used, and other information for the session and system.

Column	Datatype	Description
STATISTIC	VARCHAR2 (30)	<p>Name of the statistic:</p> <ul style="list-style-type: none"> • Allocation Height - Requested number of servers per instance • Allocation Width - Requested number of instances • DDL Parallelized - Number of DDL operations run in parallel • DFO Trees - Number of executed DFO trees • DML Parallelized - Number of DML operations run in parallel • DOP - Degree of parallelism used for the last statement • Distr Msgs Recv'd - Number of remote (inter-instance) messages received • Distr Msgs Sent - Number of remote (inter-instance) messages sent • Local Msgs Recv'd - Number of local (intra-instance) messages received • Local Msgs Sent - Number of local (intra-instance) messages sent • Queries Parallelized - Number of queries run in parallel • Server Threads - Number of PX servers used • Slave Sets - Total number of slave sets used for the last statement. For multiple parallelizers in the parallel plan, it is the cumulative count.
LAST_QUERY	NUMBER	Value of the statistic for the last operation
SESSION_TOTAL	NUMBER	<p>Value of the statistic for the entire session to this point in time.</p> <p>The value of the statistic for the entire session to this point in time is not maintained for the DOP, Server Threads, Allocation Height, Allocation Width, and Slave Set statistics.</p>
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.124 V\$PQ_SLAVE

V\$PQ_SLAVE lists statistics for each of the active parallel execution servers on an instance.

Column	Datatype	Description
SLAVE_NAME	VARCHAR2(4)	Name of the parallel execution server
STATUS	VARCHAR2(4)	Current status of the parallel execution server: <ul style="list-style-type: none"> • BUSY • IDLE
SESSIONS	NUMBER	Number of sessions that have used this parallel execution server
IDLE_TIME_CUR	NUMBER	Amount of time spent idle while processing statements in the current session
BUSY_TIME_CUR	NUMBER	Amount of time spent busy while processing statements in the current session
CPU_SECS_CUR	NUMBER	Amount of CPU time spent on the current session
MSG_S_SENT_CUR	NUMBER	Number of messages sent while processing statements for the current session
MSG_S_RECV_CUR	NUMBER	Number of messages received while processing statements for the current session
IDLE_TIME_TOTAL	NUMBER	Total amount of time this query server has been idle
BUSY_TIME_TOTAL	NUMBER	Total amount of time this query server has been active
CPU_SECS_TOTAL	NUMBER	Total amount of CPU time this query server has used to process statements
MSG_S_SENT_TOTAL	NUMBER	Total number of messages this query server has sent
MSG_S_RECV_TOTAL	NUMBER	Total number of messages this query server has received
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.125 V\$PQ_SYSSTAT

V\$PQ_SYSSTAT lists system statistics for parallel queries. After you have run a query or DML operation, you can use the information derived from V\$PQ_SYSSTAT to view the number of slave processes used, and other information for the system.

Column	Datatype	Description
STATISTIC	VARCHAR2 (30)	<p>Name of the statistic:</p> <ul style="list-style-type: none"> • Servers Busy - Number of currently busy servers on this instance • Servers Idle - Number of currently idle servers on this instance • Servers Highwater - Number of active servers on this instance that have partaken in ≥ 1 operation so far • Server Sessions - Total number of operations executed in all servers on this instance • Servers Started - Total number of servers started on this instance • Servers Shutdown - Total number of servers shutdown on this instance • Servers Cleaned Up - Total number of servers on this instance cleaned up due to process death • Queries Initiated - Total number of parallel queries initiated on this instance • DDL Initiated - Total number of parallel DDL operations that were initiated • DML Initiated - Total number of parallel DML operations that were initiated • DFO Trees - Total number of DFO trees executed on this instance • Local Msgs Sent - Total number of local (intra-instance) messages sent on this instance • Distr Msgs Sent - Total number of remote (inter-instance) messages sent on this instance • Local Msgs Recv'd - Total number of remote (inter-instance) messages received on this instance • Distr Msgs Recv'd - Total number of remote (inter-instance) messages received on this instance
VALUE	NUMBER	Value of the statistic
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.126 V\$PQ_TQSTAT

V\$PQ_TQSTAT contains statistics on parallel execution operations. The statistics are compiled after the query completes and only remain for the duration of the session. It displays the number of rows processed through each parallel execution server at each stage of the execution tree. This view can help determine skew problems in a query's execution. (Note that for PDML, information from V\$PQ_TQSTAT is available only after a commit or rollback operation.)

Column	Datatype	Description
DFO_NUMBER	NUMBER	Data flow operator (DFO) tree number to differentiate queries
TQ_ID	NUMBER	Table queue ID within the query, which represents the connection between two DFO nodes in the query execution tree
SERVER_TYPE	VARCHAR2 (10)	The role in table queue - producer/consumer/ranger

Column	Datatype	Description
NUM_ROWS	NUMBER	The number of rows produced/consumed
BYTES	NUMBER	The number of bytes produced/consumed
OPEN_TIME	NUMBER	Time (seconds) the table queue remained open
AVG_LATENCY	NUMBER	Time (minutes) for a message to be dequeued after it enters the queue
WAITS	NUMBER	The number of waits encountered during dequeue
TIMEOUTS	NUMBER	The number of timeouts when waiting for a message
PROCESS	VARCHAR2 (6)	Process ID
INSTANCE	NUMBER	Instance ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.127 V\$PROCESS

V\$PROCESS displays information about the currently active processes.

Column	Datatype	Description
ADDR	RAW(4 8)	Address of the process state object
PID	NUMBER	Oracle process identifier
SOSID	VARCHAR2 (24)	Operating system (process, thread) identifier. This identifier is unique whether the Oracle multiprocess/multithread feature is enabled or not.
SPID	VARCHAR2 (24)	Operating system process identifier. The Oracle multiprocess/multithread feature is available for UNIX systems. When the Oracle multiprocess/multithread feature is enabled, RDBMS processes are mapped to threads running in operating system processes, and the SPID identifier is not unique for RDBMS processes. When the Oracle multiprocess/multithread feature is not enabled on UNIX systems, the SPID identifier is unique for RDBMS processes.
STID	VARCHAR2 (24)	Operating system thread identifier. The Oracle multiprocess/multithread feature is available for UNIX systems. When the Oracle multiprocess/multithread feature is enabled, RDBMS processes are mapped to threads running in operating system processes, and the SPID and STID together uniquely identify an RDBMS process. The STID is not unique on Solaris. The STID is unique on Linux and AIX.
EXECUTION_TYPE	VARCHAR2 (10)	Operating system execution type
PNAME	VARCHAR2 (5)	Name of this process

Column	Datatype	Description
USERNAME	VARCHAR2 (15)	Operating system process username
SERIAL#	NUMBER	Process serial number
TERMINAL	VARCHAR2 (30)	Operating system terminal identifier
PROGRAM	VARCHAR2 (48)	Program in progress
TRACEID	VARCHAR2 (255)	Trace file identifier
TRACEFILE	VARCHAR2 (513)	Trace file name of the process
BACKGROUND	VARCHAR2 (1)	1 for a SYSTEM background process; NULL for foreground processes or non-SYSTEM background processes
LATCHWAIT	VARCHAR2 (16)	Address of the latch the process is waiting for; NULL if none
LATCHSPIN	VARCHAR2 (16)	This column is obsolete
PGA_USED_MEM	NUMBER	PGA memory currently used by the process (in bytes)
PGA_ALLOC_MEM	NUMBER	PGA memory currently allocated by the process (including free PGA memory not yet released to the operating system by the server process), in bytes
PGA_FREEABLE_MEM	NUMBER	Allocated PGA memory which can be freed (in bytes)
PGA_MAX_MEM	NUMBER	Maximum PGA memory ever allocated by the process (in bytes)
NUMA_DEFAULT	NUMBER	The NUMA processor group of this process at initialization time
NUMA_CURR	NUMBER	The NUMA processor group of this process currently
CPU_USED	NUMBER	Tracks the CPU used by this process (in microseconds) from the time it was spawned
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.128 V\$PROCESS_MEMORY

V\$PROCESS_MEMORY displays dynamic PGA memory usage by named component categories for each process.

Column	Datatype	Description
PID	NUMBER	Oracle process identifier
SERIAL#	NUMBER	Oracle process serial number
CATEGORY	VARCHAR2 (15)	Category name. Categories include "SQL", "PL/SQL", "OLAP" and "JAVA". Special categories are "Freeable" and "Other". Freeable memory has been allocated to the process by the operating system, but has not been allocated to a category. "Other" memory has been allocated to a category, but not to one of the named categories.
ALLOCATED	NUMBER	Bytes of PGA memory allocated by the process for the category. For the "Freeable" category, it is the amount of free PGA memory eligible to be released to the operating system.

Column	Datatype	Description
USED	NUMBER	Bytes of PGA memory used by the process for the category. For "Freeable", the value is zero. For "Other", the value is NULL for performance reasons.
MAX_ALLOCATED	NUMBER	Maximum bytes of PGA memory ever allocated by the process for the category.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.129 V\$PROCESS_MEMORY_DETAIL

V\$PROCESS_MEMORY_DETAIL provides detailed information on dynamic PGA memory usage for each automatically captured snapshot.

Column	Datatype	Description
PID	NUMBER	Oracle process identifier
SERIAL#	NUMBER	Oracle process serial number
CATEGORY	VARCHAR2 (15)	Category name. Categories include: <ul style="list-style-type: none"> • SQL • PL/SQL • OLAP • JAVA • Freeable • Other
NAME	VARCHAR2 (26)	PGA memory allocation comment. Small allocations may be grouped together with NAME set to Miscellaneous for performance reasons.
HEAP_NAME	VARCHAR2 (15)	Name of heap or heaps (if same name) containing the allocations
BYTES	NUMBER	Bytes of PGA memory allocated in the process from heaps with the given heap name and with the given allocation comment
ALLOCATION_COUNT	NUMBER	Number of allocations with the comment found in the process inside heaps with the given heap name
HEAP_DESCRIPTOR	RAW(4 8)	If all the allocations are from one heap, then this is the address of the heap descriptor for that heap. Otherwise, this column is NULL.
PARENT_HEAP_DESCRIPTOR	RAW(4 8)	If all the allocations are from one heap, then this is the address of the parent heap descriptor for that heap. Otherwise, this column is NULL. If the heap has no parent, the value is zero.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.130 V\$PROCESS_POOL

V\$PROCESS_POOL provides information about process pools.

Column	Datatype	Description
POOL_NAME	VARCHAR2 (512)	Pool name
ENABLED	VARCHAR2 (5)	Indicates whether the pool is active (TRUE) or not (FALSE)
MIN_COUNT	NUMBER	The default or configured minimum value
BATCH_COUNT	NUMBER	The default or configured batch count
INIT_COUNT	NUMBER	The default or configured initial count
CUR_COUNT	NUMBER	The number of spawned processes available in this pool
MAX_COUNT	NUMBER	When INIT_COUNT is set, MAX_COUNT shows the number of processes yet to be spawned. Note that the current process count (CUR_COUNT) cannot reach INIT_COUNT in cases where processes are consumed during the spawn.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This row is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.131 V\$PROPAGATION_RECEIVER

V\$PROPAGATION_RECEIVER displays information about buffer queue propagation schedules on the receiving (destination) side. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when propagation migrates to another instance, or when an unscheduled propagation is attempted.

Column	Datatype	Description
SRC_QUEUE_SCHEMA	VARCHAR2 (128)	Name of the source schema
SRC_QUEUE_NAME	VARCHAR2 (128)	Name of the source queue
SRC_DBNAME	VARCHAR2 (395)	Name of the source database
DST_QUEUE_SCHEMA	VARCHAR2 (128)	Name of the destination schema

Column	Datatype	Description
DST_QUEUE_NAME	VARCHAR2(128)	Name of the destination queue
STARTUP_TIME	DATE	Startup time of this schedule. This time changes when the source/destination database gets restarted.
HIGH_WATER_MARK	NUMBER	High watermark of the messages received
ACKNOWLEDGEMENT	NUMBER	Acknowledgement of the messages received by the receiver
LAST_RECEIVED_MSG	NUMBER	Last received message
TOTAL_MSGS	NUMBER	Total number of messages
ELAPSED_UNPICKLE_TIME	NUMBER	Elapsed unpickle time
ELAPSED_RULE_TIME	NUMBER	Elapsed rule time
ELAPSED_ENQUEUE_TIME	NUMBER	Elapsed enqueue time
SESSION_ID	NUMBER	Session ID of the propagation receiver
SERIAL#	NUMBER	Serial number of the propagation receiver
SPID	VARCHAR2(24)	Process identification number of the propagation receiver
PROPAGATION_NAME	VARCHAR2(128)	Name of the propagation on the source database
STATE	VARCHAR2(43)	<p>State of the propagation receiver:</p> <ul style="list-style-type: none"> • Initializing • Sending unapplied txns • Waiting for message from client • Receiving LCRs • Evaluating rules • Enqueueing LCRS • Waiting for memory • Waiting for apply to read • Waiting for message from propagation sender <p>When the propagation schedule is not optimized, the state is Normal.</p>
LAST_RECEIVED_MSG_POSITION	RAW(64)	Last received message position. Corresponds to LAST_RECEIVED_MSG, except the value is in position rather than SCN. Position is used by XStream to determine ordering.
ACKNOWLEDGEMENT_POSITION	RAW(64)	Acknowledgement position of the messages received by the receiver. Corresponds to ACKNOWLEDGEMENT, except the value is in position rather than SCN. Position is used by XStream to determine ordering.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.132 V\$PROPAGATION_SENDER

V\$PROPAGATION_SENDER displays information about buffer queue propagation schedules on the sending (source) side. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when propagation migrates to another instance, or when an unscheduled propagation is attempted.

Column	Datatype	Description
QUEUE_ID	NUMBER	Queue identifier of the queue
QUEUE_SCHEMA	VARCHAR2(128)	Schema of the queue
QUEUE_NAME	VARCHAR2(128)	Name of the queue
DST_QUEUE_SCHEMA	VARCHAR2(128)	Destination schema of the queue
DST_QUEUE_NAME	VARCHAR2(128)	Name of the destination queue
STARTUP_TIME	DATE	Time at which the propagation started
DBLINK	VARCHAR2(395)	Name of the destination database link
HIGH_WATER_MARK	NUMBER	High watermark of the messages sent
ACKNOWLEDGEMENT	NUMBER	Acknowledgement of the messages received by the receiver
SCHEDULE_STATUS	VARCHAR2(128)	Status of the propagation schedule
TOTAL_MSGS	NUMBER	Total messages propagated
TOTAL_BYTES	NUMBER	Total bytes propagated
ELAPSED_DEQUEUE_TIME	NUMBER	Elapsed dequeue time (in hundredths of a second)
ELAPSED_PICKLE_TIME	NUMBER	Elapsed pickle time (time taken to linearize a logical change record (LCR) into a stream of bytes that can be sent over the network) (in hundredths of a second)
ELAPSED_PROPAGATION_TIME	NUMBER	Elapsed propagation time (in hundredths of a second)
ELAPSED_RULE_TIME	NUMBER	Elapsed rule time (in hundredths of a second)
MAX_NUM_PER_WIN	NUMBER	Maximum bytes per window
MAX_SIZE	NUMBER	Maximum bytes sent per window
LAST_MSG_LATENCY	NUMBER	Last propagated message latency
LAST_MSG_ENQUEUE_TIME	TIMESTAMP(6)	Last propagated message enqueue time
LAST_MSG_PROPAGATION_TIME	TIMESTAMP(6)	Last time when the message was propagated
LAST_LCR_LATENCY	NUMBER	Last propagated LCR latency
LAST_LCR_CREATION_TIME	DATE	Last propagated LCR timestamp
LAST_LCR_PROPAGATION_TIME	DATE	Last time when the LCR was propagated
DST_DATABASE_NAME	VARCHAR2(395)	Global name of the destination database
SESSION_ID	NUMBER	Session ID of the propagation sender process
SERIAL#	NUMBER	Serial number of the propagation sender process
SPID	VARCHAR2(24)	Process identification number of the propagation sender process
PROPAGATION_NAME	VARCHAR2(128)	Name of the propagation

Column	Datatype	Description
STATE	VARCHAR2 (128)	<p>State of the propagation sender process:</p> <ul style="list-style-type: none"> • Initializing • Initializing propagation receiver • Browsing LCRs • Evaluating rules • Dequeueing LCRs • Sending LCRs • Waiting for apply to be enabled • Waiting for apply database to start • Waiting for propagation to be enabled • Waiting for capture to terminate • Waiting for a subscriber to be added • Suspended due to a dropped subscriber • Suspended for auto split/merge • Waiting on empty queue <p>When the SCHEDULE_STATUS column is not SCHEDULE OPTIMIZED, the state is the value of the SCHEDULE_STATUS column.</p>
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.133 V\$PROXY_ARCHIVEDLOG

V\$PROXY_ARCHIVEDLOG contains descriptions of archived log backups that were taken using the proxy copy functionality.

In a proxy copy, the media manager takes over the operations of backing up and restoring data. Each row represents a backup of one control file.

Column	Datatype	Description
RECID	NUMBER	Proxy copy record identifier
STAMP	NUMBER	Proxy copy stamp
DEVICE_TYPE	VARCHAR2 (17)	Type of media device that stores the proxy copy
HANDLE	VARCHAR2 (513)	Name or "handle" for the proxy copy
COMMENTS	VARCHAR2 (81)	Comments about the proxy copy
MEDIA	VARCHAR2 (65)	A comment that contains further information about the media manager that created this backup
MEDIA_POOL	NUMBER	Number of the media pool in which the proxy copy is stored
TAG	VARCHAR2 (32)	Tag for the proxy copy

Column	Datatype	Description
STATUS	VARCHAR2 (1)	<p>Status of the backup set:</p> <ul style="list-style-type: none"> • A - Available • U - Unavailable • X - Expired • D - Deleted
DELETED	VARCHAR2 (3)	Indicates whether this record has been deleted (YES) or not (NO)
THREAD#	NUMBER	Number of the redo thread
SEQUENCE#	NUMBER	Log sequence number
RESETLOGS_CHANGE#	NUMBER	RESETLOGS SCN of the database incarnation to which this archived log belongs
RESETLOGS_TIME	DATE	RESETLOGS time stamp of the database incarnation to which this archived log belongs
FIRST_CHANGE#	NUMBER	First SCN of this redo log
FIRST_TIME	DATE	Time when Oracle switched into the redo log
NEXT_CHANGE#	NUMBER	First SCN of the next redo log in the thread
NEXT_TIME	DATE	First time stamp of the next redo log in the thread
BLOCKS	NUMBER	Size of this archived redo log (in operating system blocks)
BLOCK_SIZE	NUMBER	Block size for the copy (in bytes)
START_TIME	DATE	Time when the proxy copy was initiated
COMPLETION_TIME	DATE	Time when the proxy copy was completed
ELAPSED_SECONDS	NUMBER	Duration of the proxy copy
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS stamp
TERMINAL	VARCHAR2 (3)	Indicates whether this record corresponds to a terminal archived redo log, as defined in V\$ARCHIVED_LOG (YES) or not (NO)
KEEP	VARCHAR2 (3)	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)
KEEP_UNTIL	DATE	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (11)	<p>Additional retention options for this backup set:</p> <ul style="list-style-type: none"> • LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated • BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent • NOLOGS - Indicates a consistent backup made when the database was mounted • NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.134 V\$PROXY_ARCHIVELOG_DETAILS

V\$PROXY_ARCHIVELOG_DETAILS contains information about all available archive log proxy copies.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp
COPY_KEY	NUMBER	Copy identifier
THREAD#	NUMBER	Redo thread number
SEQUENCE#	NUMBER	Redo log sequence number
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the database when this log was written
RESETLOGS_TIME	DATE	Resetlogs time of the database when this log was written
HANDLE	VARCHAR2 (513)	Proxy copy handle identifies the copy for restore
MEDIA	VARCHAR2 (65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the <code>POOL</code> operand of the Recovery Manager <code>BACKUP</code> command.
TAG	VARCHAR2 (32)	Proxy copy tag
FIRST_CHANGE#	NUMBER	First change number in the archived log
NEXT_CHANGE#	NUMBER	First change number in the next log
FIRST_TIME	DATE	Timestamp of the first change
NEXT_TIME	DATE	Timestamp of the next change
OUTPUT_BYTES	NUMBER	Total output bytes written
COMPLETION_TIME	DATE	Completion time
OUTPUT_BYTES_DISPLAY	VARCHAR2 (3)	Displayable format for output bytes
KEEP	DATE	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (<code>YES</code>) or not (<code>NO</code>)
KEEP_UNTIL	VARCHAR2 (11)	If specified, then this is the date after which the backup becomes obsolete. If this column is <code>NULL</code> , then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (4000)	Additional retention options for this backup set: <ul style="list-style-type: none"> • <code>LOGS</code> - Indicates a long-term backup made with the <code>LOGS</code> keyword, which is now deprecated • <code>BACKUP_LOGS</code> - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent • <code>NOLOGS</code> - Indicates a consistent backup made when the database was mounted • <code>NULL</code> - Indicates that this backup has no <code>KEEP</code> options and becomes obsolete based on the retention policy

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.135 V\$PROXY_ARCHIVELOG_SUMMARY

V\$PROXY_ARCHIVELOG_SUMMARY provides summary information about the output proxy archive log file.

Column	Datatype	Description
NUM_FILES_BACKED	NUMBER	Number of archived log files backed up
NUM_DISTINCT_FILES_BACKED	NUMBER	Number of distinct archived log files backed up
MIN_FIRST_CHANGE#	NUMBER	Minimum first change SCN
MAX_NEXT_CHANGE#	NUMBER	Maximum first change SCN
MIN_FIRST_TIME	DATE	Minimum first change time. Forms the redo range, along with MAX_NEXT_TIME.
MAX_NEXT_TIME	DATE	Maximum next change time
OUTPUT_BYTES	NUMBER	Total output size, in bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.136 V\$PROXY_COPY_DETAILS

V\$PROXY_COPY_DETAILS contains information about all available control file and datafile proxy copies.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp
COPY_KEY	NUMBER	Copy identifier
FILE#	NUMBER	Absolute datafile number, or 0 if this is a control file backup

Column	Datatype	Description
HANDLE	VARCHAR2 (513)	Proxy copy handle identifies the copy for restore
MEDIA	VARCHAR2 (65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the <code>POOL</code> operand of the Recovery Manager <code>BACKUP</code> command.
TAG	VARCHAR2 (32)	Proxy copy tag
CREATION_CHANGE#	NUMBER	Datafile creation change number
CREATION_TIME	DATE	Datafile creation timestamp
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change number of the datafile when the copy was made
CHECKPOINT_TIME	DATE	Checkpoint timestamp of the datafile when the copy was made
OUTPUT_BYTES	NUMBER	Total output bytes written
COMPLETION_TIME	DATE	Completion time
CONTROLFILE_TYPE	VARCHAR2 (1)	Type of control file: <ul style="list-style-type: none">• B - Normal control file• S - Standby control file
KEEP	VARCHAR2 (3)	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (<code>YES</code>) or not (<code>NO</code>)
KEEP_UNTIL	DATE	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (11)	Additional retention options for this backup set: <ul style="list-style-type: none">• LOGS - Indicates a long-term backup made with the <code>LOGS</code> keyword, which is now deprecated• BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent• NOLOGS - Indicates a consistent backup made when the database was mounted.• NULL - Indicates that this backup has no <code>KEEP</code> options and becomes obsolete based on the retention policy
OUTPUT_BYTES_DISPLAY	VARCHAR2 (4000)	Displayable format for output bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.137 V\$PROXY_COPY_SUMMARY

V\$PROXY_COPY_SUMMARY provides summary information about the output proxy datafile and control file.

Column	Datatype	Description
NUM_COPIES	NUMBER	Number of copies created

Column	Datatype	Description
NUM_DISTINCT_COPIES	NUMBER	Number of distinct copies (that contain datafiles with different checkpoints)
MIN_CHECKPOINT_CHANGE#	NUMBER	Minimum checkpoint change SCN
MAX_CHECKPOINT_CHANGE#	NUMBER	Maximum checkpoint change SCN
MIN_CHECKPOINT_TIME	DATE	Minimum checkpoint change time
MAX_CHECKPOINT_TIME	DATE	Maximum checkpoint change time
OUTPUT_BYTES	NUMBER	Total output bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.138 V\$PROXY_DATAFILE

V\$PROXY_DATAFILE contains descriptions of datafile and control file backups that are taken with Proxy Copy. Each row represents a backup of one database file.

Column	Datatype	Description
RECID	NUMBER	Proxy copy record ID
STAMP	NUMBER	Proxy copy record stamp
DEVICE_TYPE	VARCHAR2(17)	Type of the device on which the copy resides
HANDLE	VARCHAR2(513)	Proxy copy handle identifies the copy for restore
COMMENTS	VARCHAR2(81)	Comment returned by the operating system or storage subsystem. This value is informational only. It is not needed for restore.
MEDIA	VARCHAR2(65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command
TAG	VARCHAR2(32)	Proxy copy tag
STATUS	VARCHAR2(1)	Status of the backup set: <ul style="list-style-type: none"> • A - Available • U - Unavailable • X - Expired • D - Deleted
DELETED	VARCHAR2(3)	Indicates whether this record has been deleted (YES) or not (NO)
FILE#	NUMBER	Absolute datafile number, or 0 if this is a control file backup
CREATION_CHANGE#	NUMBER	Datafile creation change number
CREATION_TIME	DATE	Datafile creation Timestamp
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the datafile when the copy was made

Column	Datatype	Description
RESETLOGS_TIME	DATE	Resetlogs timestamp of the datafile when the copy was made
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change number of the datafile when the copy was made
CHECKPOINT_TIME	DATE	Checkpoint timestamp of the datafile when the copy was made
ABSOLUTE_FUZZY_CHANGE#	NUMBER	Highest change in any block of the file, if known
RECOVERY_FUZZY_CHANGE#	NUMBER	Highest change written to the file by media recovery
RECOVERY_FUZZY_TIME	DATE	Timestamp of the highest change written to the file by media recovery
INCREMENTAL_LEVEL	NUMBER	If this backup is part of an incremental backup strategy, then 0. Otherwise null.
ONLINE_FUZZY	VARCHAR2(3)	Indicates whether this copy was made after a crash or offline immediate (or is a copy of a copy which was taken improperly while the database was open) (YES) or not (NO). Recovery will need to apply all redo up to the next crash recovery marker to make the file consistent.
BACKUP_FUZZY	VARCHAR2(3)	Indicates whether this is a copy taken using the BEGIN BACKUP END BACKUP technique (YES) or not (NO). The BEGIN BACKUP END BACKUP technique is used internally when proxy copies of open files are created. Recovery will need to apply all redo up to the end backup marker to make this copy consistent.
BLOCKS	NUMBER	Size of the copy (in blocks). Also the size of the datafile when the copy was made.
BLOCK_SIZE	NUMBER	Block size of the datafile
OLDEST_OFFLINE_RANGE	NUMBER	If the file number is 0 (that is, this is a control file backup), the RECID of the oldest offline range record in this control file copy. 0 for datafile copies.
START_TIME	DATE	Starting time
COMPLETION_TIME	DATE	Completion time
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds
CONTROLFILE_TYPE	VARCHAR2(1)	Type of control file: <ul style="list-style-type: none">• B - Normal control file• S - Standby control file
KEEP	VARCHAR2(3)	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)
KEEP_UNTIL	DATE	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2(11)	Additional retention options for this backup set: <ul style="list-style-type: none">• LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated• BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent• NOLOGS - Indicates a consistent backup made when the database was mounted.• NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS stamp
FOREIGN_DBID	NUMBER	Foreign DBID of the database from which this datafile was transported. The value is 0 if the file backed up is not a foreign database file.

Column	Datatype	Description
PLUGGED_READONLY	VARCHAR2(3)	Indicates whether this is a proxy copy of a transported read-only foreign file (YES) or not (NO)
PLUGIN_CHANGE#	NUMBER	SCN at which the foreign datafile was transported into the database. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_CHANGE#	NUMBER	SCN of the <code>RESETLOGS</code> operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_TIME	DATE	Time of the <code>RESETLOGS</code> operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
BACKED_BY_PDB	VARCHAR2(3)	Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none"> • YES: The backup was taken when connected to the PDB • NO: The backup was taken when connected to the root container
GUID	RAW(16)	The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.

8.139 V\$PROXY_PDB_TARGETS

V\$PROXY_PDB_TARGETS provides information about the target of a proxy PDB.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <i>n</i> : Where <i>n</i> is the container ID of a proxy PDB
TARGET_PORT	NUMBER	Port number that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target
TARGET_HOST	VARCHAR2(128)	Host name where the target of the proxy PDB is running, and which will be used by the proxy PDB to connect to the target
TARGET_SERVICE	VARCHAR2(128)	Service name that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target
TARGET_USER	VARCHAR2(128)	User name used by the proxy PDB to connect to the target of the proxy PDB. If null, the name of the connected user will be used.

 See Also:

Oracle Multitenant Administrator's Guide for information about creating proxy PDBs

8.140 V\$PWFILE_USERS

V\$PWFILE_USERS lists all users in the password file, and indicates whether the user has been granted the SYSDBA, SYSOPER, SYSASM, SYSBACKUP, SYSDG, and SYSKM privileges.

Column	Datatype	Description
USERNAME	VARCHAR2(128)	Name of the user that is contained in the password file
SYSDBA	VARCHAR2(5)	Indicates whether the user can connect with SYSDBA privileges (TRUE) or not (FALSE)
SYSOPER	VARCHAR2(5)	Indicates whether the user can connect with SYSOPER privileges (TRUE) or not (FALSE)
SYSASM	VARCHAR2(5)	Indicates whether the user can connect with SYSASM privileges (TRUE) or not (FALSE)
SYSBACKUP	VARCHAR2(5)	Indicates whether the user can connect with SYSBACKUP privileges (TRUE) or not (FALSE)
SYSDG	VARCHAR2(5)	Indicates whether the user can connect with SYSDG privileges (TRUE) or not (FALSE)
SYSKM	VARCHAR2(5)	Indicates whether the user can connect with SYSKM privileges (TRUE) or not (FALSE)
ACCOUNT_STATUS	VARCHAR2(30)	Account status: <ul style="list-style-type: none"> • OPEN • EXPIRED • EXPIRED (GRACE) • LOCKED (TIMED) • LOCKED • EXPIRED & LOCKED (TIMED) • EXPIRED & LOCKED • EXPIRED (GRACE) & LOCKED
PASSWORD_PROFILE	VARCHAR2(128)	Password profile name
LAST_LOGIN	TIMESTAMP(9) WITH TIME ZONE	The time of the last user login This column is not populated when a user connects to the database with administrative privileges, that is, AS { SYSASM SYSBACKUP SYSDBA SYSDG SYSOPER SYSRAC SYSKM }. The exception is as follows: If a user connects to the database with administrative privileges from a remote session, and the database password file format is 12.2 (V\$PASSWORDFILE_INFO FORMAT = 12.2), then this column is populated.
LOCK_DATE	DATE	Date the account was locked if account status was LOCKED
EXPIRY_DATE	DATE	Date of expiration of the account
EXTERNAL_NAME	VARCHAR2(1024)	Shows Certificate DN or Principal Name of externally authenticated users

Column	Datatype	Description
AUTHENTICATION_TYPE	VARCHAR2 (8)	Indicates the authentication mechanism for the user: <ul style="list-style-type: none"> • EXTERNAL - CREATE USER <i>user1</i> IDENTIFIED EXTERNALLY; • GLOBAL - CREATE USER <i>user2</i> IDENTIFIED GLOBALLY; • PASSWORD - CREATE USER <i>user3</i> IDENTIFIED BY <i>password</i>;
COMMON	VARCHAR2 (3)	This column has a value of YES if an administrative privilege (for example, SYSDBA) was granted with CONTAINER=ALL. Otherwise, the column has a value of NO.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.141 V\$PX_INSTANCE_GROUP

V\$PX_INSTANCE_GROUP provides information about the instance groups being used for parallel operations by the current session.

Column	Datatype	Description
QC_INSTANCE_GROUP	VARCHAR2 (64)	The instance group being used by this session for parallel operations. This value repeats for every row returned.
WHY	VARCHAR2 (23)	Where the current instance group name comes from, as follows: SERVICE - the instance group being used is from the session's service name PARALLEL_INSTANCE_GROUP - the instance group being used is being used because the PARALLEL_INSTANCE_GROUP initialization parameter has been set. The value repeats for every row returned.
INSTANCE_NUMBER	NUMBER	Instance number of the instance providing this instance group. There will be one row for each instance in the instance group that the Query Coordinator is using.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

"PARALLEL_INSTANCE_GROUP"

8.142 V\$PX_PROCESS

V\$PX_PROCESS contains information about the sessions running parallel execution.

Column	Datatype	Description
SERVER_NAME	VARCHAR2(4)	The name of the PX server (P000, P001, and so on)
STATUS	VARCHAR2(9)	The state of the PX server (IN USE AVAILABLE)
PID	NUMBER	The process identifier
SPID	VARCHAR2(24)	Operating system process ID
SID	NUMBER	The session ID of the PX server, if in use
SERIAL#	NUMBER	The session serial number of the PX server, if in use
IS_GV	VARCHAR2(5)	Indicates whether a slave process in parallel is a normal one or a GV\$ process. Possible values: <ul style="list-style-type: none">• FALSE: The slave process in parallel is a normal process• TRUE: The slave process in parallel is a GV\$ process
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.143 V\$PX_PROCESS_SYSSTAT

V\$PX_PROCESS_SYSSTAT contains information about the sessions running parallel execution.

Column	Datatype	Description
STATISTIC	VARCHAR2 (30)	<p>Name of the statistic:</p> <ul style="list-style-type: none"> • Servers In Use - Number of PX servers currently performing parallel operations • Servers Available - Number of PX servers available to perform parallel operations • Servers Started - Number of times the system has had to create a PX server process • Servers Shutdown - Number of times a PX server process has been shut down. A PX server process will be shut down if it has not been used recently. <p>If this value is large, then consider increasing the parameter. This will improve performance by avoiding the latency of PX server process creation.</p> <ul style="list-style-type: none"> • Servers HWM - Maximum number of concurrent PX server processes <p>If this number is equal to the <code>PARALLEL_MAX_SERVERS</code> initialization parameter, then consider increasing the parameter. This could allow you to increase your throughput, especially if your system is under-utilized and the <code>V\$SYSSTAT</code> statistic "Parallel operations downgraded to serial" is large.</p> <ul style="list-style-type: none"> • Servers Cleaned Up - Number of times PMON had to clean up a PX server. This should only happen during nonstandard termination of a parallel operation. <p>If this number is large, then you should determine the cause.</p> <ul style="list-style-type: none"> • Server Sessions - Total number of sessions created by all PX servers • Memory Chunks Allocated - Number of large memory chunks allocated by PX servers • Memory Chunks Freed - Number of large memory chunks freed • Memory Chunks Current - Number of large memory chunks currently being used • Memory Chunks HWM - Maximum number of concurrently allocated chunks • Buffers allocated - Number of times a message buffer has been allocated • Buffers freed - Number of times a message buffer has been freed • Buffers Current - Number of message buffers currently being used • Buffers HWM - Maximum number of concurrently allocated message buffers
VALUE	NUMBER	Value of the statistic
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.144 V\$PX_SESSION

V\$PX_SESSION contains information about the sessions running parallel execution.

Column	Datatype	Description
SADDR	RAW (4 8)	Session address
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number
QCSID	NUMBER	Session identifier of the parallel coordinator
QC SERIAL#	NUMBER	Session serial number of the parallel coordinator
QCINST_ID	NUMBER	Instance number on which the parallel coordinator is running
SERVER_GROUP	NUMBER	The logical group of servers to which this cluster database process belongs
SERVER_SET	NUMBER	The logical set of servers to which this cluster database process belongs. A single server group will have at most two server sets.
SERVER#	NUMBER	The logical number of the cluster database process within a server set
DEGREE	NUMBER	The degree of parallelism being used by the server set
REQ_DEGREE	NUMBER	The degree of parallelism that was requested by the user when the statement was issued and before any resource, multiuser, or load balancing reductions
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.145 V\$PX_SESSTAT

V\$PX_SESSTAT contains information about the sessions running parallel execution.

Column	Datatype	Description
SADDR	RAW (4 8)	Session address
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number
QCSID	NUMBER	Session identifier of the parallel coordinator
QC SERIAL#	NUMBER	Session serial number of the parallel coordinator
QCINST_ID	NUMBER	Instance number on which the parallel coordinator is running
SERVER_GROUP	NUMBER	The logical group of servers to which this cluster database process belongs
SERVER_SET	NUMBER	The logical set of servers that this cluster database process belongs to. A single server group will have at most two server sets.
SERVER#	NUMBER	The logical number of the cluster database process within a server set
DEGREE	NUMBER	The degree of parallelism being used by the server set

Column	Datatype	Description
REQ_DEGREE	NUMBER	The degree of parallelism that was requested by the user when the statement was issued and before any resource, multiuser, or load balancing reductions
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.146 V\$QMON_COORDINATOR_STATS

V\$QMON_COORDINATOR_STATS displays statistics of the non-sharded queue master process. There is one row per instance. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QMNC_PID	VARCHAR2(24)	Non-sharded queue master process ID
STATUS	VARCHAR2(24)	Current status of the coordinator: <ul style="list-style-type: none"> • DEAD • INITIALIZING • RUNNING TASK COORDINATOR • WAITING • ADDING SERVER
NUM_SERVERS	NUMBER	Number of QMON servers currently running
LAST_SERVER_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Last server startup time
LAST_SERVER_PID	VARCHAR2(24)	Process ID of the last server process (Qnnn) created
NEXT_WAKEUP_TIME	TIMESTAMP(3) WITH TIME ZONE	Next wakeup time of the coordinator
NEXT_READY_TIME	TIMESTAMP(3) WITH TIME ZONE	Ready time of the first delayed task
NEXT_EXPIRY_TIME	TIMESTAMP(3) WITH TIME ZONE	Expiry time of the next ready task
LAST_WAIT_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the coordinator went to sleep
LAST_FAILURE	VARCHAR2(32)	Last failure encountered
LAST_FAILURE_TIME	TIMESTAMP(3) WITH TIME ZONE	Last failure time
MAX_TASK_LATENCY	VARCHAR2(40)	Maximum task latency across all the servers (in seconds)
MIN_TASK_LATENCY	VARCHAR2(40)	Minimum task latency across all the servers (in seconds)
TOTAL_TASK_LATENCY	NUMBER	Cumulative latency across all the tasks (in seconds)
TOTAL_TASKS_EXECUTED	NUMBER	Cumulative number of tasks serviced by all the servers

Column	Datatype	Description
MAX_SERVERS	NUMBER	Maximum number of servers present at any point of time
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

8.147 V\$QMON_SERVER_STATS

V\$QMON_SERVER_STATS displays information and statistics about the active queue monitor server processes. There is one row per live queue monitor server process. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QMNC_PID	VARCHAR2(24)	Non-sharded queue master process ID
SERVER_PID	VARCHAR2(24)	Process ID of the server
SERVER_NAME	VARCHAR2(48)	Name of the server
STATUS	VARCHAR2(40)	Current state of the server: <ul style="list-style-type: none"> • UNUSED • RUNNING • IDLE_WAIT • EXITING • NOT ACTIVE
SERVER_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Start time of the server
TASK_NAME	VARCHAR2(32)	Current executing task
TASK_NUMBER	NUMBER	Unique task number of the running task
TASK_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Start time of the running task
LAST_WAIT_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the server last waited
MAX_LATENCY	NUMBER	Maximum task latency for this server (in seconds)
MIN_LATENCY	NUMBER	Minimum task latency for this server (in seconds)
TOTAL_LATENCY	NUMBER	Cumulative task latency for this server (in seconds)
NUM_TASKS	NUMBER	Number of tasks processed by the server
LAST_FAILURE	VARCHAR2(128)	Last failure encountered by the server
LAST_FAILURE_TIME	TIMESTAMP(3) WITH TIME ZONE	Last failure time
LAST_FAILURE_TASK	VARCHAR2(32)	Task being run at the time of the last failure
LAST_FAILURE_TASKNUM	NUMBER	Unique task number of the failed task
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

8.148 V\$QMON_TASK_STATS

V\$QMON_TASK_STATS displays information and statistics based on different queue monitor tasks in the system (spilling, time manager activity, and so on). There is one row per kind of task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
TASK_NAME	VARCHAR2 (32)	Name of the task
TASK_TYPE	VARCHAR2 (40)	Type of the task
LAST_CREATED_TASKNUM	NUMBER	Unique task number last created for this task
NUM_TASKS	NUMBER	Number of tasks currently present
TOTAL_TASK_RUN_TIME	NUMBER	Cumulative task run time
TOTAL_TASK_RUNS	NUMBER	Cumulative task runs
TOTAL_TASK_FAILURES	NUMBER	Cumulative failures
METRIC_TYPE	VARCHAR2 (50)	Type of metric gathered for this task type
METRIC_VALUE	NUMBER	Value of this metric
LAST_FAILURE	VARCHAR2 (32)	Last failure encountered while executing this type of task
LAST_FAILURE_TIME	TIMESTAMP (3) WITH TIMEZONE	Time when the last failure occurred
LAST_FAILURE_TASKNUM	NUMBER	Task number of the last failed task for this task
REMARK	VARCHAR2 (64)	Remarks about the task
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

8.149 V\$QMON_TASKS

V\$QMON_TASKS displays information and statistics about all queue background tasks in the system, which would be served by queue monitor servers. There is one row per task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
TASK_NAME	VARCHAR2 (32)	Task name
TASK_NUMBER	NUMBER	Unique task number
TASK_TYPE	VARCHAR2 (40)	Task type
TASK_SUBMIT_TIME	TIMESTAMP (3) WITH TIMEZONE	Task submit time
TASK_READY_TIME	TIMESTAMP (3) WITH TIMEZONE	Task ready time
TASK_EXPIRY_TIME	TIMESTAMP (3) WITH TIMEZONE	Time when this task expires
TASK_START_TIME	TIMESTAMP (3) WITH TIMEZONE	Last actual start time for the task
TASK_STATUS	VARCHAR2 (32)	Status of the task
SERVER_NAME	VARCHAR2 (48)	Name of the QMON server running this task

Column	Datatype	Description
MAX_TRIES	NUMBER	Maximum retry count for the task
NUM_RUNS	NUMBER	Number of runs of the task if repeatable
NUM_FAILURES	NUMBER	Number of failures encountered while running the task
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

8.150 V\$QUARANTINE

V\$QUARANTINE provides information about quarantined objects.

Column	Datatype	Description
OBJECT	VARCHAR2 (64)	Type of quarantined object (description of the memory)
ADDRESS	RAW (8)	Address of the object
BYTES	NUMBER	Amount of memory used by the object (this is the minimum amount; the actual amount may be unknown)
ERROR	VARCHAR2 (128)	Oracle error causing quarantine
TIMESTAMP	TIMESTAMP (6) WITH TIME ZONE	Time the object was quarantined
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.151 V\$QUARANTINE_SUMMARY

V\$QUARANTINE_SUMMARY provides a summary of quarantine for each pluggable database (PDB).

Column	Datatype	Description
OBJECT_COUNT	NUMBER	Number of objects in quarantine
OBJECT_LIMIT	NUMBER	Limit on the number of objects that can be in quarantine before an abort will occur
MEMORY_TOTAL	NUMBER	Number of bytes in quarantine
MEMORY_LIMIT	NUMBER	Limit on the amount of memory that can be in quarantine before an abort will occur
RECENT_COUNT	NUMBER	Number of objects recently placed in quarantine (within the last hour)
RECENT_LIMIT	NUMBER	Limit on the number of recently quarantined objects before an abort will occur

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

"[V\\$QUARANTINE](#)" for additional details on objects recently placed into quarantine

8.152 V\$QUEUE

V\$QUEUE contains information on the shared server message queues.

Column	Datatype	Description
PADDR	RAW(4 8)	Address of the process that owns the queue
TYPE	VARCHAR2(10)	<p>Type of queue:</p> <ul style="list-style-type: none"> • COMMON - Processed by servers • DISPATCHER
QUEUED	NUMBER	Number of items in the queue
WAIT	NUMBER	Total time that all items in this queue have waited (in hundredths of a second). Divide by TOTALQ for average wait per item.
TOTALQ	NUMBER	Total number of items that have ever been in the queue
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.153 V\$QUEUEING_MTH

V\$QUEUEING_MTH displays all available queuing resource allocation methods.

Column	Datatype	Description
NAME	VARCHAR2(40)	Name of the queuing resource allocation method

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.154 V\$RECOVER_FILE

V\$RECOVER_FILE displays the status of files needing media recovery.

Column	Datatype	Description
FILE#	NUMBER	File identifier number
ONLINE	VARCHAR2 (7)	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in ONLINE_STATUS.
ONLINE_STATUS	VARCHAR2 (7)	Online status (ONLINE, OFFLINE)
ERROR	VARCHAR2 (18)	Why the file must be recovered: NULL if reason unknown, or OFFLINE NORMAL if recovery not needed
CHANGE#	NUMBER	SCN where recovery must start
TIME	DATE	Time of SCN when recovery must start
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.155 V\$RECOVERY_AREA_USAGE

V\$RECOVERY_AREA_USAGE displays usage information about recovery areas.

Column	Datatype	Description
FILE_TYPE	VARCHAR2 (23)	<p>File type:</p> <ul style="list-style-type: none"> • CONTROL FILE • REDO LOG • ARCHIVED LOG • BACKUP PIECE • IMAGE COPY • FLASHBACK LOG • REMOTE ARCHIVED LOG
PERCENT_SPACE_USED	NUMBER	Percent of the recovery area that is in use
PERCENT_SPACE_RECLAIMABLE	NUMBER	Percent of the recovery area that is reclaimable

Column	Datatype	Description
NUMBER_OF_FILES	NUMBER	Number of files in the recovery area
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.156 V\$RECOVERY_FILE_DEST

V\$RECOVERY_FILE_DEST displays information about the disk quota and current disk usage in the fast recovery area.

Column	Datatype	Description
NAME	VARCHAR2(513)	Location name. This is the value specified in the DB_RECOVERY_FILE_DEST initialization parameter.
SPACE_LIMIT	NUMBER	Maximum amount of disk space (in bytes) that the database can use for the fast recovery area. This is the value specified in the DB_RECOVERY_FILE_DEST_SIZE initialization parameter.
SPACE_USED	NUMBER	Amount of disk space (in bytes) used by fast recovery area files created in current and all previous fast recovery areas. Changing fast recovery areas does not reset SPACE_USED to 0.
SPACE_RECLAIMABLE	NUMBER	Total amount of disk space (in bytes) that can be created by deleting obsolete, redundant, and other low priority files from the fast recovery area
NUMBER_OF_FILES	NUMBER	Number of files in the fast recovery area
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

See Also:

- "[DB_RECOVERY_FILE_DEST](#)"
- "[DB_RECOVERY_FILE_DEST_SIZE](#)"

8.157 V\$RECOVERY_FILE_STATUS

V\$RECOVERY_FILE_STATUS contains one row for each datafile for each RECOVER statement. This view contains useful information only for the Oracle process doing the recovery. When

Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY_FILE_STATUS will be empty to all other Oracle users.

Column	Datatype	Description
FILENUM	NUMBER	Number of the file being recovered
FILENAME	VARCHAR2 (513)	Filename of the datafile being recovered
STATUS	VARCHAR2 (13)	Status of the recovery: <ul style="list-style-type: none"> • IN RECOVERY • CURRENT • NOT RECOVERED
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Backup and Recovery User's Guide

8.158 V\$RECOVERY_LOG

V\$RECOVERY_LOG lists information about archived logs that are needed to complete media recovery. This information is derived from the log history view, V\$LOG_HISTORY.

V\$RECOVERY_LOG contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY_LOG will be empty to all other Oracle users.

Column	Datatype	Description
THREAD#	NUMBER	Thread number of the archived log
SEQUENCE#	NUMBER	Sequence number of the archived log
TIME	DATE	Time of the first entry (lowest SCN) in the log
ARCHIVE_NAME	VARCHAR2 (513)	Name of the file when archived, using the naming convention specified by the LOG_ARCHIVE_FORMAT initialization parameter See Also: " LOG_ARCHIVE_FORMAT "

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

"V\$LOG_HISTORY" and *Oracle Database Backup and Recovery User's Guide*

8.159 V\$RECOVERY_PROGRESS

V\$RECOVERY_PROGRESS can be used to track database recovery operations to ensure that they are not stalled, and also to estimate the time required to complete the operation in progress.

On non-coordinator instances, V\$RECOVERY_PROGRESS is not populated.

On the coordinator instance (the instance where MRP0 was started to start recovery), V\$RECOVERY_PROGRESS has the same set of rows as before, except the following rows in the ITEM column are always 0 (not used) with Multi-Instance Redo Apply:

- Active Apply
- Maximum Apply Rate
- Apply Time per Log
- Checkpoint Time per Log
- Recovery ID

V\$RECOVERY_PROGRESS is a subview of V\$SESSION_LONGOPS.

 **Note:**

This view is populated on the instance where the MRP0 process is started if recovery is running in Multi-Instance Redo Apply mode. Not all the columns will be populated.

Column	Datatype	Description
START_TIME	DATE	Start time of the recovery operation
TYPE	VARCHAR2 (64)	<p>Type of recovery operation being performed:</p> <ul style="list-style-type: none"> • CRASH RECOVERY • INSTANCE RECOVERY • MEDIA RECOVERY

Column	Datatype	Description
ITEM	VARCHAR2 (32)	<p>Item being measured.</p> <p>When TYPE is CRASH RECOVERY or INSTANCE RECOVERY, the possible values are:</p> <ul style="list-style-type: none"> • Log Files • Redo Blocks <p>When TYPE is MEDIA RECOVERY, the possible values are:</p> <ul style="list-style-type: none"> • Active Apply Rate • Average Apply Rate • Maximum Apply Rate • Redo Applied • Log Files • Last Applied Redo • Active Time • Elapsed Time • Apply Time per Log • Checkpoint Time per Log • Standby Apply Lag • Recovery ID
UNITS	VARCHAR2 (32)	The units of measurement for each item
SOFAR	NUMBER	Amount of work done so far
TOTAL	NUMBER	Total amount of work expected
TIMESTAMP	DATE	Timestamp of the last redo record applied
COMMENTS	VARCHAR2 (248)	Miscellaneous notes; currently displays the SCN for the last applied redo
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

See Also:

- "[V\\$SESSION_LONGOPS](#)"
- "[Background Processes](#)" for more information about the MRP0 process
- *Oracle Database Backup and Recovery User's Guide* for more information about performing database recovery

8.160 V\$RECOVERY_SLAVE

V\$RECOVERY_SLAVE is used to track database media recovery processes to monitor their performance statistics and analyze a media recovery session.

Column	Datatype	Description
START_TIME	DATE	Start time of the recovery process
TYPE	VARCHAR2 (64)	Type of recovery process being performed: <ul style="list-style-type: none"> • MEDIA RECOVERY Apply SLAVE • MEDIA RECOVERY Merge Slave • SERIAL MEDIA RECOVERY
ITEM	VARCHAR2 (32)	Item being measured. When TYPE is MEDIA RECOVERY Apply SLAVE, the possible values are: <ul style="list-style-type: none"> • Recovery ID • Process ID • Number of Redo Cache Full • Number of Redo Cache Copy • Number of CV Cached • CV Applied OK • CV Applied Stuck • CV Applied Repair • CV Applied Corrupt • CV Applied Ckpt • CV Applied Reapplied • Total CV Processed Size • Total CV Applied • Number of Buffer Cache Full • Number of Buffer Retries • Number of Max Reads Issued • Number of Unrcv Condition • Number of Influx Buffer Flushed • Number of Reap Request • Number of Reap Wait IO • Number of Reap No Buffer • Number of Wait All Read • Number of Buffer Pinged • Buffer Ping Time • Read Issue Time • Number of Read Request Issued When TYPE is MEDIA RECOVERY Merge Slave, the possible values are: <ul style="list-style-type: none"> • Recovery ID • Process ID • Number of Redo Cache Full • Number of Redo Cache Copy • Number of CV Cached • Total Redo Read Bytes • Total CV Parsed When TYPE is SERIAL MEDIA RECOVERY, the possible values include values from the other two TYPES.
UNITS	VARCHAR2 (32)	The units of measurement for each item
SOFAR	NUMBER	Amount of work done so far
TOTAL	NUMBER	Total amount of work expected
COMMENTS	VARCHAR2 (248)	Miscellaneous notes, which may display the recovery ID and process ID for current recovery session

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

Oracle Database Backup and Recovery User's Guide

8.161 V\$RECOVERY_STATUS

V\$RECOVERY_STATUS contains statistics of the current recovery process. This view contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY_STATUS will be empty to all other Oracle users.

Column	Datatype	Description
RECOVERY_CHECKPOINT	DATE	Point in time to which the recovery has occurred. If no logs have been applied, this is the point in time the recovery starts.
THREAD	NUMBER	Number of the redo thread currently being processed
SEQUENCE_NEEDED	NUMBER	Log sequence number of the log needed by the recovery process. The value is 0 if no log is needed.
SCN_NEEDED	VARCHAR2(16)	Low SCN of the log needed by recovery. The value is 0 if unknown or no log is needed.
TIME_NEEDED	DATE	Time when the log was created. The value is midnight on 1/1/88 if the time is unknown or if no log is needed.
PREVIOUS_LOG_NAME	VARCHAR2(513)	Filename of the log
PREVIOUS_LOG_STATUS	VARCHAR2(13)	Status of the previous log. Contains one of the following values: RELEASE; WRONG NAME; MISSING NAME; UNNEEDED NAME; NONE
REASON	VARCHAR2(13)	Reason recovery is returning control to the user (NEED LOG LOG REUSED THREAD DISABLED)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

Oracle Database Backup and Recovery User's Guide

8.162 V\$REDO_DEST_RESP_HISTOGRAM

V\$REDO_DEST_RESP_HISTOGRAM provides statistical information for each redo transport destination.

Column	Datatype	Description
DEST_ID	NUMBER	A nonnegative integer value representing a SYNC standby destination
TIME	VARCHAR2 (20)	A text string that shows the last wall-clock time that a bucket was hit
DURATION	NUMBER	A positive integer value that represents a bucket of seconds, 1, 2, 3, up to 300 seconds, followed by 5 additional buckets that represent 600, 1200, 2400, 4800, and 9600 (≥ 4801) seconds
FREQUENCY	NUMBER	A nonnegative integer that shows the number of times a particular bucket was hit by the destination specified by DEST_ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.163 V\$REQDIST

V\$REQDIST lists statistics for the histogram of shared server dispatcher request times, divided into 12 buckets, or ranges of time. The time ranges grow exponentially as a function of the bucket number.

Column	Datatype	Description
BUCKET	NUMBER	Bucket number: 0 – 11; the maximum time for each bucket is $(4 * 2^N) / 100$ seconds
COUNT	NUMBER	Count of requests whose total time to complete (excluding wait time) falls in this range
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.164 V\$RESERVED_WORDS

V\$RESERVED_WORDS displays a list of all SQL keywords. To determine whether a particular keyword is reserved in any way, check the RESERVED, RES_TYPE, RES_ATTR, and RES_SEMI columns.

Column	Datatype	Description
KEYWORD	VARCHAR2(128)	Name of the keyword
LENGTH	NUMBER	Length of the keyword
RESERVED	VARCHAR2(1)	Indicates whether the keyword cannot be used as an identifier (Y) or whether the keyword is not reserved (N)
RES_TYPE	VARCHAR2(1)	Indicates whether the keyword cannot be used as a type name (Y) or whether the keyword is not reserved (N)
RES_ATTR	VARCHAR2(1)	Indicates whether the keyword cannot be used as an attribute name (Y) or whether the keyword is not reserved (N)
RES_SEMI	VARCHAR2(1)	Indicates whether the keyword is not allowed as an identifier in certain situations, such as in DML (Y) or whether the keyword is not reserved (N)
DUPLICATE	VARCHAR2(1)	Indicates whether the keyword is a duplicate of another keyword (Y) or whether the keyword is not a duplicate (N)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.165 V\$RESOURCE

V\$RESOURCE contains resource name and address information.

Column	Datatype	Description
ADDR	RAW(4 8)	Address of the resource object
TYPE	VARCHAR2(2)	Resource type; the resource types are listed in Table 8-1
ID1	NUMBER	Resource identifier #1
ID2	NUMBER	Resource identifier #2
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.166 V\$RESOURCE_LIMIT

V\$RESOURCE_LIMIT displays information about global resource use for some of the system resources. Use this view to monitor the consumption of resources so that you can take corrective action, if necessary. Many of the resources correspond to initialization parameters listed in [Table 8-5](#).

Some resources, those used by DLM for example, have an initial allocation (soft limit), and the hard limit, which is theoretically infinite (although in practice it is limited by SGA size). During SGA reservation/initialization, a place is reserved in SGA for the INITIAL_ALLOCATION of resources, but if this allocation is exceeded, additional resources are allocated up to the value indicated by LIMIT_VALUE. The CURRENT_UTILIZATION column indicates whether the initial allocation has been exceeded. When the initial allocation value is exceeded, the additional required resources are allocated from the shared pool, where they must compete for space with other resources.

A good choice for the value of INITIAL_ALLOCATION will avoid the contention for space. For most resources, the value for INITIAL_ALLOCATION is the same as the LIMIT_VALUE. Exceeding LIMIT_VALUE results in an error.

Column	Datatype	Description
RESOURCE_NAME	VARCHAR2(128)	Name of the resource (see Table 8-5)
CURRENT_UTILIZATION	NUMBER	Number of (resources, locks, or processes) currently being used
MAX_UTILIZATION	NUMBER	Maximum consumption of this resource since the last instance start-up
INITIAL_ALLOCATION	VARCHAR2(40)	Initial allocation. This will be equal to the value specified for the resource in the initialization parameter file (UNLIMITED for infinite allocation).
LIMIT_VALUE	VARCHAR2(40)	Unlimited for resources and locks. This can be greater than the initial allocation value (UNLIMITED for infinite limit).
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Table 8-5 Values for the RESOURCE_NAME Column

Resource Name	Corresponds to
DML_LOCKS	See " DML_LOCKS "
ENQUEUE_LOCKS	This value is computed by the Oracle Database. See V\$ENQUEUE_LOCK to obtain more information about the enqueue locks.
GES_LOCKS	Global Enqueue Service locks
GES_PROCS	Global Enqueue Service processes
GES_RESS	Global Enqueue Service resources
MAX_SHARED_SERVERS	See " MAX_SHARED_SERVERS "
PARALLEL_MAX_SERVERS	See " PARALLEL_MAX_SERVERS "

Table 8-5 (Cont.) Values for the RESOURCE_NAME Column

Resource Name	Corresponds to
PROCESSES	See " PROCESSES "
SESSIONS	See " SESSIONS "
SORT_SEGMENT_LOCKS	This value is computed by the Oracle Database
TEMPORARY_LOCKS	This value is computed by the Oracle Database
TRANSACTIONS	See " TRANSACTIONS "

8.167 V\$RESTORE_POINT

V\$RESTORE_POINT displays information about restore points.

Column	Datatype	Description
SCN	NUMBER	Database SCN when the restore point was created
DATABASE_INCarnation#	NUMBER	Database incarnation number when the restore point was created
GUARANTEE_FLASHBACK_DATA_BASE	VARCHAR2(3)	Indicates whether flashback log files will be kept to ensure a flashback to this point (YES) or not (NO)
STORAGE_SIZE	NUMBER	Approximate number of bytes of disk space currently tied up supporting this restore point, and which would no longer be tied up if this restore point is the oldest restore point and it is dropped. This will always be zero for non-guaranteed restore points.
TIME	TIMESTAMP(9)	Wall-clock time when the restore point was created
RESTORE_POINT_TIME	TIMESTAMP(9)	Time that was specified when the restore point was created. If a time was not specified, this value is NULL.
PRESERVED	VARCHAR2(3)	Indicates whether the restore point must be explicitly deleted (YES) or not (NO)
NAME	VARCHAR2(128)	Name of the restore point
PDB_RESTORE_POINT	VARCHAR2(3)	Indicates whether there is a PDB restore point for this PDB (YES) or not (NO)
CLEAN_PDB_RESTORE_POINT	VARCHAR2(3)	Indicates whether there is a clean PDB restore point for this PDB (YES) or not (NO)
PDB_INCarnation#	NUMBER	Pluggable database (PDB) incarnation number. This value is meaningful only for PDB restore points.
REPLICATED ¹	VARCHAR2(3)	This column is useful in Oracle Data Guard environments. It indicates the method by which a restore point was created. Possible values: <ul style="list-style-type: none"> • YES - The restore point was automatically replicated from the primary database to this database when this database was a standby database. The string _PRIMARY is appended to the name of such a restore point. • NO - The restore point was created by a user and was not replicated from the primary database.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

¹ This column is available starting with Oracle Database 19c.

8.168 V\$RESULT_CACHE_DEPENDENCY

V\$RESULT_CACHE_DEPENDENCY displays the depends-on relationship between cached results and dependencies.

Column	Datatype	Description
RESULT_ID	NUMBER	Cached result
DEPEND_ID	NUMBER	Dependency object
OBJECT_NO	NUMBER	Dictionary object number of the dependency object
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.169 V\$RESULT_CACHE_MEMORY

V\$RESULT_CACHE_MEMORY displays all the memory blocks and their status.

Column	Datatype	Description
ID	NUMBER	Unique block identifier (that is, the block number)
CHUNK	NUMBER	Chunk to which the block belongs (the upper 27 bits of the ID)
OFFSET	NUMBER	Offset of the block within its chunk (the lower 5 bits of the ID)
FREE	VARCHAR2 (3)	Indicates whether the block is free (YES) or not (NO)
OBJECT_ID	NUMBER	Cache object to which the memory block belongs; NULL if the memory block is not allocated to a cache object (FREE = YES)
POSITION	NUMBER	Position of the block in the cached object; NULL if the memory block is not allocated to a cache object (FREE = YES)

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.170 V\$RESULT_CACHE_OBJECTS

V\$RESULT_CACHE_OBJECTS displays all the objects (both cached results and dependencies) and their attributes.

Column	Datatype	Description
ID	NUMBER	Identifier for the cache object (also the ID of the first block)
TYPE	VARCHAR2(10)	<p>Type of the cache object:</p> <ul style="list-style-type: none"> • Result • Dependency
STATUS	VARCHAR2(9)	<p>Status of the object:</p> <ul style="list-style-type: none"> • New - Result is still under construction • Published - Result is available for use • Bypass - Result will be bypassed from use • Expired - Result has exceeded expiration time • Invalid - Result is no longer available for use
BUCKET_NO	NUMBER	Internal hash bucket for the object
HASH	NUMBER	Hash value for the object
NAME	VARCHAR2(387)	Name (for example, SQL prefix or PL/SQL function name)
NAMESPACE	VARCHAR2(10)	<p>Namespace:</p> <ul style="list-style-type: none"> • SQL • PLSQL • KEY VECTOR
CREATION_TIMESTAMP	DATE	Time when the object was created
CREATOR_UID	NUMBER	UID that created the object
DEPEND_COUNT	NUMBER	Number of dependencies (TYPE = Result) or dependents (TYPE = Dependency)
BLOCK_COUNT	NUMBER	Total number of blocks in the cached object
SCN	NUMBER	Build SCN (TYPE = Result) or invalidation SCN (TYPE = Dependency)
COLUMN_COUNT	NUMBER	Number of columns in the cached result ¹
PIN_COUNT	NUMBER	Number of active scans on this result ¹
SCAN_COUNT	NUMBER	Total number of scans initiated on the cached result ¹
ROW_COUNT	NUMBER	Total number of rows in the cached result ¹
ROW_SIZE_MAX	NUMBER	Size of the largest row (in bytes) ¹
ROW_SIZE_MIN	NUMBER	Size of the smallest row (in bytes) ¹

Column	Datatype	Description
ROW_SIZE_AVG	NUMBER	Average size of a row (in bytes) ¹
BUILD_TIME	NUMBER	Amount of time (in hundredths of a second) it took to build the cached result ¹
LRU_NUMBER	NUMBER	LRU list position (the larger the value, the more recent the usage) ¹
OBJECT_NO	NUMBER	Dictionary object number of the dependency object ²
INVALIDATIONS	NUMBER	Number of times the object has invalidated its dependents ²
SPACE_OVERHEAD	NUMBER	Overhead (in bytes) for the result ¹
SPACE_UNUSED	NUMBER	Unused space (in bytes) for the result ¹
CACHE_ID	VARCHAR2 (387)	CacheId for the result (object name if it's a dependency)
CACHE_KEY	VARCHAR2 (387)	CacheKey for the result (object name if it's a dependency)
CHECKSUM	NUMBER	Checksum for the result object. The checksum is computed over all the blocks in the result cache object minus the object header.
EDITION_ID	NUMBER	Shows the edition's object ID that was in use when the result was calculated
DB_LINK	VARCHAR2 (3)	Possible values: <ul style="list-style-type: none"> YES: If the result cache object references a remote database object NO: If the result cache object does not reference a remote database object
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

¹ These columns are only valid for TYPE = Result; otherwise, they are NULL.

² These columns are only valid for TYPE = Dependency; otherwise, they are NULL.

8.171 V\$RESULT_CACHE_STATISTICS

V\$RESULT_CACHE_STATISTICS displays various Result Cache settings and usage statistics.

Column	Datatype	Description
ID	NUMBER	Statistic number
NAME	VARCHAR2 (128)	Name of the statistic (see Table 8-6)
VALUE	VARCHAR2 (81)	Value of the statistic
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Table 8-6 V\$RESULT_CACHE_STATISTICS Statistics

Statistic Name	Description
Block Size (Bytes)	Size of each memory block
Block Count Maximum	Maximum number of memory blocks allowed
Block Count Current	Number of memory blocks currently allocated
Result Size Maximum (Blocks)	Maximum number of blocks allowed for a single result
Create Count Success	Number of cache results successfully created
Create Count Failure	Number of cache results that failed to create
Find Count	Number of cached results that were successfully found
Invalidation Count	Total number of invalidations
Delete Count Invalid	Number of invalid cached results deleted
Delete Count Valid	Number of valid cached results deleted
Hash Chain Length	Average length of items in the hash chain
Find Copy Count	Number of results copied directly out of the cache

8.172 V\$RMAN_BACKUP_JOB_DETAILS

V\$RMAN_BACKUP_JOB_DETAILS displays details about backup jobs.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Together, with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V\$RMAN_OUTPUT
SESSION_STAMP	NUMBER	Together, with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V\$RMAN_OUTPUT
COMMAND_ID	VARCHAR2 (33)	Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN
START_TIME	DATE	Start time of the first BACKUP command in the job
END_TIME	DATE	End time of the last BACKUP command in the job
INPUT_BYTES	NUMBER	Sum of all input file sizes backed up by this job
OUTPUT_BYTES	NUMBER	Output size of all pieces generated by this job
STATUS_WEIGHT	NUMBER	Used internally by Enterprise Manager
OPTIMIZED_WEIGHT	NUMBER	Used internally by Enterprise Manager
OBJECT_TYPE_WEIGHT	NUMBER	Used internally by Enterprise Manager
OUTPUT_DEVICE_TYPE	VARCHAR2 (17)	Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).
AUTOBACKUP_COUNT	NUMBER	Number of autobackups performed by this job
BACKED_BY_OSB	VARCHAR2 (3)	A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.
AUTOBACKUP_DONE	VARCHAR2 (3)	YES or NO, depending upon whether or not a control file autobackup was done as part of this backup job

Column	Datatype	Description
STATUS	VARCHAR2 (23)	One of the following values: <ul style="list-style-type: none">• RUNNING WITH WARNINGS• RUNNING WITH ERRORS• COMPLETED• COMPLETED WITH WARNINGS• COMPLETED WITH ERRORS• FAILED
INPUT_TYPE	VARCHAR2 (13)	Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. <ul style="list-style-type: none">• DB FULL• RECVR AREA• DB INCR• DATAFILE FULL• DATAFILE INCR• ARCHIVELOG• CONTROLFILE• SPFILE
OPTIMIZED	VARCHAR2 (3)	YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds
COMPRESSION_RATIO	NUMBER	Compression ratio
INPUT_BYTES_PER_SEC	NUMBER	Input read-rate-per-second
OUTPUT_BYTES_PER_SEC	NUMBER	Output write-rate-per-second
INPUT_BYTES_DISPLAY	VARCHAR2 (4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
OUTPUT_BYTES_DISPLAY	VARCHAR2 (4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on
INPUT_BYTES_PER_SEC_DISP	VARCHAR2 (4000)	Input read-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
LAY		
OUTPUT_BYTES_PER_SEC_DIS	VARCHAR2 (4000)	Output write-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
PLAY		
TIME_TAKEN_DISPLAY	VARCHAR2 (4000)	Time taken, shown in user-displayable format <nn>h:<nn>m:<nn>s
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.173 V\$RMAN_BACKUP_SUBJOB_DETAILS

V\$RMAN_BACKUP_SUBJOB_DETAILS merges similar operations within an RMAN session into a single row. For example, if there are four BACKUP DATAFILE <n> commands, three RECOVERY COPY OF DATAFILE commands, and one BACKUP RECOVERY AREA command, this view will contain three rows - one each for BACKUP, ROLLFORWARD, and COPY_DISK_TO_TAPE operation.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Together with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V\$RMAN_OUTPUT
SESSION_STAMP	NUMBER	Together with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V\$RMAN_OUTPUT
OPERATION	VARCHAR2 (33)	Can be BACKUP, ROLLFORWARD, VALIDATE, or COPY_DISK_TO_TAPE. A row for each suboperation type for the session will be in the output view.
COMMAND_ID	VARCHAR2 (33)	Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN
START_TIME	DATE	Start time of the first BACKUP command in the job
END_TIME	DATE	End time of the last BACKUP command in the job
INPUT_BYTES	NUMBER	Sum of all input file sizes backed up by this job
OUTPUT_BYTES	NUMBER	Output size of all pieces generated by this job
STATUS_WEIGHT	NUMBER	Used internally by Enterprise Manager
OBJECT_TYPE_WEIGHT	NUMBER	Used internally by Enterprise Manager
OPTIMIZED_WEIGHT	NUMBER	Used internally by Enterprise Manager
OUTPUT_DEVICE_TYPE	VARCHAR2 (17)	Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).
BACKED_BY_OSB	VARCHAR2 (3)	A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.
AUTOBACKUP_DONE	VARCHAR2 (3)	YES or NO, depending upon whether or not a control file autobackup was done as part of this job
STATUS	VARCHAR2 (23)	One of the following values: <ul style="list-style-type: none">• RUNNING WITH WARNINGS• RUNNING WITH ERRORS• COMPLETED• COMPLETED WITH WARNINGS• COMPLETED WITH ERRORS• FAILED
INPUT_TYPE	VARCHAR2 (13)	Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. <ul style="list-style-type: none">• DB FULL• RECVR AREA• DB INCR• DATAFILE FULL• DATAFILE INCR• ARCHIVELOG• CONTROLFILE• SPFILE
OPTIMIZED	VARCHAR2 (3)	YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.
AUTOBACKUP_COUNT	NUMBER	Number of autobackups performed by this job
COMPRESSION_RATIO	NUMBER	Compression ratio
INPUT_BYTES_DISPLAY	VARCHAR2 (4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.

Column	Datatype	Description
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.174 V\$RMAN_BACKUP_TYPE

V\$RMAN_BACKUP_TYPE displays information about RMAN backup types.

Column	Datatype	Description
WEIGHT	NUMBER	Used to set precedence order of different backup types in reports.
INPUT_TYPE	VARCHAR2(13)	Used to represent possible filters used in creating various reporting screens.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.175 V\$RMAN_COMPRESSION_ALGORITHM

V\$RMAN_COMPRESSION_ALGORITHM provides descriptions of supported compression algorithms. It is used by the RMAN client.

Column	Datatype	Description
ALGORITHM_ID	NUMBER	Algorithm ID
ALGORITHM_NAME	VARCHAR2(64)	Name of the algorithm (for example, LOW, MEDIUM, DEFAULT, or HIGH)
INITIAL_RELEASE	VARCHAR2(18)	First Oracle Database release when this compression algorithm was available
TERMINAL_RELEASE	VARCHAR2(18)	Last Oracle Database release that supported using this compression algorithm to create new backups. Existing backups can always be restored, even if they use a deprecated compression algorithm.
ALGORITHM_DESCRIPTION	VARCHAR2(64)	Description of the algorithm
ALGORITHM_COMPATIBILITY	VARCHAR2(18)	Required database compatibility level for the algorithm (for example, 11.2.0 for DEFAULT)
IS_VALID	VARCHAR2(3)	Indicates whether the algorithm is valid with regard to the compatibility setting (YES) or not (NO). The value is YES if ALGORITHM_COMPATIBILITY <= DATABASE_COMPATIBILITY.

Column	Datatype	Description
REQUIRES_ACO	VARCHAR2 (3)	Indicates whether the algorithm requires the Advanced Compression Option (YES) or not (NO)
IS_DEFAULT	VARCHAR2 (3)	Indicates whether the algorithm is the default compression algorithm that RMAN uses to create compressed backup sets (YES) or not (NO)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.176 V\$RMAN_CONFIGURATION

V\$RMAN_CONFIGURATION lists information about RMAN persistent configuration settings.

Column	Datatype	Description
CONF#	NUMBER	A unique key identifying this configuration record within the target database that owns it.
NAME	VARCHAR2 (65)	The type of configuration. All options of the CONFIGURE command are valid types except: <ul style="list-style-type: none"> • CONFIGURE EXCLUDE (described in RC_TABLESPACE) • CONFIGURE AUXNAME (described in RC_DATAFILE) • CONFIGURE SNAPSHOT CONTROLFILE (stored only in control file)
VALUE	VARCHAR2 (1025)	The CONFIGURE command setting. Example: RETENTION POLICY TO RECOVERY WINDOW OF 10 DAYS
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.177 V\$RMAN_ENCRYPTION_ALGORITHMS

V\$RMAN_ENCRYPTION_ALGORITHMS displays supported encryption algorithms. It is used by the RMAN client to validate user-requested algorithms. This view will list AES128, AES192, and AES256 encryption algorithms for the current release. The default algorithm is AES128.

Column	Datatype	Description
ALGORITHM_ID	NUMBER	Number to identify the algorithm
ALGORITHM_NAME	VARCHAR2 (64)	Name of the algorithm (for example, AES128, AES192, or AES256)
ALGORITHM_DESCRIPTION	VARCHAR2 (64)	Description of the algorithm

Column	Datatype	Description
IS_DEFAULT	VARCHAR2 (3)	Indicates whether this is the default encryption algorithm (YES) or not (NO). This value is set by Oracle Database and may vary for each Release (that is, it is not dependent on user-specified RMAN configuration).
RESTORE_ONLY	VARCHAR2 (3)	Indicates whether this algorithm can be used for restore only (YES) or not (NO). If the value is NO, then the algorithm is also allowed for backup. This column is useful in determining whether an encryption algorithm is deprecated for backup purpose.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.178 V\$RMAN_OUTPUT

V\$RMAN_OUTPUT displays messages reported by RMAN.

This is an in-memory view and is not recorded in the controlfile. The view can hold 32768 rows.

Column	Datatype	Description
SID	NUMBER	Session ID of the session which is running this RMAN operation
RECID	NUMBER	Record ID of the corresponding V\$RMAN_STATUS row
STAMP	NUMBER	Timestamp of the corresponding V\$RMAN_STATUS row
SESSION_RECID	NUMBER	Record ID of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)
SESSION_STAMP	NUMBER	Timestamp of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)
OUTPUT	VARCHAR2 (130)	Output text reported by RMAN
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS record stamp
SESSION_KEY	NUMBER	Session identifier
GUID ¹	NUMBER	<p>The guid of the pluggable database (PDB) that did the RMAN operation. V\$RMAN_OUTPUT captures the rman output.</p> <p>If a PDB sysdba did the backup, the guid of the PDB is displayed in V\$RMAN_OUTPUT. If root did the backup, then guid of the root is displayed in V\$RMAN_OUTPUT. Root</p> <p>A root user can see all of V\$RMAN_OUTPUT rows (that is, the rows owned by all PDBs), but a PDB user can only see that PDB's V\$RMAN_OUTPUT rows (that is, no rows from root or other PDBs).</p>

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

¹ This column is available starting with Oracle Database 19c.

8.179 V\$RMAN_STATUS

V\$RMAN_STATUS displays the finished and on-going RMAN jobs. For on-going jobs, this view displays progress and status. The jobs which are in progress are stored only in memory while the finished jobs are stored in the controlfile.

Column	Datatype	Description
SID	NUMBER	Session ID of the session which is running this RMAN operation
RECID	NUMBER	Record ID of the row in the controlfile
STAMP	NUMBER	Timestamp of the row (RECID + STAMP is unique)
PARENT_RECID	NUMBER	Record ID of the parent row of this row (corresponding V\$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1)
PARENT_STAMP	NUMBER	Timestamp of the parent row of this row (corresponding V\$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1)
SESSION_RECID	NUMBER	Record ID of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)
SESSION_STAMP	NUMBER	Timestamp of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)
ROW_LEVEL	NUMBER	Level of the row. The session has level 0.
ROW_TYPE	VARCHAR2(19)	<p>Type of the row:</p> <ul style="list-style-type: none"> • SESSION • COMMAND • RECURSIVE OPERATION
COMMAND_ID	VARCHAR2(33)	Command ID set by the RMAN SET COMMAND ID command. If not set, then RMAN will create a unique number.
OPERATION	VARCHAR2(33)	Name of the command in the execution explained by this row
STATUS	VARCHAR2(23)	<p>Status of the operation:</p> <ul style="list-style-type: none"> • RUNNING • RUNNING WITH WARNINGS • RUNNING WITH ERRORS • COMPLETED • COMPLETED WITH WARNINGS • COMPLETED WITH ERRORS • FAILED
MBYTES_PROCESSED	NUMBER	Percentage of the job completed; null if not applicable for the operation
START_TIME	DATE	Start time of the job

Column	Datatype	Description
END_TIME	DATE	End time of the job
INPUT_BYTES	NUMBER	Number of input bytes read
OUTPUT_BYTES	NUMBER	Number of output bytes written
OPTIMIZED	VARCHAR2 (3)	YES, if backup optimization was applied during the backup job. Otherwise, NO.
OBJECT_TYPE	VARCHAR2 (13)	Identifies types of objects backed up
OUTPUT_DEVICE_TYPE	VARCHAR2 (17)	DISK, SBT_TAPE, or *. An * indicates that output was written to more than one device type.
OSB_ALLOCATED	VARCHAR2 (3)	A value of YES means an Oracle Secure Backup channel was allocated during the specified operation identified by the V\$RMAN_STATUS view.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.180 V\$RO_USER_ACCOUNT

V\$RO_USER_ACCOUNT is populated only on Oracle databases that are open in read-only mode. When a database is read-only, security data cannot be stored in normal catalogue tables. Instead, the security data is stored in an in-memory table that is queried through this view. In an Oracle Data Guard environment, some of the security information for user accounts on the standby is inherited from the primary server. For example, if the account is locked out unlimited on the primary, then it will be locked on the standby database(s). The information stored on the standby is volatile information that user actions on the standby database(s) can affect, such as the number of failed logins, and the time the account was locked on the standby due to failed access attempts. Note that failed login attempts on standbys do not affect the account status on primaries.

If this view is queried from the root in a multitenant container database (CDB), then only common users and the SYS user are returned.

If this view is queried from a pluggable database (PDB), only rows that pertain to the current PDB are returned.

Column	Datatype	Description
USERID	NUMBER	User ID number
PASSW_EXPIRED	NUMBER	Indicates whether the password has expired (1) or not (0)
PASSW_IN_GRACE	NUMBER	Indicates whether the account is in grace (1) or not (0)
PASSW_LOCKED	NUMBER	Indicates whether the account is locked (1) or not (0)
PASSW_LOCK_UNLIM	NUMBER	Indicates whether the account is locked for an unlimited time (1) or not (0)
FAILED_LOGINS	NUMBER	The number of failed login attempts. The count is not cumulative; it is reset upon successful logon to the account
EXPIRATION_AFTER_GRACE	TIMESTAMP (3)	The expiration time after grace

Column	Datatype	Description
PASSW_LOCK_TIME	TIMESTAMP (3)	The time the account was locked out
CON_ID	NUMBER	<p>The ID of the container where the failed login occurred.</p> <p>For users that are not common users, the CON_ID is the PDB ID where the failed login attempt occurred.</p> <p>For common users, the CON_ID is 0.</p>
		<p>The login attempts that occurred on a PDB are not displayed when you query V\$RO_USER_ACCOUNT from another PDB. You only see the failed login attempts of any users (that are not common users) if those failed login attempts occurred on the same PDB from which you are querying V\$RO_USER_ACCOUNT.</p> <p>The failed login attempts of common users (and of the SYS user) are only displayed when V\$RO_USER_ACCOUNT is queried from the root of a CDB, not when it is queried from a PDB.</p> <p>In a non-CDB, the value is always 0.</p>
USERNAME	VARCHAR2 (128)	User name

8.181 V\$ROLLNAME

V\$ROLLNAME lists the names of all online rollback segments. It can only be accessed when the database is open.

Column	Datatype	NULL	Description
USN	NUMBER		Rollback (undo) segment number
NAME	VARCHAR2 (30)	NOT NULL	Rollback segment name
CON_ID	NUMBER		<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.182 V\$ROLLSTAT

V\$ROLLSTAT contains rollback segment statistics.

Column	Datatype	Description
USN	NUMBER	Rollback segment number
LATCH	NUMBER	Latch for the rollback segment
EXTENTS	NUMBER	Number of extents in the rollback segment
RSSIZE	NUMBER	Size (in bytes) of the rollback segment. This value differs by the number of bytes in one database block from the value of the BYTES column of the *_SEGMENTS view.
		See Also: Oracle Database Administrator's Guide for more information about space management for rollback segments

Column	Datatype	Description
WRITES	NUMBER	Number of bytes written to the rollback segment
XACTS	NUMBER	Number of active transactions
GETS	NUMBER	Number of header gets
WAITS	NUMBER	Number of header waits
OPTSIZE	NUMBER	Optimal size of the rollback segment
HWMSIZE	NUMBER	High watermark of the rollback segment size
SHRINKS	NUMBER	Number of times the size of a rollback segment decreases
WRAPS	NUMBER	Number of times rollback segment is wrapped
EXTENDS	NUMBER	Number of times rollback segment size is extended
AVESHINK	NUMBER	Average shrink size
AVEACTIVE	NUMBER	Current size of active extents, averaged over time.
STATUS	VARCHAR2 (15)	Rollback segment status: <ul style="list-style-type: none">• ONLINE• PENDING OFFLINE• OFFLINE• FULL
CUREXT	NUMBER	Current extent
CURBLK	NUMBER	Current block
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.183 V\$ROWCACHE

V\$ROWCACHE displays statistics for data dictionary activity. Each row contains statistics for one data dictionary cache.

Column	Datatype	Description
CACHE#	NUMBER	Row cache ID number
TYPE	VARCHAR2 (11)	Parent or subordinate row cache type
SUBORDINATE#	NUMBER	Subordinate set number
PARAMETER	VARCHAR2 (32)	Name of the initialization parameter that determines the number of entries in the data dictionary cache
COUNT	NUMBER	Total number of entries in the cache
USAGE	NUMBER	Number of cache entries that contain valid data
FIXED	NUMBER	Number of fixed entries in the cache
GETS	NUMBER	Total number of requests for information on the data object
FASTGETS	NUMBER	Reserved for internal use
GETMISSES	NUMBER	Number of data requests resulting in cache misses

Column	Datatype	Description
SCANS	NUMBER	Number of scan requests
SCANMISSES	NUMBER	Number of times a scan failed to find the data in the cache
SCANCOMPLETES	NUMBER	For a list of subordinate entries, the number of times the list was scanned completely
MODIFICATIONS	NUMBER	Number of inserts, updates, and deletions
FLUSHES	NUMBER	Number of times flushed to disk
DLM_REQUESTS	NUMBER	Number of DLM requests
DLM_CONFLICTS	NUMBER	Number of DLM conflicts
		This column is obsolete and is maintained for backward compatibility.
DLM_RELEASES	NUMBER	Number of DLM releases
		This column is obsolete and is maintained for backward compatibility.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.184 V\$ROWCACHE_PARENT

V\$ROWCACHE_PARENT displays information for parent objects in the data dictionary. There is one row per lock owner, and one waiter for each object. This row shows the mode held or requested. For objects with no owners or waiters, a single row is displayed.

Column	Datatype	Description
INDX	NUMBER	Index of the row
HASH	NUMBER	Hash value
ADDRESS	RAW(4 8)	Address of the parent object
CACHE#	NUMBER	Parent cache ID
CACHE_NAME	VARCHAR2(64)	Parent cache name
EXISTENT	VARCHAR2(1)	Indicates whether the object is an existing object
LOCK_MODE	NUMBER	Mode the lock is held in
LOCK_REQUEST	NUMBER	Mode the lock is requested in
TXN	RAW(4 8)	Transaction currently locking the object
SADDR	RAW(4 8)	Address of the session
INST_LOCK_REQUEST	NUMBER	Mode in which instance lock is being requested. This column is only relevant for Real Application Clusters.
INST_LOCK_RELEASE	NUMBER	Whether the instance lock needs to be released. This column is only relevant for Real Application Clusters.
INST_LOCK_TYPE	VARCHAR2(2)	Type of instance lock. This column is only relevant for Real Application Clusters.
INST_LOCK_ID1	RAW(4)	ID associated with the instance lock. This column is only relevant for Real Application Clusters.

Column	Datatype	Description
INST_LOCK_ID2	RAW(4)	ID associated with the instance lock. This column is only relevant for Real Application Clusters.
KEY	RAW(100)	Contents of the key. This column is only relevant for Real Application Clusters.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.185 V\$ROWCACHE_SUBORDINATE

V\$ROWCACHE_SUBORDINATE displays information for subordinate objects in the data dictionary.

Column	Datatype	Description
INDX	NUMBER	The index
HASH	NUMBER	The hash value
ADDRESS	RAW(4 8)	Address of the subordinate object
CACHE#	NUMBER	The parent cache ID
SUBCACHE#	NUMBER	The subcache ID
SUBCACHE_NAME	VARCHAR2(64)	The subcache name
EXISTENT	VARCHAR2(1)	Whether the object is an existing object
PARENT	RAW(4 8)	Address of the parent object
KEY	RAW(100)	The contents of the key
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.186 V\$RSRC_CONS_GROUP_HISTORY

V\$RSRC_CONS_GROUP_HISTORY displays a history of consumer group statistics for each entry in V\$RSRC_PLAN_HISTORY that has a non-NULL plan.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

A new window is created in V\$RSRC_CON_GROUP_HISTORY when a pluggable database (PDB) changes its resource plan. The plan windows inside a PDB are not impacted by a multitenant container database (CDB) resource plan change.

Since PDB plans can be set independently across different PDBs, V\$RSRC_CON_GROUP_HISTORY will not cover the same time period across different PDBs. Therefore, this view is not useful for comparing statistics across different PDBs.

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.
ID	NUMBER	Consumer group object ID (a unique number, consistent across database shutdowns and startups)
NAME	VARCHAR2 (30)	Name of the consumer group
REQUESTS	NUMBER	Cumulative number of requests that were executed in the consumer group
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU on the resmgr: cpu quantum wait event because of resource management (in milliseconds). This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU on the resmgr: cpu quantum wait event because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS	NUMBER	Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_EXCLUSIVE	NUMBER	Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_WON	NUMBER	Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero.
ACTIVE_SESS_LIMIT_HIT	NUMBER	Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit
UNDO_LIMIT_HIT	NUMBER	Number of times that queries in the consumer group were canceled because the consumer group reached its UNDO_POOL limit
SWITCHES_IN_CPU_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_OUT_CPU_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_IN_IO_MEGABYTES	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_OUT_IO_MEGABYTE_S	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_IN_IO_REQUESTS	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit

Column	Datatype	Description
SWITCHES_OUT_IO_REQUESTS	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_IN_IO_LOGICAL	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_OUT_IO_LOGICAL	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_IN_ELAPSED_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SWITCHES_OUT_ELAPSED_TIM_E	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SQL_CANCELED	NUMBER	Number of times that SQL queries running in the consumer group were aborted because they exceeded one of the Resource Manager plan's SWITCH limits and CANCEL_SQL was specified as the Resource Manager plan's SWITCH_GROUP
ACTIVE_SESS_KILLED	NUMBER	Number of times that sessions running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and KILL_SESSION was specified as the Resource Manager plan's SWITCH_GROUP
IDLE_SESS_KILLED	NUMBER	Number of times that sessions in the consumer group were killed because they were idle for too long (reached MAX_IDLE_TIME)
IDLE_BLKR_SESS_KILLED	NUMBER	Number of times that sessions in the consumer group were killed because they were idle too long (reached MAX_IDLE_BLOCKER_TIME) and were blocking other sessions
QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group have spent in the QUEUED state because of the active session limit (in milliseconds)
QUEUE_TIME_OUTS	NUMBER	Number of times that requests from sessions in the consumer group timed out because they were queued for too long (reached QUEUEING_P1)
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)

Column	Datatype	Description
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
PGA_LIMIT_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were killed because their untunable PGA usage exceeded the SESSION_PGA_LIMIT limit
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.187 V\$RSRC_CONSUMER_GROUP

V\$RSRC_CONSUMER_GROUP displays data related to currently active resource consumer groups.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

Statistics in V\$RSRC_CONSUMER_GROUP are reset when a pluggable database (PDB) changes its resource plan. They are not impacted by multitenant container database (CDB) resource plan changes.

Since PDB plans can be set independently across different PDBs, V\$RSRC_CONSUMER_GROUP will not cover the same time period across different PDBs. Therefore, this view is not useful for comparing statistics across different PDBs.

Column	Datatype	Description
ID	NUMBER	Consumer group object ID (a unique number, consistent across database shutdowns and startups)
NAME	VARCHAR2 (32)	Name of the consumer group
ACTIVE_SESSIONS	NUMBER	Number of currently active sessions in the consumer group
EXECUTION_WAITERS	NUMBER	Number of currently active sessions waiting for an execution time slice in which they will be able to use CPU

Column	Datatype	Description
REQUESTS	NUMBER	Cumulative number of requests that were executed in the consumer group
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU on the resmgr: cpu quantum wait event because of resource management (in milliseconds). This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU on the resmgr: cpu quantum wait event because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS	NUMBER	Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_EXCLUSIVE	NUMBER	Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS WON	NUMBER	Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero.
QUEUE_LENGTH	NUMBER	Number of sessions waiting in the queue
CURRENT_UNDO_CONSUMPTION	NUMBER	Current amount (in KB) of undo consumed by the consumer group
ACTIVE_SESSION_LIMIT_HIT	NUMBER	Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit
UNDO_LIMIT_HIT	NUMBER	Number of times that queries in the consumer group were canceled because the consumer group reached its UNDO_POOL limit
SWITCHES_IN_CPU_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_OUT_CPU_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_IN_IO_MEGABYTES	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_OUT_IO_MEGABYTE_S	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_IN_IO_REQUESTS	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_OUT_IO_REQUESTS	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_IN_IO_LOGICAL	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_OUT_IO_LOGICAL	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit

Column	Datatype	Description
SWITCHES_IN_ELAPSED_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SWITCHES_OUT_ELAPSED_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SQL_CANCELED	NUMBER	Number of times that SQL queries running in the consumer group were aborted because they exceeded one of the Resource Manager plan's SWITCH limits and CANCEL_SQL was specified as the Resource Manager plan's SWITCH_GROUP
ACTIVE_SESSIONS_KILLED	NUMBER	Number of times that sessions running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and KILL_SESSION was specified as the Resource Manager plan's SWITCH_GROUP
IDLE_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were killed because they were idle for too long (reached MAX_IDLE_TIME)
IDLE_BLKR_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were killed because they were idle too long (reached MAX_IDLE_BLOCKER_TIME) and were blocking other sessions
QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group have spent in the QUEUED state because of the active session limit (in milliseconds)
QUEUE_TIME_OUTS	NUMBER	Number of times that requests from sessions in the consumer group timed out because they were queued for too long (reached QUEUEING_P1)
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
CURRENT_PQS_ACTIVE	NUMBER	Number of active parallel statements in the consumer group. This value does not include parallel statements that are never queued, such as GV\$ queries.
CURRENT_PQ_SERVERS_ACTIVE	NUMBER	Number of active parallel servers in the consumer group. This value does not include servers running parallel statements that are never queued, such as GV\$ queries.
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
CURRENT_PQS_QUEUED	NUMBER	Number of sessions in the consumer group that are waiting in the parallel statement queue trying to run parallel statements

Column	Datatype	Description
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
PGA_LIMIT_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were killed because their untunable PGA usage exceeded the SESSION_PGA_LIMIT limit
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.188 V\$RSRC_CONSUMER_GROUP_CPU_MTH

V\$RSRC_CONSUMER_GROUP_CPU_MTH displays all resource allocation methods defined for resource consumer groups.

Column	Datatype	Description
NAME	VARCHAR2(40)	Name of the CPU resource allocation method
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.189 V\$RSRC_PDB

V\$RSRC_PDB displays data related to currently active resource consumer groups by pluggable database (PDB).

When the `STATISTICS_LEVEL` is set to `TYPICAL` or `ALL`, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

Statistics in V\$RSRC_PDB are reset when a multitenant container database (CDB) changes its resource plan. They are not impacted by PDB resource plan changes.

V\$RSRC_PDB covers the same time period for all PDBs. This view is specifically designed for comparing statistics across different PDBs.

Since V\$RSRC_PDB does not contain information at the consumer group level, it is not useful for comparing consumer groups inside a PDB.

Column	Datatype	Description
PDB_NAME	VARCHAR2 (32)	PDB name
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read

Column	Datatype	Description
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
PQ_QUEUE_TIME_WAITED	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
CURRENT_PQS_ACTIVE	NUMBER	Number of active parallel statements in the consumer group. This value does not include parallel statements that are never queued, such as GV\$ queries.
CURRENT_PQ_SERVERS_ACTIVE	NUMBER	Number of active parallel servers in the consumer group. This value does not include servers running parallel statements that are never queued, such as GV\$ queries.
CURRENT_PQS_QUEUED	NUMBER	Number of sessions in the consumer group that are waiting in the parallel statement queue trying to run parallel statements
SGA_BYTES	NUMBER	The current SGA usage by this PDB in bytes
BUFFER_CACHE_BYTES	NUMBER	The current usage of buffer cache by this PDB in bytes
SHARED_POOL_BYTES	NUMBER	The current usage of shared pool by this PDB in bytes
PGA_BYTES	NUMBER	The current usage of PGA by this PDB in bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

"V\$RSRC_CONSUMER_GROUP"

8.190 V\$RSRC_PDB_HISTORY

V\$RSRC_PDB_HISTORY displays a history of consumer group statistics for each entry in V\$RSRC_PDB that has a non-NULL plan by pluggable database (PDB).

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

A new window is created in V\$RSRC_PDB_HISTORY when a multitenant container database (CDB) changes its resource plan. The plan windows for the CDB are not impacted by a PDB resource plan change.

V\$RSRC_PDB_HISTORY covers the same time period for all PDBs. This view is specifically designed for comparing statistics across different PDBs.

Since V\$RSRC_PDB_HISTORY does not contain information at the consumer group level, it is not useful for comparing consumer groups inside a PDB.

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V\$RSRC_PDB entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.
PDB_NAME	VARCHAR2 (32)	PBD name
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group

Column	Datatype	Description
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$RSRC_CONS_GROUP_HISTORY"](#)

8.191 V\$RSRC_PLAN

V\$RSRC_PLAN displays the names of all currently active resource plans.

Column	Datatype	Description
ID	NUMBER	Resource plan ID (a unique number, consistent across database shutdowns and startups). This is also the data dictionary object ID.
NAME	VARCHAR2 (32)	Name of the resource plan
IS_TOP_PLAN	VARCHAR2 (5)	Indicates whether the resource plan is the current top plan (TRUE) or whether the resource plan is a subplan of the current top plan (FALSE)
CPU_MANAGED	VARCHAR2 (3)	Indicates whether the resource plan has parameters that specify a policy for how the Resource Manager should schedule sessions to manage CPU usage (ON) or whether Resource Manager is not managing CPU usage (OFF)
INSTANCE_CAGING	VARCHAR2 (3)	Indicates whether instance caging is enabled (ON) or disabled (OFF). Instance caging is enabled if the CPU_COUNT initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.
PARALLEL_SERVERS_ACTIVE	NUMBER	Total number of active parallel servers on the instance
PARALLEL_SERVERS_TOTAL	NUMBER	The value of PARALLEL_SERVERS_TARGET for the instance. Parallel statements are queued if the total number of active parallel servers exceeds this value.

Column	Datatype	Description
PARALLEL_EXECUTION_MANAG ED	VARCHAR2 (32)	<p>State of parallel statement queuing:</p> <ul style="list-style-type: none"> • OFF - Parallel statement queuing is disabled • STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes • FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue • FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (<code>MGMT_P*</code>) is enabled. • DISABLED - Parallel statement queuing is disabled. This state can occur when memory is unavailable for use by parallel statement queuing in the System Global Area (SGA). Restart the Oracle instance to re-enable parallel statement queuing. <p>For an Oracle RAC database, only the instance running as master Database Resource Manager (DBRM) shows the correct state of parallel statement queuing. All other instances default to the value <code>FULL</code>. A single instance database always shows the correct value for this field.</p>
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
DIRECTIVE_TYPE	VARCHAR2 (32)	<p>The type of directive used by this PDB:</p> <ul style="list-style-type: none"> • DEFAULT_DIRECTIVE: The default plan directive • PDB: A PDB directive • PROFILE: A profile directive
SHARES	NUMBER	Resource allocation for this PDB, expressed in shares
UTILIZATION_LIMIT	NUMBER	Maximum percentage of the container's resources allowed for this PDB
PARALLEL_SERVER_LIMIT	NUMBER	Maximum percentage of the parallel target the PDB can use before queuing subsequent parallel queries
MEMORY_MIN	NUMBER	<p>The percentage of Exadata Smart Flash Cache and Exadata PMEM cache that is guaranteed to the PDB</p> <p>This percentage is based on the total amount of space allocated to the CDB for Exadata Smart Flash Cache and Exadata PMEM cache.</p> <p>See <i>Oracle Exadata System Software User's Guide</i> for more information.</p>
MEMORY_LIMIT	NUMBER	<p>The maximum percentage of Exadata Smart Flash Cache and Exadata PMEM cache that the PDB can use</p> <p>This percentage is based on the total amount of space allocated to the CDB for Exadata Smart Flash Cache and Exadata PMEM cache.</p> <p>See <i>Oracle Exadata System Software User's Guide</i> for more information.</p>
PROFILE	VARCHAR2 (32)	The value of the <code>DB_PERFORMANCE_PROFILE</code> initialization parameter for this PDB

The resource plan with CON_ID=ROOT is the CDB resource plan.

 **See Also:**

8.192 V\$RSRC_PLAN_CPU_MTH

V\$RSRC_PLAN_CPU_MTH displays all available CPU resource allocation methods defined for resource plans.

Column	Datatype	Description
NAME	VARCHAR2 (40)	Name of the resource allocation method
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "[V\\$RSRC_CONSUMER_GROUP_CPU_MTH](#)" for a listing of resource allocation methods defined for consumer groups
- *Oracle Database Administrator's Guide* for information on resource plans
- *Oracle Database PL/SQL Packages and Types Reference* for information on defining resource allocation methods for consumer plans with the DBMS_RESOURCE_MANAGER package

8.193 V\$RSRC_PLAN_HISTORY

V\$RSRC_PLAN_HISTORY displays a history of when a resource plan was enabled, disabled, or modified on the instance. Up to 15 of the most recent entries are shown. Once the database is

opened, this view shows at least one row. The row with the most recent START_TIME and with END_TIME equal to NULL gives information about the current resource plan.

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes a row. When the instance is restarted, this value is reset to zero.
ID	NUMBER	Resource plan ID; NULL if the Resource Manager was disabled
NAME	VARCHAR2 (30)	Resource plan name; NULL if the Resource Manager was disabled
START_TIME	DATE	Time that the resource plan was enabled
END_TIME	DATE	Time that the resource plan was disabled; NULL if the row contains the current resource plan information
ENABLED_BY_SCHEDULER	VARCHAR2 (5)	Indicates whether the plan was enabled by a Job Scheduler window (TRUE) or not (FALSE)
WINDOW_NAME	VARCHAR2 (128)	Job Scheduler window that triggered the resource plan event; NULL if a user triggered the resource plan event
ALLOWED_AUTOMATED_SWITCHES	VARCHAR2 (5)	Indicates whether automated plan switches were allowed after this resource plan event (TRUE) or whether automated plan switches were disabled after this resource plan event (FALSE)
See Also: the SWITCH_PLAN procedure		
CPU_MANAGED	VARCHAR2 (3)	Indicates whether the resource plan has parameters that specify a policy for how the Resource Manager should schedule sessions to manage CPU usage (ON) or whether Resource Manager is not managing CPU usage (OFF)
INSTANCE_CAGING	VARCHAR2 (3)	Indicates whether instance caging is enabled (ON) or disabled (OFF). Instance caging is enabled if the CPU_COUNT initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.
PARALLEL_EXECUTION_MANAGER	VARCHAR2 (32)	<p>State of parallel statement queuing:</p> <ul style="list-style-type: none"> • OFF - Parallel statement queuing is disabled • STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes • FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue • FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (MGMT_P*) is enabled. • DISABLED - Parallel statement queuing is disabled. This state can occur when memory is unavailable for use by parallel statement queuing in the System Global Area (SGA). Restart the Oracle instance to re-enable parallel statement queuing. <p>For an Oracle RAC database, only the instance running as master Database Resource Manager (DBRM) shows the correct state of parallel statement queuing. All other instances default to the value FULL. A single instance database always shows the correct value for this field.</p>

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

8.194 V\$RSRC_SESSION_INFO

V\$RSRC_SESSION_INFO displays Resource Manager statistics per session.

Column	Datatype	Description
SID	NUMBER	Session identifier
CURRENT_CONSUMER_GROUP_ID	NUMBER	Object ID of the consumer group in which the session currently belongs; NULL if the session has not yet logged in
CURRENT_CONSUMER_GROUP	VARCHAR2 (32)	The name of the consumer group in which the session currently belongs
ORIG_CONSUMER_GROUP_ID	NUMBER	Object ID of the consumer group in which the session was placed by the consumer group mappings; NULL if the session has not yet logged in
MAPPING_ATTRIBUTE	VARCHAR2 (32)	This group may not be the current group because the SWITCH_GROUP directive in the current plan may have changed the session's current group. This group may not equal the MAPPED_CONSUMER_GROUP because the MAPPED_CONSUMER_GROUP may not be part of the current plan.
MAPPED_CONSUMER_GROUP	VARCHAR2 (32)	Session attribute that was used to map the session into its original consumer group; NULL if no mapping was used
		See Also: " DBA_RSRC_GROUP_MAPPINGS " for more details
		Consumer group to which the session was originally mapped; NULL if no mapping was used
		This may not correspond to the original consumer group, because the mapped group may not be part of the current plan.
		See Also: " DBA_RSRC_GROUP_MAPPINGS " for more details

Column	Datatype	Description
STATE	VARCHAR2 (32)	<p>Current state of the session:</p> <ul style="list-style-type: none"> NOT MANAGED - Session has not logged in or the current Resource Manager plan does not require the session to be managed at this point in time RUNNING - Session is currently running on the CPU WAITING FOR CPU - Session is ready to run. It is waiting for a CPU quantum to run. QUEUED - Session is queued because the active session limit was reached IDLE - Session is idle IDLE BLKR - Session is idle and blocking another session WAITING - Session is currently in a wait <p>See Also: "V\$SESSION_WAIT" for the wait type</p> <ul style="list-style-type: none"> WAITING FOR IO - Session is waiting to submit an I/O request UNBOUND - Session is not bound to any process EXITING - Session is about to terminate
ACTIVE	VARCHAR2 (5)	<p>Indicates whether the session is currently active (TRUE) or not (FALSE). This includes when one of the following conditions is true:</p> <ul style="list-style-type: none"> Session is in the top call Session has a transaction in progress Session is using temporary space objects Session holds user enqueues
CURRENT_IDLE_TIME	NUMBER	<p>Number of seconds the session has been idle (in states IDLE or IDLE BLKR) while in this consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This value is reset to zero when the session becomes active.</p>
CURRENT_CPU_WAIT_TIME	NUMBER	<p>Amount of time (in milliseconds) the session has waited for CPU because of resource management (in state WAIT FOR CPU) while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This does not include waits due to latch or enqueue contention, I/O waits, and so on. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.</p>
CPU_WAIT_TIME	NUMBER	<p>Cumulative amount of time (in milliseconds) the session has waited for CPU (in its lifetime) because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.</p>
CURRENT_CPU_WAITS	NUMBER	<p>Number of times the session had to wait for CPU because of resource management while in this consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This does not include waits due to latch or enqueue contention, I/O waits, and so on. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.</p>
CPU_WAITS	NUMBER	<p>Cumulative number of times the session had to wait for CPU (in its lifetime) because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.</p>
CURRENT_CONSUMED_CPU_TIME	NUMBER	<p>Amount of CPU time (in milliseconds) consumed by the session while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.</p>
CONSUMED_CPU_TIME	NUMBER	<p>Cumulative amount of CPU time consumed by the session (in its lifetime) (in milliseconds)</p>

Column	Datatype	Description
CURRENT_ACTIVE_TIME	NUMBER	Amount of time (in milliseconds) the session has been active while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. Active time is time spent running and waiting while executing a call. It does not include the time a session waited for CPU resources. If SWITCH_TIME_IN_CALL is used, then this is reset at the end of every call.
ACTIVE_TIME	NUMBER	Cumulative amount of active time (in milliseconds) consumed by the session (in its lifetime)
CURRENT_QUEUED_TIME	NUMBER	Amount of time (in milliseconds) the current request from the session has been queued (in state QUEUED). If the session does not have a request currently queued up, then this number will be zero.
QUEUED_TIME	NUMBER	Total amount of time (in milliseconds) the session has spent in the QUEUED state (in its lifetime)
CURRENT_YIELDS	NUMBER	Number of times the session had to yield the CPU to other sessions (due to quantum expiration) while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. If SWITCH_TIME_IN_CALL is used, then this is reset at the end of every call.
YIELDS	NUMBER	Cumulative number of times the session had to yield CPU to other sessions due to quantum expiration (in its lifetime)
CURRENT_UNDO_CONSUMPTION	NUMBER	Current amount (in KB) of undo consumed by the session; NULL if the current Resource Manager plan does not have an UNDO_POOL directive
MAX_UNDO_CONSUMPTION	NUMBER	Maximum amount of undo consumed (in KB) during the session's lifetime. This value may not be updated because the current Resource Manager plan may not have an UNDO_POOL directive.
SQL_CANCELED	NUMBER	Number of times SQL queries running in the session were canceled due to exceeding the Resource Manager plan's SWITCH_TIME limit.
QUEUE_TIME_OUTS	NUMBER	Number of times requests from the session timed out because they queued longer than the Resource Manager plan's limit
ESTIMATED_EXECUTION_LIMIT_HIT	NUMBER	Number of times requests from the session were not run because the optimizer's estimated time to execute the query exceeded the MAX_EST_EXEC_TIME limit
CURRENT_IO_SERVICE_TIME	NUMBER	Current I/O wait time of the session (in milliseconds) for the current SQL operation
IO_SERVICE_TIME	NUMBER	Cumulative amount of I/O wait time by the session (in its lifetime) (in milliseconds)
CURRENT_IO_SERVICE_WAITS	NUMBER	Current I/O waits by session for the current SQL operation
IO_SERVICE_WAITS	NUMBER	Cumulative I/O waits by session (in its lifetime)
CURRENT_SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read by the session for the current SQL operation
SMALL_READ_MEGABYTES	NUMBER	Total number of single block megabytes read by the session (in its lifetime)
CURRENT_LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read by the session for the current SQL operation
LARGE_READ_MEGABYTES	NUMBER	Total number of multiblock megabytes read by the session (in its lifetime)
CURRENT_SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written by the session for the current SQL operation

Column	Datatype	Description
SMALL_WRITE_MEGABYTES	NUMBER	Total number of single block megabytes written by the session (in its lifetime)
CURRENT_LARGE_WRITE_MEGA BYTES	NUMBER	Number of multiblock megabytes written by the session for the current SQL operation
LARGE_WRITE_MEGABYTES	NUMBER	Total number of multiblock megabytes written by the session (in its lifetime)
CURRENT_SMALL_READ_REQUE STS	NUMBER	Number of single block read requests by the session for the current SQL operation
SMALL_READ_REQUESTS	NUMBER	Total number of single block read requests by the session (in its lifetime)
CURRENT_SMALL_WRITE_REQU ESTS	NUMBER	Number of single block write requests by the session for the current SQL operation
SMALL_WRITE_REQUESTS	NUMBER	Total number of single block write requests by the session (in its lifetime)
CURRENT_LARGE_READ_REQUE STS	NUMBER	Number of multiblock read requests by the session for the current SQL operation
LARGE_READ_REQUESTS	NUMBER	Total number of multiblock read requests by the session (in its lifetime)
CURRENT_LARGE_WRITE_REQU ESTS	NUMBER	Number of multiblock write requests by the session for the current SQL operation
LARGE_WRITE_REQUESTS	NUMBER	Total number of multiblock write requests by the session (in its lifetime)
CURRENT_PQ_ACTIVE_TIME	NUMBER	Amount of time that the current active parallel statement has been executing for the current SQL operation, not including the amount of time that the statement has been queued (in milliseconds). If the parallel statement is queued, then the value is 0.
PQ_ACTIVE_TIME	NUMBER	Cumulative amount of time that parallel statements have been executed over the lifetime of the session (in milliseconds)
DOP	NUMBER	Degree of parallelism for the active or queued parallel statement, if there are any in the session
PQ_SERVERS	NUMBER	The number of active parallel servers if the session is active and running the parallel query. If the query is queued, the number of parallel servers that this query is trying to run with is shown.
ESTIMATED_EXECUTION_TIME	NUMBER	Estimated execution time for the parallel statement, as estimated by the optimizer (in milliseconds). You can compare this value to CURRENT_PQ_ACTIVE_TIME to estimate how much longer the parallel statement will run.
CURRENT_PQ_QUEUED_TIME	NUMBER	Amount of time that the current parallel statement in the session has been queued (in milliseconds) for the current SQL operation. If the session does not have a queued parallel statement, then the value is 0.
PQ_QUEUED_TIME	NUMBER	Total amount of time that the session has spent in the PQ_QUEUED state in its lifetime (in milliseconds)
PQ_QUEUED	NUMBER	Number of times that parallel statements in the session have been queued
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements in the session timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
PQ_ACTIVE	VARCHAR2 (5)	Indicates whether the session is actively running a parallel statement (TRUE) or not (FALSE).

Column	Datatype	Description
PQ_STATUS	VARCHAR2 (44)	The status of the parallel statement running in this session: <ul style="list-style-type: none"> • Active: The parallel statement is currently active and running • Queued: The parallel statement is queued and is not a possible candidate to be run next • Queue head: The parallel statement is queued due to the global systemwide limit and is the next parallel statement to be dequeued and run • Queue head - waiting on CG limit: The parallel statement is queued due to the consumer group limit and is the one to be run next from the session's consumer group • Queue head - waiting on service availability: The parallel statement is queued since there are not enough parallel servers available for the service this session is running on. This session is the one to be run next from the session's service • Queue head - waiting on PDB limit: The parallel statement is queued due to the PDB limit and is the one to be run next from the session's PDB • NULL: The session currently does not involve a parallel execution
CURRENT_LOGICAL_IOS	NUMBER	Number of logical I/O requests by the session for the current SQL operation
LOGICAL_IOS	NUMBER	Total number of logical I/O requests in this session's lifetime
CURRENT_ELAPSED_TIME	NUMBER	Elapsed time of the session's current SQL operation
ELAPSED_TIME	NUMBER	Total elapsed time for all of this session's SQL operations in its lifetime
LAST_ACTION	VARCHAR2 (48)	The most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none"> • CANCEL_SQL • KILL_SESSION • LOG_ONLY • SWITCH TO <CG NAME> For the last value, <CG NAME> is the name of the consumer group that the SQL operation was switched to. If the Resource Plan has since been changed then <CG NAME> is the ID of the consumer group.
LAST_ACTION_REASON	VARCHAR2 (30)	The reason for the most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none"> • SWITCH_CPU_TIME • SWITCH_IO_REQS • SWITCH_IO_MBS • SWITCH_ELAPSED_TIME • SWITCH_IO_LOGICAL
LAST_ACTION_TIME	DATE	The time of the most recent action that was taken on this SQL operation by Resource Manager
CURRENT_PGA	NUMBER	Amount of PGA memory (in bytes) used by the session for the current SQL operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.195 V\$RSRCMGRMETRIC

V\$RSRCMGRMETRIC displays information about resources consumed and wait times per consumer group.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources. Metrics are collected and stored every minute when CPU utilization is not being monitored.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.
CONSUMER_GROUP_ID	NUMBER	Consumer group object ID (a unique number, consistent across database shutdowns and startups)
CONSUMER_GROUP_NAME	VARCHAR2 (30)	Name of the consumer group
CPU_CONSUMED_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group, in milliseconds
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
NUM_CPUS	NUMBER	Number of CPUs that the Resource Manager is utilizing. If instance caging is enabled, then this column is equal to the value of the CPU_COUNT initialization parameter. If instance caging is not enabled, then this column is equal to the total number of CPUs in the system.
RUNNING_SESSIONS_LIMIT	NUMBER	Maximum number of sessions in the consumer group that can run simultaneously. The value of this column is NUM_CPUS multiplied by the consumer group's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.
AVG_RUNNING_SESSIONS	NUMBER	Average number of sessions in the consumer group that are currently running
AVG_WAITING_SESSIONS	NUMBER	Average number of sessions in the consumer group that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.
CPU_UTILIZATION_LIMIT	NUMBER	Maximum percentage of CPU that the consumer group can use at any time, with respect to the total number of CPUs in the system. The value of this column is RUNNING_SESSIONS_LIMIT divided by the number of CPUs in the system. If instance caging is enabled, then this value is derived using the CPU_COUNT initialization parameter.
AVG_CPU_UTILIZATION	NUMBER	Average percentage of CPU consumed by the consumer group, with respect to the total number of CPUs in the system
CPU_DECISIONS	NUMBER	Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.

Column	Datatype	Description
CPU_DECISIONS_EXCLUSIVE	NUMBER	Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.
CPU_DECISIONS_WON	NUMBER	Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.
IO_REQUESTS	NUMBER	I/O requests
IO_MEGABYTES	NUMBER	I/O megabytes
AVG_ACTIVE_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were running during the 1-minute metric window
AVG_QUEUED_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were queued during the 1-minute metric window
AVG_ACTIVE_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window
AVG_QUEUED_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window
PARALLEL_SERVERS_LIMIT	NUMBER	The number of parallel servers allowed to be used by this consumer group during the 1-minute metric window
PLAN_NAME	VARCHAR2 (30)	Resource Manager plan name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["STATISTICS_LEVEL"](#)

8.196 V\$RSRCMGRMETRIC_HISTORY

V\$RSRCMGRMETRIC_HISTORY displays a history (the last one hour) of resource manager metrics, taken from V\$RSRCMGRMETRIC. When a resource plan is set, this history is cleared and restarted. This view provides information about resources consumed and wait times per consumer group. The columns for V\$RSRCMGRMETRIC_HISTORY are the same as those for V\$RSRCMGRMETRIC.

 See Also:["V\\$RSRCMGRMETRIC"](#)

8.197 V\$RSRCPDBMETRIC

V\$RSRCPDBMETRIC displays information about resources consumed and wait times per PDB.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources. Metrics are collected and stored every minute when CPU utilization is not being monitored.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these PDB statistics apply. When the instance is restarted, this value is reset to zero.
CPU_CONSUMED_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the PDB, in milliseconds
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
NUM_CPUS	NUMBER	Number of CPUs that the Resource Manager is utilizing. If instance caging is enabled, then this column is equal to the value of the CPU_COUNT initialization parameter. If instance caging is not enabled, then this column is equal to the total number of CPUs in the system.
RUNNING_SESSIONS_LIMIT	NUMBER	Maximum number of sessions in the PDB that can run simultaneously. The value of this column is NUM_CPUS multiplied by the PDB's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.
AVG_RUNNING_SESSIONS	NUMBER	Average number of sessions in the PDB that are currently running
AVG_WAITING_SESSIONS	NUMBER	Average number of sessions in the PDB that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.
CPU_UTILIZATION_LIMIT	NUMBER	Maximum percentage of CPU that the PDB can use at any time, with respect to the total number of CPUs in the system. The value of this column is RUNNING_SESSIONS_LIMIT divided by the number of CPUs in the system. If instance caging is enabled, then this value is derived using the CPU_COUNT initialization parameter.
AVG_CPU_UTILIZATION	NUMBER	Average percentage of CPU consumed by the PDB, with respect to the total number of CPUs in the system
IOPS	NUMBER	I/O operations per second during the previous minute for this PDB
IOMBPS	NUMBER	I/O megabytes per second during the previous minute for this PDB
IOPS_THROTTLE_EXEMPT	NUMBER	Indicates how much of the I/O per second in the current PDB was exempted from throttling. For example, if the value in the IOPS column is 20 I/Os and the value in the IOPS_THROTTLE_EXEMPT column is 5 I/Os, then 5 I/Os of the 20 I/Os in that second were exempted from throttling.
		I/O throttling is defined by the MAX_IOPS database initialization parameter.

Column	Datatype	Description
IOMBPS_THROTTLE_EXEMPT	NUMBER	Indicates how many megabytes of I/O executed per second in the current PDB were exempted from throttling. For example, if the value in the IOMBPS column is 200 megabytes and the value in the IOMBPS_THROTTLE_EXEMPT column is 50 megabytes, then 50 megabytes of the 200 megabytes were exempt from throttling. I/O megabytes per second throttling is defined by the MAX_MBPS database initialization parameter.
AVG_IO_THROTTLE	NUMBER	Average throttle time per I/O operation in milliseconds during the previous minute for this PDB
AVG_ACTIVE_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were running during the 1-minute metric window
AVG_QUEUED_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were queued during the 1-minute metric window
AVG_ACTIVE_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window
AVG_QUEUED_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window
PARALLEL_SERVERS_LIMIT	NUMBER	The number of parallel servers allowed to be used by this PDB during the 1-minute metric window
SGA_BYTES	NUMBER	The current SGA usage by this PDB in bytes
BUFFER_CACHE_BYTES	NUMBER	The current usage of the buffer cache by this PDB in bytes
SHARED_POOL_BYTES	NUMBER	The current usage of the shared pool by this PDB in bytes
PGA_BYTES	NUMBER	The current PGA usage by this PDB in bytes
PLAN_NAME	VARCHAR2(30)	Resource Manager plan name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

["STATISTICS_LEVEL"](#)

8.198 V\$RSRCPDBMETRIC_HISTORY

V\$RSRCPDBMETRIC_HISTORY displays a history (the last one hour) of resource manager metrics for a PDB, taken from V\$RSRCPDBMETRIC. When a resource plan is set, this history is cleared and restarted. This view provides information about resources consumed and wait times per consumer group.

The columns for V\$RSRCPDBMETRIC_HISTORY are the same as those for V\$RSRCPDBMETRIC.

 **See Also:**["V\\$RSRCPDBMETRIC"](#)

8.199 V\$RULE

V\$RULE displays rule statistics. This view has a row for every rule loaded into shared memory.

Column	Datatype	Description
RULE_SET_OBJECT_ID	NUMBER	Rule set object ID
EVALUATION_CONTEXT_OBJECT_ID	NUMBER	Evaluation context object ID
RULE_OWNER	VARCHAR2 (128)	Owner of the rule
RULE_NAME	VARCHAR2 (128)	Name of the rule
RULE_CONDITION	VARCHAR2 (200)	Rule condition
TRUE_HITS	NUMBER	Number of times the rule evaluated to TRUE
MAYBE_HITS	NUMBER	Number of times the rule evaluated to MAYBE
SQL_EVALUATIONS	NUMBER	Number of evaluations of the rule that were performed by issuing SQL
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

8.200 V\$RULE_SET

V\$RULE_SET displays rule set statistics. This view has a row for every rule set loaded into shared memory.

 **Note:**

Querying the V\$RULE_SET view may have a negative impact on performance if a database has a large library cache.

Column	Datatype	Description
OWNER	VARCHAR2 (128)	Owner of the rule set
NAME	VARCHAR2 (128)	Name of the rule set
CPU_TIME	NUMBER	Total CPU time (in hundredths of a second) spent in evaluation of the rule set

Column	Datatype	Description
ELAPSED_TIME	NUMBER	Total elapsed time (in hundredths of a second) spent in evaluation of the rule set
FIRST_LOAD_TIME	DATE	First time the current cached copy of the rule set was loaded
LAST_LOAD_TIME	DATE	Last time the current cached copy of the rule set was loaded
LAST_LOADING_TIME	NUMBER	Total elapsed time (in hundredths of a second) spent to load the rule set the last time it was loaded
SHARABLE_MEM	NUMBER	Shared memory (in bytes) used by the rule set
RELOADS	NUMBER	Number of times the rule set object was reloaded in shared memory
INVALIDATIONS	NUMBER	Number of times the rule set object was invalidated
EVALUATIONS	NUMBER	Number of evaluations on the rule set
FIRST_HIT_EVALUATIONS	NUMBER	Number of evaluations on the rule set, with <code>stop_on_first_hit</code> set to TRUE
SIMPLE_RULES_ONLY_EVALUATIONS	NUMBER	Number of evaluations on the rule set, with <code>simple_rules_only</code> set to TRUE
SQL_FREE_EVALUATIONS	NUMBER	Number of evaluations on the rule set which did not internally issue SQL to evaluate rules
SQL_EXECUTIONS	NUMBER	Total number of SQL statements executed during evaluation of the rule set
CONDITIONS_PROCESSED	NUMBER	Total number of fast (indexed) conditions processed during evaluation of the rule set
TRUE_RULES	NUMBER	Total number of TRUE rules returned during evaluation of the rule set
MAYBE_RULES	NUMBER	Total number of MAYBE rules returned during evaluation of the rule set
VARIABLE_VALUE_FUNCTION_CALLS	NUMBER	Total number of calls made to user-defined functions to retrieve variable values (specified by the <code>variable_value_function</code> field in RE\$VARIABLE_TYPE) made during evaluation of the rule set
VARIABLE_METHOD_FUNCTION_CALLS	NUMBER	Total number of calls made to user-defined functions to retrieve variable method values (specified by the <code>variable_method_function</code> field in RE\$VARIABLE_TYPE) made during evaluation of the rule set
EVALUATION_FUNCTION_CALLS	NUMBER	Total number of calls made to user-defined evaluation functions (specified as the <code>evaluation_function</code> argument to the DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT procedure) made during evaluation of the rule set
RESULT_CACHE_HITS	NUMBER	Number of result cache hits across all the sessions evaluating this rule set
IS_RESULT_CACHE	VARCHAR2(3)	Indicates whether this rule set result can be cached (YES) or not (NO)
RESULT_CACHE_ELEMENTS	NUMBER	Number of elements cached within the result cache
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT procedure

8.201 V\$RULE_SET_AGGREGATE_STATS

V\$RULE_SET_AGGREGATE_STATS displays statistics aggregated over all evaluations on all rule sets. This view has a row for each type of statistic.

Column	Datatype	Description
NAME	VARCHAR2(80)	<p>Name of the statistic:</p> <ul style="list-style-type: none"> • rule set evaluations (all) - Total number of evaluations on all rule sets • rule set evaluations (first_hit) - Total number of evaluations on rule sets with stop_on_first_hit set to TRUE • rule set evaluations (simple_rules_only) - Total number of evaluations on rule sets with simple_rules_only set to TRUE • rule set evaluations (SQL free) - Total number of evaluations on rule sets which did not internally issue SQL to evaluate rules • rule set evaluation time (CPU) - Total CPU time (in hundredths of a second) spent in evaluations on rule sets • rule set evaluation time (elapsed) - Total elapsed time (in hundredths of a second) spent in evaluations on rule sets • rule set SQL executions - Total number of SQL statements executed during evaluations on rule sets • rule set conditions processed - Total number of fast (indexed) conditions processed during evaluations on rule sets • rule set true rules - Total number of TRUE rules returned during evaluations on rule sets • rule set maybe rules - Total number of MAYBE rules returned during evaluations on rule sets • rule set user function calls (variable value function) - Total number of calls made to user-defined functions to retrieve variable values (specified by the variable_value_function field in RE\$VARIABLE_TYPE) made during evaluations on rule sets • rule set user function calls (variable method function) - Total number of calls made to user-defined functions to retrieve variable method values (specified by the variable_method_function field in RE\$VARIABLE_TYPE) made during evaluations on rule sets • rule set user function calls (evaluation function) - Total number of calls made to user-defined evaluation functions (specified as the evaluation_function argument to the DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT procedure) made during evaluations on rule sets
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

 **See Also:**

Oracle Database PL/SQL Packages and Types Reference for more information about the `DBMS_RULE_ADMIN.CREATE_EVALUATION_CONTEXT` procedure

Dynamic Performance (V\$) Views: V\$SCHEDULER_RUNNING_JOBS to V\$ZONEMAP_USAGE_STATS

This chapter contains the dynamic performance views V\$SCHEDULER_RUNNING_JOBS to V\$ZONEMAP_USAGE_STATS.

9.1 V\$SCHEDULER_RUNNING_JOBS

V\$SCHEDULER_RUNNING_JOBS displays information about running Scheduler jobs.

Column	Datatype	Description
SESSION_ID	NUMBER	Identifier of the session running the Scheduler job
SESSION_SERIAL_NUM	NUMBER	Session serial number
JOB_ID	NUMBER	ID of the running Scheduler job
PADDR	RAW(4 8)	Process address
OS_PROCESS_ID	VARCHAR2(12)	Operating system process ID
SESSION_STAT_CPU	INTERVAL DAY(2) TO SECOND(3)	CPU statistics for the session
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.2 V\$SECUREFILE_TIMER

V\$SECUREFILE_TIMER displays information about time taken (in microseconds) by functions of SecureFiles. These timer values are collected per session.

Column	Datatype	Description
NAME	VARCHAR2(50)	Name of the function

Column	Datatype	Description
LAYER_ID	NUMBER	ID of the layer that the function belongs to: <ul style="list-style-type: none"> • 0 - Entire Subtree • 1 - Delta Updates • 2 - Write gather cache • 3 - Deduplication • 4 - Compression & Encryption • 5 - Inode • 6 - Space • 7 - Utilities • 8 - Row-Column Intersection
OWNTIME	NUMBER	Total time taken by the function
MAXTIME	NUMBER	Maximum time taken by a single call
MINTIME	NUMBER	Minimum time taken by a single call
INVOCATIONS	NUMBER	Number of times the function was invoked
LAYER_NAME	VARCHAR2 (50)	Name of the layer to which the function belongs
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.3 V\$SEGMENT_STATISTICS

V\$SEGMENT_STATISTICS displays information about segment-level statistics.

Column	Datatype	Description
OWNER	VARCHAR2 (128)	Owner of the object
OBJECT_NAME	VARCHAR2 (128)	Name of the object
SUBOBJECT_NAME	VARCHAR2 (128)	Name of the subobject
TABLESPACE_NAME	VARCHAR2 (30)	Name of the table space to which the object belongs
TS#	NUMBER	Tablespace number
OBJ#	NUMBER	Dictionary object number of the object
DATAOBJ#	NUMBER	Data object number of the object
OBJECT_TYPE	VARCHAR2 (18)	Type of the object
STATISTIC_NAME	VARCHAR2 (64)	Name of the statistic
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Statistic value

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.4 V\$SEGSTAT

V\$SEGSTAT displays information about segment-level statistics.

Column	Datatype	Description
TS#	NUMBER	Tablespace number
OBJ#	NUMBER	Dictionary object number
DATAOBJ#	NUMBER	Data object number
STATISTIC_NAME	VARCHAR2 (64)	Name of the statistic
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.5 V\$SEGSTAT_NAME

V\$SEGSTAT_NAME displays information about segment-level statistics properties.

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number
NAME	VARCHAR2 (64)	Name of the statistic
SAMPLED	VARCHAR2 (3)	Indicates whether the statistic was collected by sampling (YES) or not (NO)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.6 V\$SERV_MOD_ACT_STATS

V\$SERV_MOD_ACT_STATS displays the same set of performance statistics as V\$SERVICE_STATS except for a specific combination of service/module/action names.

When aggregation is enabled for the service name, module, and action name, then this view provides the timing and work done for calls issued for the business transaction.

Column	Datatype	Description
AGGREGATION_TYPE	VARCHAR2 (21)	Aggregation statistic type: <ul style="list-style-type: none"> SERVICE_MODULE - Action value is NULL and the entry is an aggregate for all actions within a given module SERVICE_MODULE_ACTION - Action value is NULL only for an empty action, and the aggregation is on the level of service/module/action
SERVICE_NAME	VARCHAR2 (64)	Service name from V\$SERVICES
MODULE	VARCHAR2 (65)	Module name from DBA_ENABLED_AGGREGATIONS
ACTION	VARCHAR2 (65)	Action name from DBA_ENABLED_AGGREGATIONS
STAT_ID	NUMBER	Statistic identifier
STAT_NAME	VARCHAR2 (64)	Derived statistic name from V\$STATNAME and V\$SESS_TIME_MODEL
VALUE	NUMBER	Cumulative value (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root n: Where n is the applicable container ID for the rows containing data

See Also:

- "V\$SERVICE_STATS"
- "V\$STATNAME"
- "V\$SESS_TIME_MODEL"

9.7 V\$SERVICE_EVENT

V\$SERVICE_EVENT displays aggregated wait counts and wait times for each wait statistic.

Column	Datatype	Description
SERVICE_NAME	VARCHAR2 (64)	Service name from V\$SERVICES
SERVICE_NAME_HASH	NUMBER	Service name hash from V\$SERVICES
EVENT	VARCHAR2 (64)	Name of the wait event; derived statistic name from V\$EVENT_NAME See Also: " Oracle Wait Events"

Column	Datatype	Description
EVENT_ID	NUMBER	Identifier of the wait event
TOTAL_WAITS	NUMBER	Total number of waits for the event by the service
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event by the service
TIME_WAITED	NUMBER	Total amount of time waited for the event by the service (in hundredths of a second)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event by the service (in hundredths of a second)
MAX_WAIT	NUMBER	Maximum amount of time waited for the event by the service (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time waited for the event by the service (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.8 V\$SERVICE_REGION_METRIC

V\$SERVICE_REGION_METRIC displays the metric values captured for the most recent 30-second intervals for the workload against each service region available on the database.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SERVICE_ID	NUMBER	Service number (internal)
SERVICE_NETWORK_NAME	VARCHAR2 (512)	Network name for the service
REGION_NAME	VARCHAR2 (30)	Region name
CALLSPERSEC	NUMBER	Number of user calls per second to the services
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

- "[V\\$CHUNK_METRIC](#)"

9.9 V\$SERVICE_STATS

V\$SERVICE_STATS displays a minimal set of performance statistics. These call rate statistics are used for making run-time routing decisions, for tracking service levels, and for per-instance diagnostics per call rate. The elapsed timing for each call provides a relative value across instances for how well a node is processing SQL calls issued under a service name. When aggregation is enabled for the Service Name, then this view provides the timing and work done for calls issued for the whole service.

Column	Datatype	Description
SERVICE_NAME_HASH	NUMBER	Service name hash from V\$SERVICES
SERVICE_NAME	VARCHAR2 (64)	Service name from V\$SERVICES
STAT_ID	NUMBER	Statistic identifier
STAT_NAME	VARCHAR2 (64)	Derived statistic name from V\$STATNAME and V\$SESS_TIME_MODEL
VALUE	NUMBER	For statistics that measure time (such as the DB CPU, background elapsed time, or parse time elapsed statistics), this column displays a cumulative value in microseconds. For other statistics that do not measure time (such as the db block changes, execute count, or logons cumulative statistics), this column displays the appropriate numeric value for the statistic.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$SERVICES](#)"
- "[V\\$STATNAME](#)"
- "[V\\$SESS_TIME_MODEL](#)"
- *Oracle Database Performance Tuning Guide* for more information about using database statistics to manage the performance of Oracle Database

9.10 V\$SERVICE_WAIT_CLASS

V\$SERVICE_WAIT_CLASS displays aggregated wait counts and wait times for each wait statistic. An aggregation of these wait classes is used when thresholds are imported.

Column	Datatype	Description
SERVICE_NAME	VARCHAR2(64)	Service name from V\$SERVICES
SERVICE_NAME_HASH	NUMBER	Service name hash from V\$SERVICES
WAIT_CLASS_ID	NUMBER	Identifier of the wait class
WAIT_CLASS#	NUMBER	Number of the wait class
WAIT_CLASS	VARCHAR2(64)	Name of the wait class
TOTAL_WAITS	NUMBER	Total number waits from this wait class by the service
TIME_WAITED	NUMBER	Total amount of time spent in waits from this wait class by the service (in hundredths of a second)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.11 V\$SERVICEMETRIC

V\$SERVICEMETRIC displays metric values measured on the most recent time interval period for services executing inside the database. Service metrics are measured in 5-second and 1-minute intervals.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin timestamp for the interval period
END_TIME	DATE	End timestamp for the interval period
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Group ID for the service metric group
SERVICE_NAME_HASH	NUMBER	Service name hash
SERVICE_NAME	VARCHAR2(64)	Service name
CTMHASH	NUMBER	Service create timestamp hash value
ELAPSEDPERCALL	NUMBER	Elapsed time per call (in microseconds). This column is deprecated in favor of the DBTIMEPERCALL column.
CPUPERCALL	NUMBER	CPU time per call (in microseconds)
DBTIMEPERCALL	NUMBER	Elapsed time per call (in microseconds)
CALLSPERSEC	NUMBER	Number of user calls per second
DBTIMEPERSEC	NUMBER	Database time per second
GOODNESS	NUMBER	Indicates how attractive a given instance is with respect to processing the workload that is presented to the service. A lower number is better. This number is internally computed based on the GOAL (LONG or SHORT) that is specified for the particular service.
DELTA	NUMBER	Indicates the predicted increase in the goodness for every additional session that is routed to this instance

Column	Datatype	Description
FLAGS	NUMBER	Flags that can be any of the following values: <ul style="list-style-type: none">• 0x01 - Service is BLOCKED from accepting new connections• 0x02 - Service is VIOLATING the set threshold on some metric• 0x04 - Goodness is UNKNOWN
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.12 V\$SERVICEMETRIC_HISTORY

V\$SERVICEMETRIC_HISTORY displays a recent history of the metric values measured in predefined time interval periods for services executing inside the database. Service metrics are measured in 5-second and 1-minute intervals.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin timestamp for the interval period
END_TIME	DATE	End timestamp for the interval period
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Group ID for the service metric group
SERVICE_NAME_HASH	NUMBER	Service name hash
SERVICE_NAME	VARCHAR2 (64)	Service name
CTMHASH	NUMBER	Service create timestamp hash value
ELAPSEDPERCALL	NUMBER	Elapsed time per call (in microseconds). This column is deprecated in favor of the DBTIMEPERCALL column.
CPUPERCALL	NUMBER	CPU time per call (in microseconds)
DBTIMEPERCALL	NUMBER	Elapsed time per call (in microseconds)
CALLSPERSEC	NUMBER	Number of user calls per second
DBTIMEPERSEC	NUMBER	Database time per second
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.13 V\$SERVICES

V\$SERVICES displays information about the services in the database.

Column	Datatype	Description
SERVICE_ID	NUMBER	Service ID
NAME	VARCHAR2(64)	Name of the service
NAME_HASH	NUMBER	Service name hash
NETWORK_NAME	VARCHAR2(512)	Network name
CREATION_DATE	DATE	Creation date
CREATION_DATE_HASH	NUMBER	Creation date hash
GOAL	VARCHAR2(12)	Runtime Load Balancing Goal being used to create run-time load balancing and connection load balancing advice: <ul style="list-style-type: none"> • NONE • SERVICE_TIME - Connections are balanced by response time • THROUGHPUT - Connections are balanced by throughput
DTP	VARCHAR2(1)	Indicates whether or not Distributed Transaction Processing is enabled for this service. When Distributed Transaction Processing is set to YES (YES), it means that the service is offered at exactly one instance at a time for XA affinity. Possible values: <ul style="list-style-type: none"> • Y - YES • N - NO
AQ_HA_NOTIFICATION	VARCHAR2(3)	Indicates whether FAN - Fast Application Notification for OCI connections is set (YES) or not (NO)
CLB_GOAL	VARCHAR2(5)	Connection load balancing goal used with statistics that are sent to the listeners to determine how new connections are distributed: <ul style="list-style-type: none"> • LONG - is using session count • SHORT - is using service time or throughput
COMMIT_OUTCOME	VARCHAR2(3)	For Transaction Guard, indicates whether the database service associated with the user session has the COMMIT_OUTCOME service attribute enabled (YES) or not (NO). This attribute applies on a per session basis and is set at connect time. When COMMIT_OUTCOME = YES: <ul style="list-style-type: none"> • Transaction Guard manages the commit status for all supported transaction types. The outcome of a COMMIT transaction is known. If there is an outage, the application can use DBMS_APP_CONT.GET_LTXID_OUTCOME to return a reliable status for the last in-flight work. • A logical transaction ID (LTXID) is set for each user session at login and at each successful commit. See Also: For information about preserving the commit outcome, see <i>Oracle Database Development Guide</i> . For information about logical transaction IDs, see <i>Oracle Database Development Guide</i>
RETENTION_TIME	NUMBER	For Transaction Guard, when COMMIT_OUTCOME = YES, this value indicates the amount of time (in seconds) that the commit outcome is retained in the database.
REPLAY_INITIATION_TIMEOUT	NUMBER	For Application Continuity, this option specifies the difference between the time (in seconds) of original execution of the first operation of a request and the time that the replay is ready to start after a successful reconnect. Application Continuity will not replay after the specified amount of time has passed. This option is intended to avoid the unintentional execution of a request when a system is recovered after a long period of time. The default is 5 minutes (300 seconds).

Column	Datatype	Description
SESSION_STATE_CONSISTENC Y	VARCHAR2(128)	Describes how non-transactional is changed during a request. This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If non-transactional values change after the request starts, the default value of <code>DYNAMIC</code> should be set. Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode.
GLOBAL	VARCHAR2(3)	Indicates whether the service is global. A global service is managed by Global Service Manager (GSM) and can be provided by multiple databases that contain replicated data. Possible values: <ul style="list-style-type: none"> YES: Indicates the service is global NO: Indicates the service is not global
PDB	VARCHAR2(128)	Name of a pluggable database (PDB) associated with a given service. Will contain <code>NULL</code> if a database is a non-CDB or if the service is not associated with a PDB (that is, connecting to a CDB using this service will cause a user to connect to the root.)
SQL_TRANSLATION_PROFILE	VARCHAR2(261)	A non-NULL value specifies the initial SQL translation profile for subsequent database connections that use the service and do not specify a SQL translation profile. A NULL value has no effect.
MAX_LAG_TIME	VARCHAR2(128)	The maximum replication lag (in seconds) that is acceptable for a data replica to be used for providing the database service. Can only be specified for global services.
STOP_OPTION	VARCHAR2(128)	Stop option for sessions of this service for planned maintenance
FAILOVER_RESTORE	VARCHAR2(128)	Indicates whether sessions recover their commonly used session state (like NLS, schema) when they are failed over with TAF
DRAIN_TIMEOUT	NUMBER	Number of seconds to wait for sessions to be drained
TABLE_FAMILY_ID ¹	NUMBER	Sharded table family ID associated with the service
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

¹ This column is available starting with Oracle Database 19c.

9.14 V\$SES_OPTIMIZER_ENV

V\$SES_OPTIMIZER_ENV displays the contents of the optimizer environment used by each session. When a new session is first created, it automatically inherits its optimizer environment from the optimizer environment defined at the instance level by V\$SYS_OPTIMIZER_ENV. The value of certain parameters can be dynamically modified by issuing an `ALTER SESSION` statement.

Column	Datatype	Description
SID	NUMBER	Session identifier. This column can be used to join with V\$SESSION on the SID column.

Column	Datatype	Description
ID	NUMBER	Unique identifier of the parameter in the optimizer environment
NAME	VARCHAR2 (40)	Name of the parameter
SQL_FEATURE	VARCHAR2 (64)	Associated feature control ID
ISDEFAULT	VARCHAR2 (3)	Indicates whether the parameter is set to the default value (YES) or not (NO)
VALUE	VARCHAR2 (25)	Value of the parameter for the session
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$SYS_OPTIMIZER_ENV"](#)

9.15 V\$SESS_IO

V\$SESS_IO displays I/O statistics for each user session.

Column	Datatype	Description
SID	NUMBER	Session identifier
BLOCK_GETS	NUMBER	Block gets for this session
CONSISTENT_GETS	NUMBER	Consistent gets for this session
PHYSICAL_READS	NUMBER	Physical reads for this session
BLOCK_CHANGES	NUMBER	Block changes for this session
CONSISTENT_CHANGES	NUMBER	Consistent changes for this session
OPTIMIZED_PHYSICAL_READS	NUMBER	Number of physical reads from Database Smart Flash Cache for this session
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.16 V\$SESS_TIME_MODEL

V\$SESS_TIME_MODEL displays the session-accumulated time for various operations. The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.

The time values are 8-byte integers and can therefore hold approximately 580,000 years of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

Column	Datatype	Description
SID	NUMBER	Session ID (same as in V\$SESSION)
STAT_ID	NUMBER	Statistic identifier for the time statistic
STAT_NAME	VARCHAR2 (64)	Name of the statistic (see Table 9-1)
VALUE	NUMBER	Amount of time (in microseconds) that the session has spent in this operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

Table 9-1 V\$SESS_TIME_MODEL and V\$SYS_TIME_MODEL Statistics

Statistic Name	Description
DB time	Amount of elapsed time (in microseconds) spent performing Database user-level calls. This does not include the elapsed time spent on instance background processes such as PMON.
DB CPU	Amount of CPU time (in microseconds) spent on database user-level calls. This does not include the CPU time spent on instance background processes such as PMON.
background elapsed time	Amount of elapsed time (in microseconds) consumed by database background processes.
background CPU time	Amount of CPU time (in microseconds) consumed by database background processes.
sequence load elapsed time	Amount of elapsed time spent getting the next sequence number from the data dictionary. If a sequence is cached, then this is the amount of time spent replenishing the cache when it runs out. No time is charged when a sequence number is found in the cache. For non-cached sequences, some time will be charged for every nextval call.
parse time elapsed	Amount of elapsed time spent parsing SQL statements. It includes both soft and hard parse time.
hard parse elapsed time	Amount of elapsed time spent hard parsing SQL statements.
SQL execute elapsed time	Amount of elapsed time SQL statements are executing. Note that for select statements this also includes the amount of time spent performing fetches of query results.

Table 9-1 (Cont.) V\$SESS_TIME_MODEL and V\$SYS_TIME_MODEL Statistics

Statistic Name	Description
connection management call elapsed time	Amount of elapsed time spent performing session connect and disconnect calls.
failed parse elapsed time	Amount of time spent performing SQL parses which ultimately fail with some parse error.
failed parse (out of shared memory) elapsed time	Amount of time spent performing SQL parses which ultimately fail with error ORA-04031.
hard parse (sharing criteria) elapsed time	Amount of elapsed time spent performing SQL hard parses when the hard parse resulted from not being able to share an existing cursor in the SQL cache.
hard parse (bind mismatch) elapsed time	Amount of elapsed time spent performing SQL hard parses when the hard parse resulted from bind type or bind size mismatch with an existing cursor in the SQL cache.
PL/SQL execution elapsed time	Amount of elapsed time spent running the PL/SQL interpreter. This does not include time spent recursively executing/parsing SQL statements or time spent recursively executing the Java VM.
PL/SQL compilation elapsed time	Amount of elapsed time spent running the PL/SQL compiler.
inbound PL/SQL rpc elapsed time	Time inbound PL/SQL remote procedure calls have spent executing. It includes all time spent recursively executing SQL and JAVA, and therefore is not easily related to "PL/SQL execution elapsed time".
Java execution elapsed time	Amount of elapsed time spent running the Java VM. This does not include time spent recursively executing/parsing SQL statements or time spent recursively executing PL/SQL.
RMAN cpu time (backup/restore)	Amount of CPU time (in microseconds) spent in RMAN backup and restore operations.
repeated bind elapsed time	Amount of elapsed time spent giving new values to bind variables (rebinding).
OLAP engine elapsed time	Amount of time spent performing OLAP session transactions. This includes time spent on database user-level calls, SQL statement execution, and PL/SQL execution within the OLAP transaction.
OLAP engine CPU time	Amount of CPU time spent on OLAP session transactions. This includes time spent on database user-level calls, SQL statement execution, and PL/SQL execution within the OLAP transaction.

The relationships between the statistics listed in [Table 9-1](#) form two trees in which all the time reported by a child in the tree is contained within the parent in the tree. The following are the relationship trees; the number is the level in the given tree.

- 1) background elapsed time
- 2) background cpu time
- 3) RMAN cpu time (backup/restore)
- 1) DB time
 - 2) DB CPU
 - 2) connection management call elapsed time
 - 2) sequence load elapsed time
 - 2) sql execute elapsed time
 - 2) parse time elapsed
 - 3) hard parse elapsed time
 - 4) hard parse (sharing criteria) elapsed time
 - 5) hard parse (bind mismatch) elapsed time
 - 3) failed parse elapsed time
 - 4) failed parse (out of shared memory) elapsed time
 - 2) PL/SQL execution elapsed time
 - 2) inbound PL/SQL rpc elapsed time

- 2) PL/SQL compilation elapsed time
- 2) Java execution elapsed time
- 2) repeated bind elapsed time

The relationship between a parent and a child in the tree indicates containment only. Keep the following in mind regarding the tree:

- Children do not necessarily add up to the parent.
- Children are not necessarily exclusive (that is, they may overlap).
- The union of children does not necessarily cover the whole of the parent.

 **See Also:**

["V\\$SYS_TIME_MODEL"](#)

9.17 V\$SESSION

V\$SESSION displays session information for each current session.

Column	Datatype	Description
SADDR	RAW(4 8)	Session address
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number. Used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID.
AUDSID	NUMBER	Auditing session ID <ul style="list-style-type: none"> • If the database is configured for unified auditing, then this column displays the unified auditing session ID • If the database is configured for mixed mode auditing, then this column displays the traditional auditing session ID
PADDR	RAW(4 8)	Address of the process that owns the session
USER#	NUMBER	Oracle user identifier
USERNAME	VARCHAR2(128)	Oracle username
COMMAND	NUMBER	Command in progress (last statement parsed). You can find the command name for any value <i>n</i> returned in this COMMAND column by running this SQL query: <pre>SELECT command_name FROM v\$sqlcommand WHERE command_type = n;</pre> A value of 0 in this COMMAND column means the command is not recorded in V\$SESSION.
OWNERID	NUMBER	Identifier of the user who owns the migratable session; the column contents are invalid if the value is 2147483644 For operations using Parallel Slaves, interpret this value as a 4-byte value. The low-order 2 bytes represent the session number and the high-order bytes represent the instance ID of the query coordinator.
TADDR	VARCHAR2(16)	Address of the transaction state object

Column	Datatype	Description
LOCKWAIT	VARCHAR2(16)	Address of the lock the session is waiting for; NULL if none
STATUS	VARCHAR2(8)	Status of the session: <ul style="list-style-type: none"> • ACTIVE - Session currently executing SQL • INACTIVE - Session which is inactive and either has no configured limits or has not yet exceeded the configured limits • KILLED - Session marked to be killed • CACHED - Session temporarily cached for use by Oracle*XA • SNIPED - An inactive session that has exceeded some configured limits (for example, resource limits specified for the resource manager consumer group or idle_time specified in the user's profile). Such sessions will not be allowed to become active again.
SERVER	VARCHAR2(9)	Server type: <ul style="list-style-type: none"> • DEDICATED • SHARED • PSEUDO • POOLED • NONE
SCHEMA#	NUMBER	Schema user identifier
SCHEMENAME	VARCHAR2(128)	Schema user name
OSUSER	VARCHAR2(128)	Operating system client user name
PROCESS	VARCHAR2(24)	Operating system client process ID
MACHINE	VARCHAR2(64)	Operating system machine name
PORT	NUMBER	Client port number
TERMINAL	VARCHAR2(30)	Operating system terminal name
PROGRAM	VARCHAR2(48)	Operating system program name
TYPE	VARCHAR2(10)	Session type
SQL_ADDRESS	RAW(4 8)	Used with SQL_HASH_VALUE to identify the SQL statement that is currently being executed
SQL_HASH_VALUE	NUMBER	Used with SQL_ADDRESS to identify the SQL statement that is currently being executed
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement that is currently being executed
SQL_CHILD_NUMBER	NUMBER	Child number of the SQL statement that is currently being executed
SQL_EXEC_START	DATE	Time when the execution of the SQL currently executed by this session started; NULL if SQL_ID is NULL
SQL_EXEC_ID	NUMBER	SQL execution identifier; NULL if SQL_ID is NULL or if the execution of that SQL has not yet started (see V\$SQL_MONITOR)
PREV_SQL_ADDR	RAW(4 8)	Used with PREV_HASH_VALUE to identify the last SQL statement executed
PREV_HASH_VALUE	NUMBER	Used with SQL_HASH_VALUE to identify the last SQL statement executed
PREV_SQL_ID	VARCHAR2(13)	SQL identifier of the last SQL statement executed
PREV_CHILD_NUMBER	NUMBER	Child number of the last SQL statement executed
PREV_EXEC_START	DATE	SQL execution start of the last executed SQL statement
PREV_EXEC_ID	NUMBER	SQL execution identifier of the last executed SQL statement
PLSQL_ENTRY_OBJECT_ID	NUMBER	Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack

Column	Datatype	Description
PLSQL_ENTRY_SUBPROGRAM_ID	NUMBER	Subprogram ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack
PLSQL_OBJECT_ID	NUMBER	Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL
PLSQL_SUBPROGRAM_ID	NUMBER	Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL
MODULE	VARCHAR2 (64)	Name of the currently executing module as set by calling the DBMS_APPLICATION_INFO.SET_MODULE procedure
MODULE_HASH	NUMBER	Hash value of the MODULE column
ACTION	VARCHAR2 (64)	Name of the currently executing action as set by calling the DBMS_APPLICATION_INFO.SET_ACTION procedure
ACTION_HASH	NUMBER	Hash value of the ACTION column
CLIENT_INFO	VARCHAR2 (64)	Information set by the DBMS_APPLICATION_INFO.SET_CLIENT_INFO procedure
FIXED_TABLE_SEQUENCE	NUMBER	This contains a number that increases every time the session completes a call to the database and there has been an intervening select from a dynamic performance table. This column can be used by performance monitors to monitor statistics in the database. Each time the performance monitor looks at the database, it only needs to look at sessions that are currently active or have a higher value in this column than the highest value that the performance monitor saw the last time. All the other sessions have been idle since the last time the performance monitor looked at the database.
ROW_WAIT_OBJ#	NUMBER	Object ID for the table containing the row specified in ROW_WAIT_ROW#
ROW_WAIT_FILE#	NUMBER	Identifier for the data file containing the row specified in ROW_WAIT_ROW#. This column is valid only if the session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
ROW_WAIT_BLOCK#	NUMBER	Identifier for the block containing the row specified in ROW_WAIT_ROW#. This column is valid only if the session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
ROW_WAIT_ROW#	NUMBER	Current row being locked. This column is valid only if the session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
TOP_LEVEL_CALL#	NUMBER	Oracle top level call number
LOGON_TIME	DATE	Time of logon
LAST_CALL_ET	NUMBER	If the session STATUS is currently ACTIVE, then the value represents the elapsed time (in seconds) since the session has become active. If the session STATUS is currently INACTIVE, then the value represents the elapsed time (in seconds) since the session has become inactive.
PDML_ENABLED	VARCHAR2 (3)	This column has been replaced by the PDML_STATUS column

Column	Datatype	Description
FAILOVER_TYPE	VARCHAR2 (13)	<p>Indicates whether failover is enabled for this session:</p> <ul style="list-style-type: none"> • NONE - Failover is disabled for this session. • SESSION - Transparent application failover (TAF) is enabled for this session and the client can fail over its session following a disconnect. • SELECT - TAF is enabled for this session and the client can fail over queries. The application must not set session state after the initial setup. (Transactions are not included at failover.) • TRANSACTION - Application Continuity (AC) is enabled for this session. This feature is available with the Oracle Real Application Clusters (RAC), Oracle RAC One Node, and Oracle Active Data Guard options. AC hides outages from end users and applications by recovering the database sessions following recoverable outages and planned maintenance. • AUTO - Transparent Application Continuity (TAC) is enabled for this session. This feature is the automated version of Application Continuity (AC) that makes decisions on your behalf. TAC is on by default for Oracle Autonomous Database Cloud and can also be on by default for your applications.
		<p>See Also:</p> <ul style="list-style-type: none"> • <i>Oracle Database Net Services Administrator's Guide</i> for more information on TAF • <i>Oracle Real Application Clusters Administration and Deployment Guide</i> for more information on AC • <i>Oracle Real Application Clusters Administration and Deployment Guide</i> for more information on TAC
FAILOVER_METHOD	VARCHAR2 (10)	<p>Indicates the transparent application failover method for the session:</p> <ul style="list-style-type: none"> • NONE - Failover is disabled for this session • BASIC - Client itself reconnects following a disconnect • PRECONNECT - Backup instance can support all connections from every instance for which it is backed up
FAILED_OVER	VARCHAR2 (3)	Indicates whether the session is running in failover mode and failover has occurred (YES) or not (NO)
RESOURCE_CONSUMER_GROUP	VARCHAR2 (32)	Name of the session's current resource consumer group
PDML_STATUS	VARCHAR2 (8)	If ENABLED, the session is in a PARALLEL DML enabled mode. If DISABLED, PARALLEL DML enabled mode is not supported for the session. If FORCED, the session has been altered to force PARALLEL DML.
PDDL_STATUS	VARCHAR2 (8)	If ENABLED, the session is in a PARALLEL DDL enabled mode. If DISABLED, PARALLEL DDL enabled mode is not supported for the session. If FORCED, the session has been altered to force PARALLEL DDL.
PQ_STATUS	VARCHAR2 (8)	If ENABLED, the session is in a PARALLEL QUERY enabled mode. If DISABLED, PARALLEL QUERY enabled mode is not supported for the session. If FORCED, the session has been altered to force PARALLEL QUERY.
CURRENT_QUEUE_DURATION	NUMBER	If queued (1), the current amount of time the session has been queued. If not currently queued, the value is 0.
CLIENT_IDENTIFIER	VARCHAR2 (64)	Client identifier of the session

Column	Datatype	Description
BLOCKING_SESSION_STATUS	VARCHAR2(11)	<p>This column provides details on whether there is a blocking session:</p> <ul style="list-style-type: none"> • VALID - there is a blocking session, and it is identified in the BLOCKING_INSTANCE and BLOCKING_SESSION columns • NO HOLDER - there is no session blocking this session • NOT IN WAIT - this session is not in a wait • UNKNOWN - the blocking session is unknown
BLOCKING_INSTANCE	NUMBER	Instance identifier of the blocking session. This column is valid only if BLOCKING_SESSION_STATUS has the value VALID.
BLOCKING_SESSION	NUMBER	Session identifier of the blocking session. This column is valid only if BLOCKING_SESSION_STATUS has the value VALID.
FINAL_BLOCKING_SESSION_STATUS	VARCHAR2(11)	<p>The final blocking session is the final element in the wait chain constructed by following the sessions that are blocked by one another starting with this session. In the case of a cyclical wait chain, one of the sessions in the wait chain will be chosen as the final blocker.</p>
FINAL_BLOCKING_INSTANCE	NUMBER	<p>This column provides details on whether there is a final blocking session:</p> <ul style="list-style-type: none"> • VALID - there is a final blocking session and it is identified in the FINAL_BLOCKING_INSTANCE and FINAL_BLOCKING_SESSION columns • NO HOLDER - there is no session blocking this session • NOT IN WAIT - this session is not in a wait • UNKNOWN - the final blocking session is unknown
FINAL_BLOCKING_SESSION	NUMBER	Instance identifier of the final blocking session. This column is valid only if FINAL_BLOCKING_SESSION_STATUS has the value VALID.
SEQ#	NUMBER	Session identifier of the blocking session. This column is valid only if FINAL_BLOCKING_SESSION_STATUS has the value VALID.
EVENT#	NUMBER	A number that uniquely identifies the current or last wait (incremented for each wait)
EVENT	VARCHAR2(64)	If the session is currently waiting, then the number of the resource or event for which the session is waiting. If the session is not in a wait, then the number of the resource or event for which the session most recently waited.
P1TEXT	VARCHAR2(64)	If the session is currently waiting, then the resource or event for which the session is waiting. If the session is not in a wait, then the resource or event for which the session most recently waited.
P1	NUMBER	See Also: " Oracle Wait Events "
P1RAW	RAW(8)	Description of the first wait event parameter
P2TEXT	VARCHAR2(64)	First wait event parameter (in decimal)
P2	NUMBER	First wait event parameter (in hexadecimal) ¹
P2RAW	RAW(8)	Description of the second wait event parameter
P3TEXT	VARCHAR2(64)	Second wait event parameter (in decimal)
P3	NUMBER	Second wait event parameter (in hexadecimal) ¹
P3RAW	RAW(8)	Description of the third wait event parameter
WAIT_CLASS_ID	NUMBER	Third wait event parameter (in decimal)
WAIT_CLASS#	NUMBER	Third wait event parameter (in hexadecimal) ¹
WAIT_CLASS	VARCHAR2(64)	Identifier of the class of the wait event
		Number of the class of the wait event
		Name of the class of the wait event

Column	Datatype	Description
WAIT_TIME	NUMBER	<p>If the session is currently waiting, then the value is 0. If the session is not in a wait, then the value is as follows:</p> <ul style="list-style-type: none"> • > 0 - Value is the duration of the last wait in hundredths of a second • -1 - Duration of the last wait was less than a hundredth of a second • -2 - Parameter <code>TIMED_STATISTICS</code> was set to false <p>This column has been deprecated in favor of the columns <code>WAIT_TIME_MICRO</code> and <code>STATE</code>.</p>
SECONDS_IN_WAIT	NUMBER	<p>If the session is currently waiting, then the value is the amount of time waited for the current wait. If the session is not in a wait, then the value is the amount of time since the start of the last wait.</p> <p>This column has been deprecated in favor of the columns <code>WAIT_TIME_MICRO</code> and <code>TIME_SINCE_LAST_WAIT_MICRO</code>.</p>
STATE	VARCHAR2 (19)	<p>Wait state:</p> <ul style="list-style-type: none"> • WAITING - Session is currently waiting • WAITED UNKNOWN TIME - Duration of the last wait is unknown; this is the value when the parameter <code>TIMED_STATISTICS</code> is set to false • WAITED SHORT TIME - Last wait was less than a hundredth of a second • WAITED KNOWN TIME - Duration of the last wait is specified in the <code>WAIT_TIME</code> column
WAIT_TIME_MICRO	NUMBER	Amount of time waited (in microseconds). If the session is currently waiting, then the value is the time spent in the current wait. If the session is currently not in a wait, then the value is the amount of time waited in the last wait.
TIME_REMAINING_MICRO	NUMBER	<p>Value is interpreted as follows:</p> <ul style="list-style-type: none"> • > 0 - Amount of time remaining for the current wait (in microseconds) • 0 - Current wait has timed out • -1 - Session can indefinitely wait in the current wait • NULL - Session is not currently waiting
TIME_SINCE_LAST_WAIT_MICRO	NUMBER	Time elapsed since the end of the last wait (in microseconds). If the session is currently in a wait, then the value is 0.
SERVICE_NAME	VARCHAR2 (64)	Service name of the session
SQL_TRACE	VARCHAR2 (8)	Indicates whether SQL tracing is enabled (<code>ENABLED</code>) or disabled (<code>DISABLED</code>)
SQL_TRACE_WAITS	VARCHAR2 (5)	Indicates whether wait tracing is enabled (<code>TRUE</code>) or not (<code>FALSE</code>)
SQL_TRACE_BINDS	VARCHAR2 (5)	Indicates whether bind tracing is enabled (<code>TRUE</code>) or not (<code>FALSE</code>)
SQL_TRACE_PLAN_STATS	VARCHAR2 (10)	<p>Frequency at which row source statistics are dumped in the trace files for each cursor:</p> <ul style="list-style-type: none"> • never • first_execution • all_executions
SESSION_EDITION_ID	NUMBER	Shows the value that, in the session, would be reported by <code>sys_context('USERENV', 'SESSION_EDITION_ID')</code>
CREATOR_ADDR	RAW (4 8)	Address of the creating process or circuit
CREATOR_SERIAL#	NUMBER	Serial number of the creating process or circuit
ECID	VARCHAR2 (64)	Execution context identifier (sent by Application Server)

Column	Datatype	Description
SQL_TRANSLATION_PROFILE_ID	NUMBER	Object number of the SQL translation profile
PGA_TUNABLE_MEM	NUMBER	The amount of tunable PGA memory (in bytes). Untunable memory is <code>PGA_ALLOC_MEM</code> from <code>V\$PROCESS</code> minus <code>PGA_TUNABLE_MEM</code> from <code>V\$SESSION</code> .
SHARD_DDL_STATUS	VARCHAR2(8)	Indicates whether shard DDL is enabled in the current session (ENABLED) or not (DISABLED). This value is only relevant for the shard catalog database.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
EXTERNAL_NAME	VARCHAR2(1024)	External name of the database user. For enterprise users, returns the Oracle Internet Directory DN.
PLSQL_DEBUGGER_CONNECTED	VARCHAR2(5)	Indicates whether the session is connected to a PL/SQL debugger. Possible values: <ul style="list-style-type: none"> • TRUE • FALSE

¹ The P1RAW, P2RAW, and P3RAW columns display the same values as the P1, P2, and P3 columns, except that the numbers are displayed in hexadecimal.

See Also:

9.18 V\$SESSION_BLOCKERS

V\$SESSION_BLOCKERS displays the blocker sessions for each blocked session. Each row represents a blocked and blocker session pair. If a session is blocked by multiple sessions there will be multiple rows for that blocked session. The maximum number of blocker sessions displayed for a single blocked session is 30. If a session is not blocked by other sessions, then there will be no row in this view for that session.

Column	Datatype	Description
SID	NUMBER	Blocked session's Oracle session identifier
SESS_SERIAL#	NUMBER	Blocked session's Oracle session serial number

Column	Datatype	Description
WAIT_ID	NUMBER	A number identifying the wait for the blocked session
WAIT_EVENT	NUMBER	Resource or event number for which the blocked session is waiting
WAIT_EVENT_TEXT	VARCHAR2(64)	Resource or event for which the blocked session is waiting
BLOCKER_INSTANCE_ID	NUMBER	Blocker session's instance identifier
BLOCKER_SID	NUMBER	Blocker session's Oracle session identifier
BLOCKER_SESS_SERIAL#	NUMBER	Blocker session's Oracle session serial number
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.19 V\$SESSION_CONNECT_INFO

V\$SESSION_CONNECT_INFO displays information about network connections for all currently logged in sessions.

Column	Datatype	Description
SID	NUMBER	Session identifier (can be used to join this view with V\$SESSION)
SERIAL#	NUMBER	Session serial number. Used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID. (Can be used to join this view with V\$SESSION.)
AUTHENTICATION_TYPE	VARCHAR2(26)	How the user was authenticated: <ul style="list-style-type: none"> • DATABASE - Username/password authentication • OS - Operating system external user authentication • NETWORK - Network protocol or ANO authentication • PROXY - OCI proxy connection authentication • SERVER • PASSWORD • EXTERNAL ADAPTERS • INTERNAL • GLOBAL • EXTERNAL • PASSWORD BASED GLOBAL USER
OSUSER	VARCHAR2(128)	External username for this database user
NETWORK_SERVICE_BANNER	VARCHAR2(4000)	Product banners for each Oracle Net service used for this connection (one row per banner)
CLIENT_CHARSET	VARCHAR2(40)	Client character set as specified in the NLS_LANG environment variable or in the OCIEnvNlsCreate() call; Unknown if the Oracle client is older than release 11.1 or the connection is through the JDBC thin driver
CLIENT_CONNECTION	VARCHAR2(13)	Client server connection flags: <ul style="list-style-type: none"> • Heterogeneous • Homogeneous

Column	Datatype	Description
CLIENT_OCI_LIBRARY	VARCHAR2(27)	OCI client library: <ul style="list-style-type: none">• Home-based• Full Instant Client• Light Weight Instant Client• OCI• Unknown
CLIENT_VERSION	VARCHAR2(40)	Client library version number
CLIENT_DRIVER	VARCHAR2(30)	Client driver name
CLIENT_LOBATTR	VARCHAR2(23)	Client LOB flags: <ul style="list-style-type: none">• Client Temp Lob Rfc On• Client Temp Lob Rfc Off
CLIENT_REGID	NUMBER	Query cache registration ID sent by the client
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**
"V\$SESSION"

9.20 V\$SESSION_CURSOR_CACHE

V\$SESSION_CURSOR_CACHE displays information on cursor usage for the current session.

 **Note:**

The V\$SESSION_CURSOR_CACHE view is not a measure of the effectiveness of the SESSION_CACHED_CURSORS initialization parameter.

Column	Datatype	Description
MAXIMUM	NUMBER	Maximum number of cursors to cache. Once you hit this number, some cursors will need to be closed in order to open more. The value in this column is derived from the initialization parameter SESSION_CACHED_CURSORS.
COUNT	NUMBER	Current number of cursors (whether they are in use or not)
OPENS	NUMBER	Cumulative total of cursor opens minus one. This is because the cursor that is currently open and being used for this query is not counted in the OPENS statistic.
HITS	NUMBER	Cumulative total of cursor open hits

Column	Datatype	Description
HIT_RATIO	NUMBER	Ratio of the number of times an open cursor was found divided by the number of times a cursor was sought
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["SESSION_CACHED_CURSORS"](#)

9.21 V\$SESSION_EVENT

V\$SESSION_EVENT displays information on waits for an event by a session. Note that the TIME_WAITED and AVERAGE_WAIT columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you want this column to reflect true wait times, then you must set TIMED_STATISTICS to true in the parameter file; doing this will have a small negative effect on system performance.

 See Also:["TIMED_STATISTICS"](#)

Column	Datatype	Description
SID	NUMBER	Session identifier
EVENT	VARCHAR2 (64)	Name of the wait event; derived statistic name from V\$EVENT_NAME See Also: "Oracle Wait Events"
TOTAL_WAITS	NUMBER	Total number of waits for the event by the session
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event by the session
TIME_WAITED	NUMBER	Total amount of time waited for the event by the session (in hundredths of a second)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event by the session (in hundredths of a second)
MAX_WAIT	NUMBER	Maximum amount of time waited for the event by the session (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time waited for the event by the session (in microseconds)
EVENT_ID	NUMBER	Identifier of the wait event
WAIT_CLASS_ID	NUMBER	Identifier of the wait class of the wait event

Column	Datatype	Description
WAIT_CLASS#	NUMBER	Number of the wait class of the wait event
WAIT_CLASS	VARCHAR2 (64)	Name of the wait class of the wait event
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.22 V\$SESSION_FIX_CONTROL

V\$SESSION_FIX_CONTROL displays information about Fix Control (enabled/disabled) for the current session.

Column	Datatype	Description
SESSION_ID	NUMBER	Session identifier (can be used to join this view with V\$SESSION)
BUGNO	NUMBER	Bug number (as fix control identifier)
VALUE	NUMBER	Current value set for the fix control
SQL_FEATURE	VARCHAR2 (64)	Feature control ID
DESCRIPTION	VARCHAR2 (64)	Description of the fix control
OPTIMIZER_FEATURE_ENABLE	VARCHAR2 (25)	Version on (and after) which the fix is enabled by default
EVENT	NUMBER	Event formerly used to control the fix
IS_DEFAULT	NUMBER	Indicates whether the current value is the same as the default (1) or not (0)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.23 V\$SESSION_LONGOPS

V\$SESSION_LONGOPS displays the status of various operations that run for longer than 6 seconds (in absolute time). These operations currently include many backup and recovery functions, statistics gathering, and query execution, and more operations are added for every Oracle release.

To monitor query execution progress, you must be using the cost-based optimizer and you must:

- Set the TIMED_STATISTICS or SQL_TRACE parameters to true
- Gather statistics for your objects with the DBMS_STATS package

You can add information to this view about application-specific long-running operations by using the `DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS` procedure.

Column	Datatype	Description
SID	NUMBER	Identifier of the session processing the long-running operation. If multiple sessions are cooperating in the long-running operation, then SID corresponds to the main or master session.
SERIAL#	NUMBER	Serial number of the session processing the long-running operation. If multiple sessions are cooperating in the long-running operation, then SERIAL# corresponds to the main or master session. SERIAL# is used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID.
OPNAME	VARCHAR2 (64)	Brief description of the operation
TARGET	VARCHAR2 (64)	Object on which the operation is carried out
TARGET_DESC	VARCHAR2 (32)	Description of the target
SOFAR	NUMBER	Units of work done so far for the operation specified in the OPNAME column
TOTALWORK	NUMBER	Total units of work for the operation specified in the OPNAME column
UNITS	VARCHAR2 (32)	Units of measurement
START_TIME	DATE	Starting time of the operation
LAST_UPDATE_TIME	DATE	Time when statistics were last updated for the operation
TIMESTAMP	DATE	Timestamp specific to the operation
TIME_REMAINING	NUMBER	Estimate (in seconds) of time remaining for the operation to complete
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds from the start of the operations
CONTEXT	NUMBER	Context
MESSAGE	VARCHAR2 (512)	Statistics summary message
USERNAME	VARCHAR2 (30)	User ID of the user performing the operation
SQL_ADDRESS	RAW(4 8)	Used with the value of the SQL_HASH_VALUE column to identify the SQL statement associated with the operation
SQL_HASH_VALUE	NUMBER	Used with the value of the SQL_ADDRESS column to identify the SQL statement associated with the operation
SQL_ID	VARCHAR2 (13)	SQL identifier of the SQL statement associated with the long operation, if any
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value; NULL if SQL_ID is NULL
SQL_EXEC_START	DATE	Time when the execution of the SQL started; NULL if SQL_ID is NULL
SQL_EXEC_ID	NUMBER	SQL execution identifier (see V\$SQL_MONITOR)
SQL_PLAN_LINE_ID	NUMBER	SQL plan line ID corresponding to the long operation; NULL if the long operation is not associated with a line of the execution plan
SQL_PLAN_OPERATION	VARCHAR2 (30)	Plan operation name; NULL if SQL_PLAN_LINE_ID is NULL
SQL_PLAN_OPTIONS	VARCHAR2 (30)	Plan operation options; NULL if SQL_PLAN_LINE_ID is NULL
QCSID	NUMBER	Session identifier of the parallel coordinator

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.24 V\$SESSION_OBJECT_CACHE

V\$SESSION_OBJECT_CACHE displays object cache statistics for the current user session on the local server (instance).

Column	Datatype	Description
PINS	NUMBER	Number of object pins or look-ups in the cache
HITS	NUMBER	Number of object pins that found the object already in the cache
TRUE_HITS	NUMBER	Number of object pins that found the object already in the cache and in the desired state (thus, not requiring refresh from the database)
HIT_RATIO	NUMBER	Ratio of HITS / PINS
TRUE_HIT_RATIO	NUMBER	Ratio of TRUE_HITS/PINS
OBJECT_REFRESHES	NUMBER	Number of objects in the cache that were refreshed with a new value from the database
CACHE_REFRESHES	NUMBER	Number of times the whole cache (all objects) were refreshed
OBJECT_FLUSHES	NUMBER	Number of objects in the cache that were flushed to the database
CACHE_FLUSHES	NUMBER	Number of times the whole cache (all objects) were flushed to the database
CACHE_SHRINKS	NUMBER	Number of times the cache was shrunk to the optimal size
CACHED_OBJECTS	NUMBER	Number of objects currently cached
PINNED_OBJECTS	NUMBER	Number of objects currently pinned
CACHE_SIZE	NUMBER	Current size of the cache (in bytes)
OPTIMAL_SIZE	NUMBER	Optimal size of the cache (in bytes)
MAXIMUM_SIZE	NUMBER	Maximum size of the cache (in bytes)

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.25 V\$SESSION_WAIT

V\$SESSION_WAIT displays the current or last wait for each session.

Column	Datatype	Description
SID	NUMBER	Session identifier; maps to V\$SESSION.SID
SEQ#	NUMBER	A number that uniquely identifies the current or last wait (incremented for each wait)
EVENT	VARCHAR2 (64)	If the session is currently waiting, then the resource or event for which the session is waiting. If the session is not in a wait, then the resource or event for which the session most recently waited.
		See Also: " Oracle Wait Events "
P1TEXT	VARCHAR2 (64)	Description of the first wait event parameter
P1	NUMBER	First wait event parameter (in decimal)
P1RAW	RAW (8)	First wait event parameter (in hexadecimal) ¹
P2TEXT	VARCHAR2 (64)	Description of the second wait event parameter
P2	NUMBER	Second wait event parameter (in decimal)
P2RAW	RAW (8)	Second wait event parameter (in hexadecimal) ¹
P3TEXT	VARCHAR2 (64)	Description of the third wait event parameter
P3	NUMBER	Third wait event parameter (in decimal)
P3RAW	RAW (8)	Third wait event parameter (in hexadecimal) ¹
WAIT_CLASS_ID	NUMBER	Identifier of the class of the wait event
WAIT_CLASS#	NUMBER	Number of the class of the wait event
WAIT_CLASS	VARCHAR2 (64)	Name of the class of the wait event
WAIT_TIME	NUMBER	If the session is currently waiting, then the value is 0. If the session is not in a wait, then the value is as follows: <ul style="list-style-type: none"> • > 0 - Value is the duration of the last wait in hundredths of a second • -1 - Duration of the last wait was less than a hundredth of a second • -2 - Parameter <code>TIMED_STATISTICS</code> was set to <code>false</code> This column has been deprecated in favor of the columns <code>WAIT_TIME_MICRO</code> and <code>STATE</code> .
SECONDS_IN_WAIT	NUMBER	If the session is currently waiting, then the value is the amount of time waited for the current wait. If the session is not in a wait, then the value is the amount of time since the start of the last wait. <p>This column has been deprecated in favor of the columns <code>WAIT_TIME_MICRO</code> and <code>TIME_SINCE_LAST_WAIT_MICRO</code>.</p>

Column	Datatype	Description
STATE	VARCHAR2 (19)	<p>Wait state:</p> <ul style="list-style-type: none"> • WAITING - Session is currently waiting • WAITED UNKNOWN TIME - Duration of the last wait is unknown; this is the value when the parameter <code>TIMED_STATISTICS</code> is set to <code>false</code> • WAITED SHORT TIME - Last wait was less than a hundredth of a second • WAITED KNOWN TIME - Duration of the last wait is specified in the <code>WAIT_TIME</code> column
WAIT_TIME_MICRO	NUMBER	Amount of time waited (in microseconds). If the session is currently waiting, then the value is the time spent in the current wait. If the session is currently not in a wait, then the value is the amount of time waited in the last wait.
TIME_REMAINING_MICRO	NUMBER	<p>Value is interpreted as follows:</p> <ul style="list-style-type: none"> • > 0 - Amount of time remaining for the current wait (in microseconds) • 0 - Current wait has timed out • -1 - Session can indefinitely wait in the current wait • NULL - Session is not currently waiting
TIME_SINCE_LAST_WAIT_MICRO	NUMBER	Time elapsed since the end of the last wait (in microseconds). If the session is currently in a wait, then the value is 0.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

¹ The P1RAW, P2RAW, and P3RAW columns display the same values as the P1, P2, and P3 columns, except that the numbers are displayed in hexadecimal.

See Also:

["TIMED_STATISTICS"](#) and ["Oracle Wait Events"](#)

9.26 V\$SESSION_WAIT_CLASS

V\$SESSION_WAIT_CLASS displays the time spent in various wait event operations on a per-session basis.

Column	Datatype	Description
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Serial number
WAIT_CLASS_ID	NUMBER	Identifier of the wait class
WAIT_CLASS#	NUMBER	Number of the wait class

Column	Datatype	Description
WAIT_CLASS	VARCHAR2 (64)	Name of the wait class
TOTAL_WAITS	NUMBER	Total number waits from this wait class by the session
TIME_WAITED	NUMBER	Total amount of time spent in waits from this wait class by the session (in hundredths of a second)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.27 V\$SESSION_WAIT_HISTORY

V\$SESSION_WAIT_HISTORY displays the last 10 wait events for each active session.

Column	Datatype	Description
SID	NUMBER	Session identifier
SEQ#	NUMBER	Sequence of wait events; 1 is the most recent
EVENT#	NUMBER	Event number
EVENT	VARCHAR2 (64)	Resource or event for which the session is waiting
P1TEXT	VARCHAR2 (64)	Description of the first wait event parameter
P1	NUMBER	First wait event parameter (in decimal)
P2TEXT	VARCHAR2 (64)	Description of the second wait event parameter
P2	NUMBER	Second wait event parameter (in decimal)
P3TEXT	VARCHAR2 (64)	Description of the third wait event parameter
P3	NUMBER	Third wait event parameter (in decimal)
WAIT_TIME	NUMBER	Amount of time waited (in hundredths of a second)
WAIT_TIME_MICRO	NUMBER	Amount of time waited (in microseconds)
TIME_SINCE_LAST_WAIT_MICRO	NUMBER	Time elapsed (in microseconds) since the end of the previous wait in the wait history
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.28 V\$SESSIONS_COUNT

V\$SESSIONS_COUNT displays the current number of sessions for each PDB.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
USER_SESSION_COUNT	NUMBER	Displays the current number of user sessions for the PDB
RECURSIVE_SESSION_COUNT	NUMBER	Displays the current number of recursive sessions for the PDB

9.29 V\$SESSMETRIC

V\$SESSMETRIC displays the metric values for all sessions.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SESSION_ID	NUMBER	Session ID
SESSION_SERIAL_NUM	NUMBER	Session serial number
CPU	NUMBER	CPU usage
PHYSICAL_READS	NUMBER	Number of physical reads
LOGICAL_READS	NUMBER	Number of logical reads
PGA_MEMORY	NUMBER	PGA size at the end of the interval
HARD_PARSES	NUMBER	Number of hard parses
SOFT_PARSES	NUMBER	Number of soft parses
PHYSICAL_READ_PCT	NUMBER	Physical read ratio
LOGICAL_READ_PCT	NUMBER	Logical read ratio
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.30 V\$SESSTAT

V\$SESSTAT displays user session statistics. To find the name of the statistic associated with each statistic number (STATISTIC#), query the V\$STATNAME view.

Column	Datatype	Description
SID	NUMBER	Session identifier
STATISTIC#	NUMBER	Statistic number Note: Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$STATNAME"](#) and ["Statistics Descriptions"](#)

9.31 V\$SGA

V\$SGA displays summary information about the system global area (SGA).

Column	Datatype	Description
NAME	VARCHAR2 (20)	SGA component group
VALUE	NUMBER	Memory size (in bytes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.32 V\$SGA_CURRENT_RESIZE_OPS

V\$SGA_CURRENT_RESIZE_OPS displays information about SGA resize operations which are currently in progress. An operation can be a grow or a shrink of a dynamic SGA component. All sizes are expressed in bytes.

Column	Datatype	Description
COMPONENT	VARCHAR2 (64)	Component name

Column	Datatype	Description
OPER_TYPE	VARCHAR2(13)	Operation type: <ul style="list-style-type: none">• STATIC• INITIALIZING• DISABLED• GROW• SHRINK• SHRINK_CANCEL
OPER_MODE	VARCHAR2(9)	Operation mode: <ul style="list-style-type: none">• MANUAL• DEFERRED• IMMEDIATE
PARAMETER	VARCHAR2(80)	Name of the parameter for the resize operation
INITIAL_SIZE	NUMBER	Parameter value at the start of the operation
TARGET_SIZE	NUMBER	Desired value of the parameter after the resize
CURRENT_SIZE	NUMBER	Current value of the parameter
START_TIME	DATE	Start time of the operation
LAST_UPDATE_TIME	DATE	Last time progress was made for the operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.33 V\$SGA_DYNAMIC_COMPONENTS

V\$SGA_DYNAMIC_COMPONENTS displays information about the dynamic SGA components. This view summarizes information based on all completed SGA resize operations since instance startup. All sizes are expressed in bytes.

Column	Datatype	Description
COMPONENT	VARCHAR2(64)	Component name
CURRENT_SIZE	NUMBER	Current size of the component
MIN_SIZE	NUMBER	Minimum size of the component since instance startup
MAX_SIZE	NUMBER	Maximum size of the component since instance startup
USER_SPECIFIED_SIZE	NUMBER	Value of the user parameter for the component
OPER_COUNT	NUMBER	Number of operations since instance startup
LAST_OPER_TYPE	VARCHAR2(13)	Last completed operation for the component: <ul style="list-style-type: none">• STATIC• INITIALIZING• DISABLED• GROW• SHRINK• SHRINK_CANCEL

Column	Datatype	Description
LAST_OPER_MODE	VARCHAR2(9)	Mode of the last completed operation: <ul style="list-style-type: none">• MANUAL• DEFERRED• IMMEDIATE
LAST_OPER_TIME	DATE	Start time of the last completed operation
GRANULE_SIZE	NUMBER	Granularity of the grow or the shrink operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.34 V\$SGA_DYNAMIC_FREE_MEMORY

V\$SGA_DYNAMIC_FREE_MEMORY displays information about the amount of SGA memory available for future dynamic SGA resize operations.

Column	Datatype	Description
CURRENT_SIZE	NUMBER	Amount of available memory (in bytes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.35 V\$SGA_RESIZE_OPS

V\$SGA_RESIZE_OPS displays information about the last 800 completed SGA resize operations. This does not include in-progress operations. All sizes are expressed in bytes.

Column	Datatype	Description
COMPONENT	VARCHAR2(64)	Component name
OPER_TYPE	VARCHAR2(13)	Operation type: <ul style="list-style-type: none">• STATIC• INITIALIZING• DISABLED• GROW• SHRINK• SHRINK_CANCEL

Column	Datatype	Description
OPER_MODE	VARCHAR2 (9)	Operation mode: <ul style="list-style-type: none"> • MANUAL • DEFERRED • IMMEDIATE
PARAMETER	VARCHAR2 (80)	Name of the parameter for the resize operation
INITIAL_SIZE	NUMBER	Parameter value at the start of the operation
TARGET_SIZE	NUMBER	Requested value of the parameter after the resize
FINAL_SIZE	NUMBER	Real value of the parameter after the resize
STATUS	VARCHAR2 (9)	Completion status of the operation: <ul style="list-style-type: none"> • INACTIVE • PENDING • COMPLETE • CANCELLED • ERROR
START_TIME	DATE	Start time of the operation
END_TIME	DATE	End time of the operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.36 V\$SGA_TARGET_ADVICE

V\$SGA_TARGET_ADVICE displays information about the SGA_TARGET initialization parameter.

Column	Datatype	Description
SGA_SIZE	NUMBER	Size of the SGA
SGA_SIZE_FACTOR	NUMBER	Ratio between the SGA_SIZE and the current size of the SGA
ESTD_DB_TIME	NUMBER	Estimated DB_TIME for this SGA_SIZE
ESTD_DB_TIME_FACTOR	NUMBER	Ratio between ESTD_DB_TIME and DB_TIME for the current size of the SGA
ESTD_PHYSICAL_READS	NUMBER	Estimated number of physical reads
ESTD_BUFFER_CACHE_SIZE	NUMBER	Estimated size of the buffer cache
ESTD_SHARED_POOL_SIZE	NUMBER	Estimated size of the shared pool
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["SGA_TARGET"](#)

9.37 V\$SGAINFO

V\$SGAINFO displays size information about the SGA, including the sizes of different SGA items, the granule size, and free memory.

Column	Datatype	Description
NAME	VARCHAR2 (32)	Name of the SGA size item
BYTES	NUMBER	Size of the item (in bytes)
RESIZEABLE	VARCHAR2 (3)	Indicates whether the item is resizable (Yes) or not (No)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.38 V\$SGASTAT

V\$SGASTAT displays detailed information on the system global area (SGA).

Column	Datatype	Description
POOL	VARCHAR2 (14)	Designates the pool in which the memory in NAME resides: <ul style="list-style-type: none"> • in-memory pool - Memory is allocated from the In-Memory pool • java pool - Memory is allocated from the Java pool • large pool - Memory is allocated from the large pool • numa pool - Memory is allocated from the NUMA pool • shared pool - Memory is allocated from the shared pool • streams pool - Memory is allocated from the Streams pool
NAME	VARCHAR2 (26)	SGA component name
BYTES	NUMBER	Memory size (in bytes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.39 V\$SHARED_POOL_ADVICE

V\$SHARED_POOL_ADVICE displays information about estimated parse time in the shared pool for different pool sizes. The sizes range from 10% of the current shared pool size or the amount of pinned library cache memory (whichever is higher) to 200% of the current shared pool size, in equal intervals. The value of the interval depends on the current size of the shared pool.

Column	Datatype	Description
SHARED_POOL_SIZE_FOR_ESTIMATE	NUMBER	Shared pool size for the estimate (in megabytes)
SHARED_POOL_SIZE_FACTOR	NUMBER	Size factor with respect to the current shared pool size
ESTD_LC_SIZE	NUMBER	Estimated memory in use by the library cache (in megabytes)
ESTD_LC_MEMORY_OBJECTS	NUMBER	Estimated number of library cache memory objects in the shared pool of the specified size
ESTD_LC_TIME_SAVED	NUMBER	Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a shared pool of the specified size. This is the time that would have been spent in reloading the required objects in the shared pool had they been aged out due to insufficient amount of available free memory.
ESTD_LC_TIME_SAVED_FACTOR	NUMBER	Estimated parse time saved factor with respect to the current shared pool size
ESTD_LC_LOAD_TIME	NUMBER	Estimated elapsed time (in seconds) for parsing in a shared pool of the specified size
ESTD_LC_LOAD_TIME_FACTOR	NUMBER	Estimated load time factor with respect to the current shared pool size
ESTD_LC_MEMORY_OBJECT_HI_TS	NUMBER	Estimated number of times a library cache memory object was found in a shared pool of the specified size
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.40 V\$SHARED_POOL_RESERVED

V\$SHARED_POOL_RESERVED displays statistics that help you tune the reserved pool and space within the shared pool.

Column	Datatype	Description
FREE_SPACE	NUMBER	Total amount of free space on the reserved list in bytes ¹
AVG_FREE_SIZE	NUMBER	Average size of the free memory on the reserved list in bytes ¹
FREE_COUNT	NUMBER	Number of free pieces of memory on the reserved list ¹
MAX_FREE_SIZE	NUMBER	Size of the largest free piece of memory on the reserved list in bytes ¹
USED_SPACE	NUMBER	Total amount of used memory on the reserved list in bytes ¹
AVG_USED_SIZE	NUMBER	Average size of the used memory on the reserved list in bytes ¹
USED_COUNT	NUMBER	Number of used pieces of memory on the reserved list ¹

Column	Datatype	Description
MAX_USED_SIZE	NUMBER	Size of the largest used piece of memory on the reserved list in bytes ¹
REQUESTS	NUMBER	Number of times that the reserved list was searched for a free piece of memory ¹
REQUEST_MISSES	NUMBER	Number of times the reserved list did not have a free piece of memory to satisfy the request, and started flushing objects from the LRU list ¹
LAST_MISS_SIZE	NUMBER	Request size of the last request miss in bytes, when the reserved list did not have a free piece of memory to satisfy the request and started flushing objects from the LRU list ¹
MAX_MISS_SIZE	NUMBER	Request size of the largest request miss in bytes, when the reserved list did not have a free piece of memory to satisfy the request and started flushing objects from the LRU list ¹
REQUEST_FAILURES	NUMBER	Number of times that no memory was found to satisfy a request. If an internal flush (used to free up memory) does not meet a memory need, then the error ORA-04031 occurs. ²
LAST_FAILURE_SIZE	NUMBER	Request size of the last failed request in bytes. If an internal flush (used to free up memory) does not meet a memory need, then the error ORA-04031 occurs. ²
ABORTED_REQUEST_THRESHOLD	NUMBER	Minimum size of a request in bytes which signals an ORA-04031 error without flushing objects ²
ABORTED_REQUESTS	NUMBER	Number of requests that signalled an ORA-04031 error without flushing objects ²
LAST_ABORTED_SIZE	NUMBER	Last size of the request in bytes that returned an ORA-04031 error without flushing objects from the LRU list ²
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

¹ These columns are valid only if the initialization parameter SHARED_POOL_RESERVED_SIZE is set to a valid value.

² These columns contain values which are valid even if SHARED_POOL_RESERVED_SIZE is not set.

9.41 V\$SHARED_SERVER

V\$SHARED_SERVER displays information on the shared server processes.

Column	Datatype	Description
NAME	VARCHAR2 (4)	Name of the server
PADDR	RAW (4 8)	Server's process address

Column	Datatype	Description
STATUS	VARCHAR2 (16)	<p>Server status:</p> <ul style="list-style-type: none"> • EXEC - Executing SQL • WAIT (ENQ) - Waiting for a lock • WAIT (SEND) - Waiting to send data to user • WAIT (COMMON) - Idle; waiting for a user request • WAIT (RECEIVE) - Waiting for records to be shown in the client application • WAIT (RESET) - Waiting for a circuit to reset after a break • QUIT - Terminating
MESSAGES	NUMBER	Number of messages processed
BYTES	NUMBER	Total number of bytes in all messages
BREAKS	NUMBER	Number of breaks
CIRCUIT	RAW (4 8)	Address of the circuit currently being serviced
IDLE	NUMBER	Total idle time (in hundredths of a second)
BUSY	NUMBER	Total busy time (in hundredths of a second)
IN_NET	NUMBER	Total incoming network wait time (in hundredths of a second)
OUT_NET	NUMBER	Total outgoing network wait time (in hundredths of a second)
REQUESTS	NUMBER	Total number of requests taken from the common queue in this server's lifetime
BOUND_TIME ¹	NUMBER	Time that a circuit and shared server have been bound (in centiseconds)
BOUND_REASON ¹	VARCHAR2 (32)	<p>Provides a reason (a short explanation) for why a shared server and circuit could not be unbound.</p> <p>This column is empty when a circuit is not bound to a server.</p> <p>When the server starts serving a circuit, BOUND_REASON is empty and remains empty unless the server tries unsuccessfully to unbind the circuit (after it finishes serving the current request).</p> <p>When this column is not empty, it will be cleared once the server and circuit are unbound (that is, once the resources preventing the session migration to another shared server are released).</p>
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

¹ This column is available starting with Oracle Database 19c.

9.42 V\$SHARED_SERVER_MONITOR

V\$SHARED_SERVER_MONITOR displays information for tuning the shared server.

Column	Datatype	Description
MAXIMUM_CONNECTIONS	NUMBER	Highest number of virtual circuits in use at one time since the instance started. If this value reaches the value set for the CIRCUITS initialization parameter, then consider raising the value of CIRCUITS. See Also: "CIRCUITS"
MAXIMUM_SESSIONS	NUMBER	Highest number of shared server sessions in use at one time since the instance started. If this reaches the value set for the SHARED_SERVER_SESSIONS initialization parameter, then consider raising the value of SHARED_SERVER_SESSIONS. See Also: "SHARED_SERVER_SESSIONS"
SERVERS_STARTED	NUMBER	Total number of shared servers started since the instance started (but not including those started during startup)
SERVERS_TERMINATED	NUMBER	Total number of shared servers stopped by Oracle since the instance started
SERVERS_HIGHWATER	NUMBER	Highest number of servers running at one time since the instance started. If this value reaches the value set for the MAX_SHARED_SERVERS initialization parameter, then consider raising the value of SHARED_SERVERS. See Also: "SHARED_SERVERS"
DISPATCHERS_CPU	NUMBER	Total CPU time of all dispatchers since the instance started (in millionths of a second)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.43 V\$SHARED_SERVER_STAT

V\$SHARED_SERVER_STAT displays statistics for all shared server processes. The statistics are cumulative from the start of the instance.

Column	Datatype	Description
MESSAGES	NUMBER	Number of messages processed
BYTES	NUMBER	Total number of bytes in all messages
IDLE	NUMBER	Total idle time (in hundredths of a second)
BUSY	NUMBER	Total busy time (in hundredths of a second)
IN_NET	NUMBER	Total incoming network wait time (in hundredths of a second)
OUT_NET	NUMBER	Total outgoing network wait time (in hundredths of a second)
REQUESTS	NUMBER	Total number of requests taken from the common queue

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 Note:

This view is available starting with Oracle Database 19c.

9.44 V\$SORT_SEGMENT

V\$SORT_SEGMENT displays information about every sort segment in a given instance. The view is only updated when the tablespace is of the TEMPORARY type.

Column	Datatype	Description
TABLESPACE_NAME	VARCHAR2 (30)	Name of the tablespace
SEGMENT_FILE	NUMBER	File number of the first extent
SEGMENT_BLOCK	NUMBER	Block number of the first extent
EXTENT_SIZE	NUMBER	Extent size
CURRENT_USERS	NUMBER	Number of active users of the segment
TOTAL_EXTENTS	NUMBER	Total number of extents in the segment
TOTAL_BLOCKS	NUMBER	Total number of blocks in the segment
USED_EXTENTS	NUMBER	Extents allocated to active sorts
USED_BLOCKS	NUMBER	Blocks allocated to active sorts
FREE_EXTENTS	NUMBER	Extents not allocated to any sort
FREE_BLOCKS	NUMBER	Blocks not allocated to any sort
ADDED_EXTENTS	NUMBER	Number of extent allocations
EXTENT_HITS	NUMBER	Number of times an unused extent was found in the pool
FREED_EXTENTS	NUMBER	Number of deallocated extents
FREE_REQUESTS	NUMBER	Number of requests to deallocate
MAX_SIZE	NUMBER	Maximum number of extents ever used
MAX_BLOCKS	NUMBER	Maximum number of blocks ever used
MAX_USED_SIZE	NUMBER	Maximum number of extents used by all sorts
MAX_USED_BLOCKS	NUMBER	Maximum number of blocks used by all sorts
MAX_SORT_SIZE	NUMBER	Maximum number of extents used by an individual sort
MAX_SORT_BLOCKS	NUMBER	Maximum number of blocks used by an individual sort
RELATIVE_FNO	NUMBER	Relative file number of the sort segment header

Column	Datatype	Description
TS#	NUMBER	Tablespace number
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
IS_LOCAL_TEMP	NUMBER	Indicates whether the sort segment is allocated from a local temporary tablespace (1) or not (0).

9.45 V\$SPPARAMETER

V\$SPPARAMETER displays information about the contents of the server parameter file. If a server parameter file was not used to start the instance, then each row of the view will contain FALSE in the ISSPECIFIED column.

Column	Datatype	Description
FAMILY	VARCHAR2(80)	For internal use only
SID	VARCHAR2 (80)	SID for which the parameter is defined.
NAME	VARCHAR2 (80)	Name of the parameter
TYPE	VARCHAR2 (11)	Parameter type
VALUE	VARCHAR2 (255)	Parameter value (null if a server parameter file was not used to start the instance)
DISPLAY_VALUE	VARCHAR2 (255)	Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.
ISSPECIFIED	VARCHAR2 (6)	Indicates whether the parameter was specified in the server parameter file (TRUE) or not (FALSE)
ORDINAL	NUMBER	Position (ordinal number) of the parameter value (0 if a server parameter file was not used to start the instance). Useful only for parameters whose values are lists of strings.
UPDATE_COMMENT	VARCHAR2 (255)	Comments associated with the most recent update (null if a server parameter file was not used to start the instance)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.46 V\$SQL

V\$SQL lists statistics on shared SQL areas without the GROUP BY clause and contains one row for each child of the original SQL text entered. Statistics displayed in V\$SQL are normally updated at the end of query execution. However, for long running queries, they are updated every 5 seconds. This makes it easy to see the impact of long running SQL statements while they are still in progress.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	First thousand characters of the SQL text for the current cursor
SQL_FULLTEXT	CLOB	Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V\$SQLTEXT dynamic performance view.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
SHARABLE_MEM	NUMBER	Amount of shared memory used by the child cursor (in bytes)
PERSISTENT_MEM	NUMBER	Fixed amount of memory used for the lifetime of the child cursor (in bytes)
RUNTIME_MEM	NUMBER	Fixed amount of memory required during the execution of the child cursor
SORTS	NUMBER	Number of sorts that were done for the child cursor
LOADED VERSIONS	NUMBER	Indicates whether the context heap is loaded (1) or not (0)
OPEN VERSIONS	NUMBER	Indicates whether the child cursor is locked (1) or not (0)
USERS_OPENING	NUMBER	Number of users that have any of the child cursors open
FETCHES	NUMBER	Number of fetches associated with the SQL statement
EXECUTIONS	NUMBER	Number of executions that took place on this object since it was brought into the library cache
PX_SERVERS_EXECUTIONS	NUMBER	Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)
END_OF_FETCH_COUNT	NUMBER	Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column.
USERS_EXECUTING	NUMBER	Number of users executing the statement
LOADS	NUMBER	Number of times the object was either loaded or reloaded
FIRST_LOAD_TIME	VARCHAR2(76)	Timestamp of the parent creation time
INVALIDATIONS	NUMBER	Number of times this child cursor has been invalidated
PARSE_CALLS	NUMBER	Number of parse calls for this child cursor
DISK_READS	NUMBER	Number of disk reads for this child cursor
DIRECT_WRITES	NUMBER	Number of direct writes for this child cursor
DIRECT_READS	NUMBER	Number of direct reads for this child cursor
BUFFER_GETS	NUMBER	Number of buffer gets for this child cursor
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds)
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds)

Column	Datatype	Description
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds)
USER_IO_WAIT_TIME	NUMBER	User I/O Wait Time (in microseconds)
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds)
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds)
ROWS_PROCESSED	NUMBER	Total number of rows the parsed SQL statement returns
COMMAND_TYPE	NUMBER	Oracle command type definition
OPTIMIZER_MODE	VARCHAR2(10)	Mode under which the SQL statement was executed
OPTIMIZER_COST	NUMBER	Cost of this query given by the optimizer
OPTIMIZER_ENV	RAW(2000)	Optimizer environment
OPTIMIZER_ENV_HASH_VALUE	NUMBER	Hash value for the optimizer environment
PARSING_USER_ID	NUMBER	User ID of the user who originally built this child cursor
PARSING_SCHEMA_ID	NUMBER	Schema ID that was used to originally build this child cursor
PARSING_SCHEMA_NAME	VARCHAR2(128)	Schema name that was used to originally build this child cursor
KEPT VERSIONS	NUMBER	Indicates whether this child cursor has been marked to be kept pinned in the cache using the DBMS_SHARED_POOL package
ADDRESS	RAW(4 8)	Address of the handle to the parent for this cursor
TYPE_CHK_HEAP	RAW(4 8)	Descriptor of the type check heap for this child cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
OLD_HASH_VALUE	NUMBER	Old SQL hash value
PLAN_HASH_VALUE	NUMBER	Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
CHILD_NUMBER	NUMBER	Number of this child cursor
SERVICE	VARCHAR2(64)	Service name
SERVICE_HASH	NUMBER	Hash value for the name listed in the SERVICE column
MODULE	VARCHAR2(64)	Contains the name of the module that was executing when the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_MODULE
MODULE_HASH	NUMBER	Hash value of the module listed in the MODULE column
ACTION	VARCHAR2(64)	Contains the name of the action that was executing when the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_ACTION
ACTION_HASH	NUMBER	Hash value of the action listed in the ACTION column
SERIALIZABLE_ABORTS	NUMBER	Number of times the transaction failed to serialize, producing ORA-08177 errors, per cursor
OUTLINE_CATEGORY	VARCHAR2(64)	If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise the column is left blank.

Column	Datatype	Description
CPU_TIME	NUMBER	CPU time (in microseconds) used by this cursor for parsing, executing, and fetching
ELAPSED_TIME	NUMBER	Elapsed database time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then <code>ELAPSED_TIME</code> is the cumulative time for the query coordinator, plus all parallel query slave processes. Note that this column displays database time, not wall clock time. In some cases, <code>ELAPSED_TIME</code> can exceed the duration of the query. For example, this can occur for parallel queries.
OUTLINE_SID	NUMBER	Outline session identifier
CHILD_ADDRESS	RAW(4 8)	Address of the child cursor
SQLTYPE	NUMBER	Denotes the version of the SQL language used for this statement
REMOTE	VARCHAR2(1)	Indicates whether the cursor is remote mapped (Y) or not (N)
OBJECT_STATUS	VARCHAR2(19)	Status of the cursor: <ul style="list-style-type: none">• VALID - Valid, authorized without errors• VALID_AUTH_ERROR - Valid, authorized with authorization errors• VALID_COMPILE_ERROR - Valid, authorized with compilation errors• VALID_UNAUTH - Valid, unauthorized• INVALID_UNAUTH - Invalid, unauthorized• INVALID - Invalid, unauthorized but keep the timestamp
LITERAL_HASH_VALUE	NUMBER	Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when <code>CURSOR_SHARING</code> is used. This is not the hash value for the SQL statement. If <code>CURSOR_SHARING</code> is not used, then the value is 0.
LAST_LOAD_TIME	VARCHAR2(76)	Time at which the query plan was loaded into the library cache
IS_OBSOLETE	VARCHAR2(1)	Indicates whether the cursor has become obsolete (Y) or not (N). This can happen if the number of child cursors is too large.
IS_BIND_SENSITIVE	VARCHAR2(1)	Indicates whether the cursor is bind sensitive (Y) or not (N). A query is considered bind-sensitive if the optimizer peeked at one of its bind variable values when computing predicate selectivities and where a change in a bind variable value may cause the optimizer to generate a different plan.
IS_BIND_AWARE	VARCHAR2(1)	Indicates whether the cursor is bind aware (Y) or not (N). A query is considered bind-aware if it has been marked to use extended cursor sharing. The query would already have been marked as bind-sensitive.
IS_SHAREABLE	VARCHAR2(1)	Indicates whether the cursor can be shared (Y) or not (N)
CHILD_LATCH	NUMBER	Child latch number that is protecting the cursor. This column is obsolete and maintained for backward compatibility.
SQL_PROFILE	VARCHAR2(64)	SQL profile used for this statement, if any
SQL_PATCH	VARCHAR2(128)	SQL patch used for this statement, if any
SQL_PLAN_BASELINE	VARCHAR2(128)	SQL plan baseline used for this statement, if any
PROGRAM_ID	NUMBER	Program identifier
PROGRAM_LINE#	NUMBER	Program line number
EXACT_MATCHING_SIGNATURE	NUMBER	Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.
FORCE_MATCHING_SIGNATURE	NUMBER	Signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>FORCE</code>

Column	Datatype	Description
LAST_ACTIVE_TIME	DATE	Time at which the query plan was last active
BIND_DATA	RAW (2000)	Bind data
TYPECHECK_MEM	NUMBER	Typecheck memory
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system
		See Also: Oracle Exadata Storage Server Software documentation for more information
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
OPTIMIZED_PHY_READ_REQUESTS	NUMBER	Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL
LOCKED_TOTAL	NUMBER	Total number of times the child cursor has been locked
PINNED_TOTAL	NUMBER	Total number of times the child cursor has been pinned
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells
		See Also: Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells)
		See Also: Oracle Exadata Storage Server Software documentation for more information
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
IS_REOPTIMIZABLE	VARCHAR2 (1)	This column shows whether the next execution matching this child cursor will trigger a reoptimization. The values are: <ul style="list-style-type: none"> • Y: If the next execution will trigger a reoptimization • R: If the child cursor contains reoptimization information, but will not trigger reoptimization because the cursor was compiled in reporting mode • N: If the child cursor has no reoptimization information

Column	Datatype	Description
IS_RESOLVED_ADAPTIVE_PLA_N	VARCHAR2(1)	<p>This column shows whether all of the adaptive parts of a plan have been resolved to the final plan. Once the plan is resolved, the plan hash value and the plan displayed by DBMS_XPLAN will not change through the end of execution. The values for this column are:</p> <ul style="list-style-type: none"> • NULL: If the plan is not adaptive • Y: If the plan is fully resolved • N: If the plan is not yet fully resolved <p>See Also: Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_XPLAN package</p>
IM_SCANS	NUMBER	Number of In-Memory Column Store (IM column store) segment scans
IM_SCAN_BYTES_UNCOMPRESS_ED	NUMBER	Uncompressed size of data scanned from the IM column store
IM_SCAN_BYTES_INMEMORY	NUMBER	In-memory size of data scanned from the IM column store
DDL_NO_INVALIDATE	VARCHAR2(1)	Indicates if a DDL statement updated a dependent object and did not invalidate this cursor. The values are: <ul style="list-style-type: none"> • N: There has not been a DDL statement that updated a dependent object without invalidating this cursor. • Y: A DDL statement updated a dependent object and did not invalidate this cursor, but the cursor has not executed since this happened. • X: A DDL statement updated a dependent object and did not invalidate this cursor, and the cursor has executed since this happened.
IS_ROLLING_INVALID	VARCHAR2(1)	Indicates if this cursor is rolling invalidated. The values are: <ul style="list-style-type: none"> • N: This cursor is not rolling invalidated. • Y: This cursor is rolling invalidated, but the cursor has not executed in this state. • X: This cursor is rolling invalidated, and the cursor has executed in this state.
IS_ROLLING_REFRESH_INVAL_ID	VARCHAR2(1)	Indicates if this cursor is rolling invalidated and requires execution time refresh. The values are: <ul style="list-style-type: none"> • N: This cursor is not a cursor that is rolling invalidated and requires execution time refresh. • Y: This cursor is rolling invalidated and requires execution time refresh, but the cursor has not executed in this state. • X: This cursor is rolling invalidated and requires execution time refresh, and the cursor has executed in this state.
RESULT_CACHE	VARCHAR2(1)	Indicates whether the SQL statement used the result cache (Y) or not (N)
SQL_QUARANTINE ¹	VARCHAR2(128)	If the execution plan for this cursor is quarantined, then this column contains the name of the SQL quarantine configuration (corresponds to the NAME column in the DBA_SQL_QUARANTINE view). Otherwise, this column is null.
AVOIDED_EXECUTIONS ¹	NUMBER	Number of times this cursor was prevented from being used due to the plan being quarantined

¹ This column is available starting with Oracle Database 19c.

9.47 V\$SQL_BIND_CAPTURE

V\$SQL_BIND_CAPTURE displays information on bind variables used by SQL cursors. Each row in the view contains information for one bind variable defined in a cursor. This includes:

- Reference to the cursor defining the bind variable
(hash_value, address) for the parent cursor and (hash_value, child_address) for the child cursor.
- Bind metadata
Name, position, data type, character set ID, precision, scale, and maximum length of the bind variable.
- Bind data
One of the bind values used for the bind variable during a past execution of its associated SQL statement. Bind values are not always captured for this view. Bind values are displayed by this view only when the type of the bind variable is simple (this excludes LONG, LOB, and ADT data types) and when the bind variable is used in the WHERE or HAVING clauses of the SQL statement.

Bind capture is disabled when the STATISTICS_LEVEL initialization parameter is set to BASIC. This view can be joined with V\$SQLAREA on (HASH_VALUE, ADDRESS) and with V\$SQL on (HASH_VALUE, CHILD_ADDRESS).

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the parent cursor
HASH_VALUE	NUMBER	Hash value of the parent cursor in the library cache. The hash value is a fixed index for the view and should always be used to speed up access to the view.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
CHILD_ADDRESS	RAW(4 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Child cursor number
NAME	VARCHAR2(128)	Name of the bind variable

Column	Datatype	Description
POSITION	NUMBER	Position of the bind variable in the SQL statement
DUP_POSITION	NUMBER	If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable.
DATATYPE	NUMBER	Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.
DATATYPE_STRING	VARCHAR2 (15)	Textual representation of the bind data type. Beginning in Oracle Database 12c, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed.
CHARACTER_SID	NUMBER	National character set identifier
PRECISION	NUMBER	Precision (for numeric binds)
SCALE	NUMBER	Scale (for numeric binds)
MAX_LENGTH	NUMBER	Maximum bind length
WAS_CAPTURED	VARCHAR2 (3)	Indicates whether the bind value was captured (YES) or not (NO)
LAST_CAPTURED	DATE	Date when the bind value was captured. Bind values are captured when SQL statements are executed. To limit the overhead, binds are captured at most every 15 minutes for a given cursor.
VALUE_STRING	VARCHAR2 (4000)	Value of the bind represented as a string
VALUE_ANYDATA	ANYDATA	Value of the bind represented using the ANYDATA data type. This representation is useful to programmatically decode the value of the bind variable. This column is NULL if a PL/SQL-only data type appears in the DATATYPE column.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "[STATISTICS_LEVEL](#)"
- "[V\\$SQLAREA](#)"
- "[V\\$SQL](#)"

9.48 V\$SQL_BIND_DATA

V\$SQL_BIND_DATA describes information related to bind variables.

V\$SQL_BIND_DATA describes, for each distinct bind variable in each cursor owned by the session querying this view:

- Actual bind data, if the bind variable is user defined

- The underlying literal, if the CURSOR_SHARING parameter is set to FORCE and the bind variable is system generated. (System-generated binds have a value of 256 in the SHARED_FLAG2 column.)

Column	Datatype	Description
CURSOR_NUM	NUMBER	Cursor number for this bind
POSITION	NUMBER	Bind position
DATATYPE	NUMBER	Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.
SHARED_MAX_LEN	NUMBER	Shared maximum length for this bind from the shared cursor object associated with this bind
PRIVATE_MAX_LEN	NUMBER	Private maximum length for this bind sent from the client
ARRAY_SIZE	NUMBER	Maximum number of array elements (for array binds only)
PRECISION	NUMBER	Precision (for numeric binds)
SCALE	NUMBER	Scale (for numeric binds)
SHARED_FLAG	NUMBER	Shared bind data flags
SHARED_FLAG2	NUMBER	Shared bind data flags (continued)
BUF_ADDRESS	RAW(4 8)	Bind buffer memory address
BUF_LENGTH	NUMBER	Bind buffer length
VAL_LENGTH	NUMBER	Actual bind value length
BUF_FLAG	NUMBER	Bind buffer flags
INDICATOR	NUMBER	Bind indicator
VALUE	VARCHAR2(4000)	Contents of the bind buffer
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

["CURSOR_SHARING"](#)

9.49 V\$SQL_BIND_METADATA

V\$SQL_BIND_METADATA describes metadata related to bind variables.

V\$SQL_BIND_METADATA describes, for each distinct bind variable in each cursor owned by the session querying this view:

- Bind metadata provided by the client, if the bind variable is user defined
- Metadata based on the underlying literal, if the CURSOR_SHARING parameter is set to FORCE and the bind variable is system-generated.

Column	Datatype	Description
ADDRESS	RAW(4 8)	Memory address of the child cursor that owns this bind variable
POSITION	NUMBER	Bind position
DATATYPE	NUMBER	Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.
MAX_LENGTH	NUMBER	Maximum length of the bind value
ARRAY_LEN	NUMBER	Maximum number of array elements (for array binds only)
BIND_NAME	VARCHAR2(128)	User-defined or system-generated bind variable name (if used)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

["CURSOR_SHARING"](#)

9.50 V\$SQL_CS_HISTOGRAM

V\$SQL_CS_HISTOGRAM summarizes the monitoring information stored by adaptive cursor sharing. This information is used to decide whether to enable extended cursor sharing for a query. It is stored in a histogram, whose bucket's contents are exposed by this view.

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
CHILD_NUMBER	NUMBER	Number of the child cursor being monitored
BUCKET_ID	NUMBER	Bucket number of the monitoring histogram
COUNT	NUMBER	Value in this bucket of the histogram
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.51 V\$SQL_CS_SELECTIVITY

V\$SQL_CS_SELECTIVITY exposes the valid selectivity ranges for a child cursor in extended cursor sharing mode. A valid range consists of a low and high value for each predicate containing binds. Each predicate's selectivity (with the current bind value) must fall between the corresponding low and high values in order for the child cursor to be shared.

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
CHILD_NUMBER	NUMBER	Number of the child cursor
PREDICATE	VARCHAR2(40)	Predicate whose selectivity must fall between low and high values
RANGE_ID	NUMBER	Identifier for the range used to match up the low and high values for multiple predicates
LOW	VARCHAR2(10)	Lower bound for allowable selectivity
HIGH	VARCHAR2(10)	Upper bound for allowable selectivity
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.52 V\$SQL_CS_STATISTICS

V\$SQL_CS_STATISTICS contains the raw execution statistics used by the monitoring component of adaptive cursor sharing. A sample of the executions is monitored. This view exposes which executions were sampled, and what the statistics were for those executions. The statistics are cumulative for each distinct set of bind values.

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
CHILD_NUMBER	NUMBER	Number of the child cursor being monitored
BIND_SET_HASH_VALUE	NUMBER	Hash of the values of the binds
PEEKED	VARCHAR2(1)	Indicates if this is the bind set used to build the cursor (Y) or not (N)
EXECUTIONS	NUMBER	Number of times this bind set has been executed and monitored
ROWS_PROCESSED	NUMBER	Cumulative number of rows processed by all row sources in the plan over all monitored executions with this bind set
BUFFER_GETS	NUMBER	Cumulative number of buffer gets over all monitored executions with this bind set

Column	Datatype	Description
CPU_TIME	NUMBER	Cumulative CPU time (in microseconds) used by this cursor for monitored executions with this bind set
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.53 V\$SQL_CURSOR

V\$SQL_CURSOR displays debugging information for each cursor associated with the session querying this view.

Column	Datatype	Description
CURNO	NUMBER	Cursor number
FLAG	NUMBER	Flags set in the cursor
STATUS	VARCHAR2 (9)	Status of the cursor; that is, what state the cursor is in
PARENT_HANDLE	RAW (4 8)	Pointer to the parent cursor handle
PARENT_LOCK	RAW (4 8)	Pointer to the parent cursor lock
CHILD_LOCK	RAW (4 8)	Pointer to the child cursor lock
CHILD_PIN	RAW (4 8)	Pointer to the child cursor pin
PERS_HEAP_MEM	NUMBER	Total amount of memory allocated from persistent heap for this cursor
WORK_HEAP_MEM	NUMBER	Total amount of memory allocated from the work heap for this cursor
BIND_VARS	NUMBER	Total number of bind positions in the query currently parsed into this cursor
DEFINE_VARS	NUMBER	Total number of define variables in the query currently parsed into this cursor
BIND_MEM_LOC	VARCHAR2 (64)	Which memory heap the bind variables are stored in: either the UGA or the CGA
INST_FLAG	VARCHAR2 (64)	Instantiation object flags
INST_FLAG2	VARCHAR2 (64)	Instantiation object flags (continued)
CHILD_HANDLE	RAW (4 8)	Pointer to the child cursor handle
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.54 V\$SQL_JOIN_FILTER

V\$SQL_JOIN_FILTER displays performance information about the characteristics of join filters when they are used for a parallel cursor. (A join filter is a bitmap filter applied to table rows before a join operation in order to avoid parallel communication.)

Column	Datatype	Description
QC_SESSION_ID	NUMBER	QC (Query Coordinator) session ID of the given cursor for the given parallel query
QC_INSTANCE_ID	NUMBER	QC (Query Coordinator) instance ID of the given cursor for the given parallel query
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value of the given cursor for the given parallel query
FILTER_ID	NUMBER	An ID that identifies the join filter in the given cursor and corresponds to the filter ID in the execution plan
LENGTH	NUMBER	Total size of the join filter field
BITS_SET	NUMBER	Number of bits set in this filter
FILTERED	NUMBER	Number of rows seen by the join filter
PROBED	NUMBER	Number of rows of the right table that have been tested against the bitmap filter. This is the sum of the filtered rows plus the non-filtered rows.
ACTIVE	NUMBER	Whether the filter is active (Yes) or not (No)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.55 V\$SQL_MONITOR

V\$SQL_MONITOR displays SQL statements whose execution have been (or are being) monitored by Oracle.

This view contains global, high-level information about simple and composite database operations.

Oracle Database monitors simple database operations, which are top SQL statements and PL/SQL subprograms, when any of the following conditions is true:

- The operations run in parallel.
- The operations have consumed at least 5 seconds of CPU or I/O time in a single execution.
- Tracking for the operations is forced by the /*+ MONITOR */ hint.

For simple database operations, monitoring statistics are not cumulative over several executions. In this case, one entry in V\$SQL_MONITOR is dedicated to a single execution of a SQL statement. If the database monitors two executions of the same SQL statement, then each execution has a separate entry in V\$SQL_MONITOR.

For simple database operations, V\$SQL_MONITOR has one entry for the parallel execution coordinator process and one entry for each parallel execution server process. Each entry has corresponding entries in V\$SQL_PLAN_MONITOR. Because the processes allocated for the parallel execution of a SQL statement are cooperating for the same execution, these entries share the same execution key (the combination of SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID).

Oracle Database monitors composite database operations when either of the following conditions is true:

- A database operation was started with DBMS_SQL_MONITOR.BEGIN_OPERATION and the operation has consumed at least 5 seconds of CPU or I/O time.
- Tracking for the operation is forced by setting FORCE_TRACKING to Y in DBMS_SQL_MONITOR.BEGIN_OPERATION.

For composite database operations, each row contains an operation whose statistics are accumulated over the SQL statements and PL/SQL subprograms that run in the same session as part of the operation.

The V\$SQL_MONITOR view contains a subset of the statistics available in V\$SQL. However, unlike V\$SQL, monitoring statistics are not cumulative over several executions. Instead, one entry in V\$SQL_MONITOR is dedicated to a single execution of a SQL statement. If the database monitors two executions of the same SQL statement, then each execution has a separate entry in V\$SQL_MONITOR.

The primary key is the combination of the columns SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID.

V\$SQL_MONITOR has one entry for the parallel execution coordinator process, and one entry for each parallel execution server process. Each entry has corresponding entries in V\$SQL_PLAN_MONITOR. Because the processes allocated for the parallel execution of a SQL statement are cooperating for the same execution, these entries share the same execution key (the composite SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID). You can aggregate the execution key to determine the overall statistics for a parallel execution.

When the SQL statement being monitored is executing, statistics in V\$SQL_MONITOR are generally refreshed in near real time, once every second. Once the execution ends, monitoring information is not deleted immediately. Instead, it is kept in V\$SQL_MONITOR for at least one minute. The entry will eventually be deleted to reclaim its space as new statements are monitored.

Column	Datatype	Description
KEY	NUMBER	Artificial join key to efficiently join V\$SQL_MONITOR with its corresponding plan level monitoring statistics stored in V\$SQL_PLAN_MONITOR
REPORT_ID	NUMBER	Unique ID of the XML report stored in Automatic Workload Repository (AWR) for this monitored entity
STATUS	VARCHAR2(19)	SQL execution status: <ul style="list-style-type: none"> • QUEUED - SQL statement is queued • EXECUTING - SQL statement is still executing • DONE (ERROR) - Execution terminated with an error • DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched • DONE (ALL ROWS) - Execution terminated and all rows were fetched • DONE - Execution terminated (parallel execution)
USER#	NUMBER	User ID of the database user who issued the SQL being monitored
USERNAME	VARCHAR2(128)	User name of the database user who issued the SQL being monitored

Column	Datatype	Description
MODULE	VARCHAR2(64)	Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_MODULE procedure
ACTION	VARCHAR2(64)	Name of the executing action when sampled, as set by the DBMS_APPLICATION_INFO.SET_ACTION procedure
SERVICE_NAME	VARCHAR2(64)	Service name of the user session
CLIENT_IDENTIFIER	VARCHAR2(64)	Client identifier from the user session
CLIENT_INFO	VARCHAR2(64)	Client information for the user session
PROGRAM	VARCHAR2(48)	Name of the operating system program that issued the monitored SQL
PLSQL_ENTRY_OBJECT_ID	NUMBER	Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack
PLSQL_ENTRY_SUBPROGRAM_ID	NUMBER	Subprogram ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack
PLSQL_OBJECT_ID	NUMBER	Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL
PLSQL_SUBPROGRAM_ID	NUMBER	Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL
FIRST_REFRESH_TIME	DATE	Time when monitoring of the SQL statement started, generally a few seconds after execution start time
LAST_REFRESH_TIME	DATE	Time when statistics in V\$SQL_MONITOR were last updated for the SQL statement. Statistics are generally refreshed every second when the statement executes.
REFRESH_COUNT	NUMBER	Number of times V\$SQL_MONITOR statistics have been refreshed (generally once every second when the SQL statement executes)
DBOP_EXEC_ID	NUMBER	Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.
DBOP_NAME	VARCHAR2(30)	Database operation name. If the type is SQL, the DBOP_NAME will be NULL.
SID	NUMBER	Session identifier executing (or having executed) the SQL statement being monitored
PROCESS_NAME	VARCHAR2(5)	Process name identifier executing (or having executed) the statement; ora if the process is foreground, else the background process name (for example, p001 for PX server p001)
SQL_ID	VARCHAR2(13)	SQL identifier of the statement being monitored
SQL_TEXT	VARCHAR2(2000)	Up to the first 2000 characters of the text of the SQL being monitored
IS_FULL_SQLTEXT	VARCHAR2(1)	Indicates whether the SQL_TEXT column has the entire SQL text (Y) or not (N)
SQL_EXEC_START	DATE	Time when the execution started
SQL_EXEC_ID	NUMBER	Execution identifier. Together, the three columns SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID represent the execution key. The execution key is used to uniquely identify one execution of the SQL statement.
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value
SQL_FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one SQL_FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the SQL_FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.

Column	Datatype	Description
EXACT_MATCHING_SIGNATURE	NUMBER	Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.
FORCE_MATCHING_SIGNATURE	NUMBER	Same as EXACT_MATCHING_SIGNATURE but literals in the SQL text are replaced by binds
SQL_CHILD_ADDRESS	RAW(4 8)	Address of the child cursor (can be used with SQL_ID to join with V\$SQL)
SESSION_SERIAL#	NUMBER	Session serial number executing the statement being monitored
PX_IS_CROSS_INSTANCE	VARCHAR2(1)	Indicates whether the SQL statement ran parallel across multiple instances (Y) or not (N)
PX_MAXDOP	NUMBER	Maximum degree of parallelism for any plan operation executed on behalf of the monitored SQL
PX_MAXDOP_INSTANCES	NUMBER	Number of database instances touched at the maximum degree of parallelism
PX_SERVERS_REQUESTED	NUMBER	Total number of parallel execution servers requested to execute the monitored SQL
PX_SERVERS_ALLOCATED	NUMBER	Actual number of parallel execution servers allocated to execute the query
PX_SERVER#	NUMBER	Logical parallel execution server process number executing (or having executed) the statement being monitored; NULL if this monitoring entry is not associated with an execution server. This is a logical number within the parallel server set (see SERVER# in V\$PX_SESSION).
PX_SERVER_GROUP	NUMBER	Logical parallel execution server group number to which PX_SERVER# belongs (see SERVER_GROUP in V\$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server. This value is generally 1 unless the SQL statement has one or more parallel sub-queries.
PX_SERVER_SET	NUMBER	Number (1 or 2) of the logical set of parallel execution servers to which PX_SERVER# belongs (see SERVER_SET in V\$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server
PX_QCINST_ID	NUMBER	Instance identifier where the parallel execution coordinator runs; NULL if PX_SERVER# is NULL
PX_QCSID	NUMBER	Session identifier for the parallel execution coordinator; NULL if PX_SERVER# is NULL
ERROR_NUMBER	VARCHAR2(40)	Error number encountered in case a SQL fails to execute successfully (for example, 932 in case of ORA-00932)
ERROR_FACILITY	VARCHAR2(4)	Error facility in case a SQL fails to execute successfully (for example, ORA in case of ORA-00932)
ERROR_MESSAGE	VARCHAR2(256)	Detailed error message displayed corresponding to the error number and error facility when a SQL fails to execute successfully
BINDS_XML	CLOB	Information about bind variables used with the SQL, such as name, position, value, data type, and so on (stored in XML format)
OTHER_XML	CLOB	Additional information about SQL execution stored in XML format
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds); updated as the statement executes
QUEUING_TIME	NUMBER	Duration of time (in microseconds) spent by SQL in the statement queue
CPU_TIME	NUMBER	CPU time (in microseconds); updated as the statement executes
FETCHES	NUMBER	Number of fetches associated with the SQL statement; updated as the statement executes

Column	Datatype	Description
BUFFER_GETS	NUMBER	Number of buffer get operations; updated as the statement executes
DISK_READS	NUMBER	Number of disk reads; updated as the statement executes
DIRECT_WRITES	NUMBER	Number of direct writes; updated as the statement executes
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds); updated as the statement executes
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds); updated as the statement executes
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds); updated as the statement executes
USER_IO_WAIT_TIME	NUMBER	User I/O Wait Time (in microseconds); updated as the statement executes
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds); updated as the statement executes
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds); updated as the statement executes
RM_LAST_ACTION	VARCHAR2 (48)	The most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none">• CANCEL_SQL• KILL_SESSION• LOG_ONLY• SWITCH TO <CG NAME> For the last value, <CG NAME> is the name of the consumer group that the SQL operation was switched to. If the Resource Plan has since been changed then <CG NAME> is the ID of the consumer group.
RM_LAST_ACTION_REASON	VARCHAR2 (128)	The reason for the most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none">• SWITCH_CPU_TIME• SWITCH_IO_REQS• SWITCH_IO_MBS• SWITCH_ELAPSED_TIME• SWITCH_IO_LOGICAL
RM_LAST_ACTION_TIME	DATE	The time of the most recent action that was taken on this SQL operation by Resource Manager
RM_CONSUMER_GROUP	VARCHAR2 (128)	The current consumer group for this SQL operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Column	Datatype	Description
CON_NAME	VARCHAR2 (128)	Container name of the object. The value of this column is NULL in non-CDBs.
ECID	VARCHAR2 (64)	Execution context identifier (sent by Application Server)
IS_ADAPTIVE_PLAN	VARCHAR2 (1)	Indicates whether the statistics are from an adaptive plan (Y) or not (N).
IS_FINAL_PLAN	VARCHAR2 (1)	Indicates whether the statistics are from the final plan (Y) or not (N).
IN_DBOP_NAME	VARCHAR2 (30)	If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the name of that DBOP
IN_DBOP_EXEC_ID	NUMBER	If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the execution ID of that DBO
IO_CELL_UNCOMPRESSED_BYT ES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells
		See Also: Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_ELIGIBLE _BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system
		See Also: Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_RETURNED _BYTES	NUMBER	Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells)
		See Also: Oracle Exadata Storage Server Software documentation for more information
CURRENT_USER ¹	NUMBER	Unique number identifying the current user
CURRENT_USERNAME ¹	VARCHAR2 (128)	Username for the current user

¹ This column is available starting with Oracle Database 19c.

9.56 V\$SQL_MONITOR_SESSTAT

`V$SQL_MONITOR_SESSTAT` displays information about statistics that are exposed in `V$SESSTAT`.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
KEY	NUMBER	Artificial join key to efficiently join with other database operation views
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Value associated with the statistic

 See Also:["V\\$SESSTAT"](#)

9.57 V\$SQL_MONITOR_STATNAME

V\$SQL_MONITOR_STATNAME provides information about the plan line statistics exposed in V\$SQL_PLAN_MONITOR. A plan line statistic is identified by its group ID (column GROUP_ID) and its ID (column ID).

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
ID	NUMBER	Plan line statistic ID
GROUP_ID	NUMBER	Plan line statistic group ID
NAME	VARCHAR2 (40)	Short name for the statistic
DESCRIPTION	VARCHAR2 (200)	Short description for the statistic
TYPE	NUMBER	Reserved for internal use
FLAGS	NUMBER	Reserved for internal use

 See Also:["V\\$SQL_PLAN_MONITOR"](#)

9.58 V\$SQL_OPTIMIZER_ENV

V\$SQL_OPTIMIZER_ENV displays the contents of the optimizer environment used to build the execution plan of a SQL cursor. This view can be joined with V\$SQLAREA on (HASH_VALUE, ADDRESS) and with V\$SQL on (HASH_VALUE, CHILD_ADDRESS).

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the parent cursor
HASH_VALUE	NUMBER	Hash value of the parent cursor in the library cache. The hash value is the fixed index for the view and should be used when querying V\$SQL_OPTIMIZER_ENV to avoid scanning the entire library cache.
SQL_ID	VARCHAR2(13)	SQL identifier
CHILD_ADDRESS	RAW(4 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Child cursor number
ID	NUMBER	Unique identifier of the parameter in the optimizer environment
NAME	VARCHAR2(40)	Name of the parameter
ISDEFAULT	VARCHAR2(3)	Indicates whether the parameter is set to the default value (YES) or not (NO)
VALUE	VARCHAR2(25)	Value of the parameter
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.59 V\$SQL_PLAN

V\$SQL_PLAN contains the execution plan information for each child cursor loaded in the library cache.

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V\$SQLAREA to add the cursor-specific information.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
PLAN_HASH_VALUE	NUMBER	Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.

Column	Datatype	Description
CHILD_ADDRESS	RAW(4 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Number of the child cursor that uses this execution plan. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to add the child cursor-specific information.
TIMESTAMP	DATE	Date and time when the execution plan was generated
OPERATION	VARCHAR2(120)	Name of the internal operation performed in this step (for example, TABLE ACCESS)
OPTIONS	VARCHAR2(120)	A variation on the operation described in the OPERATION column (for example, FULL)
OBJECT_NODE	VARCHAR2(160)	Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed.
OBJECT#	NUMBER	Object number of the table or the index
OBJECT_OWNER	VARCHAR2(128)	Name of the user who owns the schema containing the table or index
OBJECT_NAME	VARCHAR2(128)	Name of the table or index
OBJECT_ALIAS	VARCHAR2(261)	Alias for the object
OBJECT_TYPE	VARCHAR2(80)	Type of the object
OPTIMIZER	VARCHAR2(80)	Current mode of the optimizer for the first row in the plan (statement line), for example, ALL_ROWS. When the operation is a database access (for example, TABLE ACCESS), this column indicates whether or not the object is analyzed.
ID	NUMBER	A number assigned to each step in the execution plan
PARENT_ID	NUMBER	ID of the next execution step that operates on the output of the current step
DEPTH	NUMBER	Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.
POSITION	NUMBER	Order of processing for all operations that have the same PARENT_ID
SEARCH_COLUMNS	NUMBER	Number of index columns with start and stop keys (that is, the number of columns with matching predicates)
COST	NUMBER	Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
CARDINALITY	NUMBER	Estimate, by the cost-based optimizer, of the number of rows produced by the operation
BYTES	NUMBER	Estimate, by the cost-based optimizer, of the number of bytes produced by the operation
OTHER_TAG	VARCHAR2(140)	Describes the contents of the OTHER column. See EXPLAIN PLAN for values.
PARTITION_START	VARCHAR2(256)	Start partition of a range of accessed partitions
PARTITION_STOP	VARCHAR2(256)	Stop partition of a range of accessed partitions
PARTITION_ID	NUMBER	Step that computes the pair of values of the PARTITION_START and PARTITION_STOP columns
OTHER	VARCHAR2(4000)	Other information specific to the execution step that users may find useful. See EXPLAIN PLAN for values.

Column	Datatype	Description
DISTRIBUTION	VARCHAR2(80)	Stores the method used to distribute rows from producer query servers to consumer query servers
CPU_COST	NUMBER	CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
IO_COST	NUMBER	I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
TEMP_SPACE	NUMBER	Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
ACCESS_PREDICATES	VARCHAR2(4000)	Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.
FILTER_PREDICATES	VARCHAR2(4000)	Predicates used to filter rows before producing them
PROJECTION	VARCHAR2(4000)	Expressions produced by the operation
TIME	NUMBER	Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
QBLOCK_NAME	VARCHAR2(128)	Name of the query block
REMARKS	VARCHAR2(4000)	Remarks
OTHER_XML	CLOB	Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML since multiple pieces of information can be stored there. This includes: <ul style="list-style-type: none"> • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan • Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans. Note that in Oracle Database 12c, there will be extra rows in the plan table and V\$SQL_PLAN.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.60 V\$SQL_PLAN_MONITOR

V\$SQL_PLAN_MONITOR displays plan level monitoring statistics for each SQL statement found in V\$SQL_MONITOR. Each row in V\$SQL_PLAN_MONITOR corresponds to an operation of the

execution plan being monitored. As with V\$SQL_MONITOR, statistics exposed in V\$SQL_PLAN_MONITOR are generally updated every second when the statement executes. These statistics are recycled on the same basis as V\$SQL_MONITOR.

To eliminate the overhead of SQL plan monitoring, statistics collected for each operation of the plan do not record timing information such as elapsed time, CPU time, or I/O time. Instead, this timing information can be estimated quite accurately by joining V\$SQL_PLAN_MONITOR with V\$ACTIVE_SESSION_HISTORY on SQL_ID, SQL_EXEC_START, SQL_EXEC_ID, and SQL_PLAN_LINE_ID (simply named PLAN_LINE_ID in V\$SQL_PLAN_MONITOR). The result of that join is a sample of the activity performed by each operation in the plan, from which an estimate of CPU time and wait time can be derived. This can be achieved by breaking statement level monitoring time statistics found in V\$SQL_MONITOR in proportion to the number of samples found in V\$ACTIVE_SESSION_HISTORY for the corresponding activity type.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
KEY	NUMBER	Foreign key to efficiently join V\$SQL_PLAN_MONITOR with V\$SQL_MONITOR (see V\$SQL_MONITOR)
STATUS	VARCHAR2 (19)	SQL execution status: <ul style="list-style-type: none"> • EXECUTING - SQL statement is still executing • DONE (ERROR) - Execution terminated with an error • DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched • DONE (ALL ROWS) - Execution terminated and all rows were fetched • DONE - Execution terminated (parallel execution)
FIRST_REFRESH_TIME	DATE	Time when monitoring of the SQL statement started
LAST_REFRESH_TIME	DATE	Time when statistics were last updated for the SQL statement
FIRST_CHANGE_TIME	DATE	First time a row was produced by this operation
LAST_CHANGE_TIME	DATE	Last time a row was produced by this operation
REFRESH_COUNT	NUMBER	Number of times statistics have been refreshed
SID	NUMBER	Session identifier executing (or having executed) the SQL statement being monitored
PROCESS_NAME	VARCHAR2 (5)	Process name identifier
SQL_ID	VARCHAR2 (13)	SQL identifier
SQL_EXEC_START	DATE	Time when the execution started
SQL_EXEC_ID	NUMBER	Execution identifier
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value
SQL_CHILD_ADDRESS	RAW (4 8)	Address of the child cursor
PLAN_PARENT_ID	NUMBER	ID of the next execution step that operates on the output of the current step
PLAN_LINE_ID	NUMBER	Plan line number for the entry
PLAN_OPERATION	VARCHAR2 (30)	Plan operation name (from V\$SQL_PLAN)
PLAN_OPTIONS	VARCHAR2 (30)	Plan option name (from V\$SQL_PLAN)

Column	Datatype	Description
PLAN_OBJECT_OWNER	VARCHAR2(128)	Name of the user who owns the schema containing the table or index
PLAN_OBJECT_NAME	VARCHAR2(128)	Name of the table or index
PLAN_OBJECT_TYPE	VARCHAR2(80)	Type of the object
PLAN_DEPTH	NUMBER	Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.
PLAN_POSITION	NUMBER	Order of processing for all operations that have the same PARENT_ID
PLAN_COST	NUMBER	Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_CARDINALITY	NUMBER	Estimate, by the cost-based optimizer, of the number of rows produced by the operation
PLAN_BYTES	NUMBER	Estimate, by the cost-based optimizer, of the number of bytes produced by the operation
PLAN_TIME	NUMBER	Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_PARTITION_START	VARCHAR2(256)	Start partition of a range of accessed partitions
PLAN_PARTITION_STOP	VARCHAR2(256)	Stop partition of a range of accessed partitions
PLAN_CPU_COST	NUMBER	CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_IO_COST	NUMBER	I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_TEMP_SPACE	NUMBER	Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
STARTS	NUMBER	Number of times this operation was executed. For example, an operation is executed multiple times when it is on the right side of a nested-loop join (once for each row of the left input of that nested-loop join).
OUTPUT_ROWS	NUMBER	Number of rows produced by this operation since the execution started. This number is cumulated for all executions of this operation. Divide by the value of the STARTS column to compute the average number of rows per execution of the operation. Note that the value in the STARTS column is equal to or higher than the value in the OUTPUT_ROWS column. The value will usually be equal, but depending on internal optimizations a higher value may be seen.
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.

Column	Datatype	Description
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
WORKAREA_MEM	NUMBER	Amount of memory (in bytes) used by the operation when the query is executing; NULL if the execution is done. This applies only to operations using a work area, such as sort, hash-join, group-by, and so on.
WORKAREA_MAX_MEM	NUMBER	Maximum value (in bytes) for WORKAREA_MEM; NULL if the operation is not using a work area. When the execution is finished, this value will hold the maximum amount of memory consumed by this operation during the execution of the statement.
WORKAREA_TEMPSEG	NUMBER	Amount of temporary space (in bytes) used by the operation when the query is executing; NULL if the operation has not spilled to disk or if the execution is finished
WORKAREA_MAX_TEMPSEG	NUMBER	Maximum value (in bytes) for WORKAREA_TEMPSEG; NULL if this operation never spilled to disk. When the execution is done, this value will hold the maximum amount of temporary space consumed by this operation during the entire execution.
OTHERSTAT_GROUP_ID	NUMBER	Plan line statistic group identifier (see GROUP_ID column in V\$SQL_MONITOR_STATNAME)
OTHERSTAT_1_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 1 of that plan line
OTHERSTAT_1_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_1_VALUE	NUMBER	Value of statistic number 1 of that plan line
OTHERSTAT_2_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 2 of that plan line
OTHERSTAT_2_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_2_VALUE	NUMBER	Value of statistic number 2 of that plan line
OTHERSTAT_3_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 3 of that plan line
OTHERSTAT_3_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_3_VALUE	NUMBER	Value of statistic number 3 of that plan line
OTHERSTAT_4_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 4 of that plan line
OTHERSTAT_4_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_4_VALUE	NUMBER	Value of statistic number 4 of that plan line
OTHERSTAT_5_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 5 of that plan line
OTHERSTAT_5_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_5_VALUE	NUMBER	Value of statistic number 5 of that plan line
OTHERSTAT_6_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 6 of that plan line
OTHERSTAT_6_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_6_VALUE	NUMBER	Value of statistic number 6 of that plan line
OTHERSTAT_7_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 7 of that plan line
OTHERSTAT_7_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_7_VALUE	NUMBER	Value of statistic number 7 of that plan line

Column	Datatype	Description
OTHERSTAT_8_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 8 of that plan line
OTHERSTAT_8_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_8_VALUE	NUMBER	Value of statistic number 8 of that plan line
OTHERSTAT_9_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 9 of that plan line
OTHERSTAT_9_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_9_VALUE	NUMBER	Value of statistic number 9 of that plan line
OTHERSTAT_10_ID	NUMBER	Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 10 of that plan line
OTHERSTAT_10_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_10_VALUE	NUMBER	Value of statistic number 10 of that plan line
OTHER_XML	CLOB	Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML because it allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan
PLAN_OPERATION_INACTIVE	NUMBER	Indicates whether this plan operation was part of the final resolved plan

9.61 V\$SQL_PLAN_STATISTICS

V\$SQL_PLAN_STATISTICS provides execution statistics at the row source level for each child cursor.

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V\$SQLAREA to locate the parent cursor.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent statement in the library cache

Column	Datatype	Description
PLAN_HASH_VALUE	NUMBER	Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line)
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
CHILD_ADDRESS	RAW(4 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Number of the child cursor that uses this work area. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to locate the child cursor using this area.
OPERATION_ID	NUMBER	A number assigned to each step in the execution plan
EXECUTIONS	NUMBER	Number of times this cursor has been executed
LAST_STARTS	NUMBER	Number of times this operation has been started, during the last execution
STARTS	NUMBER	Number of times this operation has been started, accumulated over the past executions
LAST_OUTPUT_ROWS	NUMBER	Number of rows produced by the row source, during the last execution
OUTPUT_ROWS	NUMBER	Number of rows produced by the row source, accumulated over the past executions
LAST_CR_BUFFER_GETS	NUMBER	Number of buffers retrieved in consistent mode, during the last execution. Buffers are usually retrieved in consistent mode for queries.
CR_BUFFER_GETS	NUMBER	Number of buffers retrieved in consistent mode, accumulated over the past executions. Buffers are usually retrieved in consistent mode for queries.
LAST CU BUFFER GETS	NUMBER	Number of buffers retrieved in current mode, during the last execution. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.
CU_BUFFER_GETS	NUMBER	Number of buffers retrieved in current mode, accumulated over the past executions. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.
LAST_DISK_READS	NUMBER	Number of physical disk reads performed by the operation, during the last execution
DISK_READS	NUMBER	Number of physical disk reads performed by the operation, accumulated over the past executions
LAST_DISK_WRITES	NUMBER	Number of physical disk writes performed by the operation, during the last execution
DISK_WRITES	NUMBER	Number of physical disk writes performed by the operation, accumulated over the past executions
LAST_ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) corresponding to this operation, during the last execution
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) corresponding to this operation, accumulated over the past executions

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$SQLAREA"](#)

9.62 V\$SQL_PLAN_STATISTICS_ALL

V\$SQL_PLAN_STATISTICS_ALL contains memory usage statistics for row sources that use SQL memory (sort or hash-join). This view concatenates information in V\$SQL_PLAN with execution statistics from V\$SQL_PLAN_STATISTICS and V\$SQL_WORKAREA.

Column	Datatype	Description
ADDRESS	RAW (4 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V\$SQLAREA to add the cursor-specific information.
SQL_ID	VARCHAR2 (13)	SQL identifier of the parent statement in the library cache
PLAN_HASH_VALUE	NUMBER	Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line)
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
CHILD_ADDRESS	RAW (4 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Number of the child cursor that uses this execution plan. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to add the child cursor-specific information.
TIMESTAMP	DATE	Date and time when the execution plan was generated
OPERATION	VARCHAR2 (120)	Name of the internal operation performed in this step (for example, TABLE ACCESS)
OPTIONS	VARCHAR2 (120)	A variation on the operation described in the OPERATION column (for example, FULL)
OBJECT_NODE	VARCHAR2 (160)	Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed.

Column	Datatype	Description
OBJECT#	NUMBER	Object number of the table or the index
OBJECT_OWNER	VARCHAR2(128)	Name of the user who owns the schema containing the table or index
OBJECT_NAME	VARCHAR2(128)	Name of the table or index
OBJECT_ALIAS	VARCHAR2(261)	Alias for the object
OBJECT_TYPE	VARCHAR2(80)	Type of the object
OPTIMIZER	VARCHAR2(80)	Current mode of the optimizer for the first row in the plan (statement line), for example, CHOOSE. When the operation is a database access (for example, TABLE ACCESS), this column indicates whether or not the object is analyzed.
ID	NUMBER	A number assigned to each step in the execution plan
PARENT_ID	NUMBER	ID of the next execution step that operates on the output of the current step
DEPTH	NUMBER	Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.
POSITION	NUMBER	Order of processing for all operations that have the same PARENT_ID
SEARCH_COLUMNS	NUMBER	Number of index columns with start and stop keys (that is, the number of columns with matching predicates)
COST	NUMBER	Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
CARDINALITY	NUMBER	Estimate, by the cost-based optimizer, of the number of rows produced by the operation
BYTES	NUMBER	Estimate, by the cost-based optimizer, of the number of bytes produced by the operation
OTHER_TAG	VARCHAR2(140)	Describes the contents of the OTHER column. See EXPLAIN PLAN for values.
PARTITION_START	VARCHAR2(256)	Start partition of a range of accessed partitions
PARTITION_STOP	VARCHAR2(256)	Stop partition of a range of accessed partitions
PARTITION_ID	NUMBER	Step that computes the pair of values of the PARTITION_START and PARTITION_STOP columns
OTHER	VARCHAR2(4000)	Other information specific to the execution step that users may find useful. See EXPLAIN PLAN for values.
DISTRIBUTION	VARCHAR2(80)	Stores the method used to distribute rows from producer query servers to consumer query servers
CPU_COST	NUMBER	CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
IO_COST	NUMBER	I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
TEMP_SPACE	NUMBER	Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
ACCESS_PREDICATES	VARCHAR2(4000)	Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.

Column	Datatype	Description
FILTER_PREDICATES	VARCHAR2(4000)	Predicates used to filter rows before producing them
PROJECTION	VARCHAR2(4000)	Expressions produced by the operation
TIME	NUMBER	Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
QBLOCK_NAME	VARCHAR2(128)	Name of the query block
REMARKS	VARCHAR2(4000)	Remarks
OTHER_XML	CLOB	Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML since multiple pieces of information can be stored there. This includes: <ul style="list-style-type: none"> • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan • Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans. Note that in Oracle Database 12c, there will be extra rows in the plan table and V\$SQL_PLAN.
EXECUTIONS	NUMBER	Number of times this cursor has been executed
LAST_STARTS	NUMBER	Number of times this operation has been started, during the last execution
STARTS	NUMBER	Number of times this operation has been started, accumulated over the past executions
LAST_OUTPUT_ROWS	NUMBER	Number of rows produced by the row source, during the last execution
OUTPUT_ROWS	NUMBER	Number of rows produced by the row source, accumulated over the past executions
LAST_CR_BUFFER_GETS	NUMBER	Number of buffers retrieved in consistent mode, during the last execution. Buffers are usually retrieved in consistent mode for queries.
CR_BUFFER_GETS	NUMBER	Number of buffers retrieved in consistent mode, accumulated over the past executions. Buffers are usually retrieved in consistent mode for queries.
LAST_CU_BUFFER_GETS	NUMBER	Number of buffers retrieved in current mode, during the last execution. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.
CU_BUFFER_GETS	NUMBER	Number of buffers retrieved in current mode, accumulated over the past executions. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.
LAST_DISK_READS	NUMBER	Number of physical disk reads performed by the operation, during the last execution
DISK_READS	NUMBER	Number of physical disk reads performed by the operation, accumulated over the past executions
LAST_DISK_WRITES	NUMBER	Number of physical disk writes performed by the operation, during the last execution

Column	Datatype	Description
DISK_WRITE	NUMBER	Number of physical disk writes performed by the operation, accumulated over the past executions
LAST_ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) corresponding to this operation, during the last execution
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) corresponding to this operation, accumulated over the past executions
POLICY	VARCHAR2(40)	Sizing policy for this work area: <ul style="list-style-type: none"> • MANUAL • AUTO
ESTIMATED_OPTIMAL_SIZE	NUMBER	Estimated size (in KB) required by this work area to execute the operation completely in memory (optimal execution). This is either derived from optimizer statistics or from previous executions.
ESTIMATED_ONEPASS_SIZE	NUMBER	Estimated size (in KB) required by this work area to execute the operation in a single pass. This is either derived from optimizer statistics or from previous executions.
LAST_MEMORY_USED	NUMBER	Memory size (in KB) used by this work area during the last execution of the cursor
LAST_EXECUTION	VARCHAR2(40)	Indicates whether this work area ran using OPTIMAL, ONE PASS, or under ONE PASS memory requirement (MULTI-PASS), during the last execution of the cursor
LAST_DEGREE	NUMBER	Degree of parallelism used, during the last execution of the cursor
TOTAL_EXECUTIONS	NUMBER	Number of times this work area was active
OPTIMAL_EXECUTIONS	NUMBER	Number of times this work area ran in optimal mode
ONEPASS_EXECUTIONS	NUMBER	Number of times this work area ran in one pass mode
MULTIPASSES_EXECUTIONS	NUMBER	Number of times this work area ran below the one pass memory requirement
ACTIVE_TIME	NUMBER	Average time this work area is active (in hundredths of a second)
MAX_TEMPSEG_SIZE	NUMBER	Maximum temporary segment size (in bytes) created by an instantiation of this work area. This column is null if this work area has never spilled to disk.
LAST_TEMPSEG_SIZE	NUMBER	Temporary segment size (in bytes) created in the last instantiation of this work area. This column is null if the last instantiation of this work area did not spill to disk.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
CON_DBID	NUMBER	The database ID of the PDB

 See Also:

- "[V\\$SQL_PLAN_STATISTICS](#)"
- "[V\\$SQL_WORKAREA](#)"

9.63 V\$SQL_REDIRECTION

V\$SQL_REDIRECTION displays SQL statements that are redirected.

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the cursor handle
PARENT_HANDLE	RAW(4 8)	Address of the parent cursor handle
HASH_VALUE	NUMBER	Hash value of the SQL statement
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement
CHILD_NUMBER	NUMBER	Number of the child (instance) for the hash
PARSING_USER_ID	NUMBER	Parsing user ID
PARSING_SCHEMA_ID	NUMBER	Parsing schema ID
COMMAND_TYPE	NUMBER	SELECT, UPDATE, INSERT, MERGE
REASON	VARCHAR2(14)	Reason for redirection ('INVALID OBJECT', 'ROWID', 'QUERY REWRITE', 'READ ONLY')
ERROR_CODE	NUMBER	Error code for local parse
POSITION	NUMBER	Error position, 0 if unknown
SQL_TEXT_PIECE	VARCHAR2(1000)	SQL Text containing position, usually a (qualified) identifier
ERROR_MESSAGE	VARCHAR2(1000)	Error code's corresponding error message resolved in the database language, no arguments resolved
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.64 V\$SQL_SHARD

V\$SQL_SHARD displays the shard information for a shard query's previous execution. This view uniquely maps a shard SQL fragment of a cross shard query to the target shard database.

Column	Datatype	Description
SQL_ID	VARCHAR2(13)	SQL identifier of a cross shard query on the coordinator
CHILD_NUMBER	NUMBER	Cursor child number of a cross shard query on the coordinator
OPERATION_ID	NUMBER	Operation ID of a remote node for a shard SQL fragment of a cross shard query

Column	Datatype	Description
SHARD_SQL_ID	VARCHAR2(13)	SQL ID of the SQL segment associated with a remote operation identified by the operation ID in the OPERATION_ID column
SHARD_ID	NUMBER	IDs of shards where the shard SQL fragment was executed
SHARD_CHILD_NUMBER	NUMBER	Cursor child number of a shard SQL fragment on a shard. The default value is 0.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

Using Oracle Sharding for more information about the V\$SQL_SHARD view

9.65 V\$SQL_SHARED_CURSOR

V\$SQL_SHARED_CURSOR explains why a particular child cursor is not shared with existing child cursors. Each column identifies a specific reason why the cursor cannot be shared.

Column	Datatype	Description
SQL_ID	VARCHAR2(13)	SQL identifier
ADDRESS	RAW(4 8)	Address of the parent cursor
CHILD_ADDRESS	RAW(4 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Child number
UNBOUND_CURSOR	VARCHAR2(1)	(Y N) The existing child cursor was not fully built (in other words, it was not optimized)
SQL_TYPE_MISMATCH	VARCHAR2(1)	(Y N) The SQL type does not match the existing child cursor
OPTIMIZER_MISMATCH	VARCHAR2(1)	(Y N) The optimizer environment does not match the existing child cursor
OUTLINE_MISMATCH	VARCHAR2(1)	(Y N) The outlines do not match the existing child cursor
STATS_ROW_MISMATCH	VARCHAR2(1)	(Y N) The existing statistics do not match the existing child cursor
LITERAL_MISMATCH	VARCHAR2(1)	(Y N) Non-data literal values do not match the existing child cursor
FORCE_HARD_PARSE	VARCHAR2(1)	(Y N) For internal use
EXPLAIN_PLAN_CURSOR	VARCHAR2(1)	(Y N) The child cursor is an explain plan cursor and should not be shared
BUFFERED_DML_MISMATCH	VARCHAR2(1)	(Y N) Buffered DML does not match the existing child cursor
PDML_ENV_MISMATCH	VARCHAR2(1)	(Y N) PDML environment does not match the existing child cursor
INST_DRTLD_MISMATCH	VARCHAR2(1)	(Y N) Insert direct load does not match the existing child cursor

Column	Datatype	Description
SLAVE_QC_MISMATCH	VARCHAR2(1)	(Y N) The existing child cursor is a slave cursor and the new one was issued by the coordinator (or, the existing child cursor was issued by the coordinator and the new one is a slave cursor)
TYPECHECK_MISMATCH	VARCHAR2(1)	(Y N) The existing child cursor is not fully optimized
AUTH_CHECK_MISMATCH	VARCHAR2(1)	(Y N) Authorization/translation check failed for the existing child cursor
BIND_MISMATCH	VARCHAR2(1)	(Y N) The bind metadata does not match the existing child cursor
DESCRIBE_MISMATCH	VARCHAR2(1)	(Y N) The typecheck heap is not present during the describe for the child cursor
LANGUAGE_MISMATCH	VARCHAR2(1)	(Y N) The language handle does not match the existing child cursor
TRANSLATION_MISMATCH	VARCHAR2(1)	(Y N) The base objects of the existing child cursor do not match
BIND_EQUIV_FAILURE	VARCHAR2(1)	(Y N) The bind value's selectivity does not match that used to optimize the existing child cursor
INSUFF_PRIVS	VARCHAR2(1)	(Y N) Insufficient privileges on objects referenced by the existing child cursor
INSUFF_PRIVS_Rem	VARCHAR2(1)	(Y N) Insufficient privileges on remote objects referenced by the existing child cursor
REMOTE_TRANS_MISMATCH	VARCHAR2(1)	(Y N) The remote base objects of the existing child cursor do not match
LOGMINER_SESSION_MISMATCH	VARCHAR2(1)	(Y N) LogMiner Session parameters mismatch
INCOMP_LTRL_MISMATCH	VARCHAR2(1)	(Y N) Cursor might have some binds (literals) which may be unsafe/non-data. Value mismatch.
OVERLAP_TIME_MISMATCH	VARCHAR2(1)	(Y N) Mismatch caused by setting session parameter ERROR_ON_OVERLAP_TIME
EDITION_MISMATCH	VARCHAR2(1)	(Y N) Cursor edition mismatch
MV_QUERY_GEN_MISMATCH	VARCHAR2(1)	(Y N) Internal, used to force a hard-parse when analyzing materialized view queries
USER_BIND_PEEK_MISMATCH	VARCHAR2(1)	(Y N) Cursor is not shared because value of one or more user binds is different and this has a potential to change the execution plan
TYPCHK_DEP_MISMATCH	VARCHAR2(1)	(Y N) Cursor has typecheck dependencies
NO_TRIGGER_MISMATCH	VARCHAR2(1)	(Y N) Cursor and child have no trigger mismatch
FLASHBACK_CURSOR	VARCHAR2(1)	(Y N) Cursor non-shareability due to flashback
ANYDATA_TRANSFORMATION	VARCHAR2(1)	(Y N) Is criteria for opaque type transformation and does not match
PDDL_ENV_MISMATCH	VARCHAR2(1)	(Y N) Environment setting mismatch for parallel DDL cursor (that is, one or more of the following parameter values have changed: PARALLEL_EXECUTION_ENABLED, PARALLEL_DDL_MODE, PARALLEL_DDL_FORCED_DEGREE, or PARALLEL_DDL_FORCED_INSTANCES)
TOP_LEVEL_RPI_CURSOR	VARCHAR2(1)	(Y N) Is top level RPI cursor
DIFFERENT_LONG_LENGTH	VARCHAR2(1)	(Y N) Value of LONG does not match
LOGICAL_STANDBY_APPLY	VARCHAR2(1)	(Y N) Logical standby apply context does not match
DIFF_CALL_DURN	VARCHAR2(1)	(Y N) If Slave SQL cursor/single call
BIND_UACS_DIFF	VARCHAR2(1)	(Y N) One cursor has bind UACs and one does not
PLSQL_CMP_SWITCHES_DIFF	VARCHAR2(1)	(Y N) PL/SQL anonymous block compiled with different PL/SQL compiler switches

Column	Datatype	Description
CURSOR_PARTS_MISMATCH	VARCHAR2(1)	(Y N) Cursor was compiled with subexecution (cursor parts were executed)
STB_OBJECT_MISMATCH	VARCHAR2(1)	(Y N) STB is an internal name for a SQL Management Object Mismatch. A SQL Management Object Mismatch means that either a SQL plan baseline, or a SQL profile, or a SQL patch has been created for your SQL statement between the executions. Because a cursor is a read-only entity, a hard parse is forced to be able to create a new cursor that contains information about the new SQL management object related to this SQL statement.
CROSSEDITION_TRIGGER_MISMATCH	VARCHAR2(1)	(Y N) The set of crossedition triggers to execute might differ
PQ_SLAVE_MISMATCH	VARCHAR2(1)	(Y N) Top-level slave decides not to share cursor
TOP_LEVEL_DDL_MISMATCH	VARCHAR2(1)	(Y N) Is top-level DDL cursor
MULTI_PX_MISMATCH	VARCHAR2(1)	(Y N) Cursor has multiple parallelizers and is slave-compiled
BIND_PEEKED_PQ_MISMATCH	VARCHAR2(1)	(Y N) Cursor based around bind peeked values
MV_REWRITE_MISMATCH	VARCHAR2(1)	(Y N) Cursor needs recompilation because an SCN was used during compile time due to being rewritten by materialized view
ROLL_INVALID_MISMATCH	VARCHAR2(1)	(Y N) Marked for rolling invalidation and invalidation window exceeded
OPTIMIZER_MODE_MISMATCH	VARCHAR2(1)	(Y N) Parameter OPTIMIZER_MODE mismatch (for example, all_rows versus first_rows_1)
PX_MISMATCH	VARCHAR2(1)	(Y N) Mismatch in one parameter affecting the parallelization of a SQL statement. For example, one cursor was compiled with parallel DML enabled while the other was not.
MV_STALEOBJ_MISMATCH	VARCHAR2(1)	(Y N) Cursor cannot be shared because there is a mismatch in the list of materialized views which were stale when the cursor was built
FLASHBACK_TABLE_MISMATCH	VARCHAR2(1)	(Y N) Cursor cannot be shared because there is a mismatch with triggers being enabled and/or referential integrity constraints being deferred
LITREP_COMP_MISMATCH	VARCHAR2(1)	(Y N) Mismatch in use of literal replacement
PLSQL_DEBUG	VARCHAR2(1)	(Y N) Value of the PLSQL_DEBUG parameter for the current session does not match the value used to build the cursor
LOAD_OPTIMIZER_STATS	VARCHAR2(1)	(Y N) A hard parse is forced to initialize extended cursor sharing
ACL_MISMATCH	VARCHAR2(1)	(Y N) Cached ACL evaluation result stored in the child cursor is not valid for the current session or user
FLASHBACK_ARCHIVE_MISMATCH	VARCHAR2(1)	(Y N) Value of the FLASHBACK_DATA_ARCHIVE_INTERNAL_CURSOR parameter for the current session does not match the value used to build the cursor
LOCK_USER_SCHEMA_FAILED	VARCHAR2(1)	(Y N) User or schema used to build the cursor no longer exists Note: This sharing criterion is deprecated
REMOTE_MAPPING_MISMATCH	VARCHAR2(1)	(Y N) Reloaded cursor was previously remote-mapped and is currently not remote-mapped. Therefore, the cursor must be reparsed.
LOAD_RUNTIME_HEAP_FAILED	VARCHAR2(1)	(Y N) Loading of run-time heap for the new cursor (or reload of aged out cursor) failed
HASH_MATCH_FAILED	VARCHAR2(1)	(Y N) No existing child cursors have the unsafe literal bind hash values required by the current cursor
PURGED_CURSOR	VARCHAR2(1)	(Y N) Child cursor is marked for purging

Column	Datatype	Description
BIND_LENGTH_UPGRADEABLE	VARCHAR2(1)	(Y N) Bind length(s) required for the current cursor are longer than the bind length(s) used to build the child cursor
USE_FEEDBACK_STATS	VARCHAR2(1)	(Y N) A hard parse is forced so that the optimizer can reoptimize the query with improved optimizer inputs (for example, cardinality estimates)
REASON	CLOB	Child number, id, and reason the cursor is not shared. The content of this column is structured using XML. If this column is null, the FORCE_HARD_PARSE, LOAD_RUNTIME_HEAP_FAILED, and HASH_MATCH_FAILED columns may enable you to determine why the child cursor is not shared.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.66 V\$SQL_SHARED_MEMORY

V\$SQL_SHARED_MEMORY displays information about the cursor shared memory snapshot. Each SQL statement stored in the shared pool has one or more child objects associated with it. Each child object has several parts, one of which is the context heap, which holds, among other things, the query plan.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	SQL text of the shared cursor child object for which this row is displaying information
SQL_FULLTEXT	CLOB	Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V\$SQLTEXT dynamic performance view.
HASH_VALUE	NUMBER	Hash value of the above SQL text in the shared pool
SQL_ID	VARCHAR2(13)	SQL identifier of the above SQL text in the shared pool
HEAP_DESC	RAW(4 8)	Address of the descriptor for the context heap of the child cursor described in this row
STRUCTURE	VARCHAR2(64)	If the memory chunk described in this row was allocated using a comment of the form "X : Y", then this is the "X" part of the comment
FUNCTION	VARCHAR2(64)	Similar to the STRUCTURE column, this is the "Y" field of the comment
CHUNK_COM	VARCHAR2(16)	Whole comment field that was supplied when this memory chunk was allocated
CHUNK_PTR	RAW(4 8)	Starting address of the allocated memory chunk
CHUNK_SIZE	NUMBER	Amount of memory allocated for this chunk
ALLOC_CLASS	VARCHAR2(8)	Class of memory that this chunk of memory belongs to. It will usually be either FREEABLE or PERMANENT.
CHUNK_TYPE	NUMBER	An index into a table of callback functions that tell the server how to re-create this chunk of memory should it need to be removed from the shared pool based on an LRU algorithm

Column	Datatype	Description
SUBHEAP_DESC	RAW(4 8)	If the parent heap of this context heap is itself a subheap, then this is the address of the descriptor of the parent heap
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.67 V\$SQL_TESTCASES

V\$SQL_TESTCASES displays information about test cases exported by SQL Test Case Builder.

You can use this view in conjunction with the V\$DIAG INCIDENT view. Join the INCIDENT_ID column in this view with the INCIDENT_ID column in V\$DIAG INCIDENT to view information about the test case associated with a particular incident.

The V\$SQL_TESTCASES view requires the existence of a TCB root directory named SQL_TCB_DIR. This view will not contain any rows if a TCB root directory does not exist, or if the TCB root directory exists with a name other than SQL_TCB_DIR. The operating system directory to which the TCB root directory refers must be writable by the owner of the Oracle Database binaries.

- In Oracle Autonomous Database environments, the TCB root directory is created automatically on each POD during provisioning.
- For on-premises databases, a user who has been granted the DBA role must explicitly create the TCB root directory. See *Oracle Database Administrator's Guide* for more information.

Column	Datatype	Description
TESTCASE_NAME	VARCHAR2(512)	Test case name
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement in the test case
SQL_TEXT	VARCHAR2(1000)	First 1000 characters of text for the SQL statement in the test case
SQL_TEXT_FULL	CLOB	Full text for the SQL statement in the test case, exposed as a CLOB column
INCIDENT_ID	NUMBER	ID for the incident associated with the test case
PROBLEM_TYPE	NUMBER	Type of problem for the incident associated with the test case. Possible values: <ul style="list-style-type: none"> • 1: Performance problem (PROBLEM_TYPE_PERFORMANCE) • 2: Inconsistent results (PROBLEM_TYPE_WRONG_RESULTS) • 3: Crash in compilation (PROBLEM_TYPE_COMPILATION_ERROR) • 4: Crash in execution (PROBLEM_TYPE_EXECUTION_ERROR) These numeric values, and their associated constant values shown in parentheses, correspond to the numeric and constant values for problem type constants in the DBMS_SQLDIAG package. See <i>Oracle Database PL/SQL Packages and Types Reference</i> for more information.
CREATION_DATE	TIMESTAMP(6)	Creation time for the incident associated with the test case

Column	Datatype	Description
STATUS	VARCHAR2(10)	Current status for the incident associated with the test case. Possible values: <ul style="list-style-type: none">• COMPLETE: The test case export completed successfully• INCOMPLETE: The test case export failed due to an error
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Note:

This view is available starting with Oracle Database 19c.

9.68 V\$SQL_WORKAREA

V\$SQL_WORKAREA displays information about work areas used by SQL cursors. Each SQL statement stored in the shared pool has one or more child cursors that are listed in the V\$SQL view. V\$SQL_WORKAREA lists all work areas needed by these child cursors; V\$SQL_WORKAREA can be joined with V\$SQLAREA on (ADDRESS, HASH_VALUE) and with V\$SQL on (ADDRESS, HASH_VALUE, CHILD_NUMBER).

You can use this view to find out answers to the following questions:

- What are the top 10 work areas that require the most cache area?
- For work areas allocated in AUTO mode, what percentage of work areas are running using maximum memory?

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the parent cursor handle
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache. Two columns PARENT_HANDLE and HASH_VALUE can be used to join with V\$SQLAREA to locate the parent cursor.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent statement in the library cache
CHILD_NUMBER	NUMBER	Number of the child cursor that uses this work area. The columns PARENT_HANDLE, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to locate the child cursor using this area.
WORKAREA_ADDRESS	RAW(4 8)	Address of the work area handle. This is the primary key for the view.

Column	Datatype	Description
OPERATION_TYPE	VARCHAR2(160)	Type of operation using the work area. Can include values such as SORT, HASH JOIN, GROUP BY, BUFFER, BITMAP MERGE, and BITMAP CONSTRUCTION.
OPERATION_ID	NUMBER	A unique number used to identify the operation in the execution plan. This identifier can be joined to V\$SQL_PLAN to locate the operation that uses this work area.
POLICY	VARCHAR2(40)	Sizing policy for this work area (MANUAL or AUTO)
ESTIMATED_OPTIMAL_SIZE	NUMBER	Estimated size (in bytes) required by this work area to execute the operation completely in memory (optimal execution). Derived from either optimizer statistics or previous executions.
ESTIMATED_ONEPASS_SIZE	NUMBER	Estimated size (in bytes) required by this work area to execute the operation in a single pass. Derived from either optimizer statistics or previous executions.
LAST_MEMORY_USED	NUMBER	Memory (in bytes) used by this work area during the last execution of the cursor
LAST_EXECUTION	VARCHAR2(40)	Indicates whether this work area runs using OPTIMAL, ONE PASS, or ONE PASS memory requirement (or MULTI-PASS), during the last execution of the cursor
LAST_DEGREE	NUMBER	Degree of parallelism used during the last execution of this operation
TOTAL_EXECUTIONS	NUMBER	Number of times this work area was active
OPTIMAL_EXECUTIONS	NUMBER	Number of times this work area ran in optimal mode
ONEPASS_EXECUTIONS	NUMBER	Number of times this work area ran in one-pass mode
MULTIPASSES_EXECUTIONS	NUMBER	Number of times this work area ran below the one-pass memory requirement
ACTIVE_TIME	NUMBER	Average time this work area is active (in hundredths of a second)
MAX_TEMPSEG_SIZE	NUMBER	Maximum temporary segment size (in bytes) created by an instantiation of this work area. This column is NULL if this work area has never spilled to disk.
LAST_TEMPSEG_SIZE	NUMBER	Temporary segment size (in bytes) created in the last instantiation of this work area. This column is NULL if the last instantiation of this work area did not spill to disk.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

- "[V\\$SQLAREA](#)"
- "[V\\$SQL](#)"

9.69 V\$SQL_WORKAREA_ACTIVE

V\$SQL_WORKAREA_ACTIVE contains an instantaneous view of the work areas currently allocated by the system. You can join this view against V\$SQL_WORKAREA on WORKAREA_ADDRESS to access the definition of that work area. If a work area spills to disk, then this view contains information for the temporary segment created on behalf of this work area.

The last three columns are included to enable joining V\$SQL_WORKAREA_ACTIVE with V\$TEMPSEG_USAGE to retrieve more information on this temporary segment.

You can use this view to answer the following:

- What are the top 10 largest work areas currently allocated in the system?
- What percentage of memory is over-allocated (`EXPECTED_SIZE < ACTUAL_MEM_USED`) and under-allocated (`EXPECTED_SIZE > ACTUAL_MEM_USED`)?
- What are the active work areas using more memory than what is expected by the memory manager?
- What are the active work areas that have spilled to disk?

Column	Datatype	Description
SQL_HASH_VALUE	NUMBER	Hash value of the SQL statement that is currently being executed
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement that is currently being executed
SQL_EXEC_START	DATE	Time when the execution of the SQL currently executed by this session started
SQL_EXEC_ID	NUMBER	SQL execution identifier (see V\$SQL_MONITOR)
WORKAREA_ADDRESS	RAW(4 8)	Address of the work area handle. This is the primary key for the view.
OPERATION_TYPE	VARCHAR2(160)	Type of operation using the work area. Can include values such as SORT, HASH JOIN, GROUP BY, BUFFER, BITMAP MERGE, and BITMAP CONSTRUCTION.
OPERATION_ID	NUMBER	A unique number used to identify the operation in the execution plan. This identifier can be joined to V\$SQL_PLAN to locate the operation that uses this work area.
POLICY	VARCHAR2(24)	Sizing policy for this work area (MANUAL or AUTO)
SID	NUMBER	Session identifier
QCINST_ID	NUMBER	Query coordinator instance identifier. Along with QCSID, enables you to uniquely identify the query coordinator.
QCSID	NUMBER	Query coordinator session identifier. This is the same as the SID if the work area is allocated by a serial cursor.
ACTIVE_TIME	NUMBER	Average time this work area is active (in microseconds)
WORK_AREA_SIZE	NUMBER	Maximum size (in bytes) of the work area as it is currently used by the operation
EXPECTED_SIZE	NUMBER	Expected size (in bytes) for this work area. EXPECTED_SIZE is set on behalf of the operation by the memory manager. Memory can be over-allocated when WORK_AREA_SIZE has a higher value than EXPECTED_SIZE. This can occur when the operation using this work area takes a long time to resize it.
ACTUAL_MEM_USED	NUMBER	Amount of PGA memory (in bytes) currently allocated on behalf of this work area. This value should range between 0 and WORK_AREA_SIZE.
MAX_MEM_USED	NUMBER	Maximum memory amount (in bytes) used by this work area

Column	Datatype	Description
NUMBER_PASSES	NUMBER	Number of passes corresponding to this work area (0 if running in OPTIMAL mode)
TEMPSEG_SIZE	NUMBER	Size (in bytes) of the temporary segment used on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.
TABLESPACE	VARCHAR2 (128)	Tablespace name for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.
SEGRFNO#	NUMBER	Relative file number within the tablespace for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.
SEGBLK#	NUMBER	Block number for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- *Oracle Database Concepts* for more information about SQL work areas

9.70 V\$SQL_WORKAREA_HISTOGRAM

V\$SQL_WORKAREA_HISTOGRAM displays the cumulative work area execution statistics (cumulated since instance startup) for different work area groups. The work areas are split into 33 groups based on their optimal memory requirements with the requirements increasing in powers of two. That is, work areas whose optimal requirement varies from 0 KB to 1 KB, 1 KB to 2 KB, 2 KB to 4 KB, ... and 2 TB to 4 TB.

For each work area group, the V\$SQL_WORKAREA_HISTOGRAM view shows how many work areas in that group were able to run in optimal mode, how many were able to run in one-pass mode, and finally how many ran in multi-pass mode. The DBA can take a snapshot at the beginning and the end of a desired time interval to derive the same statistics for that interval.

Column	Datatype	Description
LOW_OPTIMAL_SIZE	NUMBER	Lower bound for the optimal memory requirement of work areas included in this row (bytes)
HIGH_OPTIMAL_SIZE	NUMBER	Upper bound for the optimal memory requirement of work areas included in this row (bytes)
OPTIMAL_EXECUTIONS	NUMBER	Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in optimal mode since instance startup

Column	Datatype	Description
ONEPASS_EXECUTIONS	NUMBER	Number of work areas with an optimal memory requirement comprised between <code>LOW_OPTIMAL_SIZE</code> and <code>HIGH_OPTIMAL_SIZE</code> which have been executed in one-pass mode since instance startup
MULTIPASSES_EXECUTIONS	NUMBER	Number of work areas with an optimal memory requirement comprised between <code>LOW_OPTIMAL_SIZE</code> and <code>HIGH_OPTIMAL_SIZE</code> which have been executed in multi-pass mode since instance startup
TOTAL_EXECUTIONS	NUMBER	Sum of <code>OPTIMAL_EXECUTIONS</code> , <code>ONEPASS_EXECUTIONS</code> , and <code>MULTIPASSES_EXECUTIONS</code>
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.71 V\$SQLAREA

V\$SQLAREA displays statistics on shared SQL areas and contains one row per SQL string. It provides statistics on SQL statements that are in memory, parsed, and ready for execution.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	First thousand characters of the SQL text for the current cursor
SQL_FULLTEXT	CLOB	All characters of the SQL text for the current cursor
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
SHARABLE_MEM	NUMBER	Amount of shared memory used by a cursor. If multiple child cursors exist, then the sum of all shared memory used by all child cursors.
PERSISTENT_MEM	NUMBER	Fixed amount of memory used for the lifetime of an open cursor. If multiple child cursors exist, then the fixed sum of memory used for the lifetime of all the child cursors.
RUNTIME_MEM	NUMBER	Fixed amount of memory required during execution of a cursor. If multiple child cursors exist, then the fixed sum of all memory required during execution of all the child cursors.
SORTS	NUMBER	Sum of the number of sorts that were done for all the child cursors
VERSION_COUNT	NUMBER	Number of child cursors that are present in the cache under this parent
LOADED_VERSIONS	NUMBER	Number of child cursors that are present in the cache and have their context heap loaded
OPEN_VERSIONS	NUMBER	Number of child cursors that are currently open under this current parent

Column	Datatype	Description
USERS_OPENING	NUMBER	Number of users that have any of the child cursors open
FETCHES	NUMBER	Number of fetches associated with the SQL statement
EXECUTIONS	NUMBER	Total number of executions, totalled over all the child cursors
PX_SERVERS_EXECUTIONS	NUMBER	Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)
END_OF_FETCH_COUNT	NUMBER	Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column.
USERS_EXECUTING	NUMBER	Total number of users executing the statement over all child cursors
LOADS	NUMBER	Number of times the object was loaded or reloaded
FIRST_LOAD_TIME	VARCHAR2(76)	Timestamp of the parent creation time
INVALIDATIONS	NUMBER	Total number of invalidations over all the child cursors
PARSE_CALLS	NUMBER	Sum of all parse calls to all the child cursors under this parent
DISK_READS	NUMBER	Sum of the number of disk reads over all child cursors
DIRECT_WRITES	NUMBER	Sum of the number of direct writes over all child cursors
DIRECT_READS	NUMBER	Sum of the number of direct reads over all child cursors
BUFFER_GETS	NUMBER	Sum of buffer gets over all child cursors
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds)
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds)
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds)
USER_IO_WAIT_TIME	NUMBER	User I/O Wait Time (in microseconds)
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds)
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds)
ROWS_PROCESSED	NUMBER	Total number of rows processed on behalf of this SQL statement
COMMAND_TYPE	NUMBER	Oracle command type definition
OPTIMIZER_MODE	VARCHAR2(10)	Mode under which the SQL statement was executed
OPTIMIZER_COST	NUMBER	Cost of this query given by the optimizer
OPTIMIZER_ENV	RAW(2000)	Optimizer environment
OPTIMIZER_ENV_HASH_VALUE	NUMBER	Hash value for the optimizer environment
PARSING_USER_ID	NUMBER	User ID of the user that has parsed the very first cursor under this parent
PARSING_SCHEMA_ID	NUMBER	Schema ID that was used to parse this child cursor
PARSING_SCHEMA_NAME	VARCHAR2(128)	Schema name that was used to parse this child cursor
KEPT VERSIONS	NUMBER	Number of child cursors that have been marked to be kept using the DBMS_SHARED_POOL package
ADDRESS	RAW(4 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
OLD_HASH_VALUE	NUMBER	Old SQL hash value

Column	Datatype	Description
PLAN_HASH_VALUE	NUMBER	Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
MODULE	VARCHAR2(64)	Contains the name of the module that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_MODULE
MODULE_HASH	NUMBER	Hash value of the module that is named in the MODULE column
ACTION	VARCHAR2(64)	Contains the name of the action that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_ACTION
ACTION_HASH	NUMBER	Hash value of the action that is named in the ACTION column
SERIALIZABLE_ABORTS	NUMBER	Number of times the transaction failed to serialize, producing ORA-08177 errors, totalled over all the child cursors
OUTLINE_CATEGORY	VARCHAR2(64)	If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise the column is left blank.
CPU_TIME	NUMBER	CPU time (in microseconds) used by this cursor for parsing, executing, and fetching
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then ELAPSED_TIME is the cumulative time for the query coordinator, plus all parallel query slave processes.
OUTLINE_SID	VARCHAR2(40)	Outline session identifier
LAST_ACTIVE_CHILD_ADDRESS	RAW(4 8)	Address (identifier) of the child cursor that was the last to be active in the group (that is, the child cursor on behalf of which statistics in V\$SQL were updated)
REMOTE	VARCHAR2(1)	Indicates whether the cursor is remote mapped (Y) or not (N)
OBJECT_STATUS	VARCHAR2(19)	Status of the cursor: <ul style="list-style-type: none"> • VALID - Valid, authorized without errors • VALID_AUTH_ERROR - Valid, authorized with authorization errors • VALID_COMPILE_ERROR - Valid, authorized with compilation errors • VALID_UNAUTH - Valid, unauthorized • INVALID_UNAUTH - Invalid, unauthorized • INVALID - Invalid, unauthorized but keep the timestamp
LITERAL_HASH_VALUE	NUMBER	Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when CURSOR_SHARING is used. This is not the hash value for the SQL statement. If CURSOR_SHARING is not used, then the value is 0.
LAST_LOAD_TIME	DATE	Time at which the query plan was loaded into the library cache
IS_OBSOLETE	VARCHAR2(1)	Indicates whether the cursor has become obsolete (Y) or not (N). This can happen if the number of child cursors is too large.

Column	Datatype	Description
IS_BIND_SENSITIVE	VARCHAR2(1)	Indicates whether the cursor is bind sensitive (Y) or not (N). A query is considered bind-sensitive if the optimizer peeked at one of its bind variable values when computing predicate selectivities and where a change in a bind variable value may cause the optimizer to generate a different plan.
IS_BIND_AWARE	VARCHAR2(1)	Indicates whether the cursor is bind aware (Y) or not (N). A query is considered bind-aware if it has been marked to use extended cursor sharing. The query would already have been marked as bind-sensitive.
CHILD_LATCH	NUMBER	Child latch number that is protecting the cursor. This column is obsolete and maintained for backward compatibility.
SQL_PROFILE	VARCHAR2(64)	SQL profile used for this statement, if any
SQL_PATCH	VARCHAR2(128)	SQL patch used for this statement, if any
SQL_PLAN_BASELINE	VARCHAR2(128)	SQL plan baseline used for this statement, if any
PROGRAM_ID	NUMBER	Program identifier
PROGRAM_LINE#	NUMBER	Program line number
EXACT_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to EXACT
FORCE_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to FORCE
LAST_ACTIVE_TIME	DATE	Time at which the query plan was last active
BIND_DATA	RAW(2000)	Bind data
TYPECHECK_MEM	NUMBER	Typecheck memory
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system
See Also: Oracle Exadata Storage Server Software documentation for more information		
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
OPTIMIZED_PHY_READ_REQUESTS	NUMBER	Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL
LOCKED_TOTAL	NUMBER	Total number of times the child cursor has been locked
PINNED_TOTAL	NUMBER	Total number of times the child cursor has been pinned
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells
See Also: Oracle Exadata Storage Server Software documentation for more information		
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	Number of bytes that are returned by Exadata cell through the regular I/O path
See Also: Oracle Exadata Storage Server Software documentation for more information		

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
IS_REOPTIMIZABLE	VARCHAR2(1)	This column shows whether the next execution matching this child cursor will trigger a reoptimization. The values are: <ul style="list-style-type: none"> • Y: If the next execution will trigger a reoptimization • R: If the child cursor contains reoptimization information, but will not trigger reoptimization because the cursor was compiled in reporting mode • N: If the child cursor has no reoptimization information
IS_RESOLVED_ADAPTIVE_PLA_N	VARCHAR2(1)	This column shows whether all of the adaptive parts of a plan have been resolved to the final plan. Once the plan is resolved, the plan hash value and the plan displayed by DBMS_XPLAN will not change through the end of execution. The values for this column are: <ul style="list-style-type: none"> • NULL: If the plan is not adaptive • Y: If the plan is fully resolved • N: If the plan is not yet fully resolved <p>See Also: Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_XPLAN package</p>

See Also:

- Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_XPLAN package

9.72 V\$SQLAREA_PLAN_HASH

V\$SQLAREA_PLAN_HASH displays statistics on shared SQL areas (V\$SQL) by grouping on the SQL_ID and PLAN_HASH_VALUE columns. It can potentially create several rows for one parent cursor, one for each distinct value of the column PLAN_HASH_VALUE.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	First thousand characters of the SQL text for the current cursor
SQL_FULLTEXT	CLOB	All characters of the SQL text for the current cursor

Column	Datatype	Description
ADDRESS	RAW(4 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
PLAN_HASH_VALUE	NUMBER	Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
VERSION_COUNT	NUMBER	Number of child cursors that are present in the cache under this parent
LAST_ACTIVE_CHILD_ADDRESSES	RAW(4 8)	Address (identifier) of the child cursor that was the last to be active in the group (that is, the child cursor on behalf of which statistics in V\$SQL were updated)
SHARABLE_MEM	NUMBER	Amount of shared memory used by a cursor. If multiple child cursors exist, then it is the sum of all shared memory used by all child cursors.
PERSISTENT_MEM	NUMBER	Fixed amount of memory used for the lifetime of an open cursor. If multiple child cursors exist, then it is the fixed sum of memory used for the lifetime of all the child cursors.
RUNTIME_MEM	NUMBER	Fixed amount of memory required during execution of a cursor. If multiple child cursors exist, then the fixed sum of all memory required during execution of all the child cursors.
SORTS	NUMBER	Sum of the number of sorts that were done for all the child cursors
LOADED VERSIONS	NUMBER	Number of child cursors that are present in the cache and that have their context heap loaded
OPEN VERSIONS	NUMBER	Number of child cursors that are currently open under this parent
USERS_OPENING	NUMBER	Number of users that have any of the child cursors open
USERS_EXECUTING	NUMBER	Total number of users executing the statement over all child cursors
FETCHES	NUMBER	Number of fetches associated with the SQL statement
EXECUTIONS	NUMBER	Total number of executions, totalled over all the child cursors
PX_SERVERS_EXECUTIONS	NUMBER	Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)
END_OF_FETCH_COUNT	NUMBER	Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column.
LOADS	NUMBER	Number of times the object was loaded or reloaded
FIRST_LOAD_TIME	DATE	Timestamp of the parent creation time
LAST_LOAD_TIME	DATE	Time at which the query plan was loaded into the library cache
LAST_ACTIVE_TIME	DATE	Time at which the query plan was last active
LAST_EXEC_START_TIME	DATE	Time at which the most recent execution of this SQL started
INVALIDATIONS	NUMBER	Total number of invalidations over all the child cursors
PARSE_CALLS	NUMBER	Sum of all parse calls to all the child cursors under this parent
DISK_READS	NUMBER	Sum of the number of disk reads over all child cursors
DIRECT_WRITES	NUMBER	Sum of the number of direct writes over all child cursors
BUFFER_GETS	NUMBER	Sum of buffer gets over all child cursors

Column	Datatype	Description
CPU_TIME	NUMBER	CPU time (in microseconds) used by this cursor for parsing, executing, and fetching
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds)
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds)
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds)
USER_IO_WAIT_TIME	NUMBER	User I/O wait time (in microseconds)
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds)
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds)
ROWS_PROCESSED	NUMBER	Total number of rows processed on behalf of this SQL statement
COMMAND_TYPE	NUMBER	Oracle command type definition
OPTIMIZER_MODE	VARCHAR2(10)	Mode under which the SQL statement was executed
OPTIMIZER_COST	NUMBER	Cost of this query given by the optimizer
OPTIMIZER_ENV	RAW(2000)	Optimizer environment
OPTIMIZER_ENV_HASH_VALUE	NUMBER	Hash value for the optimizer environment
PARSING_USER_ID	NUMBER	User ID of the user that has parsed the very first cursor under this parent
PARSING_SCHEMA_ID	NUMBER	Schema ID that was used to parse this child cursor
PARSING_SCHEMA_NAME	VARCHAR2(128)	Schema name that was used to parse this child cursor
KEPT VERSIONS	NUMBER	Number of child cursors that have been marked to be kept using the DBMS_SHARED_POOL package
MODULE	VARCHAR2(64)	Contains the name of the module that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_MODULE
MODULE_HASH	NUMBER	Hash value of the module that is named in the MODULE column
ACTION	VARCHAR2(64)	Contains the name of the action that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_ACTION
ACTION_HASH	NUMBER	Hash value of the action that is named in the ACTION column
SERIALIZABLE_ABORTS	NUMBER	Number of times the transaction failed to serialize, producing ORA-08177 errors, totalled over all the child cursors
OUTLINE_CATEGORY	VARCHAR2(64)	If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise, the column is left blank.
OUTLINE_SID	VARCHAR2(40)	Outline session identifier
REMOTE	VARCHAR2(1)	Indicates whether the cursor is remote mapped (Y) or not (N)
OBJECT_STATUS	VARCHAR2(19)	Status of the cursor: <ul style="list-style-type: none"> • VALID - Valid, authorized without errors • VALID_AUTH_ERROR - Valid, authorized with authorization errors • VALID_COMPILE_ERROR - Valid, authorized with compilation errors • VALID_UNAUTH - Valid, unauthorized • INVALID_UNAUTH - Invalid, unauthorized • INVALID - Invalid, unauthorized but keep the timestamp

Column	Datatype	Description
LITERAL_HASH_VALUE	NUMBER	Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when CURSOR_SHARING is used. This is not the hash value for the SQL statement. If CURSOR_SHARING is not used, then the value is 0.
SQL_PROFILE	VARCHAR2(64)	SQL profile used for this statement, if any
PROGRAM_ID	NUMBER	Program identifier
PROGRAM_LINE#	NUMBER	Program line number
EXACT_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to EXACT
FORCE_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to FORCE
BIND_DATA	RAW(2000)	Bind data
TYPECHECK_MEM	NUMBER	Typecheck memory
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system
See Also: Oracle Exadata Storage Server Software documentation for more information		
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
OPTIMIZED_PHY_READ_REQUESTS	NUMBER	Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells
See Also: Oracle Exadata Storage Server Software documentation for more information		
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	Number of bytes that are returned by Exadata cell through the regular I/O path
See Also: Oracle Exadata Storage Server Software documentation for more information		
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
CON_DBID	NUMBER	The database ID of the PDB

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_APPLICATION_INFO.SET_MODULE procedure
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_APPLICATION_INFO.SET_ACTION procedure

9.73 V\$SQLCOMMAND

V\$SQLCOMMAND displays the mapping between SQL opcodes and names.

Column	Datatype	Description
COMMAND_TYPE	NUMBER	SQL command number
COMMAND_NAME	VARCHAR2(64)	SQL command name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.74 V\$SQLFN_ARG_METADATA

V\$SQLFN_ARG_METADATA contains metadata about function arguments. There is one row for each argument of every function found in V\$SQLFN_METADATA. There are no rows for functions that do not have any arguments.

Column	Datatype	Description
FUNC_ID	NUMBER	Internal function identification number. This column can be used to join with the V\$SQLFN_METADATA view.
ARGNUM	NUMBER	Argument number
DATATYPE	VARCHAR2(8)	Data type of the argument. The value is NULL if this argument is not used. Otherwise, it can take values of any Oracle data type, family data type, or EXPR data type.
DESCR	VARCHAR2(128)	This column is reserved for future use.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$SQLFN_METADATA"](#)

9.75 V\$SQLFN_METADATA

V\$SQLFN_METADATA contains metadata about operators and built-in functions. Note that this view does not contain information about arguments because the number of arguments will be different for various functions. Information about arguments is contained in V\$SQLFN_ARG_METADATA, which can be joined with V\$SQLFN_METADATA to get information about any function and its arguments.

Column	Datatype	Description
FUNC_ID	NUMBER	Internal function identification number
NAME	VARCHAR2 (128)	Name of the built-in function
MINARGS	NUMBER	Minimum number of arguments for the function
MAXARGS	NUMBER	Maximum number of arguments for the function
DATATYPE	VARCHAR2 (8)	Return data type, which can take any Oracle data type values, data type family values, or ARG[n] data types
VERSION	VARCHAR2 (12)	Minimum version of the database that has this function
ANALYTIC	VARCHAR2 (3)	Indicates whether the function is an analytic function (YES) or not (NO)
AGGREGATE	VARCHAR2 (3)	Indicates whether the function is an aggregate function (YES) or not (NO)
OFFLOADABLE	VARCHAR2 (3)	Indicates whether execution of the function can be offloaded to the Oracle Exadata Storage Server (YES) or not (NO)
DISP_TYPE	VARCHAR2 (13)	<p>Function display type:</p> <ul style="list-style-type: none"> • NORMAL • ARITHMETIC • PARENTHESIS • REL-OP • CASELIKE • NOPARENTHESIS
USAGE	VARCHAR2 (128)	A text explanation of how to use this function. The text is based on the syntax diagram for the function in the <i>Oracle Database SQL Language Reference</i> .
DESCR	VARCHAR2 (4000)	Description of the function
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$SQLFN_ARG_METADATA"](#)

9.76 V\$SQLSTATS

V\$SQLSTATS displays basic performance statistics for SQL cursors and contains one row per SQL statement (that is, one row per unique value of `SQL_ID`). The column definitions for columns in V\$SQLSTATS are identical to those in the V\$SQL and V\$SQLAREA views. However, the V\$SQLSTATS view differs from V\$SQL and V\$SQLAREA in that it is faster, more scalable, and has a greater data retention (the statistics may still appear in this view, even after the cursor has been aged out of the shared pool). Note that V\$SQLSTATS contains a subset of columns that appear in V\$SQL and V\$SQLAREA.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	First thousand characters of the SQL text for the current cursor
SQL_FULLTEXT	CLOB	Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V\$SQLTEXT view.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
LAST_ACTIVE_TIME	DATE	Last time the statistics of a contributing cursor were updated
LAST_ACTIVE_CHILD_ADDRESS	RAW(4 + 8)	Address of the contributing cursor that last updated these statistics
PLAN_HASH_VALUE	NUMBER	Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
PARSE_CALLS	NUMBER	Number of parse calls for all cursors with this SQL text and plan
DISK_READS	NUMBER	Number of disk reads for all cursors with this SQL text and plan
DIRECT_WRITES	NUMBER	Number of direct writes for all cursors with this SQL text and plan
DIRECT_READS	NUMBER	Number of direct reads for all cursors with this SQL text and plan
BUFFER_GETS	NUMBER	Number of buffer gets for all cursors with this SQL text and plan
ROWS_PROCESSED	NUMBER	Total number of rows the parsed SQL statement returns
SERIALIZABLE_ABORTS	NUMBER	Number of times the transaction failed to serialize, producing ORA-08177 errors, per cursor
FETCHES	NUMBER	Number of fetches associated with the SQL statement
EXECUTIONS	NUMBER	Number of executions that took place on this object since it was brought into the library cache
END_OF_FETCH_COUNT	NUMBER	Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column.
LOADS	NUMBER	Number of times the object was either loaded or reloaded
VERSION_COUNT	NUMBER	number of cursors present in the cache with this SQL text and plan

Column	Datatype	Description
INVALIDATIONS	NUMBER	Number of times this child cursor has been invalidated
PX_SERVERS_EXECUTIONS	NUMBER	Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)
CPU_TIME	NUMBER	CPU time (in microseconds) used by this cursor for parsing, executing, and fetching
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then ELAPSED_TIME is the cumulative time for the query coordinator, plus all parallel query slave processes.
AVG_HARD_PARSE_TIME	NUMBER	Average hard parse time (in microseconds) used by this cursor
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds)
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds)
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds). This value is specific to Oracle RAC. It shows the total time spent waiting for all waits that are categorized under the cluster class of wait events. The value in this column is an accumulated wait time spent waiting for Oracle RAC cluster resources.
USER_IO_WAIT_TIME	NUMBER	User I/O wait time (in microseconds)
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds)
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds)
SORTS	NUMBER	Number of sorts that were done for the child cursor
SHARABLE_MEM	NUMBER	Total shared memory (in bytes) currently occupied by all cursors with this SQL text and plan
TOTAL_SHARABLE_MEM	NUMBER	Total shared memory (in bytes) occupied by all cursors with this SQL text and plan if they were to be fully loaded in the shared pool (that is, cursor size)
TYPECHECK_MEM	NUMBER	Typecheck memory
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system
See Also: Oracle Exadata Storage Server Software documentation for more information		
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system. Typically used for Cache Fusion or parallel queries.
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL. The requests may not be disk reads.
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
EXACT_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to EXACT
FORCE_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to FORCE
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells
See Also: Oracle Exadata Storage Server Software documentation for more information		

Column	Datatype	Description
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	<p>Number of bytes that are returned by Exadata cell through the regular I/O path</p> <p>See Also: Oracle Exadata Storage Server Software documentation for more information</p>
DELTA_PARSE_CALLS	NUMBER	<p>Number of parse calls for the cursor since the last Automatic Workload Repository (AWR) snapshot</p> <p>See Also: <i>Oracle Database Concepts</i> for an introduction to AWR</p>
DELTA_DISK_READS	NUMBER	Number of disk reads for the cursor since the last AWR snapshot
DELTA_DIRECT_WRITES	NUMBER	Number of direct writes for the cursor since the last AWR snapshot
DELTA_DIRECT_READS	NUMBER	Number of direct reads for the cursor since the last AWR snapshot
DELTA_BUFFER_GETS	NUMBER	Number of buffer gets for the cursor since the last AWR snapshot
DELTA_ROWS_PROCESSED	NUMBER	Number of rows returned by the cursor since the last AWR snapshot
DELTA_FETCH_COUNT	NUMBER	Number of fetches for the cursor since the last AWR snapshot
DELTA_EXECUTION_COUNT	NUMBER	Number of executions for the cursor since the last AWR snapshot
DELTA_PX_SERVERS_EXECUTIONS	NUMBER	Number of executions performed by parallel execution servers since the last AWR snapshot
DELTA_END_OF_FETCH_COUNT	NUMBER	Number of times the cursor was fully executed since the last AWR snapshot
DELTA_CPU_TIME	NUMBER	CPU time (in microseconds) for the cursor since the last AWR snapshot
DELTA_ELAPSED_TIME	NUMBER	Database time (in microseconds) for the cursor since the last AWR snapshot
DELTA_APPLICATION_WAIT_TIME	NUMBER	Time spent by the cursor (in microseconds) in the Application wait class since the last AWR snapshot
DELTA_CONCURRENCY_WAIT_TIME	NUMBER	Time spent by the cursor (in microseconds) in the Concurrency wait class since the last AWR snapshot
DELTA_CLUSTER_WAIT_TIME	NUMBER	Time spent by the cursor (in microseconds) in the Cluster wait class since the last AWR snapshot
DELTA_USER_IO_WAIT_TIME	NUMBER	Time spent by the cursor (in microseconds) in the User I/O wait class since the last AWR snapshot
DELTA_PLSQL_EXEC_TIME	NUMBER	Time spent by the cursor (in microseconds) executing PL/SQL since the last AWR snapshot
DELTA_JAVA_EXEC_TIME	NUMBER	Time spent by the cursor (in microseconds) executing Java since the last AWR snapshot
DELTA_SORTS	NUMBER	Number of sorts for the cursor since the last AWR snapshot
DELTA_LOADS	NUMBER	Number of times the cursor was loaded since the last AWR snapshot
DELTA_INVALIDATIONS	NUMBER	Number of times the cursor was invalidated since the last AWR snapshot
DELTA_PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests for the cursor since the last AWR snapshot
DELTA_PHYSICAL_READ_BYT	NUMBER	Number of bytes read from disk for the cursor since the last AWR snapshot
DELTA_PHYSICAL_WRITE_REQ	NUMBER	Number of physical write I/O requests for the cursor since the last AWR snapshot
DELTA_PHYSICAL_WRITE_BYT	NUMBER	Number of bytes written to disk for the cursor since the last AWR snapshot

Column	Datatype	Description
DELTA_IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between the Oracle database and the storage system for the cursor since the last AWR snapshot
DELTA_CELL_OFFLOAD_ELIG_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system for the cursor since the last AWR snapshot
		See Also: Oracle Exadata Storage Server Software documentation for more information
DELTA_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes that are offloaded to the Exadata cell for the cursor since the last AWR snapshot
		See Also: Oracle Exadata Storage Server Software documentation for more information
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
CON_DBID	NUMBER	The database ID of the PDB
OBsolete_Count	NUMBER	Number of times that a parent cursor became obsolete
AVOIDED_EXECUTIONS ¹	NUMBER	Number of executions attempted on this object, but prevented due to the SQL statement being in quarantine
DELTA_AVOIDED_EXECUTIONS ¹	NUMBER	Number of executions attempted on this object, but prevented due to the SQL statement being in quarantine, since the last AWR snapshot

¹ This column is available starting with Oracle Database 19c.

See Also:

- "[V\\$SQL](#)"
- "[V\\$SQLAREA](#)"

9.77 V\$SQLSTATS_PLAN_HASH

V\$SQLSTATS_PLAN_HASH displays basic performance statistics for SQL cursors and contains one row per execution plan of a SQL statement (that is, one row per unique combination of `SQL_ID` and `PLAN_HASH_VALUE`).

The columns for V\$SQLSTATS_PLAN_HASH are the same as those for V\$SQLSTATS.

See Also:

- "[V\\$SQLSTATS](#)"

9.78 V\$SQLTEXT

V\$SQLTEXT displays the text of SQL statements belonging to shared SQL cursors in the SGA.

Column	Datatype	Description
ADDRESS	RAW (4 8)	Used with HASH_VALUE to uniquely identify a cached cursor
HASH_VALUE	NUMBER	Used with ADDRESS to uniquely identify a cached cursor
SQL_ID	VARCHAR2 (13)	SQL identifier of a cached cursor
COMMAND_TYPE	NUMBER	Code for the type of SQL statement (SELECT, INSERT, and so on)
PIECE	NUMBER	Number used to order the pieces of SQL text
SQL_TEXT	VARCHAR2 (64)	A column containing one piece of the SQL text
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.79 V\$SQLTEXT_WITH_NEWLINES

V\$SQLTEXT_WITH_NEWLINES is identical to the V\$SQLTEXT view except that, to improve legibility, V\$SQLTEXT_WITH_NEWLINES does not replace newlines and tabs in the SQL statement with spaces.

Column	Datatype	Description
ADDRESS	RAW (4 8)	Used with HASH_VALUE to uniquely identify a cached cursor
HASH_VALUE	NUMBER	Used with ADDRESS to uniquely identify a cached cursor
SQL_ID	VARCHAR2 (13)	SQL identifier of a cached cursor
COMMAND_TYPE	NUMBER	Code for the type of SQL statement (SELECT, INSERT, and so on)
PIECE	NUMBER	Number used to order the pieces of SQL text
SQL_TEXT	VARCHAR2 (64)	A column containing one piece of the SQL text
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

"V\$SQLTEXT"

9.80 V\$STANDBY_EVENT_HISTOGRAM

V\$STANDBY_EVENT_HISTOGRAM displays the histogram of apply lag on the physical standby. Each distinct value of apply lag has its own bucket and the count in the corresponding bucket represents the number of occurrences so far. The physical standby samples the apply lag every second and increments the corresponding bucket in the histogram.

Column	Datatype	Description
NAME	VARCHAR2 (64)	Name of the event (currently APPLY LAG is the only valid value)
TIME	NUMBER	Time duration that the bucket represents
UNIT	VARCHAR2 (16)	Time unit (seconds, minutes, hours, or days)
COUNT	NUMBER	Each row is a histogram bucket for apply lag. COUNT is the number of occurrences the apply lag falls into the histogram bucket.
LAST_TIME_UPDATED	VARCHAR2 (20)	Last time the bucket was updated by an event falling into that time duration
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.81 V\$STANDBY_LOG

V\$STANDBY_LOG displays information about standby redo logs. Standby redo logs are similar to online redo logs, but standby redo logs are only used on a standby database that is receiving redo data from the primary database.

Column	Datatype	Description
GROUP#	NUMBER	Log group number
DBID	VARCHAR2 (40)	Database ID of the primary database to which the standby redo logfile is assigned. If the standby redo logfile is unassigned, the value UNASSIGNED will be displayed.
THREAD#	NUMBER	Log thread number
SEQUENCE#	NUMBER	Log sequence number
BYTES	NUMBER	Size of the log (in bytes)
BLOCKSIZE	NUMBER	Block size of the logfile (512 or 4096)
USED	NUMBER	Number of bytes used in the log
ARCHIVED	VARCHAR2 (3)	Archive status (YES) or (NO). See the STATUS column for further details.

Column	Datatype	Description
STATUS	VARCHAR2(10)	Log status: <ul style="list-style-type: none"> UNASSIGNED - If ARCHIVED is NO, then the standby redo log has been archived and is again available. If ARCHIVED is YES, then the standby redo log has never been used and is available. ACTIVE - If ARCHIVED is NO, then the standby redo log is complete and waiting to be archived. If ARCHIVED is YES, then the standby redo log is currently being written to and is therefore not ready to be archived. For a given thread, there should be only one such log.
FIRST_CHANGE#	NUMBER	Lowest SCN in the log
FIRST_TIME	DATE	Time of the first SCN in the log
NEXT_CHANGE#	NUMBER	All redo records contained within this log will have an SCN lower than NEXT_CHANGE#. Only filled in once the log is complete. Also the lowest SCN of any redo record in the next log.
NEXT_TIME	DATE	All redo records contained within this log will have a timestamp lower than NEXT_TIME. Only filled in once the log is complete. Also the lowest timestamp of any redo record in the next log.
LAST_CHANGE#	NUMBER	Redo in the standby redo log that recovery can possibly apply from the log has an SCN lower than LAST_CHANGE#
LAST_TIME	DATE	Timestamp of LAST_CHANGE#
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root n: Where n is the applicable container ID for the rows containing data

9.82 V\$STATISTICS_LEVEL

V\$STATISTICS_LEVEL displays the status of the statistics/advisories controlled by STATISTICS_LEVEL.

Column	Datatype	Description
STATISTICS_NAME	VARCHAR2(64)	Name of the statistic/advisory
DESCRIPTION	VARCHAR2(4000)	Description of the statistic/advisory
SESSION_STATUS	VARCHAR2(8)	Status of the statistic/advisory for the session: <ul style="list-style-type: none"> ENABLED DISABLED
SYSTEM_STATUS	VARCHAR2(8)	System-wide status of the statistic/advisory: <ul style="list-style-type: none"> ENABLED DISABLED
ACTIVATION_LEVEL	VARCHAR2(7)	Indicates the level of STATISTICS_LEVEL that enables the statistic/advisory: <ul style="list-style-type: none"> BASIC TYPICAL ALL

Column	Datatype	Description
STATISTICS_VIEW_NAME	VARCHAR2 (64)	If there is a single view externalizing the statistic/advisory, then this column contains the name of that view. If there is no such view, then this column is null. If there are multiple views involved, then the DESCRIPTION column mentions the view names.
SESSION_SETTABLE	VARCHAR2 (3)	Indicates whether the statistic/advisory can be set at the session level (YES) or not (NO)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["STATISTICS_LEVEL"](#)

9.83 V\$STATNAME

V\$STATNAME displays decoded statistic names for the statistics shown in the V\$SESSTAT and V\$SYSSTAT tables.

On some platforms, the NAME and CLASS columns contain additional operating system-specific statistics.

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number Note: Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.
NAME	VARCHAR2 (64)	Statistic name. Names that appear in this column remain stable across Oracle Database releases, and they can be relied on by customer scripts.
CLASS	NUMBER	A number representing one or more statistics classes. The following class numbers are additive: <ul style="list-style-type: none"> • 1 - User • 2 - Redo • 4 - Enqueue • 8 - Cache • 16 - OS • 32 - Real Application Clusters • 64 - SQL • 128 - Debug
STAT_ID	NUMBER	Identifier of the statistic

Column	Datatype	Description
DISPLAY_NAME	VARCHAR2 (64)	A clearer and more descriptive name for the statistic that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

- "[V\\$SESSTAT](#)" and "[V\\$SYSSTAT](#)"
- "[Statistics Descriptions](#)" for statistic descriptions
- Your operating system-specific Oracle documentation

9.84 V\$STATS_ADVISOR_RULES

V\$STATS_ADVISOR_RULES displays the rule definition information for each Optimizer Statistics Advisor rule.

Column	Datatype	Description
RULE_ID	NUMBER	ID of the rule
NAME	VARCHAR2 (64)	Name of the rule
RULE_TYPE	VARCHAR2 (9)	<p>Type of the rule:</p> <ul style="list-style-type: none"> • OBJECT • OPERATION • SYSTEM
DESCRIPTION	VARCHAR2 (64)	Description of the rule
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:

Oracle Database SQL Tuning Guide for more information about Optimizer Statistics Advisor.

9.85 V\$STREAMS_APPLY_COORDINATOR

V\$STREAMS_APPLY_COORDINATOR displays information about each apply process coordinator. The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the coordinator's session
SERIAL#	NUMBER	Serial number of the coordinator's session
STATE	VARCHAR2 (21)	State of the coordinator: <ul style="list-style-type: none"> • INITIALIZING - Starting up • IDLE - Performing no work • APPLYING - Passing transactions to apply servers • SHUTTING DOWN CLEANLY - Stopping without an error • ABORTING - Stopping because of an apply error
APPLY#	NUMBER	Apply process number. An apply process coordinator is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2 (128)	Name of the apply process
TOTAL_APPLIED	NUMBER	Total number of transactions applied by the apply process since the apply process was last started
TOTAL_WAIT_DEPS	NUMBER	Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions
TOTAL_WAIT_COMMITS	NUMBER	Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits
TOTAL_ADMIN	NUMBER	Number of administrative jobs issued since the apply process was last started
TOTAL_ASSIGNED	NUMBER	Number of transactions assigned to apply servers since the apply process was last started
TOTAL_RECEIVED	NUMBER	Total number of transactions received by the coordinator process since the apply process was last started
TOTAL_IGNORED	NUMBER	Number of transactions which were received by the coordinator but were ignored because they had been previously applied
TOTAL_ROLLBACKS	NUMBER	Number of transactions which were rolled back due to unexpected contention
TOTAL_ERRORS	NUMBER	Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started
UNASSIGNED_COMPLETE_TXNS	NUMBER	Total number of complete transactions that the coordinator has not assigned to any apply servers

Column	Datatype	Description
AUTO_TXN_BUFFER_SIZE	NUMBER	Current value of transaction buffer size. Transaction buffer size refers to the number of transactions that the apply reader can assemble ahead of apply servers. The apply process periodically adjusts the transaction buffer size.
LWM_TIME	DATE	Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.
LWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.
LWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.
HWM_TIME	DATE	Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.
HWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.
HWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.
STARTUP_TIME	DATE	Time when the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started
ELAPSED_IDLE_TIME	NUMBER	Elapsed idle time
LWM_POSITION	RAW (64)	Position of the low-watermark LCR
HWM_POSITION	RAW (64)	Position of the high-watermark LCR
PROCESSED_MESSAGE_NUMBER	NUMBER	Message number currently processed by the apply coordinator
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
ACTIVE_SERVER_COUNT	NUMBER	Active server count

 **Note:**

The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

 **See Also:**

- "[TIMED_STATISTICS](#)"
- "[STATISTICS_LEVEL](#)"

9.86 V\$STREAMS_APPLY_READER

V\$STREAMS_APPLY_READER displays information about each apply reader. The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the reader's session
SERIAL#	NUMBER	Serial number of the reader's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2 (128)	Name of the apply process
STATE	VARCHAR2 (36)	State of the reader: <ul style="list-style-type: none"> • INITIALIZING - Starting up • IDLE - Performing no work • DEQUEUE MESSAGES - Dequeueing messages from the queue • SCHEDULE MESSAGES - Computing dependencies between messages and assembling messages into transactions • SPILLING - Spilling unapplied messages from memory to hard disk • PAUSED - WAITING FOR DDL TO COMPLETE - Waiting for a data definition language (DDL) logical change record (LCR) to be applied
TOTAL_MESSAGES_DEQUEUED	NUMBER	Total number of messages dequeued since the apply process was last started
TOTAL_MESSAGES_SPILLED	NUMBER	Number of messages spilled by the reader since the apply process was last started
DEQUEUE_TIME	DATE	Time when the last message was received
DEQUEUED_MESSAGE_NUMBER	NUMBER	Number of the last message received
DEQUEUED_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the last message received. For user-enqueued messages, time when the message was enqueued into the queue at the local database.
SGA_USED	NUMBER	Amount (in bytes) of SGA memory used by the apply process since it was last started
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started. Scheduling includes computing dependencies between messages and assembling messages into transactions.
ELAPSED_SPILL_TIME	NUMBER	Elapsed time (in hundredths of a second) spent spilling messages since the apply process was last started

Column	Datatype	Description
LAST_BROWSE_NUM	NUMBER	Reserved for internal use
OLDEST_SCN_NUM	NUMBER	Oldest SCN
LAST_BROWSE_SEQ	NUMBER	Reserved for internal use
LAST_DEQ_SEQ	NUMBER	Last dequeue sequence number
OLDEST_XIDUSN	NUMBER	Transaction ID undo segment number of the oldest transaction that either has been applied or is being applied
OLDEST_XIDSLT	NUMBER	Transaction ID slot number of the oldest transaction that either has been applied or is being applied
OLDEST_XIDSQLN	NUMBER	Transaction ID sequence number of the oldest transaction that either has been applied or is being applied
SPILL_LWM_SCN	NUMBER	Spill low-watermark SCN
PROXY_SID	NUMBER	When the apply process uses combined capture and apply, the session ID of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
PROXY_SERIAL	NUMBER	When the apply process uses combined capture and apply, the serial number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
PROXY_SPID	VARCHAR2(12)	When the apply process uses combined capture and apply, the process identification number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
CAPTURE_BYTES_RECEIVED	NUMBER	When the apply process uses combined capture and apply, the number of bytes received by the apply process from the capture process since the apply process last started. If the apply process does not use combined capture and apply, then this column is not populated.
DEQUEUED_POSITION	RAW(64)	Dequeued position. This column is populated only for an apply process that is functioning as an XStream inbound server.
LAST_BROWSE_POSITION	RAW(64)	Reserved for internal use
OLDEST_POSITION	RAW(64)	The earliest position of the transactions currently being dequeued and applied. This column is populated only for an apply process that is functioning as an XStream inbound server.
SPILL_LWM_POSITION	RAW(64)	Spill low-watermark position. This column is populated only for an apply process that is functioning as an XStream inbound server.
OLDEST_TRANSACTION_ID	VARCHAR2(128)	Oldest transaction ID
TOTAL_LCRS_WITH_DEP	NUMBER	Total number of LCRs with row-level dependencies since the apply process last started
TOTAL_LCRS_WITH_WMDEP	NUMBER	Total number of LCRs with watermark dependencies since the apply process last started. A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.
TOTAL_IN_MEMORY_LCRS	NUMBER	Total number of LCRs currently in memory
SGA_ALLOCATED	NUMBER	The total amount of shared memory (in bytes) allocated from the Streams pool for the apply process since the apply process last started

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **Note:**

The `ELAPSED_DEQUEUE_TIME` and `ELAPSED_SCHEDULE_TIME` columns are only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

 **See Also:**

- "[TIMED_STATISTICS](#)"
- "[STATISTICS_LEVEL](#)"

9.87 V\$STREAMS_APPLY_SERVER

V\$STREAMS_APPLY_SERVER displays information about each apply server and its activities. An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the apply server's session
SERIAL#	NUMBER	Serial number of the apply server's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by <code>ap</code> .
APPLY_NAME	VARCHAR2 (128)	Name of the apply process
SERVER_ID	NUMBER	Parallel execution server number of the apply server

Column	Datatype	Description
STATE	VARCHAR2 (20)	<p>State of the apply server:</p> <ul style="list-style-type: none"> • INITIALIZING - Starting up • IDLE - Performing no work • RECORD LOW-WATERMARK - Performing an administrative job that maintains information about the apply progress, which is used in the ALL_APPLY_PROGRESS and DBA_APPLY_PROGRESS data dictionary views • ADD PARTITION - Performing an administrative job that adds a partition that is used for recording information about in-progress transactions • DROP PARTITION - Performing an administrative job that purges rows that were used to record information about in-progress transactions • EXECUTE TRANSACTION - Applying a transaction • WAIT COMMIT - Waiting to commit a transaction until all other transactions with a lower commit SCN are applied. This state is possible only if the COMMIT_SERIALIZATION apply process parameter is set to a value other than DEPENDENT_TRANSACTIONS and the PARALLELISM apply process parameter is set to a value greater than 1. • WAIT DEPENDENCY - Waiting to apply a logical change record (LCR) in a transaction until another transaction, on which it has a dependency, is applied. This state is possible only if the PARALLELISM apply process parameter is set to a value greater than 1. • ROLLBACK TRANSACTION - Rolling back a transaction • TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the apply process's queue • WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs • WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction currently being applied
XIDSLT	NUMBER	Transaction ID slot number of the transaction currently being applied
XIDSQN	NUMBER	Transaction ID sequence number of the transaction currently being applied
COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction currently being applied
DEP_XIDUSN	NUMBER	Transaction ID undo segment number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSLT	NUMBER	Transaction ID slot number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSQN	NUMBER	Transaction ID sequence number of a transaction on which the transaction being applied by this apply server depends
DEP_COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction on which this apply server depends
MESSAGE_SEQUENCE	NUMBER	Number of the current message being applied by the apply server. This value is reset to 1 at the beginning of each transaction.
TOTAL_ASSIGNED	NUMBER	Total number of transactions assigned to the apply server since the apply process was last started

Column	Datatype	Description
TOTAL_ADMIN	NUMBER	Total number of administrative jobs done by the apply server since the apply process was last started. See the STATE information in this view for the types of administrative jobs.
TOTAL_ROLLBACKS	NUMBER	Number of transactions assigned to this server which were rolled back
TOTAL_MESSAGES_APPLIED	NUMBER	Total number of messages applied by this apply server since the apply process was last started
APPLY_TIME	DATE	Time the last message was applied
APPLIED_MESSAGE_NUMBER	NUMBER	Number of the last message applied
APPLIED_MESSAGE_CREATE_TIME	DATE	Creation time at the source database of the last captured message applied. No information about user-enqueued messages is recorded in this column.
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started
ELAPSED_APPLY_TIME	NUMBER	Time elapsed (in hundredths of a second) applying messages since the apply process was last started
COMMIT_POSITION	RAW (64)	Commit position of the transaction. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.
DEP_COMMIT_POSITION	RAW (64)	Commit position of the transaction the slave depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.
LAST_APPLY_POSITION	RAW (64)	For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.
TRANSACTION_ID	VARCHAR2 (128)	Transaction ID that the slave is applying. This column is populated only for an apply process that is functioning as an XStream inbound server.
DEP_TRANSACTION_ID	VARCHAR2 (128)	Transaction ID of the transaction the slave depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
TOTAL_LCRS_RETRYED	NUMBER	Total number of LCRs retried by this server
LCR_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RETRYED	NUMBER	Total transactions retried by this server
TXN_RETRY_ITERATION	NUMBER	Total retry iterations by this server
TOTAL_TXNS_RECORDED	NUMBER	Total transactions recorded in error queue by this server

Note:

The `ELAPSED_DEQUEUE_TIME` and `ELAPSED_APPLY_TIME` columns are only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

See Also:

- ["TIMED_STATISTICS"](#)
- ["STATISTICS_LEVEL"](#)

9.88 V\$STREAMS_POOL_ADVICE

`V$STREAMS_POOL_ADVICE` displays information about the estimated count of spilled or unspilled messages and the associated time spent in the spill or unspill activity for different Streams pool sizes. The sizes range from 10% to 200% of the current Streams pool size, in equal intervals. The value of the interval depends on the current size of the Streams pool.

Column	Datatype	Description
<code>STREAMS_POOL_SIZE_FOR_ESTIMATE</code>	NUMBER	Streams pool size (in megabytes) for the estimate. The size ranges from values smaller than the current Streams pool size to values larger than the current Streams pool size, and there is a separate row for each increment. There is always an entry that shows the current Streams pool size, and there are always 20 increments. The range and the size of the increments depend on the current size of the Streams pool.
<code>STREAMS_POOL_SIZE_FACTOR</code>	NUMBER	Size factor with respect to the current Streams pool size
<code>ESTD_SPILL_COUNT</code>	NUMBER	Estimated count of messages spilled from the Streams pool
<code>ESTD_SPILL_TIME</code>	NUMBER	Estimated elapsed time (in seconds) to spill
<code>ESTD_UNSPILL_COUNT</code>	NUMBER	Estimated count of unspills (read back from disk)
<code>ESTD_UNSPILL_TIME</code>	NUMBER	Estimated elapsed time (in seconds) to unspill
<code>CON_ID</code>	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.89 V\$STREAMS_POOL_STATISTICS

`V$STREAMS_POOL_STATISTICS` displays information about the current Streams pool usage percentage.

Column	Datatype	Description
TOTAL_MEMORY_ALLOCATED	NUMBER	Total memory allocated to the Streams pool (in bytes). It should always be less than the current size of the Streams pool. You can get the percentage of the Streams pool used by dividing TOTAL_MEMORY_ALLOCATED by CURRENT_SIZE.
CURRENT_SIZE	NUMBER	Current size of the Streams pool (in bytes)
SGA_TARGET_VALUE	NUMBER	Value of SGA_TARGET. Used to determine whether or not streams pool automatic tuning is enabled. This should be set even if MEMORY_TARGET is set and SGA_TARGET is not set.
SHRINK_PHASE	NUMBER	This only pertains to the Streams pool in an automatic tuning environment (SGA_TARGET and MEMORY_TARGET set). In this case, this shows whether or not the Streams pool is being asked to shrink. During the shrink phase, enqueues are blocked, flow control is enabled for all components, and cached memory is returned to the SGA.
ADVICE_DISABLED	NUMBER	This determines whether or not Streams pool advice in V\$STREAMS_POOL_ADVICE as well as all statistics gathering related to auto-tuning the Streams pool have been disabled.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.90 V\$SUBCACHE

V\$SUBCACHE displays information about the subordinate caches currently loaded into library cache memory. The view walks through the library cache, printing out a row for each loaded subordinate cache per library cache object.

Column	Datatype	Description
OWNER_NAME	VARCHAR2(64)	Owner of the object containing these cache entries
NAME	VARCHAR2(1000)	Object Name
TYPE	NUMBER	Object Type
HEAP_NUM	NUMBER	Heap number containing this subordinate cache
CACHE_ID	NUMBER	Subordinate cache ID
CACHE_CNT	NUMBER	Number of entries for this cache in this object
HEAP_SZ	NUMBER	Amount of extent space allocated to this heap
HEAP_ALOC	NUMBER	Amount of extent space allocated from this heap
HEAP_USED	NUMBER	Amount of space utilized in this heap

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.91 V\$SUBSCR_REGISTRATION_STATS

V\$SUBSCR_REGISTRATION_STATS displays information for diagnosability of notifications.

Column	Datatype	Description
REG_ID	NUMBER	Registration identifier
NUM_NTFNS	NUMBER	Number of notifications
NUM_GROUPING_NTFNS	NUMBER	Number of grouping notifications
NUM_NTFNS_CURRENT_GROUP	NUMBER	Number of events received in the current group
LAST_NTFN_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the last notification was started
LAST_NTFN_SENT_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the last notification was sent
TOTAL_EMON_LATENCY	NUMBER	Total EMON latency (time taken by the EMON slave to process notifications)
EMON#	NUMBER	Active EMON slave serving the registration
ALL_EMON_SERVERS	RAW(2000)	EMON slaves that served the registration
TOTAL_PAYLOAD_BYTES_SENT	NUMBER	Total payload bytes sent
SHARD_ID ¹	NUMBER	Shard number for current registration used for Key Based Messaging
NUM_RETRIES	NUMBER	Number of retries in sending notifications
TOTAL_PLSQL_EXEC_TIME	NUMBER	Total PL/SQL callback execution time (relevant only for PL/SQL notifications)
LAST_ERR	VARCHAR2(90)	Last error message
LAST_ERR_TIME	TIMESTAMP(3) WITH TIME ZONE	Time of the last error
LAST_UPDATE_TIME	TIMESTAMP(3) WITH TIME ZONE	Time of the last update
NUM_PENDING_NTFNS	NUMBER	Number of notifications pending to be sent
TOTAL_PENDING_NTFN_BYTES	NUMBER	Total number of bytes for notifications pending to be sent
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

¹ This column is available starting with Oracle Database 19c.

9.92 V\$SYS_OPTIMIZER_ENV

V\$SYS_OPTIMIZER_ENV displays the contents of the optimizer environment for the instance. The optimizer environment stores the value of the main parameters used by the Oracle optimizer when building the execution plan of a SQL statement. Hence, modifying the value of one or more of these parameters (for example, by issuing an `ALTER SYSTEM` statement) could lead to plan changes.

The parameters displayed by this view are either regular initialization parameters (such as `OPTIMIZER_FEATURES_ENABLE`) or pseudo parameters (such as `ACTIVE_INSTANCE_COUNT`).

Column	Datatype	Description
ID	NUMBER	Unique identifier of the parameter in the optimizer environment
NAME	VARCHAR2 (40)	Name of the parameter
SQL_FEATURE	VARCHAR2 (64)	Associated feature control ID
ISDEFAULT	VARCHAR2 (3)	Indicates whether the parameter is set to the default value (<code>YES</code>) or not (<code>NO</code>)
VALUE	VARCHAR2 (25)	Value of the parameter
DEFAULT_VALUE	VARCHAR2 (25)	Default value of the parameter
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

- "[OPTIMIZER_FEATURES_ENABLE](#)"
- "[ACTIVE_INSTANCE_COUNT](#)"

9.93 V\$SYS_TIME_MODEL

V\$SYS_TIME_MODEL displays the system-wide accumulated times for various operations. The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.

The time values are 8-byte integers and can therefore hold approximately 580,000 years worth of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

Column	Datatype	Description
STAT_ID	NUMBER	Statistic identifier for the time statistic

Column	Datatype	Description
STAT_NAME	VARCHAR2 (64)	Name of the statistic (see Table 9-1)
VALUE	NUMBER	Amount of time (in microseconds) that the system has spent in this operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **Note:**

This view returns instance-wide data and a value of 0 in the CON_ID column when queried from the root of a CDB.

9.94 V\$SYSAUX_OCCUPANTS

V\$SYSAUX_OCCUPANTS displays SYSAUX tablespace occupant information.

Column	Datatype	Description
OCCUPANT_NAME	VARCHAR2 (64)	Occupant name
OCCUPANT_DESC	VARCHAR2 (64)	Occupant description
SCHEMA_NAME	VARCHAR2 (64)	Schema name for the occupant
MOVE_PROCEDURE	VARCHAR2 (64)	Name of the move procedure; null if not applicable
MOVE_PROCEDURE_DESC	VARCHAR2 (64)	Description of the move procedure
SPACE_USAGE_KBYTES	NUMBER	Current space usage of the occupant (in KB)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.95 V\$SYSMETRIC

V\$SYSMETRIC displays the system metric values captured for the most current time interval for both the long duration (60-second) and short duration (15-second) system metrics.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval

Column	Datatype	Description
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric group ID
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2 (64)	Metric name
VALUE	NUMBER	Metric value
METRIC_UNIT	VARCHAR2 (64)	Metric unit description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

- "[DBA_HIST_SYS_TIME_MODEL](#)"
- "[V\\$CON_SYSMETRIC](#)"
- "[DBA_HIST_CON_SYS_TIME_MODEL](#)"

9.96 V\$SYSMETRIC_HISTORY

V\$SYSMETRIC_HISTORY displays all system metric values available in the database. Both long duration (60-second with 1 hour history) and short duration (15-second with one-interval only) metrics are displayed by this view.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric group ID
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2 (64)	Metric name
VALUE	NUMBER	Metric value
METRIC_UNIT	VARCHAR2 (64)	Metric unit description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • n: Where n is the applicable container ID for the rows containing data

 See Also:

- "[DBA_HIST_SYSMETRIC_HISTORY](#)"
- "[V\\$CON_SYSMETRIC_HISTORY](#)"
- "[DBA_HIST_CON_SYSMETRIC_HIST](#)"

9.97 V\$SYSMETRIC_SUMMARY

`V$SYSMETRIC_SUMMARY` displays a summary of all system metric values for the long-duration system metrics. The average, maximum value, minimum value, and the value of one standard deviation for the last hour are displayed for each metric item.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric group ID
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2 (64)	Metric name
NUM_INTERVAL	NUMBER	Number of intervals observed
MAXVAL	NUMBER	Maximum value observed
MINVAL	NUMBER	Minimum value observed
AVERAGE	NUMBER	Average value over the period
STANDARD_DEVIATION	NUMBER	One standard deviation
METRIC_UNIT	VARCHAR2 (64)	Metric unit description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • n: Where n is the applicable container ID for the rows containing data

 See Also:

- "[DBA_HIST_SYSMETRIC_SUMMARY](#)"
- "[V\\$CON_SYSMETRIC_SUMMARY](#)"
- "[DBA_HIST_CON_SYSMETRIC_SUMM](#)"

9.98 V\$SYSSTAT

`V$SYSSTAT` displays system statistics. To find the name of the statistic associated with each statistic number (`STATISTIC#`), query the `V$STATNAME` view.

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number Note: Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.
NAME	VARCHAR2 (64)	Statistic name. You can get a complete listing of statistic names by querying the V\$STATNAME view.
CLASS	NUMBER	A number representing one or more statistics class. The following class numbers are additive: <ul style="list-style-type: none"> • 1 - User • 2 - Redo • 4 - Enqueue • 8 - Cache • 16 - OS • 32 - Real Application Clusters • 64 - SQL • 128 - Debug
VALUE	NUMBER	Statistic value
STAT_ID	NUMBER	Identifier of the statistic
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

Note:

This view returns instance-wide data and a value of 0 in the CON_ID column when queried from the root of a CDB.

See Also:

"V\$STATNAME" and "Statistics Descriptions"

9.99 V\$SYSTEM_CURSOR_CACHE

V\$SYSTEM_CURSOR_CACHE displays system wide information on cursor usage.

See Also:

"V\$SESSION_CURSOR_CACHE"

Column	Datatype	Description
OPENS	NUMBER	Cumulative total of cursor opens
HITS	NUMBER	Cumulative total of cursor open hits
HIT_RATIO	NUMBER	Ratio of the number of times an open cursor was found divided by the number of times a cursor was sought
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.100 V\$SYSTEM_EVENT

V\$SYSTEM_EVENT displays information on total waits for an event. Note that the TIME_WAITED and AVERAGE_WAIT columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you want this column to reflect true wait times, then you must set TIMED_STATISTICS to TRUE in the parameter file; doing this will have a small negative effect on system performance.

 **See Also:**

["TIMED_STATISTICS"](#)

Column	Datatype	Description
EVENT	VARCHAR2 (64)	Name of the wait event; derived statistic name from V\$EVENT_NAME See Also: "Oracle Wait Events"
TOTAL_WAITS	NUMBER	Total number of waits for the event
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event
TIME_WAITED	NUMBER	Total amount of time waited for the event (in hundredths of a second)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time waited for the event (in microseconds)
TOTAL_WAITS_FG	NUMBER	Total number of waits for the event, from foreground sessions
TOTAL_TIMEOUTS_FG	NUMBER	Total number of timeouts for the event, from foreground sessions
TIME_WAITED_FG	NUMBER	Total amount of time waited for the event, from foreground sessions (in hundredths of a second)
AVERAGE_WAIT_FG	NUMBER	Average amount of time waited for the event, from foreground sessions (in hundredths of a second)
TIME_WAITED_MICRO_FG	NUMBER	Total amount of time waited for the event, from foreground sessions (in microseconds)
EVENT_ID	NUMBER	Identifier of the wait event
WAIT_CLASS_ID	NUMBER	Identifier of the wait class of the wait event

Column	Datatype	Description
WAIT_CLASS#	NUMBER	Number of the wait class of the wait event
WAIT_CLASS	VARCHAR2 (64)	Name of the wait class of the wait event
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 Note:

This view returns instance-wide data and a value of 0 in the CON_ID column when queried from the root of a CDB.

9.101 V\$SYSTEM_FIX_CONTROL

V\$SYSTEM_FIX_CONTROL displays information about Fix Control (enabled/disabled) at the system level.

Column	Datatype	Description
BUGNO	NUMBER	Bug number (as fix control identifier)
VALUE	NUMBER	Current value set for the fix control
SQL_FEATURE	VARCHAR2 (64)	Feature control ID
DESCRIPTION	VARCHAR2 (64)	Description of the fix control
OPTIMIZER_FEATURE_ENABLE	VARCHAR2 (25)	Version on (and after) which the fix is enabled by default
EVENT	NUMBER	Event formerly used to control this fix
IS_DEFAULT	NUMBER	Indicates whether the current value is the same as the default (1) or not (0)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.102 V\$SYSTEM_PARAMETER

V\$SYSTEM_PARAMETER displays information about the initialization parameters that are currently in effect for the instance. A new session inherits parameter values from the instance-wide values.

Column	Datatype	Description
NUM	NUMBER	Parameter number
NAME	VARCHAR2 (80)	Name of the parameter
TYPE	NUMBER	Parameter type: <ul style="list-style-type: none">• 1 - Boolean• 2 - String• 3 - Integer• 4 - Parameter file• 5 - Reserved• 6 - Big integer
VALUE	VARCHAR2 (4000)	Instance-wide parameter value
DISPLAY_VALUE	VARCHAR2 (4000)	Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.
DEFAULT_VALUE	VARCHAR2 (255)	The default value for this parameter. This is the value of the parameter if a value is not explicitly specified for the parameter.
ISDEFAULT	VARCHAR2 (9)	Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE) The database sets the value of the ISDEFAULT column to TRUE for parameters that are not specified in the init.ora or server parameter file (SPFILE).
ISSES_MODIFIABLE	VARCHAR2 (5)	Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)
ISSYS_MODIFIABLE	VARCHAR2 (9)	Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: <ul style="list-style-type: none">• IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately.• DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions.• FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.
ISPDB_MODIFIABLE	VARCHAR2 (5)	Indicates whether the parameter can be modified inside a PDB (TRUE) or not (FALSE). In a non-CDB, the value of this column is NULL.
ISINSTANCE_MODIFIABLE	VARCHAR2 (5)	For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.
ISMODIFIED	VARCHAR2 (8)	Indicates how the parameter was modified. If an ALTER SYSTEM was performed, the value will be MODIFIED.
ISADJUSTED	VARCHAR2 (5)	Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)
ISDEPRECATED	VARCHAR2 (5)	Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)

Column	Datatype	Description
ISBASIC	VARCHAR2 (5)	Indicates whether the parameter is a basic parameter (<code>TRUE</code>) or not (<code>FALSE</code>)
DESCRIPTION	VARCHAR2 (255)	Description of the parameter
UPDATE_COMMENT	VARCHAR2 (255)	Comments associated with the most recent update
HASH	NUMBER	Hash value for the parameter name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

"[V\\$PARAMETER](#)" for information about initialization parameters that are currently in effect for a session

9.103 V\$SYSTEM_PARAMETER2

V\$SYSTEM_PARAMETER2 displays information about the initialization parameters that are currently in effect for the instance, with each list parameter value appearing as a row in the view. A new session inherits parameter values from the instance-wide values.

Presenting the list parameter values in this format enables you to quickly determine the values for a list parameter. For example, if a parameter value is `a, b`, then the V\$SYSTEM_PARAMETER view does not tell you if the parameter has two values (both `a` and `b`) or one value (`a, b`). V\$SYSTEM_PARAMETER2 makes the distinction between the list parameter values clear.

Column	Datatype	Description
NUM	NUMBER	Parameter number
NAME	VARCHAR2 (80)	Name of the parameter
TYPE	NUMBER	Parameter type: <ul style="list-style-type: none"> • 1 - Boolean • 2 - String • 3 - Integer • 4 - Parameter file • 5 - Reserved • 6 - Big integer
VALUE	VARCHAR2 (4000)	Parameter value
DISPLAY_VALUE	VARCHAR2 (4000)	Parameter value in a user-friendly format. For example, if the VALUE column shows the value <code>262144</code> for a big integer parameter, then the DISPLAY_VALUE column will show the value <code>256K</code> .

Column	Datatype	Description
ISDEFAULT	VARCHAR2 (6)	Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE)
ISSES_MODIFIABLE	VARCHAR2 (5)	Indicates whether the parameter can be changed with <code>ALTER SESSION</code> (TRUE) or not (FALSE)
ISSYS_MODIFIABLE	VARCHAR2 (9)	Indicates whether the parameter can be changed with <code>ALTER SYSTEM</code> and when the change takes effect: <ul style="list-style-type: none"> • IMMEDIATE - Parameter can be changed with <code>ALTER SYSTEM</code> regardless of the type of parameter file used to start the instance. The change takes effect immediately. • DEFERRED - Parameter can be changed with <code>ALTER SYSTEM</code> regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions. • FALSE - Parameter cannot be changed with <code>ALTER SYSTEM</code> unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.
ISPDB_MODIFIABLE	VARCHAR2 (5)	Indicates whether the parameter can be modified on a per-PDB basis (TRUE) or not (FALSE). In a non-CDB, the value of this column is NULL .
ISINSTANCE_MODIFIABLE	VARCHAR2 (5)	For parameters that can be changed with <code>ALTER SYSTEM</code> , indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the <code>ISSYS_MODIFIABLE</code> column is FALSE , then this column is always FALSE .
ISMODIFIED	VARCHAR2 (8)	Indicates how the parameter was modified. If an <code>ALTER SYSTEM</code> was performed, the value will be MODIFIED .
ISADJUSTED	VARCHAR2 (5)	Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)
ISDEPRECATED	VARCHAR2 (5)	Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)
ISBASIC	VARCHAR2 (5)	Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)
DESCRIPTION	VARCHAR2 (255)	Description of the parameter
ORDINAL	NUMBER	Position (ordinal number) of the parameter value. Useful only for parameters whose values are lists of strings.
UPDATE_COMMENT	VARCHAR2 (255)	Comments associated with the most recent update
HASH	NUMBER	Hash value for the parameter name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$SYSTEM_PARAMETER"](#)

9.104 V\$SYSTEM_WAIT_CLASS

V\$SYSTEM_WAIT_CLASS displays the instance-wide time totals for each registered wait class.

Column	Datatype	Description
WAIT_CLASS_ID	NUMBER	Identifier of the wait class
WAIT_CLASS#	NUMBER	Number of the wait class
WAIT_CLASS	VARCHAR2 (64)	Name of the wait class
TOTAL_WAITS	NUMBER	Total number of waits from this wait class
TIME_WAITED	NUMBER	Total amount of time spent in waits from this wait class (in hundredths of a second)
TOTAL_WAITS_FG	NUMBER	Total number of waits for this wait class, from foreground sessions
TIME_WAITED_FG	NUMBER	Total amount of time spent in waits from this wait class, from foreground sessions (in hundredths of a second)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 Note:

This view returns instance-wide data and a value of 0 in the CON_ID column when queried from the root of a CDB.

9.105 V\$TABLESPACE

V\$TABLESPACE displays tablespace information from the control file.

Column	Datatype	Description
TS#	NUMBER	Tablespace number
NAME	VARCHAR2 (30)	Tablespace name
INCLUDED_IN_DATABASE_BAC_KUP	VARCHAR2 (3)	Indicates whether the tablespace is included in full database backups using the BACKUP DATABASE RMAN command (YES) or not (NO); NO only if the CONFIGURE EXCLUDE RMAN command was used for this tablespace
BIGFILE	VARCHAR2 (3)	Indicates whether the tablespace is a bigfile tablespace (YES) or a smallfile tablespace (NO)

Column	Datatype	Description
FLASHBACK_ON	VARCHAR2(3)	Indicates whether the tablespace participates in FLASHBACK DATABASE operations (YES) or not (NO)
ENCRYPT_IN_BACKUP	VARCHAR2(3)	Indicates whether encryption is turned ON or off at the tablespace level: <ul style="list-style-type: none"> • ON - Encryption is turned ON at the tablespace level • OFF - Encryption is turned OFF at the tablespace level • NULL - Encryption is neither explicitly turned on nor off at the tablespace level (default or when cleared)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.106 V\$TEMP_CACHE_TRANSFER

V\$TEMP_CACHE_TRANSFER is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE_CACHE_TRANSFER and V\$SEGMENT_STATISTICS views.

Column	Datatype	Description
FILE_NUMBER	NUMBER	Number of the temp file
X_2_NULL	NUMBER	Number of blocks with Exclusive-to-NULL conversions; always 0
X_2_NULL_FORCED_WRITE	NUMBER	Number of Exclusive-to-NULL forced writes; always 0
X_2_NULL_FORCED_STALE	NUMBER	Number of Exclusive-to-NULL blocks converted to CR; always 0
X_2_S	NUMBER	Number of blocks with Exclusive-to-Shared conversions; always 0
X_2_S_FORCED_WRITE	NUMBER	Number of Exclusive-to-Shared forced writes; always 0
S_2_NULL	NUMBER	Number of blocks with Shared-to-NULL conversions; always 0
S_2_NULL_FORCED_STALE	NUMBER	Number of Shared-to-NULL blocks converted to CR; always 0
RBR	NUMBER	Number of reuse blocks cross-instance calls; always 0
RBR_FORCED_WRITE	NUMBER	Number of blocks written due to reuse blocks cross-instance calls; always 0
NULL_2_X	NUMBER	Number of blocks with NULL-to-Exclusive conversions; always 0
S_2_X	NUMBER	Number of blocks with Shared-to-Exclusive conversions; always 0
NULL_2_S	NUMBER	Number of blocks with NULL-to-Shared conversions; always 0
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:

- "[V\\$INSTANCE_CACHE_TRANSFER](#)"
- "[V\\$SEGMENT_STATISTICS](#)"

9.107 V\$TEMP_EXTENT_MAP

V\$TEMP_EXTENT_MAP displays the status of each unit for all LOCALLY MANAGED temporary tablespaces.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2 (30)	NOT NULL	Name of the tablespace this unit belongs to
FILE_ID	NUMBER		Absolute file number
BLOCK_ID	NUMBER		Begin block number for this unit
BYTES	NUMBER		Bytes in the extent
BLOCKS	NUMBER		Blocks in the extent
OWNER	NUMBER		Instance which owns this unit
RELATIVE_FNO	NUMBER		Relative file number
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.108 V\$TEMP_EXTENT_POOL

V\$TEMP_EXTENT_POOL displays the state of temporary space cached and used for the instance. Note that loading of the temporary space cache is lazy and that instances can be dormant.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2 (30)	NOT NULL	Name of the tablespace
FILE_ID	NUMBER		Absolute file number
EXTENTS_CACHED	NUMBER		Number of extents that have been cached
EXTENTS_USED	NUMBER		Number of extents that are actually being used
BLOCKS_CACHED	NUMBER		Number of blocks that are cached
BLOCKS_USED	NUMBER		Number of blocks that are used
BYTES_CACHED	NUMBER		Number of bytes that are cached
BYTES_USED	NUMBER		Number of bytes that are used
RELATIVE_FNO	NUMBER		Relative file number

Column	Datatype	NULL	Description
CON_ID	NUMBER		<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.109 V\$TEMP_SPACE_HEADER

V\$TEMP_SPACE_HEADER displays aggregate information per file per LOCALLY MANAGED temporary tablespace regarding how much space is currently being used and how much is free as identified in the space header.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2 (30)	NOT NULL	Name of the temporary tablespace
FILE_ID	NUMBER		Absolute file number
BYTES_USED	NUMBER		How many bytes are in use
BLOCKS_USED	NUMBER		How many blocks are in use
BYTES_FREE	NUMBER		How many bytes are free
BLOCKS_FREE	NUMBER		How many blocks are free
RELATIVE_FNO	NUMBER		The relative file number for the file
CON_ID	NUMBER		<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.110 V\$TEMPFILE

V\$TEMPFILE displays temp file information.

Column	Datatype	Description
FILE#	NUMBER	Absolute file number
CREATION_CHANGE#	NUMBER	Creation System Change Number (SCN)
CREATION_TIME	DATE	Creation time
TS#	NUMBER	Tablespace number
RFILE#	NUMBER	Relative file number in the tablespace
STATUS	VARCHAR2 (7)	Status of the file (OFFLINE ONLINE)

Column	Datatype	Description
ENABLED	VARCHAR2(10)	Enabled for read and/or write
BYTES	NUMBER	Size of the file in bytes (from the file header)
BLOCKS	NUMBER	Size of the file in blocks (from the file header)
CREATE_BYTES	NUMBER	Creation size of the file (in bytes)
BLOCK_SIZE	NUMBER	Block size for the file
NAME	VARCHAR2(513)	Name of the file
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.111 V\$TEMPORARY_LOBS

V\$TEMPORARY_LOBS displays information about temporary and abstract LOBs.

Column	Datatype	Description
SID	NUMBER	Session ID
CACHE_LOBS	NUMBER	Number of cache temp LOBs
NOCACHE_LOBS	NUMBER	Number of nocache temp LOBs
ABSTRACT_LOBS	NUMBER	Number of abstract LOBs
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.112 V\$TEMPSEG_USAGE

V\$TEMPSEG_USAGE describes temporary segment usage.

Column	Datatype	Description
USERNAME	VARCHAR2(128)	User who requested temporary space
USER	VARCHAR2(128)	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in USERNAME.
SESSION_ADDR	RAW(4 8)	Session address
SESSION_NUM	NUMBER	Serial number of session
SQLADDR	RAW(4 8)	Address of SQL statement

Column	Datatype	Description
SQLHASH	NUMBER	Hash value of SQL statement
SQL_ID	VARCHAR2(13)	SQL identifier of SQL statement
TABLESPACE	VARCHAR2(30)	Tablespace in which space is allocated
CONTENTS	VARCHAR2(9)	Indicates whether tablespace is TEMPORARY or PERMANENT
SEGTYPE	VARCHAR2(9)	Type of sort segment: <ul style="list-style-type: none"> • SORT • HASH • DATA • INDEX • LOB_DATA • LOB_INDEX
SEGFILE#	NUMBER	File number of initial extent
SEGBLK#	NUMBER	Block number of the initial extent
EXTENTS	NUMBER	Extents allocated to the sort
BLOCKS	NUMBER	Extents in blocks allocated to the sort
SEGRFNO#	NUMBER	Relative file number of initial extent
TS#	NUMBER	Tablespace number
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
SQL_ID_TEMPSEG	VARCHAR2(13)	SQL identifier of the SQL statement that created the temporary segment

9.113 V\$TEMPSTAT

V\$TEMPSTAT displays information about file read/write statistics.

Column	Datatype	Description
FILE#	NUMBER	Number of the file
PHYRDS	NUMBER	Number of physical reads done
PHYWRITS	NUMBER	Number of times DBWR is required to write
PHYBLKRD	NUMBER	Number of physical blocks read
PHYBLKWRT	NUMBER	Number of blocks written to disk, which may be the same as PHYWRITS if all writes are single blocks
SINGLEBLKRDS	NUMBER	Number of single block reads
READTIM	NUMBER	Time (in hundredths of a second) spent doing reads if the TIMED_STATISTICS parameter is true; 0 if false
WITETIM	NUMBER	Time (in hundredths of a second) spent doing writes if the TIMED_STATISTICS parameter is true; 0 if false
SINGLEBLKRTIM	NUMBER	Cumulative single block read time (in hundredths of a second)

Column	Datatype	Description
AVGIOTIM	NUMBER	Average time (in hundredths of a second) spent on I/O, if the TIMED_STATISTICS parameter is true; 0 if false
LSTIOTIM	NUMBER	Time (in hundredths of a second) spent doing the last I/O, if the TIMED_STATISTICS parameter is true; 0 if false
MINIOTIM	NUMBER	Minimum time (in hundredths of a second) spent on a single I/O, if the TIMED_STATISTICS parameter is true; 0 if false
MAXIORTM	NUMBER	Maximum time (in hundredths of a second) spent doing a single read, if the TIMED_STATISTICS parameter is true; 0 if false
MAXIOWTM	NUMBER	Maximum time (in hundredths of a second) spent doing a single write, if the TIMED_STATISTICS parameter is true; 0 if false
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["TIMED_STATISTICS"](#)

9.114 V\$TEMPUNDOSTAT

V\$TEMPUNDOSTAT shows various statistics related to the temporary undo log for this database instance. It displays a histogram of statistical data to show how the system is working. Each row in the view keeps statistics collected in the instance for a 10-minute interval. The rows are in the descending order of the BEGIN_TIME column value. This view contains a total of 576 rows, spanning a 4-day cycle. This view is similar to the V\$UNDOSTAT view.

Column	Datatype	Description
BEGIN_TIME	DATE	Identifies the beginning of the time interval
END_TIME	DATE	Identifies the end of the time interval
UNDOTSN	NUMBER	Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.
TXNCOUNT	NUMBER	Total number of transaction that have bound to the temp undo segment contained in above tablespace within the interval period
MAXCONCURRENCY	NUMBER	Highest number of transactions executed concurrently which modified temporary objects within the interval period
MAXQUERYLEN	NUMBER	Reserved for future use
MAXQUERYID	VARCHAR2(13)	Reserved for future use
UNDOBLKCNT	NUMBER	Total number of temporary undo blocks consumed

Column	Datatype	Description
EXTCNT	NUMBER	Total number of extents consumed
USCOUNT	NUMBER	Temp undo segments created in this period
SSOLDEERRCNT	NUMBER	Identifies the number of times the error ORA-01555 occurred. You can use this statistic to decide whether or not the UNDO_RETENTION initialization parameter is set properly given the size of the undo tablespace. Increasing the value of UNDO_RETENTION can reduce the occurrence of this error.
NOSPACEERRCNT	NUMBER	Total number of times the error 'no space left for temporary undo' was raised
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["V\\$UNDOSTAT"](#)

9.115 V\$THREAD

V\$THREAD displays thread information from the control file. This view does not return meaningful results on a physical standby database.

Column	Datatype	Description
THREAD#	NUMBER	Thread number
STATUS	VARCHAR2 (6)	Thread status (OPEN CLOSED)
ENABLED	VARCHAR2 (8)	Enabled status: DISABLED, (enabled) PRIVATE, or (enabled) PUBLIC
GROUPS	NUMBER	Number of log groups assigned to this thread
INSTANCE	VARCHAR2 (80)	Instance name, if available
OPEN_TIME	DATE	Last time the thread was opened
CURRENT_GROUP#	NUMBER	Current log group
SEQUENCE#	NUMBER	Sequence number of current log
CHECKPOINT_CHANGE#	NUMBER	SCN at last checkpoint
CHECKPOINT_TIME	DATE	Time of last checkpoint
ENABLE_CHANGE#	NUMBER	SCN at which thread was enabled
ENABLE_TIME	DATE	Time of enable SCN
DISABLE_CHANGE#	NUMBER	SCN at which thread was disabled
DISABLE_TIME	DATE	Time of disable SCN
LAST_REDO_SEQUENCE#	NUMBER	Last redo sequence number written by LGWR

Column	Datatype	Description
LAST_REDO_BLOCK	NUMBER	Last redo block written by LGWR
LAST_REDO_CHANGE#	NUMBER	SCN of last redo for the thread
LAST_REDO_TIME	DATE	Time of last redo for the thread
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.116 V\$THRESHOLD_TYPES

V\$THRESHOLD_TYPES displays information about threshold types.

Column	Datatype	Description
METRICS_ID	NUMBER	Metrics ID
METRICS_GROUP_ID	NUMBER	Metrics group ID
OPERATOR_MASK	NUMBER	Operator mask
OBJECT_TYPE	VARCHAR2 (64)	Object type: <ul style="list-style-type: none"> • SYSTEM • FILE • SERVICE • EVENT_CLASS • TABLESPACE • SESSION
ALERT_REASON_ID	NUMBER	ID of the alert reason
METRIC_VALUE_TYPE	NUMBER	Metric value type
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.117 V\$TIMER

V\$TIMER displays the elapsed time in hundredths of a second. Time is measured since the beginning of the epoch, which is operating system specific, and wraps around to 0 again whenever the value overflows four bytes (roughly 497 days).

Column	Datatype	Description
HSECS	NUMBER	Elapsed time (in hundredths of a second)

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.118 V\$TIMEZONE_FILE

V\$TIMEZONE_FILE describes the time zone file that is currently in use by the database.

Column	Datatype	Description
FILENAME	VARCHAR2 (20)	Time zone file name
VERSION	NUMBER	Time zone file version
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.119 V\$TIMEZONE_NAMES

V\$TIMEZONE_NAMES displays valid time zone names.

Column	Datatype	Description
TZNAME	VARCHAR2 (64)	Time zone region (for example, US/Pacific)
TZABBREV	VARCHAR2 (64)	Corresponding daylight abbreviation (for example, PDT)
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.120 V\$TOPLEVELCALL

V\$TOPLEVELCALL displays the mapping between Oracle top level calls and names.

Column	Datatype	Description
TOP_LEVEL_CALL#	NUMBER	Oracle top level call number
TOP_LEVEL_CALL_NAME	VARCHAR2(64)	Oracle top level call name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.121 V\$TRANSACTION

V\$TRANSACTION lists the active transactions in the system.

Column	Datatype	Description
ADDR	RAW(4 8)	Address of the transaction state object
XIDUSN	NUMBER	Undo segment number
XIDSLOT	NUMBER	Slot number
XIDSQN	NUMBER	Sequence number
UBAFIL	NUMBER	Undo block address (UBA) filenum
UBABLK	NUMBER	UBA block number
UBASQN	NUMBER	UBA sequence number
UBAREC	NUMBER	UBA record number
STATUS	VARCHAR2(16)	Status
START_TIME	VARCHAR2(20)	Start time (wall clock)
START_SCNB	NUMBER	Start system change number (SCN) base
START_SCNW	NUMBER	Start SCN wrap
START_UEXT	NUMBER	Start extent number
START_UBAFIL	NUMBER	Start UBA file number
START_UBABLK	NUMBER	Start UBA block number
START_UBASQN	NUMBER	Start UBA sequence number
START_UBAREC	NUMBER	Start UBA record number
SES_ADDR	RAW(4 8)	User session object address
FLAG	NUMBER	Flag
SPACE	VARCHAR2(3)	YES if a space transaction
RECURSIVE	VARCHAR2(3)	YES if a recursive transaction
NOUNDO	VARCHAR2(3)	YES if a no undo transaction
PTX	VARCHAR2(3)	YES if parallel transaction
NAME	VARCHAR2(256)	Name of a named transaction
PRV_XIDUSN	NUMBER	Previous transaction undo segment number
PRV_XIDSLT	NUMBER	Previous transaction slot number

Column	Datatype	Description
PRV_XIDSQN	NUMBER	Previous transaction sequence number
PTX_XIDUSN	NUMBER	Rollback segment number of the parent XID
PTX_XIDSLT	NUMBER	Slot number of the parent XID
PTX_XIDSQN	NUMBER	Sequence number of the parent XID
DSCN-B	NUMBER	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in DSCN_BASE.
DSCN-W	NUMBER	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in DSCN_WRAP.
USED_UBLK	NUMBER	Number of undo blocks used
USED_UREC	NUMBER	Number of undo records used
LOG_IO	NUMBER	Logical I/O
PHY_IO	NUMBER	Physical I/O
CR_GET	NUMBER	Consistent gets
CR_CHANGE	NUMBER	Consistent changes
START_DATE	DATE	Start time (wall clock)
DSCN_BASE	NUMBER	Dependent SCN base
DSCN_WRAP	NUMBER	Dependent SCN wrap
START_SCN	NUMBER	Start SCN
DEPENDENT_SCN	NUMBER	Dependent SCN
XID	RAW (8)	Transaction XID
PRV_XID	RAW (8)	Previous transaction XID
PTX_XID	RAW (8)	Parent transaction XID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.122 V\$TRANSACTION_ENQUEUE

V\$TRANSACTION_ENQUEUE displays locks owned by transaction state objects.

Column	Datatype	Description
ADDR	RAW (4 8)	Address of lock state object
KADDR	RAW (4 8)	Address of lock
SID	NUMBER	Identifier for session holding or acquiring the lock
TYPE	VARCHAR2 (2)	Type of lock. TX indicates transaction enqueue.
ID1	NUMBER	Lock identifier #1 (depends on type)
ID2	NUMBER	Lock identifier #2 (depends on type)

Column	Datatype	Description
LMODE	NUMBER	Lock mode in which the session holds the lock: <ul style="list-style-type: none"> • 0 - none • 1 - null (NULL) • 2 - row-S (SS) • 3 - row-X (SX) • 4 - share (S) • 5 - S/Row-X (SSX) • 6 - exclusive (X)
REQUEST	NUMBER	Lock mode in which the process requests the lock: <ul style="list-style-type: none"> • 0 - none • 1 - null (NULL) • 2 - row-S (SS) • 3 - row-X (SX) • 4 - share (S) • 5 - S/Row-X (SSX) • 6 - exclusive (X)
CTIME	NUMBER	Time since current mode was granted
BLOCK	NUMBER	The lock is blocking another lock
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.123 V\$TRANSPORTABLE_PLATFORM

V\$TRANSPORTABLE_PLATFORM displays all platforms that support cross-platform tablespace transport. Specifically, it lists all platforms supported by the RMAN CONVERT TABLESPACE command, along with the endianness of each platform.

Column	Datatype	Description
PLATFORM_ID	NUMBER	Platform identification number
PLATFORM_NAME	VARCHAR2(101)	Platform name
ENDIAN_FORMAT	VARCHAR2(14)	Platform endian format: <ul style="list-style-type: none"> • Big • Little • UNKNOWN FORMAT
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.124 V\$TSDP_SUPPORTED_FEATURE

V\$TSDP_SUPPORTED_FEATURE displays information about the features supported by Transparent Sensitive Data Protection (TSDP).

Column	Datatype	Description
FEATURE_NAME	VARCHAR2 (200)	The name of the supported feature
FUNCTIONALITY	VARCHAR2 (200)	The functionality that is supported within the feature. If all of the functionality of the feature is supported, the value is ALL, otherwise the value will show the specific functionality that is supported.
COMMENTS\$	VARCHAR2 (4000)	More information regarding the support for the feature and the specific functionality
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Security Guide for more information about using Transparent Sensitive Data Protection.

9.125 V\$TYPE_SIZE

V\$TYPE_SIZE displays the sizes of various database components for use in estimating data block capacity.

Column	Datatype	Description
COMPONENT	VARCHAR2 (8)	Component name, such as segment or buffer header
TYPE	VARCHAR2 (8)	Component type
DESCRIPTION	VARCHAR2 (32)	Description of the component
TYPE_SIZE	NUMBER	Size of the component
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.126 V\$UNDOSTAT

V\$UNDOSTAT displays a histogram of statistical data to show how well the system is working. The available statistics include undo space consumption, transaction concurrency, and length of queries executed in the instance. You can use this view to estimate the amount of undo space required for the current workload. Oracle uses this view to tune undo usage in the system. The view returns NULL values if the system is in manual undo management mode. Each row in the view keeps statistics collected in the instance for a 10-minute interval. The rows are in descending order by the BEGIN_TIME column value. Each row belongs to the time interval marked by (BEGIN_TIME, END_TIME). Each column represents the data collected for the particular statistic in that time interval. The first row of the view contains statistics for the (partial) current time period. The view contains a total of 576 rows, spanning a 4 day cycle.

Column	Datatype	Description
BEGIN_TIME	DATE	Identifies the beginning of the time interval
END_TIME	DATE	Identifies the end of the time interval
UNDOTSN	NUMBER	Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.
UNDOBLKS	NUMBER	Represents the total number of undo blocks consumed. You can use this column to obtain the consumption rate of undo blocks, and thereby estimate the size of the undo tablespace needed to handle the workload on your system.
TXNCOUNT	NUMBER	Identifies the total number of transactions executed within the period
MAXQUERYLEN	NUMBER	Identifies the length of the longest query (in seconds) executed in the instance during the period. You can use this statistic to estimate the proper setting of the UNDO_RETENTION initialization parameter. The length of a query is measured from the cursor open time to the last fetch/execute time of the cursor. Only the length of those cursors that have been fetched/executed during the period are reflected in the view.
MAXQUERYID	VARCHAR2 (13)	SQL identifier of the longest running SQL statement in the period
MAXCONCURRENCY	NUMBER	Identifies the highest number of transactions executed concurrently within the period
UNXPSTEALCNT	NUMBER	Number of attempts to obtain undo space by stealing unexpired extents from other transactions
UNXPBLKRELCNT	NUMBER	Number of unexpired blocks removed from certain undo segments so they can be used by other transactions
UNXPBLKREUCNT	NUMBER	Number of unexpired undo blocks reused by transactions
EXPSTEALCNT	NUMBER	Number of attempts to steal expired undo blocks from other undo segments
EXPBLKRELCNT	NUMBER	Number of expired undo blocks stolen from other undo segments
EXPBLKREUCNT	NUMBER	Number of expired undo blocks reused within the same undo segments
SSOLDEERRCNT	NUMBER	Identifies the number of times the error ORA-01555 occurred. You can use this statistic to decide whether or not the UNDO_RETENTION initialization parameter is set properly given the size of the undo tablespace. Increasing the value of UNDO_RETENTION can reduce the occurrence of this error.

Column	Datatype	Description
NOSPACEERRCNT	NUMBER	Identifies the number of times space was requested in the undo tablespace and there was no free space available. That is, all of the space in the undo tablespace was in use by active transactions. The corrective action is to add more space to the undo tablespace.
ACTIVEBLKS	NUMBER	Total number of blocks in the active extents of the undo tablespace for the instance at the sampled time in the period
UNEXPIREDBLKS	NUMBER	Total number of blocks in the unexpired extents of the undo tablespace for the instance at the sampled time in the period
EXPIREDBLKS	NUMBER	Total number of blocks in the expired extents of the undo tablespace for the instance at the sampled time in the period
TUNED_UNDORETENTION	NUMBER	Amount of time (in seconds) for which undo will not be recycled from the time it was committed. At any point in time, the latest value of TUNED_UNDORETENTION is used to determine whether data committed at a particular time in the past can be recycled. The value of this column is not meaningful on an Oracle Active Data Guard standby database instance, because the system does not tune this value on such instances.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 See Also:["UNDO_RETENTION"](#)

9.127 V\$UNUSABLE_BACKUPFILE_DETAILS

V\$UNUSABLE_BACKUPFILE_DETAILS displays information about all backup files (backup pieces, proxy copies, or copies) that are marked unavailable and expired. You can select one of the rows and use BTTYPE_KEY or FILETYPE_KEY to change the status of a backup file set or a specific file to available.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session record ID
SESSION_STAMP	NUMBER	Session stamp
RMAN_STATUS_RECID	NUMBER	Record ID of the corresponding row in the control file
RMAN_STATUS_STAMP	NUMBER	Timestamp of the row in the controlfile
BTTYPE	CHAR (9)	Backup type container. Possible values are: BACKUPSET, IMAGECOPY, PROXYCOPY.
BTTYPE_KEY	NUMBER	Unique identifier for the backup type, either BS_KEY or COPY_KEY.

Column	Datatype	Description
ID1	NUMBER	If BACKUPSET, it contains SET_STAMP. If IMAGECOPY or PROXYCOPY, it is RECID from the control file.
ID2	NUMBER	If BACKUPSET, it contains SET_COUNT. If IMAGECOPY or PROXYCOPY, it is STAMP.
FILETYPE	VARCHAR2(15)	Type of file. Possible values are: BACKUPPIECE, COPY, PROXYCOPY.
FILETYPE_KEY	NUMBER	Backup piece key if the file is a backup piece; otherwise COPY_KEY.
STATUS	VARCHAR2(1)	Status of the backup file, either U (unavailable) or X (expired)
FILESIZE	NUMBER	Size of the file
DEVICE_TYPE	VARCHAR2(17)	Type of device on which the file resides
FILENAME	VARCHAR2(513)	Name of the file
MEDIA	VARCHAR2(65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.128 V\$VERSION

V\$VERSION displays the version number of Oracle Database. The database components have the same version number as the database, so the version number is returned only once.

Column	Datatype	Description
BANNER	VARCHAR2(80)	Component name and version number
BANNER_FULL	VARCHAR2(160)	The new 2 line banner format introduced in Oracle Database 18c. The banner displays the database release and version number.
BANNER_LEGACY	VARCHAR2(80)	The legacy 1 line banner used before Oracle Database 18c. This column displays the same value as the BANNER column.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.129 V\$VPD_POLICY

V\$VPD_POLICY displays all the fine-grained security policies and predicates associated with the cursors currently in the library cache.

Column	Datatype	Description
ADDRESS	RAW(4 8)	Cursor address
PARADDR	RAW(4 8)	Parent cursor address
SQL_HASH	NUMBER	SQL hash number
SQL_ID	VARCHAR2(13)	SQL identifier
CHILD_NUMBER	NUMBER	Cursor's child number under the parent
OBJECT_OWNER	VARCHAR2(128)	Owner of the object with the policy
OBJECT_NAME	VARCHAR2(128)	Name of the object with the policy
POLICY_GROUP	VARCHAR2(128)	Name of the policy group
POLICY	VARCHAR2(128)	Name of the policy
POLICY_FUNCTION_OWNER	VARCHAR2(128)	Owner of the policy function
PREDICATE	VARCHAR2(4000)	Predicate for the policy (truncated to 4000 bytes in length)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.130 V\$WAIT_CHAINS

V\$WAIT_CHAINS displays information about blocked sessions. A wait chain is composed of sessions that are blocked by one another. Each row represents a blocked and blocker session pair. If a wait chain is not a cyclical wait chain, then the last row for the chain does not have a blocker.

Column	Datatype	Description
CHAIN_ID	NUMBER	A number identifying the wait chain
CHAIN_IS_CYCLE	VARCHAR2(5)	Indicates whether the final blocked session in the wait chain is blocked by the initial blocked session (TRUE) or not (FALSE)
CHAIN_SIGNATURE	VARCHAR2(801)	An Oracle-specific text signature of the wait chain. This signature can be used to identify similar wait chains.
CHAIN_SIGNATURE_HASH	NUMBER	A numeric representation of CHAIN_SIGNATURE
INSTANCE	NUMBER	Blocked session's instance identifier
OSID	VARCHAR2(25)	Blocked session's operating system process identifier
PID	NUMBER	Blocked session's Oracle process identifier
SID	NUMBER	Blocked session's Oracle session identifier
SESS_SERIAL#	NUMBER	Blocked session's Oracle session serial number

Column	Datatype	Description
PDB_ID	NUMBER	Blocked session's PDB identifier
PDB_NAME	VARCHAR2(31)	Blocked session's PDB name
BLOCKER_IS_VALID	VARCHAR2(5)	Indicates whether the blocked session has a blocker (TRUE) or not (FALSE)
BLOCKER_INSTANCE	NUMBER	Blocker session's instance identifier; NULL if BLOCKER_IS_VALID is FALSE
BLOCKER_OSID	VARCHAR2(25)	Blocker session's operating system process identifier; NULL if BLOCKER_IS_VALID is FALSE
BLOCKER_PID	NUMBER	Blocker session's Oracle process identifier; NULL if BLOCKER_IS_VALID is FALSE
BLOCKER_SID	NUMBER	Blocker session's Oracle session identifier; NULL if BLOCKER_IS_VALID is FALSE
BLOCKER_SESS_SERIAL#	NUMBER	Blocker session's Oracle session serial number; NULL if BLOCKER_IS_VALID is FALSE
BLOCKER_PDB_ID	NUMBER	Blocker session's PDB identifier
BLOCKER_PDB_NAME	VARCHAR2(31)	Blocker session's PDB name
BLOCKER_CHAIN_ID	NUMBER	If not NULL, then the blocker session is a member of another chain specified by this chain identifier. For the remaining wait chain information, see the wait chain with the specified CHAIN_ID.
IN_WAIT	VARCHAR2(5)	Indicates whether the blocked session is in a wait (TRUE) or not (FALSE)
TIME_SINCE_LAST_WAIT_SECS	NUMBER	Number of seconds since the last time the blocked session waited; NULL if IN_WAIT is TRUE
WAIT_ID	NUMBER	A number identifying the wait; NULL if IN_WAIT is FALSE
WAIT_EVENT	NUMBER	Resource or event number for which the blocked session is waiting; NULL if IN_WAIT is FALSE
WAIT_EVENT_TEXT	VARCHAR2(64)	Resource or event for which the blocked session is waiting; NULL if IN_WAIT is FALSE
P1	NUMBER	First additional wait parameter; NULL if IN_WAIT is FALSE
P1_TEXT	VARCHAR2(64)	Description of the first additional wait parameter; NULL if IN_WAIT is FALSE
P2	NUMBER	Second additional wait parameter; NULL if IN_WAIT is FALSE
P2_TEXT	VARCHAR2(64)	Description of the second additional wait parameter; NULL if IN_WAIT is FALSE
P3	NUMBER	Third additional wait parameter; NULL if IN_WAIT is FALSE
P3_TEXT	VARCHAR2(64)	Description of the third additional wait parameter; NULL if IN_WAIT is FALSE
IN_WAIT_SECS	NUMBER	Seconds the blocked session has been in the current wait; NULL if IN_WAIT is FALSE
TIME_REMAINING_SECS	NUMBER	Seconds remaining until the blocked session ends its wait (-1 if the blocked session can indefinitely wait); NULL if IN_WAIT is FALSE
NUM_WAITERS	NUMBER	Number of sessions waiting for the blocked session
ROW_WAIT_OBJ#	NUMBER	Object ID for the table containing the row specified in ROW_WAIT_ROW#; NULL if IN_WAIT is FALSE

Column	Datatype	Description
ROW_WAIT_FILE#	NUMBER	Identifier for the data file containing the row specified in ROW_WAIT_ROW#; NULL if IN_WAIT is FALSE. This column is valid only if the blocked session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
ROW_WAIT_BLOCK#	NUMBER	Identifier for the block containing the row specified in ROW_WAIT_ROW#; NULL if IN_WAIT is FALSE. This column is valid only if the blocked session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
ROW_WAIT_ROW#	NUMBER	Current row being locked; NULL if IN_WAIT is FALSE. This column is valid only if the blocked session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.131 V\$WAITCLASSMETRIC

V\$WAITCLASSMETRIC displays metric values of wait classes for the most recent 60-second interval. A history of the last one hour will be kept in the system.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
WAIT_CLASS#	NUMBER	Number of the class of the wait event
WAIT_CLASS_ID	NUMBER	Identifier of the class of the wait event
AVERAGE_WAITER_COUNT	NUMBER	Average waiter count
DBTIME_IN_WAIT	NUMBER	Percent of database time spent in the wait
TIME_WAITED	NUMBER	Time waited during the interval (in hundredths of a second)
WAIT_COUNT	NUMBER	Number of times waited
TIME_WAITED_FG	NUMBER	Amount of time (in hundredths of a second) spent in waits from this wait class in foreground sessions
WAIT_COUNT_FG	NUMBER	Number of times foreground processes waited
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.132 V\$WAITCLASSMETRIC_HISTORY

V\$WAITCLASSMETRIC_HISTORY displays metric values of wait classes for all intervals in the last one hour.

The columns for V\$WAITCLASSMETRIC_HISTORY are the same as those for V\$WAITCLASSMETRIC.

 **See Also:**

"[V\\$WAITCLASSMETRIC](#)"

9.133 V\$WAITSTAT

V\$WAITSTAT displays block contention statistics. This table is only updated when timed statistics are enabled.

Column	Datatype	Description
CLASS	VARCHAR2 (18)	Class of the block
COUNT	NUMBER	Number of waits by this OPERATION for this CLASS of block
TIME	NUMBER	Sum of all wait times for all the waits by this OPERATION for this CLASS of block (in centiseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.134 V\$WALLET

V\$WALLET displays metadata of certificates that may be used as a master key for Transparent Data Encryption.

 **Note:**

The use of PKI encryption with Transparent Data Encryption is deprecated. To configure Transparent Data Encryption, use the ADMINISTER KEY MANAGEMENT SQL statement. See *Oracle Database Advanced Security Guide* for more information.

Column	Datatype	Description
CERT_ID	VARCHAR2 (52)	A unique certificate identifier value used to specify a particular PKI certificate for use as the master key

Column	Datatype	Description
DN	VARCHAR2 (255)	Distinguished name of a particular PKI certificate
SERIAL_NUM	VARCHAR2 (40)	Unique serial number assigned to a certificate by the issuer or signer
ISSUER	VARCHAR2 (255)	Distinguished name of the Certificate Authority or issuer that issued and signed the certificate
KEYSIZE	NUMBER	Size of the PKI key associated with the certificate
STATUS	VARCHAR2 (16)	Current status of the certificate: <ul style="list-style-type: none">• UNUSED• IN USE• USED This column allows the user to identify whether a certificate is currently in use or has already been used for Transparent Data Encryption.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.135 V\$WORKLOAD_REPLAY_THREAD

V\$WORKLOAD_REPLAY_THREAD displays information for all the different types of replay sessions.

Column	Datatype	Description
CLOCK	NUMBER	Current simulated SCN based on the SCN recorded at capture time
NEXT_TICKER	NUMBER	Next stream ID that will increment the CLOCK after a commit action
SID	NUMBER	Session ID of the replay session
SERIAL#	NUMBER	Session serial number of the replay session
SPID	VARCHAR2 (24)	The server process ID of the replay session
LOGON_USER	VARCHAR2 (128)	Logon username of the replay session
LOGON_TIME	DATE	Logon time of the replay session
EVENT	VARCHAR2 (64)	Event name
EVENT_ID	NUMBER	Event identifier
EVENT#	NUMBER	Event operation code
P1TEXT	VARCHAR2 (64)	Text for event parameter 1
P1	NUMBER	Value of event parameter 1
P2TEXT	VARCHAR2 (64)	Text for event parameter 2
P2	NUMBER	Value of event parameter 2
P3TEXT	VARCHAR2 (64)	Text for event parameter 3
P3	NUMBER	Value of event parameter 3
WAIT_FOR_SCN	NUMBER	The captured SCN for which the current user call should wait
FILE_ID	NUMBER	The stream ID that is being replayed

Column	Datatype	Description
CALL_COUNTER	NUMBER	The call counter of the user call that is being replayed
DEPENDENT_SCN	NUMBER	The dependent SCN, captured to order the commit actions using block-level dependencies
STATEMENT_SCN	NUMBER	Statement SCN
COMMIT_WAIT_SCN	NUMBER	The (maximum) SCN that the current commit should wait for
POST_COMMIT_SCN	NUMBER	The next SCN after the current commit
ACTION_TYPE	NUMBER	The type of commits. The possible values are: COMMIT, ROLLBACK, FADED_COMMIT, and NULL. A value of NULL means it is not a commit operation.
SESSION_TYPE	VARCHAR2(13)	The type of replay session: LOGON ADMIN DISPATCHER REPLAY
WRC_ID	NUMBER	Unique replay client ID assigned by the server to all participating replay clients when replay starts
SCHEDULE_CAP_ID	NUMBER	An unique identifier for a workload capture added to a replay schedule. A value of 0 is used for a non-consolidated replay.
FILE_NAME	VARCHAR2(51)	File name of the captured stream
SKIP_IT	VARCHAR2(1)	Whether or not the current replayed user call is skipped or not
DIRTY_BUFFERS	VARCHAR2(1)	Reserved for internal use
DBTIME	NUMBER	Accumulated database time for the replay session
NETWORK_TIME	NUMBER	Accumulated network time for the replay session
THINK_TIME	NUMBER	Accumulated think time for the replay session
TIME_GAIN	NUMBER	If nonzero, the accumulated time in macro seconds indicating how fast the replay is
TIME_LOSS	NUMBER	If nonzero, the accumulated time in macro seconds indicating how slow the replay is
USER_CALLS	NUMBER	Total number of user calls
PLSQL_CALLS	NUMBER	Total number of PL/SQL calls recorded in the workload capture
PLSQL_SUBCALLS	NUMBER	Total number of calls recorded in the workload capture for SQL executed from PL/SQL
PLSQL_DBTIME	NUMBER	Total amount of database time in microseconds from PL/SQL calls that have been recorded in the workload capture
CLIENT_OS_USER	VARCHAR2(15)	Operating system username of the replay client
CLIENT_HOST	VARCHAR2(64)	Host name of the replay client
CLIENT_PID	VARCHAR2(24)	Process ID of the replay client
PROGRAM	VARCHAR2(48)	Program name of the replay client
CAPTURE_ELAPSED_TIME	NUMBER	Total amount of elapsed time of a session since capture starts (in seconds)
REPLAY_ELAPSED_TIME	NUMBER	Total amount of elapsed time of a session since replay starts (in seconds)

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.136 V\$XML_AUDIT_TRAIL

V\$XML_AUDIT_TRAIL shows standard, fine-grained, SYS, and mandatory audit records written in XML format files.

Note:

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED_AUDIT_TRAIL.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

Column	Datatype	Description
AUDIT_TYPE	NUMBER	<p>Type of audit row:</p> <ul style="list-style-type: none"> • 1 = Standard XML Audit • 2 = Fine Grained XML Audit • 4 = SYS XML Audit • 8 = Mandatory XML Audit
SESSION_ID	NUMBER	Numeric ID for the Oracle session
PROXY_SESSIONID	NUMBER	Proxy session serial number, if an enterprise user has logged in through a proxy mechanism
STATEMENTID	NUMBER	Numeric ID for the statement run (a statement may cause multiple audit records)
ENTRYID	NUMBER	Numeric ID for the audit trail entry in the session
EXTENDED_TIMESTAMP	TIMESTAMP(6) WITH TIME ZONE	Timestamp of the audited operation (the timestamp of the user's logon for entries is created by AUDIT SESSION)
GLOBAL_UID	VARCHAR2(32)	Global user identifier for the user, if the user has logged in as an enterprise user
DB_USER	VARCHAR2(128)	Database username of the user whose actions were audited
CLIENTIDENTIFIER	VARCHAR2(64)	Client identifier in the Oracle session
EXT_NAME	VARCHAR2(1024)	User's external name
OS_USER	VARCHAR2(128)	Operating system logon user name of the user whose actions were audited

Column	Datatype	Description
OS_HOST	VARCHAR2(128)	Client host system name
OS_PROCESS	VARCHAR2(16)	Operating system process identifier of the Oracle server process
TERMINAL	VARCHAR2(30)	Identifier for the user's terminal
INSTANCE_NUMBER	NUMBER	Instance number as specified by the INSTANCE_NUMBER initialization parameter
OBJECT_SCHEMA	VARCHAR2(128)	Owner of the audited object
OBJECT_NAME	VARCHAR2(128)	Name of the object affected by the action
POLICY_NAME	VARCHAR2(128)	Name of the fine-grained auditing policy
NEW_OWNER	VARCHAR2(128)	Owner of the object named in the NEW_NAME column
NEW_NAME	VARCHAR2(128)	New name of object after renaming, or the name of an underlying object (for example, CREATE INDEX owner.obj_name ON new_owner.new_name)
ACTION	NUMBER	Numeric code for the action type
STATEMENT_TYPE	NUMBER	Description of the action
TRANSACTIONID	RAW(8)	Identifier of the transaction in which the object is accessed or modified
RETURNCODE	NUMBER	Oracle error code generated by the action. Zero if the action succeeded.
SCN	NUMBER	System change number (SCN) of the query
COMMENT_TEXT	VARCHAR2(4000)	Text comments on standard audit entries. Also indicates how the user was authenticated - the method can be one of the following: <ul style="list-style-type: none"> • DATABASE - authentication was done by password • NETWORK - authentication was done by Oracle Net Services or the Advanced Networking Option • PROXY - the client was authenticated by another user. The name of the proxy user follows the method type.
AUTH_PRIVILEGES	VARCHAR2(32)	Privileges granted and revoked in GRANT and REVOKE statements recorded for standard audit trail entry
GRANTEE	VARCHAR2(128)	User who granted or revoked the privilege
PRIV_USED	NUMBER	Numerical code of privileges, if any, used in the action
SES_ACTIONS	VARCHAR2(16)	Session summary for standard audit records. A string of 12 characters, one for each action type, in the following order: Alter, Audit, Comment, Delete, Grant, Index, Insert, Lock, Rename, Select, Update, Flashback. Values: - = None, S=Success, F=Failure, B=Both
OS_PRIVILEGE	VARCHAR2(7)	This column is populated only for administrative authentication audit records. It contains the administrative privilege used (for example, SYSDBA, SYSOPER, NONE). For all other types of audit records, the value of this column is null.
ECONTEXT_ID	VARCHAR2(64)	Application execution context identifier
SQL_BIND	VARCHAR2(4000)	List of bind variables used in the statement
SQL_TEXT	VARCHAR2(4000)	The statement or command that triggered the audit event
OBJ_EDITION_NAME	VARCHAR2(128)	Name of the edition containing the audited object
DBID	NUMBER	Database identifier of the audited database
RLS_INFO	VARCHAR2(4000)	Stores virtual private database (VPD) policy names and predicates separated by delimiter. To format the output into individual rows, use the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML function.

Column	Datatype	Description
CURRENT_USER	VARCHAR2(128)	Effective user for the statement execution
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Note:

The SQL_BIND and SQL_TEXT columns are only populated if the AUDIT_TRAIL initialization parameter is set to xml, extended or if the AUDIT_SYS_OPERATIONS initialization parameter is set to TRUE.

9.137 V\$XSTREAM_APPLY_COORDINATOR

V\$XSTREAM_APPLY_COORDINATOR displays information about each XStream apply process coordinator. The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the coordinator's session
SERIAL#	NUMBER	Serial number of the coordinator's session
STATE	VARCHAR2(21)	State of the coordinator: <ul style="list-style-type: none"> • INITIALIZING - Starting up • IDLE - Performing no work • APPLYING - Passing transactions to apply servers • SHUTTING DOWN CLEANLY - Stopping without an error • ABORTING - Stopping because of an apply error
APPLY#	NUMBER	Apply process number. An apply process coordinator is an Oracle background process, prefixed by ap.

Column	Datatype	Description
APPLY_NAME	VARCHAR2(128)	Name of the apply process
TOTAL_APPLIED	NUMBER	Total number of transactions applied by the apply process since the apply process was last started
TOTAL_WAIT_DEPS	NUMBER	Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions
TOTAL_WAIT_COMMITS	NUMBER	Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits
TOTAL_ADMIN	NUMBER	Number of administrative jobs issued since the apply process was last started
TOTAL_ASSIGNED	NUMBER	Number of transactions assigned to apply servers since the apply process was last started
TOTAL_RECEIVED	NUMBER	Total number of transactions received by the coordinator process since the apply process was last started
TOTAL_IGNORED	NUMBER	Number of transactions which were received by the coordinator but were ignored because they had been previously applied
TOTAL_ROLLBACKS	NUMBER	Number of transactions which were rolled back due to unexpected contention
TOTAL_ERRORS	NUMBER	Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started
UNASSIGNED_COMPLETE_TXNS	NUMBER	Total number of complete transactions that the coordinator has not assigned to any apply servers
LWM_TIME	DATE	Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.
LWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.
LWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.
HWM_TIME	DATE	Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.
HWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.
HWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.
STARTUP_TIME	DATE	Time when the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started
ELAPSED_IDLE_TIME	NUMBER	Elapsed idle time

Column	Datatype	Description
LWM_POSITION	RAW (64)	Position of the low-watermark LCR
HWM_POSITION	RAW (64)	Position of the high-watermark LCR
PROCESSED_MESSAGE_NUMBER	NUMBER	Message number currently processed by the apply coordinator
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
ACTIVE_SERVER_COUNT	NUMBER	Active server count

 **Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

 **See Also:**

- "["TIMED_STATISTICS"](#)
- "["STATISTICS_LEVEL"](#)"

9.138 V\$XSTREAM_APPLY_READER

V\$XSTREAM_APPLY_READER displays information about each XStream apply reader. The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the reader's session
SERIAL#	NUMBER	Serial number of the reader's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by <code>ap</code> .
APPLY_NAME	VARCHAR2 (128)	Name of the apply process

Column	Datatype	Description
STATE	VARCHAR2 (36)	<p>Shows the state of the apply reader and the hash server. The possible values include:</p> <ul style="list-style-type: none"> • INITIALIZING - Starting up • IDLE - Performing no work • DEQUEUE MESSAGES - Dequeueing messages from the queue • SCHEDULE MESSAGES - Computing dependencies between messages and assembling messages into transactions • SPILLING - Spilling unapplied messages from memory to hard disk • PAUSED - WAITING FOR DDL TO COMPLETE - Waiting for a data definition language (DDL) logical change record (LCR) to be applied <p>The state of the apply reader is displayed first, followed by the state of the hash server. A semicolon separates the apply reader state from the hash server state.</p>
TOTAL_MESSAGES_DEQUEUED	NUMBER	Total number of messages dequeued since the apply process was last started
TOTAL_MESSAGES_SPILLED	NUMBER	Number of messages spilled by the reader since the apply process was last started
DEQUEUE_TIME	DATE	Time when the last message was received
DEQUEUED_MESSAGE_NUMBER	NUMBER	Number of the last message received
DEQUEUED_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the last message received. For user-enqueued messages, time when the message was enqueue into the queue at the local database.
SGA_USED	NUMBER	Amount (in bytes) of SGA memory used by the apply process since it was last started
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started. Scheduling includes computing dependencies between messages and assembling messages into transactions.
ELAPSED_SPILL_TIME	NUMBER	Elapsed time (in hundredths of a second) spent spilling messages since the apply process was last started
OLDEST_SCN_NUM	NUMBER	Oldest SCN
OLDEST_XIDUSN	NUMBER	Transaction ID undo segment number of the oldest transaction that either has been applied or is being applied
OLDEST_XIDSLT	NUMBER	Transaction ID slot number of the oldest transaction that either has been applied or is being applied
OLDEST_XIDSON	NUMBER	Transaction ID sequence number of the oldest transaction that either has been applied or is being applied
SPILL_LWM_SCN	NUMBER	Spill low-watermark SCN
PROXY_SID	NUMBER	When the apply process uses combined capture and apply, the session ID of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
PROXY_SERIAL	NUMBER	When the apply process uses combined capture and apply, the serial number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.

Column	Datatype	Description
PROXY_SPID	VARCHAR2 (12)	When the apply process uses combined capture and apply, the process identification number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
BYTES_RECEIVED	NUMBER	When the apply process uses combined capture and apply, the number of bytes received by the apply process from the capture process since the apply process last started. If the apply process does not use combined capture and apply, then this column is not populated.
DEQUEUED_POSITION	RAW (64)	Dequeued position. This column is populated only for an apply process that is functioning as an XStream inbound server.
SPILL_LWM_POSITION	RAW (64)	Spill low-watermark position. This column is populated only for an apply process that is functioning as an XStream inbound server.
OLDEST_TRANSACTION_ID	VARCHAR2 (128)	Oldest transaction ID
TOTAL_LCRS_WITH_DEP	NUMBER	Total number of LCRs with row-level dependencies since the apply process last started
TOTAL_LCRS_WITH_WMDEP	NUMBER	Total number of LCRs with watermark dependencies since the apply process last started. A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.
TOTAL_IN_MEMORY_LCRS	NUMBER	Total number of LCRs currently in memory
SGA_ALLOCATED	NUMBER	The total amount of shared memory (in bytes) allocated from the XStreams pool for the apply process since the apply process last started
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **Note:**

The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

 **See Also:**

- "[TIMED_STATISTICS](#)"
- "[STATISTICS_LEVEL](#)"

9.139 V\$XSTREAM_APPLY_RECEIVER

V\$XSTREAM_APPLY_RECEIVER displays information about the message receiver of the apply process. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when apply migrates to another instance, or when the XStream process is stopped.

Column	Datatype	Description
SID	NUMBER	Session ID of the apply receiver
SERIAL#	NUMBER	Serial number of the apply receiver
APPLY_NAME	VARCHAR2 (128)	Name of the apply process
STARTUP_TIME	DATE	Startup time of the apply process
SOURCE_DATABASE_NAME	VARCHAR2 (128)	Name of the source database
ACKNOWLEDGEMENT	NUMBER	Acknowledgement SCN of the messages received by the receiver
LAST_RECEIVED_MSG	NUMBER	Last received message
TOTAL_MESSAGES RECEIVED	NUMBER	Total number of messages received
TOTAL_AVAILABLE_MESSAGES	NUMBER	Number of available messages
STATE	VARCHAR2 (44)	State of the apply receiver: <ul style="list-style-type: none"> • Initializing • Sending unapplied txns • Waiting for message from client • Waiting for LCR from client • Receiving LCRs • Evaluating rules • Enqueueing LCNS • Waiting for memory • Waiting for apply to read • Waiting for client flush request to complete • Waiting for client commit to complete
LAST_RECEIVED_MSG_POSITION	RAW (64)	Last received message position
ACKNOWLEDGEMENT_POSITION	RAW (64)	Acknowledgement position of the messages received by the receiver. Corresponds to ACKNOWLEDGEMENT, except the value is in position rather than SCN.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.140 V\$XSTREAM_APPLY_SERVER

V\$XSTREAM_APPLY_SERVER displays information about each XStream apply server and its activities. An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the

message to the appropriate apply handler. An apply server is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the apply server's session
SERIAL#	NUMBER	Serial number of the apply server's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2 (128)	Name of the apply process
SERVER_ID	NUMBER	Parallel execution server number of the apply server
STATE	VARCHAR2 (20)	<p>State of the apply server:</p> <ul style="list-style-type: none"> • INITIALIZING - Starting up • IDLE - Performing no work • RECORD LOW-WATERMARK - Performing an administrative job that maintains information about the apply progress, which is used in the ALL_APPLY_PROGRESS and DBA_APPLY_PROGRESS data dictionary views • ADD PARTITION - Performing an administrative job that adds a partition that is used for recording information about in-progress transactions • DROP PARTITION - Performing an administrative job that purges rows that were used to record information about in-progress transactions • EXECUTE TRANSACTION - Applying a transaction • WAIT COMMIT - Waiting to commit a transaction until all other transactions with a lower commit SCN are applied. This state is possible only if the COMMIT_SERIALIZATION apply process parameter is set to a value other than DEPENDENT_TRANSACTIONS and the PARALLELISM apply process parameter is set to a value greater than 1. • WAIT DEPENDENCY - Waiting to apply a logical change record (LCR) in a transaction until another transaction, on which it has a dependency, is applied. This state is possible only if the PARALLELISM apply process parameter is set to a value greater than 1. • ROLLBACK TRANSACTION - Rolling back a transaction • TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the apply process's queue • WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs • WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction currently being applied
XIDSLT	NUMBER	Transaction ID slot number of the transaction currently being applied
XIDSQN	NUMBER	Transaction ID sequence number of the transaction currently being applied
COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction currently being applied
DEP_XIDUSN	NUMBER	Transaction ID undo segment number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSLT	NUMBER	Transaction ID slot number of a transaction on which the transaction being applied by this apply server depends

Column	Datatype	Description
DEP_XIDSQN	NUMBER	Transaction ID sequence number of a transaction on which the transaction being applied by this apply server depends
DEP_COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction on which this apply server depends
MESSAGE_SEQUENCE	NUMBER	Number of the current message being applied by the apply server. This value is reset to 1 at the beginning of each transaction.
TOTAL_ASSIGNED	NUMBER	Total number of transactions assigned to the apply server since the apply process was last started
TOTAL_ADMIN	NUMBER	Total number of administrative jobs done by the apply server since the apply process was last started. See the STATE information in this view for the types of administrative jobs.
TOTAL_ROLLBACKS	NUMBER	Number of transactions assigned to this server which were rolled back
TOTAL_MESSAGES_APPLIED	NUMBER	Total number of messages applied by this apply server since the apply process was last started
APPLY_TIME	DATE	Time the last message was applied
APPLIED_MESSAGE_NUMBER	NUMBER	Number of the last message applied
APPLIED_MESSAGE_CREATE_TIME	DATE	Creation time at the source database of the last captured message applied. No information about user-enqueued messages is recorded in this column.
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started
ELAPSED_APPLY_TIME	NUMBER	Time elapsed (in hundredths of a second) applying messages since the apply process was last started
COMMIT_POSITION	RAW (64)	Commit position of the transaction. This column is populated only for an apply process that is functioning as an XStream inbound server.
DEP_COMMIT_POSITION	RAW (64)	Commit position of the transaction the slave depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.
LAST_APPLY_POSITION	RAW (64)	For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.
TRANSACTION_ID	VARCHAR2 (128)	Transaction ID that the slave is applying. This column is populated only for an apply process that is functioning as an XStream inbound server.
DEP_TRANSACTION_ID	VARCHAR2 (128)	Transaction ID of the transaction the slave depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
TOTAL_LCRS_RETRYED	NUMBER	Total number of LCRs retried by this server
LCR_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RETRYED	NUMBER	Total transactions retried by this server

Column	Datatype	Description
TXN_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RECORDED	NUMBER	Total transactions recorded in error queue by this server

Note:

The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

See Also:

- "[TIMED_STATISTICS](#)"
- "[STATISTICS_LEVEL](#)"

9.141 V\$XSTREAM_CAPTURE

V\$XSTREAM_CAPTURE displays information about each capture process that sends LCRs to an XStream outbound server.

Column	Datatype	Description
SID	NUMBER	Session identifier of the capture process
SERIAL#	NUMBER	Session serial number of the capture process session
CAPTURE#	NUMBER	Capture process number. A capture process is an Oracle background process prefixed by cp
CAPTURE_NAME	VARCHAR2(128)	Name of the capture process
LOGMINER_ID	NUMBER	Session ID of the Oracle LogMiner session associated with the capture process
STARTUP_TIME	DATE	Time when the capture process was last started

Column	Datatype	Description
STATE	VARCHAR2(551)	<p>State of the capture process:</p> <ul style="list-style-type: none"> • INITIALIZING - Starting up. • WAITING FOR DICTIONARY REDO - Waiting for redo log files containing the dictionary build related to the first SCN to be added to the capture process session. A capture process cannot begin to scan the redo log files until all of the log files containing the dictionary build have been added. • DICTIONARY INITIALIZATION - Processing a dictionary build. • MINING (PROCESSED SCN = <i>scn_value</i>) - Mining a dictionary build at the SCN <i>scn_value</i>. • LOADING (step <i>X</i> of <i>Y</i>) - Processing information from a dictionary build and currently at step <i>X</i> in a process that involves <i>Y</i> steps, where <i>X</i> and <i>Y</i> are numbers. • CAPTURING CHANGES - Scanning the redo log for changes that satisfy the capture process rule sets. • WAITING FOR REDO - Waiting for new redo log files to be added to the capture process session. The capture process has finished processing all of the redo log files added to its session. This state is possible if there is no activity at a source database. For a downstream capture process, this state is possible if the capture process is waiting for new log files to be added to its session. • EVALUATING RULE - Evaluating a change against a capture process rule set. • CREATING LCR - Converting a change into an LCR. • ENQUEUEING MESSAGE - Enqueuing an LCR that satisfies the capture process rule sets into the capture process queue. • PAUSED FOR FLOW CONTROL - Unable to enqueue LCRs either because of low memory or because propagations and outbound servers are consuming messages slower than the capture process is creating them. This state indicates flow control that is used to reduce spilling of captured LCRs when propagation or apply has fallen behind or is unavailable. • WAITING FOR THE BUFFERED QUEUE TO SHRINK - Waiting for the buffered queue to change to a smaller size. The buffered queue shrinks when there is a memory limitation or when an administrator reduces its size. • WAITING FOR <i>n</i> SUBSCRIBER(S) INITIALIZING - Waiting for outbound servers that receive LCRs from the capture process to start, where <i>n</i> is the number of apply processes. • WAITING FOR TRANSACTION - Waiting for LogMiner to provide more transactions. • WAITING FOR INACTIVE DEQUEUERS - Waiting for the capture process's queue subscribers to start. The capture process stops enqueueing LCRs if there are no active subscribers to the queue. • SUSPENDED FOR AUTO SPLIT/MERGE - Waiting for a merge operation to complete. • SHUTTING DOWN - Stopping. • ABORTING - Aborting.
TOTAL_PREFILTER_DISCARDE	NUMBER	Total number of prefiltered messages discarded
D		
TOTAL_PREFILTER_KEPT	NUMBER	Total number of prefiltered messages kept
TOTAL_PREFILTER_EVALUATI	NUMBER	Total number of prefilter evaluations
ONS		

Column	Datatype	Description
TOTAL_MESSAGES_CAPTURED	NUMBER	Total number of redo entries passed by LogMiner to the capture process for detailed rule evaluation since the capture process last started. A capture process converts a redo entry into a message and performs detailed rule evaluation on the message when capture process prefiltering cannot discard the change.
CAPTURE_TIME	DATE	Time when the most recent message was captured
CAPTURE_MESSAGE_NUMBER	NUMBER	Number of the most recently captured message
CAPTURE_MESSAGE_CREATE_TIME	DATE	Creation time of the most recently captured message
TOTAL_MESSAGES_CREATED	NUMBER	Count associated with ELAPSED_LCR_TIME to calculate rate
TOTAL_FULL_EVALUATIONS	NUMBER	Count associated with ELAPSED_RULE_TIME to calculate rate
TOTAL_MESSAGES_ENQUEUED	NUMBER	Total number of messages enqueued since the capture process was last started
ENQUEUE_TIME	DATE	Time when the last message was enqueued
ENQUEUE_MESSAGE_NUMBER	NUMBER	Number of the last enqueued message
ENQUEUE_MESSAGE_CREATE_TIME	DATE	Creation time of the last enqueued message
AVAILABLE_MESSAGE_NUMBER	NUMBER	For local capture, the last redo SCN flushed to the log files. For downstream capture, the last SCN added to LogMiner through the archived redo log files.
AVAILABLE_MESSAGE_CREATE_TIME	DATE	For local capture, the time the SCN was written to the log file. For downstream capture, the time the most recent archived redo log file (containing the most recent SCN) was added to LogMiner.
ELAPSED_CAPTURE_TIME	NUMBER	Elapsed time (in hundredths of a second) scanning for changes in the redo log since the capture process was last started
ELAPSED_RULE_TIME	NUMBER	Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started
ELAPSED_ENQUEUE_TIME	NUMBER	Elapsed time (in hundredths of a second) enqueueing messages since the capture process was last started
ELAPSED_LCR_TIME	NUMBER	Elapsed time (in hundredths of a second) creating LCRs since the capture process was last started
ELAPSED_REDO_WAIT_TIME	NUMBER	Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state
ELAPSED_PAUSE_TIME	NUMBER	Elapsed flow control pause time (in hundredths of a second)
STATE_CHANGED_TIME	DATE	Time at which the state of the capture process changed
SGA_USED	NUMBER	The total amount of shared memory (in bytes) currently used by the capture process out of the amount allocated (<code>SGA_ALLOCATED</code>)
SGA_ALLOCATED	NUMBER	The total amount of shared memory (in bytes) allocated from the Streams pool for the capture process
BYTES_OF_REDO_MINED	VARCHAR2(64)	The total amount of redo data mined (in bytes) since the capture process last started
SESSION_RESTART_SCN	VARCHAR2(64)	The SCN from which the capture process started mining redo data when it was last started

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 **Note:**

The `ELAPSED_CAPTURE_TIME`, `ELAPSED_RULE_TIME`, `ELAPSED_ENQUEUE_TIME`, `ELAPSED_LCR_TIME`, and `ELAPSED_REDO_WAIT_TIME` columns are only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

 **See Also:**

- "["TIMED_STATISTICS"](#)
- "["STATISTICS_LEVEL"](#)

9.142 V\$XSTREAM_MESSAGE_TRACKING

`V$XSTREAM_MESSAGE_TRACKING` displays information about LCRs tracked through the stream that are processed by XStream components.

You can track an LCR through a stream using one of the following methods:

- Set the `message_tracking_frequency` capture process parameter to 1 or another relatively low value for XStream Outbound processes.
- Set the `message_tracking_frequency` apply process parameter to 1 or another relatively low value for XStream Inbound processes.
- Use the `DBMS_XSTREAMADM.SET_MESSAGE_TRACKING` procedure to specify a tracking label that becomes part of each LCR generated by the current session.

When the `actions` parameter in the `DBMS_XSTREAMADM.SET_MESSAGE_TRACKING` procedure is set to `DBMS_XSTREAMADM.ACTION_MEMORY`, information about the LCRs is tracked in memory, and this view is populated with information about the LCRs. Currently, `DBMS_XSTREAMADM.ACTION_MEMORY` is the only valid setting for the `actions` parameter in the procedure.

 **Note:**

This view does not display information about messages flowing in an Oracle GoldenGate configuration. To view information about such message streams, query the `V$GOLDENGATE_MESSAGE_TRACKING` view.

Column	Datatype	Description
TRACKING_LABEL	VARCHAR2(128)	User-specified tracking label
TAG	RAW(30)	First 30 bytes of the tag of the LCR
COMPONENT_NAME	VARCHAR2(128)	Name of the component that processed the LCR
COMPONENT_TYPE	VARCHAR2(128)	Type of the component that processed the LCR
ACTION	VARCHAR2(50)	Action performed on the LCR
ACTION_DETAILS	VARCHAR2(100)	Details of the action
TIMESTAMP	TIMESTAMP(9) WITH TIME ZONE	Time when the action was performed
MESSAGE_CREATION_TIME	DATE	Time when the message was created
MESSAGE_NUMBER	NUMBER	SCN of the message
TRACKING_ID	RAW(16)	Globally unique OID of the LCR
SOURCE_DATABASE_NAME	VARCHAR2(128)	Name of the source database
OBJECT_OWNER	VARCHAR2(128)	Owner of the object
OBJECT_NAME	VARCHAR2(128)	Name of the object
XID	VARCHAR2(128)	Transaction ID
COMMAND_TYPE	VARCHAR2(128)	Command type of the LCR
MESSAGE_POSITION	RAW(64)	Position of the message
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "["V\\$GOLDENGATE_MESSAGE_TRACKING"](#)"

- *Oracle Database XStream Guide* for more information about XStream concepts

9.143 V\$XSTREAM_OUTBOUND_SERVER

V\$XSTREAM_OUTBOUND_SERVER displays statistics about an outbound server. An outbound server sends LCRs to the XStream client application.

 **Note:**

When the COMMITTED_DATA_ONLY column is YES in the V\$XSTREAM_OUTBOUND_SERVER view, the V\$STREAMS_APPLY_SERVER view provides additional information about the outbound server process, and information about the apply server background processes used by the outbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the outbound server's session
SERIAL#	NUMBER	Serial number of the outbound server's session
SPID	VARCHAR2(12)	Process identification number of the operating-system process that sends LCRs to the client application
SERVER_NAME	VARCHAR2(128)	Name of the outbound server
STARTUP_TIME	DATE	Time when the client application attached to the outbound server

Column	Datatype	Description
STATE	VARCHAR2(19)	<p>State of the outbound server</p> <p>When the <code>COMMITTED_DATA_ONLY</code> column shows YES, the following states are possible:</p> <ul style="list-style-type: none"> INITIALIZING - Starting up the outbound server. IDLE - Performing no work because there are no LCRs to send to the XStream client application. GET TRANSACTIONS - Receiving transactions from the outbound server's apply coordinator. SEND TRANSACTION - Sending a transaction to an XStream client application. WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction. TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the outbound server's queue. WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs. <p>When the <code>COMMITTED_DATA_ONLY</code> column shows NO, the following states are possible:</p> <ul style="list-style-type: none"> INITIALIZING - Starting up the outbound server. INITIALIZING RULE EVALUATION CONTEXT - Initializing the context to evaluate the outbound server's rules. IDLE - Performing no work because there is no LCR to send to the XStream client application. BROWSING LCR - Browsing the outbound server's queue for next LCR. EVALUATING RULES - Evaluating an LCR against a rule set. DEQUEUING LCR - Dequeueing an LCR from the outbound server's queue. SENDING LCR - Sending an LCR to an XStream client application. WAITING FOR CAPTURE TO TERMINATE - Waiting for the capture process to become disabled. SUSPENDED DUE TO A DROPPED SUBSCRIBER - Suspended because a connected subscriber was dropped. For example, a subscriber can be dropped during a split or merge operation. SUSPENDED FOR AUTO SPLIT/MERGE - Suspended because an automatic split or merge operation is being performed. WAITING ON EMPTY QUEUE - Waiting for more LCRs from the capture process. WAITING FOR CLIENT - Waiting for the XStream client application to request more LCRs. WAITING FOR CAPTURE TO INITIALIZE - Waiting for the capture process to finish the data dictionary build. WAITING TO ATTACH TO CAPTURE - Waiting for the outbound server to attach to the capture process. <p>When a state refers to a capture process, it is the capture process that captures changes for the outbound server. When a state refers to a propagation, it is the outbound server that sends LCRs to the XStream client application.</p>
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction currently being processed. This column is populated only if the <code>COMMITTED_DATA_ONLY</code> column shows YES. When the <code>COMMITTED_DATA_ONLY</code> column shows NO, this column is NULL.

Column	Datatype	Description
XIDSIT	NUMBER	Transaction ID slot number of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
XIDSQN	NUMBER	Transaction ID sequence number of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
COMMITSCN	NUMBER	Commit SCN of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
TOTAL_TRANSACTIONS_SENT	NUMBER	Total number of transactions sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
MESSAGE_SEQUENCE	NUMBER	Number of the current LCR being processed by the outbound server. This value is reset to 1 at the beginning of each transaction. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
TOTAL_MESSAGES_SENT	NUMBER	Total number of LCRs sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server
SEND_TIME	DATE	Time the last LCR was sent by the outbound server to the XStream client application
LAST_SENT_MESSAGE_NUMBER	NUMBER	Message number of the last LCR sent by the outbound server to the XStream client application
LAST_SENT_MESSAGE_CREATE_TIME	DATE	Creation time at the source database of the last LCR sent by the outbound server to the client application
ELAPSED_SEND_TIME	NUMBER	Time elapsed (in hundredths of a second) sending LCRs to the XStream client application since the last time the client application attached to the outbound server
COMMIT_POSITION	RAW(64)	Commit position of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
LAST_SENT_POSITION	RAW(64)	Position of the last LCR sent to the XStream client application. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
BYTES_SENT	NUMBER	Total number of bytes sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server
COMMITTED_DATA_ONLY	CHAR(3)	YES if the outbound server can send only LCRs in committed transactions to the XStream client application. A committed transaction is an assembled, noninterleaving transaction with no rollbacks. NO if the outbound server can send LCRs in transactions that have not yet committed to the XStream client application. This mode is for internal Oracle use only.

Column	Datatype	Description
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

 See Also:["V\\$STREAMS_APPLY_SERVER"](#)

9.144 V\$STREAM_TABLE_STATS

V\$STREAM_TABLE_STATS shows the statistics for all the tables processed by each apply server for the XStream session.

Column	Datatype	Description
APPLY_NAME	VARCHAR2(128)	Name of XStream Out or XStream In process
SERVER_ID	NUMBER	Parallel apply server slave ID. If the server ID is 0, then this is an aggregate of statistics for servers that may have been automatically shutdown due to session inactivity.
SOURCE_TABLE_OWNER	VARCHAR2(128)	Source owner of the captured or replicated table
SOURCE_TABLE_NAME	VARCHAR2(128)	Source name of the captured or replicated table
DESTINATION_TABLE_OWNER	VARCHAR2(128)	Target owner of the captured or replicated table
DESTINATION_TABLE_NAME	VARCHAR2(128)	Target name of the captured or replicated table
LAST_UPDATE	DATE	Time of last update
TOTAL_INSERTS	NUMBER	Number of insert operations on this table processed by this apply server for the current session
TOTAL_UPDATES	NUMBER	Number of update operations on this table processed by this apply server for the current session
TOTAL_DELETES	NUMBER	Number of delete operations on this table processed by this apply server for the current session
INSERT_COLLISIONS	NUMBER	Number of insert collisions on this table encountered by this apply server for the current session
UPDATE_COLLISIONS	NUMBER	Number of update collisions on this table encountered by this apply server for the current session
DELETE_COLLISIONS	NUMBER	Number of delete collisions on this table encountered by this apply server for the current session
REPERROR_RECORDS	NUMBER	Number of change records that were recorded on this table by this apply server for the current session
REPERROR_IGNORES	NUMBER	Number of ignored change records on this table by this apply server for the current session
WAIT_DEPENDENCIES	NUMBER	Number of waits for this table due to dependency for the current session

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data
CDR_INSERT_ROW_EXISTS	NUMBER	Number of conflicts where an insert gets an ORA-00001 error
CDR_UPDATE_ROW_EXISTS	NUMBER	Number of conflicts where an update gets an ORA-26786 error
CDR_UPDATE_ROW_MISSING	NUMBER	Number of conflicts where an update gets an ORA-26787 error
CDR_DELETE_ROW_EXISTS	NUMBER	Number of conflicts where a delete gets an ORA-26786 error
CDR_DELETE_ROW_MISSING	NUMBER	Number of conflicts where a delete gets an ORA-26787 error
CDR_SUCCESSFUL_RESOLUTIONS	NUMBER	Number of successfully resolved conflicts
CDR_FAILED_RESOLUTIONS	NUMBER	Number of conflicts that could not be resolved due to an error during resolution
LOB_OPERATIONS	NUMBER	The number of LOB updates (LOB writes, LOB trims, and LOB erases) applied by the inbound server.

 **See Also:**

Oracle Database XStream Guide for more information about XStream conflict detection and resolution

9.145 V\$XSTREAM_TRANSACTION

V\$XSTREAM_TRANSACTION displays information about transactions that are being processed by capture processes, outbound servers, and inbound servers. This view can identify long running transactions and to display how many LCRs are being processed in each transaction. This view only contains information about captured LCRs. It does not contain information about user-enqueued LCRs or user messages.

This view only shows information about LCRs that are being processed because they satisfied the rule sets for the component at the time of the query. For capture processes, this view only shows information about changes in transactions that the capture process has converted into LCRs. It does not show information about all the active transactions present in the redo log.

For outbound servers, this view only shows information about LCRs that the outbound server has dequeued. It does not show information about LCRs in the outbound server's queue. For outbound servers, information about a transaction remains in the view until the transaction is sent to the XStream client application.

For inbound servers, information about a transaction remains in the view until the transaction commits or until the entire transaction is rolled back.

Column	Datatype	Description
COMPONENT_NAME	VARCHAR2 (128)	Name of the component

Column	Datatype	Description
COMPONENT_TYPE	VARCHAR2(20)	Type of component <ul style="list-style-type: none"> • CAPTURE - Capture process • APPLY - Apply reader subcomponent in an outbound server or inbound server • PROPAGATION_SENDER - Propagation sender that sends LCRs from a capture process to an outbound server
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction
XIDSLT	NUMBER	Transaction ID slot number of the transaction
XIDSQN	NUMBER	Transaction ID sequence number of the transaction
CUMULATIVE_MESSAGE_COUNT	NUMBER	Number of LCRs processed in the transaction. If a component is restarted while the transaction is being processed, then this column shows the number of LCRs processed in the transaction since the component was started.
TOTAL_MESSAGE_COUNT	NUMBER	Total number of LCRs processed in the transaction by an outbound server or inbound server. This column does not pertain to capture processes.
FIRST_MESSAGE_TIME	DATE	Time stamp of the first LCR processed in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the time stamp of the first LCR processed after the capture process was started.
FIRST_MESSAGE_NUMBER	NUMBER	SCN of the first message in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the SCN of the first message processed after the capture process was started.
LAST_MESSAGE_TIME	DATE	Time stamp of the last LCR processed in the transaction
LAST_MESSAGE_NUMBER	NUMBER	SCN of the most recent message encountered for the transaction
FIRST_MESSAGE_POSITION	RAW(64)	Position of the first message seen by an XStream inbound server This column is populated only for an apply process that is functioning as an XStream inbound server.
LAST_MESSAGE_POSITION	RAW(64)	Position of the last message seen by an XStream inbound server. This column is populated only for an apply process that is functioning as an XStream inbound server.
TRANSACTION_ID	VARCHAR2(128)	Transaction ID for an XStream inbound server. This column is populated only for an apply process that is functioning as an XStream inbound server.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.146 V\$ZONEMAP_USAGE_STATS

V\$ZONEMAP_USAGE_STATS displays zone map usage statistics.

Column	Datatype	Description
ZONEMAP	VARCHAR2(257)	Name of the zone map in the form of <i>owner.name</i>
PRUNING_TYPE	VARCHAR2(11)	Type of data pruning performed using the zone map
EXECUTIONS	NUMBER	Number of executions, including parallel slave executions
BASE_COUNT	NUMBER	Base count accumulated over number of executions
PRUNED_COUNT	NUMBER	Pruned count accumulated over number of executions
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

The ratio (`PRUNED_COUNT / BASE_COUNT`) shows the fraction of data pruned by the zone map.

Part IV

Appendices

This part includes the following appendixes:

- Database Limits
- SQL Scripts
- Oracle Wait Events
- Oracle Enqueue Names
- Statistics Descriptions
- Background Processes

A

Database Limits

This appendix lists the limits of values associated with database functions and objects. Limits exist on several levels in the database. There is usually a hard-coded limit in the database that cannot be exceeded. This value may be further restricted for any given operating system. Database limits are divided into four categories:

- Datatype Limits
- Physical Database Limits
- Logical Database Limits
- Process and Runtime Limits

See Also:

Your operating system-specific Oracle documentation

A.1 Datatype Limits

This table documents the limits for datatypes, and includes comments about the datatypes.

Datatypes	Limit	Comments
BFILE	Maximum size: 2^{64} bytes (18.44 exabytes) or OS file size limit, whichever is the lower value Maximum size of a file name: 255 characters Maximum size of a directory name: 128 bytes Maximum number of open BFILEs: see Comments	The maximum number of BFILEs is limited by the value of the SESSION_MAX_OPEN_FILES initialization parameter, which is itself limited by the maximum number of open files the operating system will allow.
BLOB	Maximum size: $(4 \text{ GB} - 1) * \text{DB_BLOCK_SIZE}$ initialization parameter (8 TB to 128 TB)	The number of LOB columns per table is limited only by the maximum number of columns per table (that is, 1000 ¹).
CHAR	Maximum size: 2000 bytes	None
CLOB	Maximum size: $(4 \text{ GB} - 1) * \text{DB_BLOCK_SIZE}$ initialization parameter (8 TB to 128 TB)	The number of LOB columns per table is limited only by the maximum number of columns per table (that is, 1000 ¹).
Literals (characters or numbers in SQL or PL/SQL)	Maximum size: 4000 characters	None
LONG ²	Maximum size: 2 GB - 1	Only one LONG column is allowed per table.
NCHAR	Maximum size: 2000 bytes	None

Datatypes	Limit	Comments
NCLOB	Maximum size: (4 GB - 1) * DB_BLOCK_SIZE initialization parameter (8 TB to 128 TB)	The number of LOB columns per table is limited only by the maximum number of columns per table (that is, 1000 ¹).
NUMBER	999... (38 9's) $\times 10^{125}$ maximum value -999... (38 9's) $\times 10^{125}$ minimum value	Can be represented to full 38-digit precision (the mantissa) Can be represented to full 38-digit precision (the mantissa)
NVARCHAR2	Maximum size: 4000 bytes, or 32767 bytes if the MAX_STRING_SIZE initialization parameter is set to EXTENDED See Also: " MAX_STRING_SIZE " initialization parameter for additional details	None
Precision	38 significant digits	None
RAW	Maximum size: 2000 bytes, or 32767 bytes if the MAX_STRING_SIZE initialization parameter is set to EXTENDED See Also: " MAX_STRING_SIZE " initialization parameter for additional details	None
VARCHAR2	Maximum size: 4000 bytes, or 32767 bytes if the MAX_STRING_SIZE initialization parameter is set to EXTENDED See Also: " MAX_STRING_SIZE " initialization parameter for additional details	None

- ¹ The absolute maximum number of columns in a table is 1000. However, when you create an object table (or a relational table with columns of object, nested table, varray, or REF type), Oracle maps the columns of the user-defined types to relational columns, creating in effect hidden columns that count toward the 1000-column limit. For details on how Oracle calculates the total number of columns in such a table, refer to *Oracle Database Administrator's Guide*.
- ² All forms of LONG data types (LONG, LONG RAW, LONG VARCHAR, LONG VARRAW) were deprecated in Oracle8i Release 8.1.6. For succeeding releases, the LONG data type was provided for backward compatibility with existing applications. In new applications developed with later releases, Oracle strongly recommends that you use the CLOB or NCLOB data type for storing large amounts of character data.

See Also:

- *Oracle Database SQL Language Reference* for more information about datatypes
- *Oracle Database SQL Language Reference* for more information on naming database objects

A.2 Physical Database Limits

This table describes limit types and limit values for physical database items.

Item	Type of Limit	Limit Value
Controlfiles	Number of control files	1 minimum; 2 or more (on separate devices) strongly recommended
Controlfiles	Size of a control file	Maximum of 201031680 logical blocks
Database Block Size	Minimum	2048 bytes; must be a multiple of operating system physical block size
Database Block Size	Maximum	Operating system dependent; never more than 32 KB
Database Blocks	Minimum in initial extent of a segment	2 blocks
Database Blocks	Maximum per datafile	Platform dependent; typically 2^{22} - 1 blocks
Database extents	Maximum per dictionary managed tablespace	4 GB * physical block size (with K/M modifier); 4 GB (without K/M modifier)
Database extents	Maximum per locally managed (uniform) tablespace	256 KB * physical block size
Database file size	Maximum	Operating system dependent. Limited by maximum operating system file size. See the Bigfile Tablespaces and Smallfile (traditional) Tablespaces rows for more information about the maximum database file size in these types of tablespaces.
Database files	Maximum per tablespace	Operating system dependent; usually 1023
Database files	Maximum per database	65533 May be less on some operating systems Limited also by size of database blocks and by the <code>DB_FILES</code> initialization parameter for a particular instance
External Tables file	Maximum size	Dependent on the operating system An external table can be composed of multiple files.
MAXEXTENTS	Default value	Derived from tablespace default storage or <code>DB_BLOCK_SIZE</code> initialization parameter
MAXEXTENTS	Maximum	Not defined
Redo Log File Size	Minimum size	4 MB
Redo Log File Size	Maximum Size	Operating system limit; typically 2 TB
Redo Log Files	Maximum number of logfiles	Limited by value of <code>MAXLOGFILES</code> parameter in the <code>CREATE DATABASE</code> statement Control file can be resized to allow more entries; ultimately an operating system limit
Redo Log Files	Maximum number of logfiles per group	Not defined
Tablespaces	Maximum number per database	64 K Number of tablespaces cannot exceed the number of database files because each tablespace must include at least one file

Item	Type of Limit	Limit Value
Bigfile Tablespaces	Number of blocks	A bigfile tablespace contains only one datafile or tempfile, which can contain up to approximately 4 billion (2^{32}) blocks. The maximum size of the single datafile or tempfile is 128 terabytes (TB) for a tablespace with 32 K blocks and 32 TB for a tablespace with 8 K blocks.
Smallfile (traditional) Tablespaces	Number of blocks	A smallfile tablespace is a traditional Oracle tablespace, which can contain 1023 datafiles or tempfiles, each of which can contain up to approximately 4 million (2^{22}) blocks.

A.3 Logical Database Limits

This table describes limit types and limit values for logical database items.

Item	Type of Limit	Limit Value
Columns	Maximum per table	1000
Columns	Maximum per index (or clustered index)	32
Columns	Maximum per bitmapped index	30
Constraints	Maximum per column	Not defined Oracle does not define a limit on the number of constraints per column. However, constraints are subject to the limit on the maximum number of constraints in the database. See the entry for " Constraints - Maximum per database " in this table.
Constraints	Maximum per database	4,294,967,293 Constraints are numbered internally from 1 to 4,294,967,294. The internal number is incremented each time a constraint is created, and numbers are never recycled. One number is always consumed by a special internal user called <code>_NEXT_CONSTRAINT</code> , which represents the next available number for a new constraint. Therefore, the maximum number of constraints that can be created during the lifetime of a database is 4,294,967,293. You can view constraint numbers by querying the <code>CON#</code> column of the <code>SYS.CON\$</code> table. If your database has reached the constraint limit and you would like to create more constraints, contact Oracle Support.

Item	Type of Limit	Limit Value
Dictionary-managed database objects	Maximum per database	<p>4,254,950,911 - overhead</p> <ul style="list-style-type: none"> The value of 4,254,950,911 is derived as follows: The data type used for object identifiers can store a maximum value of 4,294,967,294. However, approximately 40 million of these values are reserved at the high end for other purposes, which results in a maximum object identifier value of 4,254,950,911. Overhead includes the following: <ul style="list-style-type: none"> Multiple object identifiers for one database object Database objects consume one object identifier at the time of creation. This identifier is displayed in both the <code>OBJECT_ID</code> and <code>DATA_OBJECT_ID</code> columns of the ALL_OBJECTS view. Over the lifetime of an object, the value of <code>OBJECT_ID</code> remains unchanged, but the value of <code>DATA_OBJECT_ID</code> changes when the object is altered, for example, with a DDL statement or a table truncation. Therefore, one object can consume more than one object identifier over its lifetime. Object identifiers for lightweight jobs Lightweight jobs consume object identifiers, even though they are not permanent objects. Therefore, if many lightweight jobs are running in the database, the number of objects that can be created in the database is dependent upon the remaining pool of identifiers.
Indexes	Maximum per table	<p>Not defined</p> <p>Oracle does not define a limit on the number of indexes per table. However, indexes are subject to the limit on the maximum number of dictionary-managed database objects allowed per database. See the entry for "Dictionary-managed database objects" in this table.</p>
Indexes	Total size of indexed column(s)	Approximately 75% of the database block size minus some overhead
Partitions	Maximum length of linear partitioning key	4 KB - overhead
Partitions	Maximum number of columns in partition key	16 columns
Partitions	Maximum number of partitions allowed per table or index	1024K - 1
Rows	Maximum number per table	Not defined
Stored Packages	Maximum size	<p>Approximately 6,000,000 lines of code.</p> <p>See Also: Oracle Database PL/SQL Language Reference for details</p>
Subpartitions	Maximum number of subpartitions in a composite partitioned table	1024K - 1

Item	Type of Limit	Limit Value
Subqueries	Maximum levels of subqueries in a SQL statement	255 subqueries in the WHERE clause A limit is not defined for subqueries in the FROM clause of the top-level query.
System Change Numbers (SCNs)	Maximum	$2^{63} - 2^{48} = 9,223,090,561,878,065,152$ SCNs
Tables	Maximum per clustered table	32 tables
Tables	Maximum per database	Not defined Oracle does not define a limit on the number of tables per database. However, tables are subject to the limit on the maximum number of dictionary-managed database objects allowed per database. See the entry for " Dictionary-managed database objects " in this table.
Users and Roles	Maximum	2,147,483,638 Users and roles are numbered internally from 0 to 2,147,483,638. The internal number is incremented each time a user or role is created, and numbers are never recycled. One number is always consumed by a special internal user called <code>_NEXT_USER</code> , which represents the next available number for a new user or role. Therefore, the maximum number of users and roles that can be created during the lifetime of a database is 2,147,483,638. You can view user and role numbers by querying the <code>USER#</code> column of the <code>SYS.USER\$</code> table.

Note:

The limit on how long a SQL statement can be depends on many factors, including database configuration, disk space, and memory

Note:

When an object instance exists in memory, there is no fixed limit on the number of attributes in the object. But the maximum total amount of memory consumed by an object instance is 4 GB. When an object instance is inserted into a table, the attributes are exploded into separate columns in the table, and the Oracle 1000-column limit applies.

A.4 Process and Runtime Limits

This table describes limit types and limit values for process and runtime items.

Item	Type of Limit	Limit Value
Advanced Queuing Processes	Maximum per instance	10

Item	Type of Limit	Limit Value
Backup Sessions	Maximum per instance	Limited by the PROCESSES and SESSIONS initialization parameters, for instance
Dispatchers	Maximum per instance	Limited by the PROCESSES and SESSIONS initialization parameters, for instance
Global Cache Service Processes	Maximum per instance	10
Instances per database	Maximum number of cluster database instances per database	Operating system-dependent
I/O Worker Processes	Maximum per background process (DBWR, LGWR, and so on)	15
I/O Worker Processes	Maximum per Backup session	15
Job Queue Processes	Maximum per instance	1000
Locks	Distributed Lock Manager	Operating system dependent
Locks	Row-level	Not defined
Parallel Execution Workers	Maximum per instance	Limited by the PROCESSES and SESSIONS initialization parameters, for instance
Services	Maximum per instance	8200
Sessions	Maximum per instance	2^{16} ; limited by the PROCESSES and SESSIONS initialization parameters. 2^{16} is 65536.
SGA size	Maximum value	Operating system-dependent; typically 2 to 4 GB for 32-bit operating systems, and > 4 GB for 64-bit operating systems
Shared Servers	Maximum per instance	Limited by the PROCESSES and SESSIONS initialization parameters, for instance

B

SQL Scripts

This appendix describes SQL scripts that are required for optimal operation of the Oracle Database.

The SQL scripts are described in the following sections:

- [Creating the Data Dictionary](#)
- [Creating Additional Data Dictionary Structures](#)
- [The "NO" Scripts](#)
- [Upgrade Scripts](#)
- [Java Scripts](#)

 **Note:**

Comments within the SQL scripts themselves contain more detailed information and examples.

 **Note:**

To run scripts in a pluggable database (PDB), connect to the PDB before running the script. For more information about running scripts in a multitenant container database (CDB), see *Oracle Multitenant Administrator's Guide*.

B.1 Creating the Data Dictionary

When you use the Database Configuration Assistant to create a database, Oracle automatically creates the data dictionary. Thereafter, whenever the database is in operation, Oracle updates the data dictionary in response to every DDL statement.

The data dictionary base tables are the first objects created in any Oracle database. They are created in the `SYSTEM` tablespace and must remain there. The data dictionary base tables store information about all user-defined objects in the database.

[Table B-1](#) lists required scripts, which are run automatically when you create a database using the Database Configuration Assistant. They are described here because you might need to run them if you create a database manually. To run these scripts, you must be connected to Oracle as a user with `SYSDBA` privileges.

Table B-1 Creating the Data Dictionary Scripts

Script Name	Needed For	Description
catalog.sql	All databases	Creates the data dictionary and public synonyms for many of its views Grants PUBLIC access to the synonyms
catproc.sql	All databases	Runs all scripts required for, or used with, PL/SQL
catpcat.sql ¹	All databases	Runs the catalog.sql and catproc.sql scripts as parallel processes, which can speed up database creation Note: You must run catpcat.sql by using the catctl.pl program. See <i>Oracle Database Administrator's Guide</i> for more information.
catclust.sql	Oracle Real Application Clusters	Creates Oracle Real Application Clusters data dictionary views

¹ This script is available starting with Oracle Database 19c.

See Also:

- Your operating system-specific Oracle documentation for the exact names and locations of these scripts on your operating system
- *Oracle Database Administrator's Guide* for more information about creating a database
- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about creating Oracle Real Application Cluster views

B.2 Creating Additional Data Dictionary Structures

Oracle Database supplies other scripts that create additional structures you can use in managing your database and creating database applications. These scripts are listed in [Table B-2](#).

See Also:

Your operating system-specific Oracle documentation for the exact names and locations of these scripts on your operating system

Table B-2 Creating Additional Data Dictionary Structures

Script Name	Needed For	Run By	Description
catblock.sql	Performance management	SYS	<p>Creates views that can dynamically display lock dependency graphs</p> <p>See Also: <i>Oracle Database Administrator's Guide</i></p>
caths.sql	Heterogeneous Services	SYS	<p>Installs packages for administering heterogeneous services</p> <p>See Also: <i>Oracle Database Gateway for APPC Installation and Configuration Guide for Microsoft Windows</i></p>
catio.sql	Performance management	SYS	Allows I/O to be traced on a table-by-table basis
catqueue.sql	Advanced Queuing		Creates the dictionary objects required for Advanced Queuing
catrep.sql	Oracle Replication	SYS	Runs all SQL scripts for enabling database replication
catwrr.sql	Database Replay	SYS	Master script that creates the entire schema related to Database Replay - calls the create schema scripts for Workload Capture, Database Replay, Workload Replay, and Workload Intelligence
catwrrwitb.sql	Database Replay	SYS	Creates the schema for Workload Intelligence
dbmsiotc.sql	Storage management	Any user	Analyzes chained rows in index-organized tables
dbmspool.sql	Performance management	SYS or SYSDBA	Enables DBA to lock PL/SQL packages, SQL statements, and triggers into the shared pool
			See Also: <i>Oracle Database PL/SQL Packages and Types Reference</i>
userlock.sql	Concurrency control	SYS or SYSDBA	Provides a facility for user-named locks that can be used in a local or clustered environment to aid in sequencing application actions
utlbstat.sql and utleststat.sql	Performance monitoring	SYS	Respectively start and stop collecting performance tuning statistics
utlchn1.sql	Storage management	Any user	For use with the Oracle Database. Creates tables for storing the output of the ANALYZE command with the CHAINED ROWS option. Can handle both physical and logical rowids.
			See Also: <i>Oracle Database Administrator's Guide</i>
utlconst.sql	Year 2000 compliance	Any user	Provides functions to validate that CHECK constraints on date columns are year 2000 compliant
utldtree.sql	Metadata management	Any user	Creates tables and views that show dependencies between objects
			See Also: <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i>

Table B-2 (Cont.) Creating Additional Data Dictionary Structures

Script Name	Needed For	Run By	Description
utlexpt1.sql	Constraints	Any user	<p>For use with the Oracle Database. Creates the default table (<code>EXCEPTIONS</code>) for storing exceptions from enabling constraints. Can handle both physical and logical rowids.</p> <p>See Also: <i>Oracle Database Administrator's Guide</i></p>
utlfixdirs.sql ¹	Moving a database to a new Oracle home	SYS	<p>Used after moving a database to a new Oracle home. Updates directory objects to use the new path names for the Oracle home and Oracle base directories, as defined by the new values for the <code>ORACLE_HOME</code> and <code>ORACLE_BASE</code> environment variables.</p> <p>When you run this script in the root container of a CDB, it updates directory objects in the root, as well as any Oracle-maintained directory objects in the PDBs; you must manually update any PDB directory objects that are not Oracle-maintained.</p>
utlip.sql	PL/SQL	SYS	<p>Used primarily for upgrade and downgrade operations. It invalidates all existing PL/SQL modules by altering certain dictionary tables so that subsequent recompilations will occur in the format required by the database. It also reloads the packages <code>STANDARD</code> and <code>DBMS_STANDARD</code>, which are necessary for any PL/SQL compilations.</p>
utlirp.sql	PL/SQL	SYS	<p>Used to change from 32-bit to 64-bit word size or vice versa. This script recompiles existing PL/SQL modules in the format required by the new database. It first alters some data dictionary tables. Then it reloads the packages <code>STANDARD</code> and <code>DBMS_STANDARD</code>, which are necessary for using PL/SQL. Finally, it triggers a recompilation of all PL/SQL modules, such as packages, procedures, and types.</p>
utllockt.sql	Performance monitoring	SYS or SYSDBA	<p>Displays a lock wait-for graph, in tree structure format</p> <p>See Also: <i>Oracle Database Administrator's Guide</i></p>
utlpwdmg.sql	Security	SYS or SYSDBA	<p>Creates PL/SQL functions for default password complexity verification. Sets the default password profile parameters and enables password management features.</p> <p>See Also: <i>Oracle Database Security Guide</i></p>
utlrp.sql	PL/SQL	SYS	<p>Recompiles all existing PL/SQL modules that were previously in an <code>INVALID</code> state, such as packages, procedures, and types.</p>
utlsampl.sql	Examples	SYS or any user with DBA role	<p>Creates sample tables, such as <code>emp</code> and <code>dept</code>, and users, such as <code>scott</code></p>
utlscln.sql	Oracle Replication	Any user	<p>Copies a snapshot schema from another snapshot site</p>

Table B-2 (Cont.) Creating Additional Data Dictionary Structures

Script Name	Needed For	Run By	Description
utltkprf.sql	Performance management	SYS	Creates the TKPROFER role to allow the TKPROF profiling utility to be run by non-DBA users
utlvalid.sql	Partitioned tables	Any user	Creates tables required for storing output of ANALYZE TABLE ... VALIDATE STRUCTURE of a partitioned table
utlxplan.sql	Performance management	Any user	Creates the table PLAN_TABLE, which holds output from the EXPLAIN PLAN statement See Also: <i>Oracle Database Data Warehousing Guide</i>

¹ This script is available starting with Oracle Database 19c.

B.3 The "NO" Scripts

These scripts are used to remove dictionary information for various optional services or components.

Table B-3 The NO Scripts

Script Name	Needed For	Run By	Description
catnoadt.sql	Objects	SYS	Drops views and synonyms on dictionary metadata that relate to object types
catnoaud.sql	Security	SYS	Drops views and synonyms on auditing metadata
catnoclust.sql	Real Application Clusters	SYS	Drops views that are specific to Oracle Real Application Clusters (Oracle RAC)
catnodrdaas.sql	DRDA Application Server	SYS	Drops all DRDA Application Server objects from the database
catnogwm.sql	Global Data Services	SYS	Drops users, roles, and other objects created for Global Data Services.
catnohs.sql	Heterogeneous Services	SYS	Removes Heterogeneous Services dictionary metadata
catnojav.sql	Java	SYS	Drops the RDBMS Java classes and system triggers created by the catjava.sql script.
catnoprt.sql	Partitioning	SYS	Drops views and synonyms on dictionary metadata that relate to partitioned tables and indexes
catnosvm.sql	Server Manager	SYS	Removes Oracle7 Server Manager views and synonyms
catnowrr.sql	Database Replay	SYS	Master script that drops the entire schema related to Database Replay - calls the drop schema scripts for Workload Capture, Database Replay, Workload Replay, and Workload Intelligence
catnowrrc.sql	Database Replay	SYS	Drops the schema related to Workload Capture
catnowrrp.sql	Database Replay	SYS	Drops the schema related to Workload Replay
catnowrrwibt.sql	Database Replay	SYS	Drops the schema related to Workload Intelligence

Table B-3 (Cont.) The NO Scripts

Script Name	Needed For	Run By	Description
catnsnmp.sql	Distributed management	SYS	Drops the DBSNMP user and SNMPAGENT role

B.4 Upgrade Scripts

Upgrade scripts are used when upgrading to another release of Oracle.

 **See Also:**

Oracle Database Upgrade Guide for information about upgrade scripts

B.5 Java Scripts

The Java scripts are useful only if the JServer option is installed.

Table B-4 Java Scripts

Script Name	Description
initjvm.sql	Initializes JServer by installing core Java class libraries and Oracle-specific Java classes
rmjvm.sql	Removes all elements of the JServer See Also: <i>Oracle Database Java Developer's Guide</i>
catjava.sql	Installs Java-related packages and classes

C

Oracle Wait Events

This appendix describes Oracle wait events.

It includes these topics:

- [Classes of Wait Events](#)
- [Descriptions of Common Wait Event Parameters](#)
- [Descriptions of Wait Events](#)

Information about wait events is displayed in three dynamic performance views:

- `V$SESSION_WAIT` displays the events for which sessions have just completed waiting or are currently waiting.
- `V$SYSTEM_EVENT` displays the total number of times all the sessions have waited for the events in that view.
- `V$SESSION_EVENT` is similar to `V$SYSTEM_EVENT`, but displays all waits for each session.

See Also:

["V\\$SESSION_WAIT"](#), ["V\\$SYSTEM_EVENT"](#), and ["V\\$SESSION_EVENT"](#)

Many of these wait events are tied to the internal implementation of Oracle and therefore are subject to change or deletion without notice. Application developers should be aware of this and write their code to tolerate missing or extra wait events.

The following SQL statement displays an alphabetical list of all Oracle wait events and the wait class to which they belong:

```
SQL> SELECT name, wait_class FROM V$EVENT_NAME ORDER BY name;
```

C.1 Classes of Wait Events

Every wait event belongs to a class of wait event.

The following list describes each of the wait classes.

Administrative

Waits resulting from DBA commands that cause users to wait (for example, an index rebuild)

Application

Waits resulting from user application code (for example, lock waits caused by row level locking or explicit lock commands)

Cluster

Waits related to Oracle Real Application Clusters resources (for example, global cache resources such as 'gc cr block busy')

Commit

This wait class only comprises one wait event - wait for redo log write confirmation after a commit (that is, 'log file sync')

Concurrency

Waits for internal database resources (for example, latches)

Configuration

Waits caused by inadequate configuration of database or instance resources (for example, undersized log file sizes, shared pool size)

Idle

Waits that signify the session is inactive, waiting for work (for example, 'SQL*Net message from client')

Network

Waits related to network messaging (for example, 'SQL*Net more data to dblink')

Other

Waits which should not typically occur on a system (for example, 'wait for EMON to spawn')

Queueing

Contains events that signify delays in obtaining additional data in a pipelined environment. The time spent on these wait events indicates inefficiency or other problems in the pipeline. It affects features such as parallel queries or `DBMS_PIPE` PL/SQL packages.

Scheduler

Resource Manager related waits (for example, 'resmgr: become active')

System I/O

Waits for background process I/O (for example, DBWR wait for 'db file parallel write')

User I/O

Waits for user I/O (for example 'db file sequential read')

C.2 Descriptions of Common Wait Event Parameters

This section describes some of the common wait event parameters.

block#

This is the block number of the block for which Oracle needs to wait. The block number is relative to the start of the file. To find the object to which this block belongs, issue the following SQL statement:

```
select segment_name, segment_type, owner, tablespace_name
from dba_extents
where file_id = file#
      and block#
        between block_id and block_id + blocks - 1;
```

blocks

The number of blocks that is being either read from or written to the file. The block size depends on the file type:

- Database files have a block size of `DB_BLOCK_SIZE`
- Logfiles and control files have a block size that is equivalent to the physical block size of the platform

break?

If the value for this parameter equals 0, a reset was sent to the client. A nonzero value indicates that a break was sent to the client.

class

The class of the block describes how the contents of the block are used. For example, class 1 represents data block, and class 2 represents sort block. Use this SQL query to see the block classes:

```
select view_definition
from v$fixed_view_definition
where view_name='GV$WAITSTAT';
```

dba

The initials "dba" represents the data block address, which consists of a file number and a block number.

driver id

The address of the disconnect function of the driver that is currently being used.

file#

The following query returns the name of the database file:

```
select *
from v$datafile
where file# = file#;
```

id1

The first identifier (*id1*) of the enqueue or global lock takes its value from P2 or P2RAW. The meaning of the identifier depends on the name (P1).

id2

The second identifier (*id2*) of the enqueue or global lock takes its value from P3 or P3RAW. The meaning of the identifier depends on the name (P1).

le

The relative index number into V\$GC_ELEMENT.

mode

The *mode* is usually stored in the low order bytes of P1 or P1RAW and indicates the mode of the enqueue or global lock request. This parameter has one of the following values:

Table C-1 Lock Mode Values

Mode Value	Description
1	Null mode
2	Sub-Share
3	Sub-Exclusive
4	Share
5	Share/Sub-Exclusive
6	Exclusive

Use the following SQL statement to retrieve the name of the lock and the mode of the lock request:

```
select chr(bitand(p1,-16777216)/16777215) ||
       chr(bitand(p1, 16711680)/65535) "Lock",
       bitand(p1, 65535) "Mode"
  from v$session_wait
 where event = 'DFS enqueue lock acquisition';
```

name and type

The name or "type" of the enqueue or global lock can be determined by looking at the two high order bytes of P1 or P1RAW. The name is always two characters. Use the following SQL statement to retrieve the lock name.

```
select chr(bitand(p1,-16777216)/16777215) ||
       chr(bitand(p1, 16711680)/65535) "Lock"
  from v$session_wait
 where event = 'DFS enqueue lock acquisition';
```

namespace

The name of the object namespace as it is displayed in V\$DB_OBJECT_CACHE view.

requests

The number of I/Os that are "requested." This differs from the number of blocks in that one request could potentially contain multiple blocks.

session#

The number of the inactive session. Use the following SQL statement to find more information about the session:

```
select *
  from v$session
 where sid = session#;
```

waited

This is the total amount of time the session has waited for this session to terminate.

C.3 Descriptions of Wait Events

This section provides detailed descriptions for those wait events of greatest interest.

Where appropriate, pointers are provided to further information elsewhere in Oracle Database documentation. For a complete listing of wait events, in alphabetical order, you can issue the following SQL statement:

```
SQL> SELECT name FROM V$EVENT_NAME ORDER BY name;
```

C.3.1 alter system set dispatcher

A session has issued a statement `ALTER SYSTEM SET DISPATCHER = string` and is waiting for the dispatchers to get started.

Wait Time: The session will wait 1 / 100 of a second and verify if the new dispatchers have started, else the session will wait again

Parameter	Description
<code>waited</code>	Number of times that the session has waited 1 / 100 of a second

C.3.2 ARCH Remote Write

Used to track the time (in centiseconds) that `ARCn` background processes spend blocked waiting for network write operations to complete.

C.3.3 ASYNC Remote Write

Used to track the time (in centiseconds) for asynchronous streaming `RFSWRITE` operations. This includes stall reaps and streaming network submission time. This time is accumulated by `TTnn` (Redo Transport Slave) background processes.

 **See Also:**

Oracle Data Guard Concepts and Administration for more information about using RFS to manage standby redo logs.

C.3.4 BFILE check if exists

The session waits to check if an external large object (LOB) exists.

Wait Time: The total elapsed time for the `exists` call

Parameter	Description
<code>session#</code>	See " session# "

Parameter	Description
<i>waited</i>	See " waited "

C.3.5 BFILE check if open

The session waits for an external large object (LOB) to open.

Wait Time: The total elapsed time for the **isopen** call

Parameter	Description
<i>session#</i>	See " session# "
<i>waited</i>	See " waited "

C.3.6 BFILE closure

The session waits for an external large object (LOB) to close.

Wait Time: The total elapsed time for the **close** call

Parameter	Description
<i>session#</i>	See " session# "
<i>waited</i>	See " waited "

C.3.7 BFILE get length

The session waits on a call to check the size of an external large object (LOB).

Wait Time: The total elapsed time for the call to check the LOB size

Parameter	Description
<i>session#</i>	See " session# "
<i>waited</i>	See " waited "

C.3.8 BFILE get name object

The session waits on a call to find or generate the external name of a external large object.

Wait Time: The total elapsed time for **make external file name** to complete

Parameter	Description
<i>session#</i>	See " session# "
<i>waited</i>	See " waited "

C.3.9 BFILE get path object

The session is waiting on a call to find or generate the external path name of an external large object (LOB).

Wait Time: The total elapsed time for **make external path** to complete

Parameter	Description
<i>session#</i>	See " session# "
<i>waited</i>	See " waited "

C.3.10 BFILE internal seek

The session waits for a positioning call within the external large object (LOB) to complete.

Wait Time: The total elapsed time for the **seek** to complete

Parameter	Description
<i>session#</i>	See " session# "
<i>waited</i>	See " waited "

C.3.11 BFILE open

The session waits for an external large object (LOB) to open.

Wait Time: The total elapsed time for the **isopen** call

Parameter	Description
<i>session#</i>	See " session# "
<i>waited</i>	See " waited "

C.3.12 BFILE read

The session waits for a read from a external large object (LOB) to complete.

Wait Time: The total elapsed time for the **read** to complete

Parameter	Description
<i>session#</i>	See " session# "
<i>waited</i>	See " waited "

C.3.13 broadcast mesg queue transition

Processes enter "wait for broadcast mesg queue transition" when cleaning up a publisher channel handle to a RELIABLE broadcast channel. The publisher is responsible for moving the message to the free queue, but it cannot do so until the message is in the done queue. If the message is still not in the done queue, process enters this wait. This wait event will most likely

appear when an Oracle process is about to exit normally, or when PMON cleans up a dead process.

Wait Time: Varies

Parameter	Description
<i>channel handle</i>	publisher channel handle pointer
<i>message</i>	broadcast message pointer
<i>location</i>	A number indicating the function in KSR where the process is waiting

C.3.14 broadcast mesg recovery queue transition

Processes enter "wait for broadcast mesg recovery queue transition" when cleaning up a publisher channel handle to a RELIABLE broadcast channel. The broadcasted message is in the recovery queue of another channel handle (for example, ch2). Process enters this wait, if the message is yet to be removed from the recovery queue of the ch2 channel handle. This wait event will most likely appear when an Oracle process is about to exit normally, or when PMON cleans up a dead process.

Wait Time: Varies

Parameter	Description
<i>channel handle</i>	Publisher channel handle pointer
<i>message</i>	Broadcast message pointer
<i>location</i>	A number indicating the function in KSR where the process is waiting

C.3.15 buffer busy waits

Wait until a buffer becomes available.

There are four reasons that a session cannot pin a buffer in the buffer cache, and a separate wait event exists for each reason:

1. "buffer busy waits": A session cannot pin the buffer in the buffer cache because another session has the buffer pinned.
2. "read by other session": A session cannot pin the buffer in the buffer cache because another session is reading the buffer from disk.
3. "gc buffer busy acquire": A session cannot pin the buffer in the buffer cache because another session is reading the buffer from the cache of another instance.
4. "gc buffer busy release": A session cannot pin the buffer in the buffer cache because another session on another instance is taking the buffer from this cache into its own cache so it can pin it.

Prior to release 10.1, all four reasons were covered by "buffer busy waits." In release 10.1, the "gc buffer busy" wait event covered both the "gc buffer busy acquire" and "gc buffer busy release" wait events.

Wait Time: Normal wait time is 1 second. If the session was waiting for a buffer during the last wait, then the next wait will be 3 seconds.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

See Also:

Oracle Database Performance Tuning Guide for more information about the potential causes of the buffer busy waits wait event

C.3.16 buffer deadlock

Oracle does not really wait on this event; the foreground only yields the CPU. Thus, the chances of catching this event are very low. This is not an application induced deadlock, but an assumed deadlock by the cache layer. The cache layer cannot get a buffer in a certain mode within a certain amount of time.

Wait Time: 0 seconds. The foreground process only yields the CPU and will usually be placed at the end of the CPU run queue.

Parameter	Description
<i>class</i>	See " class "
<i>mode</i>	See " mode "
<i>flag</i>	The flag points to the internal flags used by the session to get this block
<i>dba</i>	See " dba "

C.3.17 buffer latch

The session waits on the buffer hash chain latch. Primarily used in the dump routines.

Wait Time: 1 second

Parameter	Description
<i>latch addr</i>	<p>The virtual address in the SGA where this latch is located. Use the following statement to find the name of this latch:</p> <pre>select * from v\$latch a, v\$Latchname b where addr = <i>latch addr</i> and a.latch# = b.latch#;</pre>
<i>chain#</i>	The index into array of buffer hash chains. When the chain is 0xffffffff, the foreground waits on the LRU latch.

C.3.18 buffer read retry

This event occurs only if the instance is mounted in shared mode (Oracle Real Application Cluster).

During the read of the buffer, the contents changed. This means that either:

- The version number, dba, or the incarnation and sequence number stored in the block no longer match
- The checksum on the block does not match the checksum in the block

The block will be reread (this may fail up to 3 times), then corruption is assumed and the corrupt block is dumped in the trace file.

Wait Time: The wait time is the elapsed time of the read

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "

C.3.19 checkpoint completed

A session waits for a checkpoint to complete. This could happen, for example, during a close database or a local checkpoint.

Wait Time: 5 seconds

Parameters: None

C.3.20 cleanup of aborted process

When a process spawn is aborted while the process spawning background is in the middle of spawning, the current session must wait until the pid of the new process is filled in. Once the pid is filled in, then the process spawn can be actually aborted.

Wait Time: Usually 3 seconds

Parameter	Description
<i>location</i>	Location of the wait

C.3.21 control file parallel write

This event occurs while the session is writing physical blocks to all control files. This happens when:

- The session starts a control file transaction (to ensure the control files are up to date in case the session crashes before committing the control file transaction)
- The session commits a transaction to a control file
- Changing a generic entry in the control file, the new value is being written to all control files

Wait Time: The wait time is the time it takes to finish all writes to all control files

Parameter	Description
<i>files</i>	The number of control files to which the session is writing
<i>blocks</i>	The number of blocks that the session is writing to the control file
<i>requests</i>	The number of I/O requests which the session wants to write

C.3.22 control file sequential read

Reading from the control file. This happens often. For example, while:

- Making a backup of the control files
- Sharing information (between instances) from the control file
- Reading other blocks from the control files
- Reading the header block

Wait Time: The wait time is the elapsed time of the read

Parameter	Description
<i>file#</i>	The control file from which the session is reading
<i>block#</i>	Block number in the control file from where the session starts to read. The block size is the physical block size of the port (usually 512 bytes, some UNIX ports have 1 or 2 Kilobytes).
<i>blocks</i>	The number of blocks that the session is trying to read

C.3.23 control file single write

This wait is signaled while the control file's shared information is written to disk. This is an atomic operation protected by an enqueue (CF), so that only one session at a time can write to the entire database.

Wait Time: The wait time is the elapsed time of the write

Parameter	Description
<i>file#</i>	This identifies the control file to which the session is currently writing
<i>block#</i>	Block number in the control file where the write begins. The block size is the as the physical block size of the port (usually 512 bytes, some UNIX ports have 1 or 2 Kilobytes).
<i>blocks</i>	The number of blocks that the session is trying to write

C.3.24 cursor: mutex S

A session waits on this event when it is requesting a mutex in shared mode, when another session is currently holding a this mutex in exclusive mode on the same cursor object.

Parameter	Description
<i>P1</i>	Hash value of cursor
<i>P2</i>	Mutex value (top 2 bytes contain SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)

Parameter	Description
<i>P3</i>	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.25 cursor: mutex X

The session requests the mutex for a cursor object in exclusive mode, and it must wait because the resource is busy. The mutex is busy because either the mutex is being held in exclusive mode by another session or the mutex is being held shared by one or more sessions. The existing mutex holder(s) must release the mutex before the mutex can be granted exclusively.

Parameter	Description
<i>P1</i>	Hash value of cursor
<i>P2</i>	Mutex value (top 2 bytes contain SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)
<i>P3</i>	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.26 cursor: pin S

A session waits on this event when it wants to update a shared mutex pin and another session is currently in the process of updating a shared mutex pin for the same cursor object. This wait event should rarely be seen because a shared mutex pin update is very fast.

Wait Time: Microseconds

Parameter	Description
<i>P1</i>	Hash value of cursor
<i>P2</i>	Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)
<i>P3</i>	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.27 cursor: pin S wait on X

A session waits for this event when it is requesting a shared mutex pin and another session is holding an exclusive mutex pin on the same cursor object.

Wait Time: Microseconds

Parameter	Description
<i>P1</i>	Hash value of cursor
<i>P2</i>	Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)
<i>P3</i>	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.28 cursor: pin X

A session waits on this event when it is requesting an exclusive mutex pin for a cursor object and it must wait because the resource is busy. The mutex pin for a cursor object can be busy

either because a session is already holding it exclusive, or there are one or more sessions which are holding shared mutex pin(s). The exclusive waiter must wait until all holders of the pin for that cursor object have released it, before it can be granted.

Wait Time: Microseconds

Parameter	Description
P1	Hash value of cursor
P2	Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)
P3	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.29 db file async I/O submit

When asynchronous I/O is available, this wait event captures any time spent in submitting I/Os to the underlying storage.

 **See Also:**

"db file parallel write"

C.3.30 db file parallel read

This happens during recovery. It can also happen during buffer prefetching, as an optimization (rather than performing multiple single-block reads). Database blocks that must be changed as part of recovery are read in parallel from the database.

Wait Time: Wait until all of the I/Os are completed

Parameter	Description
files	This indicates the number of files to which the session is reading
blocks	This indicates the total number of blocks to be read
requests	This indicates the total number of I/O requests, which will be the same as blocks

C.3.31 db file parallel write

This event occurs in the DBWR. It indicates the time that DBWR spends waiting for I/O completion.

If asynchronous I/O is available, then the db file async I/O submit wait event captures any time spent in submitting I/Os to the underlying storage.

When asynchronous I/O is not available, db file parallel write captures the time spent during submit and reap.

Wait Time: While there are outstanding I/Os, DBWR waits for some of the writes to complete. DBWR does not wait for all of the outstanding I/Os to complete.

Parameter	Description
<i>requests</i>	This indicates the total number of I/O requests, which will be the same as blocks
<i>interrupt</i>	
<i>timeout</i>	This indicates the timeout value in hundredths of a second to wait for the I/O completion.

 **See Also:**

- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems
- "[db file async I/O submit](#)"

C.3.32 db file scattered read

Similar to the “db file sequential read” wait event, except that the session is reading multiple data blocks.

Wait Time: The wait time is the actual time it takes to do all of the I/Os

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>blocks</i>	The number of blocks that the session is trying to read from the <i>file#</i> starting at <i>block#</i>

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems
- *Oracle Database Performance Tuning Guide* about potential causes for this wait event

C.3.33 db file sequential read

The session waits while a sequential read from the database is performed. This event is also used for rebuilding the control file, dumping data file headers, and getting the database file headers.

Wait Time: The wait time is the actual time it takes to do the I/O

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>blocks</i>	This is the number of blocks that the session is trying to read (should be 1)

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about how this wait event can help identify I/O problems
- *Oracle Database Performance Tuning Guide* about potential causes for this wait event

C.3.34 db file single write

This event is used to wait for the writing of the file headers.

Wait Time: The wait time is the actual time it takes to do the I/O

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>blocks</i>	This is the number of blocks that the session is trying to write in <i>file#</i> starting at <i>block#</i>

 **See Also:**

- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems

C.3.35 DFS db file lock

This event occurs only for the DBWR in Real Application Clusters. Each DBWR of every instance holds a global lock on each file in shared mode. The instance that is trying to offline the file will escalate the global lock from shared to exclusive. This signals the other instances to synchronize their SGAs with the control file before the file can be taken offline. The name of this lock is **DF** (see [Oracle Enqueue Names](#) for more information).

Wait Time: 1 second in loop. The DBWR is waiting in a loop (sleep, check) for the other instances to downgrade to NULL mode. During this time, the DBWR cannot perform other tasks such as writing buffers.

Parameter	Description
<i>file</i>	See " file# "

C.3.36 DFS lock handle

The session waits for the lock handle of a global lock request. The lock handle identifies a global lock. With this lock handle, other operations can be performed on this global lock (to identify the global lock in future operations such as conversions or release). The global lock is maintained by the DLM.

Wait Time: The session waits in a loop until it has obtained the lock handle from the DLM. Inside the loop there is a wait of 0.5 seconds.

Parameter	Description
<i>name</i>	See " name and type "
<i>mode</i>	See " mode "
<i>id1</i>	See " id1 "
<i>id2</i>	See " id2 "

C.3.37 direct path read

During Direct Path operations the data is asynchronously read from the database files. At some stage the session needs to make sure that all outstanding asynchronous I/O have been completed to disk. This can also happen if during a direct read no more slots are available to store outstanding load requests (a load request could consist of multiple I/Os).

Wait Time: 10 seconds. The session will be posted by the completing asynchronous I/O. It will never wait the entire 10 seconds. The session waits in a tight loop until all outstanding I/Os have completed.

Parameter	Description
<i>descriptor address</i>	This is a pointer to the I/O context of outstanding direct I/Os on which the session is currently waiting
<i>first dba</i>	The dba of the oldest I/O in the context referenced by the descriptor address
<i>block cnt</i>	Number of valid buffers in the context referenced by the descriptor address

See Also:

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.38 direct path sync

During Direct Path write operations the data is asynchronously written to the database files. At some point the session needs to ensure that all outstanding asynchronous I/O have been

completed to disk. On UNIX the `fsync` command, which synchronizes data to disk, is issued to confirm that all the writes have completed and the data is all on disk.

Wait Time: The time taken for the `fsync` operation to complete, which normally is the time taken to complete the outstanding I/Os.

Parameters	Description
<code>file#</code>	See " file# "
<code>flags</code>	Flags used for debugging purposes

C.3.39 direct path write

During Direct Path operations, the data is asynchronously written to the database files. At some stage the session needs to make sure that all outstanding asynchronous I/O have been completed to disk. This can also happen if, during a direct write, no more slots are available to store outstanding load requests (a load request could consist of multiple I/Os).

Wait Time: 10 seconds. The session will be posted by the completing asynchronous I/O. It will never wait the entire 10 seconds. The session waits in a tight loop until all outstanding I/Os have completed.

Parameter	Description
<code>descriptor address</code>	This is a pointer to the I/O context of outstanding direct I/Os on which the session is currently waiting
<code>first dba</code>	The dba of the oldest I/O in the context referenced by the descriptor address
<code>block cnt</code>	Number of valid buffers in the context referenced by the descriptor address

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this parameter

C.3.40 Disk file operations I/O

This event is used to wait for disk file operations (for example, open, close, seek, and resize). It is also used for miscellaneous I/O operations such as block dumps and password file accesses.

Wait Time: The wait time is the actual time it takes to do the I/O

Parameter	Description
<code>FileOperation</code>	Type of file operation
<code>fileno</code>	File identification number
<code>filetype</code>	Type of file (for example, log file, data file, and so on)

C.3.41 dispatcher shutdown

During shutdown immediate or normal, the shutdown process must wait for all the dispatchers to shutdown. As each dispatcher is signaled, the session that causes the shutdown waits on this event until the requested dispatcher is no longer running.

Wait Time: 1 second

Parameter	Description
<code>waited</code>	Indicates the cumulative wait time. After 5 minutes, the session writes to the alert and trace files to indicate that there might be a problem.

 **See Also:**

Oracle Database SQL Language Reference for information about shutting down a dispatcher using `SHUTDOWN` clause of the `SQL ALTER SYSTEM` statement

C.3.42 dispatcher timer

This basically means that the dispatcher is idle and waiting for some work to arrive.

Wait Time: 60 seconds

Parameter	Description
<code>sleep time</code>	The intended sleep time. The dispatcher will return to work sooner if it is posted by either data arriving on the network or by a post from a shared server process to send data back to the client.

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.43 dupl. cluster key

It is possible for a race condition to occur when creating a new cluster key. If it is found that another process has put the cluster key into the data/index block, then the session waits and retries. The retry should then find a valid cluster key.

Wait Time: 0.01 seconds

Parameter	Description
<code>dba</code>	The dba of the block into which the session is trying to insert a cluster key

C.3.44 enq: OW - initialization

A session will wait on this event if it is trying to initialize the database wallet, and another session has already begun an initialization.

Wait Time: Total time necessary to initialize the wallet context

Parameters: None

 **See Also:**

Oracle Database Performance Tuning Guide for more information about the potential causes of an enqueue wait event

C.3.45 enq: OW - termination

A session will wait on this event if it is trying to terminate the database wallet, and another session has already begun a termination.

Wait Time: Total time necessary to deallocate memory used by the wallet context and terminate the context.

Parameters: None

 **See Also:**

Oracle Database Performance Tuning Guide for more information about the potential causes of an enqueue wait event

C.3.46 enq: SV - contention

A session is accessing a sequence number from an ordered sequence object.

Wait Time: The wait time is the actual time waited until the requested sequence number is acquired.

Parameter	Description
<i>id1</i>	Sequence object#

 **See Also:**

Oracle Database SQL Language Reference for more information about sequences

C.3.47 enq: TX - index contention

Occurs when a transaction inserting a row in an index has to wait for the end of an index block split being done by another transaction.

C.3.48 enq: TX - row lock contention

This wait event can occur for several reasons.

- If one user is wanting to update or delete a row or rows that another session is modifying. The session holding the lock will release it when it performs a COMMIT or ROLLBACK.
- If a session is waiting due to potential duplicates in a UNIQUE index. If two sessions try to insert the same key value, the second session has to wait to see if an ORA-0001 should be raised or not. The session holding the lock will release it when it performs a COMMIT or ROLLBACK.
- If a session is waiting due to a shared bitmap index fragment. Bitmap indexes index key values and a range of rowids. Each entry in a bitmap index can cover many rows in the actual table. If two sessions want to update rows covered by the same bitmap index fragment, then the second session waits for the first transaction to either COMMIT or ROLLBACK by waiting for the TX lock.

C.3.49 enqueue

The session is waiting for a local enqueue.

The wait depends on the name of the enqueue (see [Oracle Enqueue Names](#)).

Wait Time: Depends on the enqueue name

Parameter	Description
<i>name</i>	See " name and type "
<i>mode</i>	See " mode "

See Also:

Oracle Database Performance Tuning Guide for more information about the potential causes of an enqueue wait event

C.3.50 flashback buf free by RVWR

This wait event only occurs when Flashback Database is turned on. A session waits for recovery writer (RVWR) to write flashback data to the flashback logs on disk because the buffers are full. Until RVWR can free up the buffers, the session may need to wait.

If this event becomes a top wait event for the database, it is typically because the file system or storage system for the Fast Recovery Area does not support enough bandwidth for Oracle to write the flashback database logs. Refer to the Flashback Database section in *Oracle Database Backup and Recovery User's Guide* for tuning considerations.

Wait Time: 1 second**Parameters:** None

C.3.51 flashback log file sync

Waits for flashback database data to be written to disk.

Wait Time: Includes RVWR writing the flashback database data and posting this process

Parameters: None

C.3.52 free buffer waits

This wait event can occur for several reasons.

- All buffer gets have been suspended. This could happen when a file was read-only and is now read/write. All the existing buffers must be invalidated since they are not linked to lock elements (needed when mounted parallel (shared)). So cache buffers are not assigned to data block addresses until the invalidation is finished.
- The session moved some dirty buffers to the dirty queue and now this dirty queue is full. The dirty queue must be written first. The session will wait on this event and try again to find a free buffer
- This also happens after inspecting **free buffer inspected** buffers. If no free buffer is found, Oracle waits for one second, and then tries to get the buffer again (depends on the context). For more information, see [free buffer inspected](#).

Wait Time: 1 second

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "

See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* about potential causes of this wait event

C.3.53 free global transaction table entry

The session is waiting for a free slot in the global transaction table (used by the Distributed Database option). It will wait for 1 second and try again.

Wait Time: 1 second

Parameter	Description
<i>tries</i>	The number of times the session tried to find a free slot in the global transaction table

C.3.54 free process state object

Used during the creation of a process. The session will scan the process table and look for a free process slot. If none can be found, PMON is posted to check if all the processes currently in the process table are still alive. If there are dead processes, then PMON will clean them and make the process slot available to new processes. The waiting process will then rescan the process table to find the new slot.

Wait Time: 1 second

Parameters: None

C.3.55 gc buffer busy acquire

This event indicates that the requested buffer was globally busy in the cluster, because it had already been requested from a remote instance by another local client.

Wait Time: The wait time is the actual time it took to resolve the buffer contention.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.56 gc buffer busy release

This event indicates that the requested buffer was globally busy in the cluster, because the requested buffer had been transferred away by a remote instance and needed to be requested again.

Wait Time: The wait time is the actual time it took to resolve the buffer contention.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.57 gc cr block 2-way

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and 2 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "

Parameter	Description
<i>class#</i>	See " class "

C.3.58 gc cr block 3-way

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and 3 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.59 gc cr block busy

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, but the request had to be put on hold at the serving instance.

This could happen when a dirty buffer had to be transferred, in which case REDO needs to be flushed before the Cache Fusion transfer could be processed. This could also happen if the requested buffer was being held by another process on the remote instance. The serving instance would transfer the requested buffer once the REDO flush is complete, or once the buffer is released by the holding process.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.60 gc cr block congested

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, but the request was queued at the serving instance for too long.

This could happen when the GCS server processes (LMSn and LMnn) are very busy due to having a high volume of incoming Cache Fusion requests. Increasing the GCS server processes ([GCS_SERVER_PROCESSES](#)) is usually the remedy to alleviate congestion for the GCS server processes.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
<i>file#</i>	See " file# "

Parameter	Description
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

 See Also:["GCS_SERVER_PROCESSES"](#)

C.3.61 gc cr block lost

This event indicates that a Cache Fusion consistent read (CR) buffer request resulted in a potentially lost block. The request will be re-tried automatically.

This is typically caused by unreliable interconnect network protocols, usually when the network is congested and packets are dropped. It can also be the result of interconnect hardware errors or simply the result of an overloaded system, or a sign that a public network path is used for Cache Fusion instead of a private network.

Wait Time: The wait time is the actual time it took to detect the potentially lost block.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.62 gc cr grant read-mostly invalidation

The client is performing a DML on a read-mostly object, which requires a read lock invalidation on all other instances.

Wait Time: The wait time is the actual time it takes to complete the invalidation on all other instances.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.63 gc cr multi block grant

This event indicates that a client requested multiple consistent read (CR) buffers from another instance in the cluster, and the request resulted in multiple lock grants from the remote instance.

Wait Time: The wait time is the actual time waited for the multi-block request to complete.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.64 gc cr multi block mixed

This event indicates that a client requested multiple consistent read (CR) buffers from another instance in the cluster, and the remote instance returned a mixture of blocks and grants.

Wait Time: The wait time is the actual time waited for the multi-block request to complete.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.65 gc cr request

This event is used for ongoing Cache Fusion consistent read (CR) buffer requests. The event is renamed to reflect the actual outcome of the request (example: "gc cr block 2-way") upon completion of the wait. Therefore, these events will not be reported in AWR reports, but may appear in ASH data.

Wait Time: The wait time is the actual time waited for the request.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.66 gc current block 2-way

This event indicates that the requested current buffer was transferred from another instance in the cluster, and 2 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>id#</i>	Block class and global access mode held and requested

C.3.67 gc current block 3-way

This event indicates that the requested current buffer was transferred from another instance in the cluster, and 3 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>id#</i>	Block class and global access mode held and requested

C.3.68 gc current block busy

This event indicates that the requested current buffer was transferred from another instance in the cluster, but the request had to be put on hold at the serving instance.

This could happen when a dirty buffer had to be transferred, in which case REDO needs to be flushed before the Cache Fusion transfer could be processed. This could also happen if the requested buffer was being held by another process on the remote instance. The serving instance would transfer the requested buffer once the REDO flush is complete, or once the buffer is released by the holding process.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>id#</i>	Block class and global access mode held and requested

C.3.69 gc current block congested

This event indicates that the requested current buffer was transferred from another instance in the cluster, but the request was queued at the serving instance for too long.

This could happen when the GCS server processes (LMS) are very busy due to having a high volume of incoming Cache Fusion requests. Increasing the GCS server processes (`GCS_SERVER_PROCESSES`) is usually the remedy to alleviate congestion for the GCS server processes.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>id#</i>	Block class and global access mode held and requested

 See Also:["GCS_SERVER_PROCESSES"](#)

C.3.70 gc current block lost

This event indicates that a Cache Fusion current buffer request resulted in a potentially lost block. The request will be re-tried automatically.

This is typically caused by unreliable interconnect network protocols, usually when the network is congested and packets are dropped. It can also be the result of interconnect hardware errors or simply the result of an overloaded system, or a sign that a public network path is used for Cache Fusion instead of a private network.

Wait Time: The wait time is the actual time it took to detect the potentially lost block.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>id#</i>	Block class and global access mode held and requested

C.3.71 gc current request

This event is used for ongoing Cache Fusion current buffer requests. The event is renamed to reflect the actual outcome of the request (example: "gc current block 2-way") upon completion of the wait. Therefore, these events will not be reported in AWR reports, but may appear in ASH data.

Wait Time: The wait time is the actual time waited for the request.

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>id#</i>	Block class and global access mode held and requested

C.3.72 gc index operation

This event occurs when a transaction inserting a row into an index must wait for the end of an index block split being performed by another transaction. In an Oracle RAC database, some index split waits will use this wait event in lieu of the "enq: TX - index contention" wait event.

Wait Time: The wait time is the actual time waited for the split to complete.

Parameter	Description
<i>undo seg#</i>	The rollback segment ID
<i>slot#</i>	The slot ID inside the rollback segment
<i>wrap#</i>	The sequence number that is incremented for each transaction
<i>count</i>	The number of times that the session has waited on this transaction

C.3.73 gc recovery quiesce

Instance recovery is waiting for a global cache operation to complete.

Wait Time: The total elapsed time for the global cache operation to complete

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class</i>	See " class "

C.3.74 GCS lock open S

The session waits for a resource get in SHARED mode on the block identified by file# and block#.

Wait Time: 1 second

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class</i>	See " class "

C.3.75 GCS lock open X

The session waits for a resource get in EXCLUSIVE mode on the block identified by file# and block#.

Wait Time: 1 second

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>lenum</i>	See " le "

C.3.76 global cache busy

The session waits to convert a buffer from Shared Current to Exclusive Current status.

Wait Time: 1 second

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>le</i>	See " le "

C.3.77 inactive session

This event is used for switching and killing sessions.

- Switching sessions

If a timeout period has been specified, then wait that amount of time for the session to be detached.

- Killing sessions

From either `KILL SESSION` or internal request. Having posted a session that it should kill itself, wait for up to 1 minute for the session to terminate.

Wait Time: 1 second

Parameter	Description
<code>session#</code>	See " session# "
<code>waited</code>	See " waited "

C.3.78 inactive transaction branch

The session waits for a transaction branch that is currently used by another session.

Wait Time: 1 second

Parameter	Description
<code>branch#</code>	The serial number of the transaction for which the session is waiting
<code>waited</code>	See " waited "

C.3.79 index block split

While trying to find an index key in an index block, Oracle noticed that the index block was being split. Oracle will wait for the split to finish and try to find the key again.

Wait Time: The session will yield the CPU, so there is no actual waiting time

Parameter	Description
<code>rootdba</code>	The root of the index
<code>level</code>	This is the level of the block that the session is trying to split in the index. The leaf blocks are level 0. If the level is > 0, it is a branch block. (The root block can be considered a special branch block).
<code>childdba</code>	The block that the session is trying to split

C.3.80 instance state change

The session waits for SMON to enable or disable cache or transaction recovery. This usually happens during `ALTER DATABASE OPEN` or `CLOSE`.

Wait Time: Wait time depends on the amount of time the action takes (that is, the amount of recovery needed)

Parameter	Description
<i>layer</i>	This value can be 1 or 2. If 1, it means that the transaction layer wants transaction recovery to be performed. If 2, it means that cache recovery will be performed.
<i>value</i>	This value can be 0 (disable) or 1 (enable)
<i>waited</i>	The number of seconds waited so far

C.3.81 io done

The session waits for an I/O to complete or it waits for a slave process to become available to submit the I/O request. This event occurs on platforms that do not support asynchronous I/O.

Wait Time: 50 milliseconds

Parameter	Description
<i>msg ptr</i>	A pointer to the I/O request

C.3.82 ksxr wait for mount shared

The cross instance broadcast facility of this Oracle instance is waiting for the database mount in shared mode to complete.

Wait Time: The time taken for the instance to mount. An indefinite wait on this event implies that the instance startup is hanging.

C.3.83 ktm: instance recovery

The session waits for SMON to finish the instance, transaction recovery, or sort segment cleanup.

Wait Time: The wait time can vary and depends on the amount of recovery needed

Parameter	Description
<i>undo segment#</i>	If the value is 0, SMON is probably performing instance recovery. If P1 > 0, use this query to find the undo segment: select * from v\$rollstat where usn = <i>undo segment#</i> ;

C.3.84 latch activity

This event is used as part of the process of determining whether a latch must be cleaned.

Wait Time: 0.05 to 0.1 seconds

Parameter	Description
<i>address</i>	The address of the latch that is being checked

Parameter	Description
<i>number</i>	The latch number of the latch that has activity. To find more information on the latch, use the following SQL statement: select * from v\$Latchname where latch# = <i>number</i> ;
<i>process#</i>	If this is 0, it is the first phase of the in-flux tests

 **See Also:**

Oracle Database Performance Tuning Guide for more information about latch wait events

C.3.85 latch free

The process waits for a latch that is currently busy (held by another process).

Wait Time: The wait time increases exponentially and does not include spinning on the latch (active waiting). The maximum wait time also depends on the number of latches that the process is holding. There is an incremental wait of up to 2 seconds.

Parameter	Description
<i>address</i>	The address of the latch for which the process is waiting
<i>number</i>	The latch number that indexes in the V\$LATCHNAME view. To find more information on the latch, use the following SQL statement: select * from v\$Latchname where latch# = <i>number</i> ;
<i>tries</i>	A count of the number of times the process tried to get the latch (slow with spinning) and the process has to sleep

 **See Also:**

Oracle Database Performance Tuning Guide for more information about latch wait events

C.3.86 latch: redo copy

Redo copy latches are acquired by sessions in order to write changes into the redo log buffer and by the LGWR process to ensure that there are no current writers before it copies data from the buffer to the redo log.

C.3.87 latch: row cache objects

This event occurs when another session is modifying the contents of part of the dictionary cache (or row cache). This event is often associated with high parse activity but may occur for other reasons, such as manipulation of rollback segments. `V$ROWCACHE` may indicate which part of the row cache is being contended.

C.3.88 library cache load lock

The session tries to find the load lock for the database object so that it can load the object. The load lock is always obtained in Exclusive mode, so that no other process can load the same object. If the load lock is busy the session will wait on this event until the lock becomes available.

Wait Time: 3 seconds (1 second for PMON)

Parameter	Description
<i>object address</i>	Address of the object being loaded
<i>lock address</i>	Address of load lock being used
<i>mask</i>	Indicates which data pieces of the object that must loaded

C.3.89 library cache lock

This event controls the concurrency between clients of the library cache. It acquires a lock on the object handle so that either:

- One client can prevent other clients from accessing the same object
- The client can maintain a dependency for a long time (for example, no other client can change the object)

This lock is also obtained to locate an object in the library cache.

Wait Time: 3 seconds (1 second for PMON)

Parameter	Description
<i>handle address</i>	Address of the object being loaded
<i>lock address</i>	Address of the load lock being used. This is not the same thing as a latch or an enqueue, it is a State Object.
<i>mode</i>	Indicates the data pieces of the object which must be loaded
<i>namespace</i>	See " namespace "

See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

C.3.90 library cache pin

This event manages library cache concurrency. Pinning an object causes the heaps to be loaded into memory. If a client wants to modify or examine the object, the client must acquire a pin after the lock.

Wait Time: 3 seconds (1 second for PMON)

Parameter	Description
<i>handle address</i>	Address of the object being loaded
<i>pin address</i>	Address of the load lock being used. This is not the same thing as a latch or an enqueue, it is basically a State Object.
<i>mode</i>	Indicates which data pieces of the object that must be loaded
<i>namespace</i>	See " namespace "

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

C.3.91 library cache shutdown

The process shutting down the instance waits for sessions to complete before proceeding with library cache shutdown.

C.3.92 library cache: mutex X

Library cache mutexes protect hash buckets within the shared pool. Each hash bucket contains a number of cursors. The mutex must be held in exclusive mode before any of the structures that it protects can be changed. This wait event is often associated with high parse activity.

C.3.93 LMON global data update

The rolling migration operation is waiting for a response from LMON to acknowledge the global data was updated.

Wait Time: The time it takes for LMON to publish/retrieve the global data

Parameters: None

C.3.94 Log archive I/O

Used local archiving of online redo logs (for a production database) or standby redo logs (for a standby database). When the archiving process exhausts its I/O buffers because all of them

are being used for on-going I/O's, the wait for an available I/O buffer is captured in this system wait event.

Wait Time: Depends on the speed of the disks

Parameters: None

C.3.95 log buffer space

Waiting for space in the log buffer because the session is writing data into the log buffer faster than LGWR can write it out. Consider making the log buffer bigger if it is small, or moving the log files to faster disks such as striped disks.

Wait Time: Usually 1 second, but 5 seconds if it is waiting for a Switch Logfile to complete

Parameters: None

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

C.3.96 log file parallel write

Writing redo records to the redo log files from the log buffer.

Wait Time: Time it takes for the I/Os to complete. Even though redo records are written in parallel, the parallel write is not complete until the last I/O is on disk.

Parameter	Description
<i>files</i>	Number of files to be written
<i>blocks</i>	Number of blocks to be written
<i>requests</i>	Number of I/O requests

 **See Also:**

- Oracle Database Performance Tuning Guide* for information about how this wait event can help identify I/O problems

C.3.97 log file sequential read

Waiting for the read from this logfile to return. This is used to read redo records from the log file.

Wait Time: Time it takes to complete the physical I/O (read)

Parameter	Description
<i>log#</i>	The relative sequence number of the logfiles within a log group (used only when dumping the logfiles)
<i>block#</i>	See " block# "
<i>blocks</i>	The number of blocks to read

C.3.98 log file single write

Waiting for the write to this logfile to complete. This event is used while updating the header of the logfile. It is signaled when adding a log file member and when incrementing sequence numbers.

Wait Time: Time it takes for the physical I/O (write) to complete

Parameter	Description
<i>log#</i>	This is the number of the group/log to which the session is currently writing
<i>block#</i>	See " block# "
<i>blocks</i>	The number of blocks to write

C.3.99 log file switch (archiving needed)

Waiting for a log switch because the log that the LGWR will be switching into has not been archived yet. Check the alert log to ensure that archiving has not stopped due to a failed archive write. To speed archiving, consider adding more archive processes or putting the archive files on striped disks.

Wait Time: 1 second

Parameters: None

C.3.100 log file switch (checkpoint incomplete)

Waiting for a log switch because the session cannot wrap into the next log. Wrapping cannot be performed because the checkpoint for that log has not completed.

Wait Time: 1 second

Parameters: None

C.3.101 log file switch (clearing log file)

Waiting for a log switch because the log is being cleared due to a `CLEAR LOGFILE` command or implicit clear logfile executed by recovery.

Wait Time: 1 second

Parameters: None

C.3.102 log file switch (private strand flush incomplete)

User sessions trying to generate redo, wait on this event when LGWR waits for DBWR to complete flushing redo from IMU buffers into the log buffer; when DBWR is complete LGWR can then finish writing the current log, and then switch log files.

Wait Time: 1 second

Parameters: None

C.3.103 log file switch completion

Waiting for a log switch to complete.

Wait Time: 1 second

Parameters: None

C.3.104 log file sync

When a user session commits, the session's redo information must be flushed to the redo logfile. The user session will post the LGWR to write the log buffer to the redo log file. When the LGWR has finished writing, it will post the user session.

Wait Time: The wait time includes the writing of the log buffer and the post.

Parameter	Description
buffer#	The number of the physical buffer in the redo log buffer that must be synchronized

See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for information about potential causes of this wait event

C.3.105 log switch/archive

Used as part of the ALTER SYSTEM ARCHIVE LOG CHANGE *scn* statement. The session waits for the current log from all open threads to be archived.

Wait Time: Wait for up to 10 seconds

Parameter	Description
thread#	The thread number of the thread that is currently archiving its current log

C.3.106 optimizer stats update retry

When concurrent sessions try to update optimizer statistics for the same object, all of them except the one that successfully acquired all necessary locks/pins on the library/row cache entries, wait on this wait event and then retry locking after a short period of time. In addition to explicit statistics gathering and maintenance operations using the DBMS_STATS package, Oracle database itself may try to update statistics for some objects, either on behalf of the user or for its own maintenance purposes.

Wait Time: 10 ms

Parameters: None

C.3.107 parallel recovery change buffer free

The parallel recovery coordinator is waiting for a change mapping buffer to be released by one of the recovery slaves.

Wait Time: 100ms

Parameters: None

C.3.108 parallel recovery control message reply

The parallel recovery coordinator is waiting for all recovery slaves to respond to a synchronous control message.

Wait Time: 100ms

Parameters: None

C.3.109 parallel recovery coord send blocked

The parallel recovery coordinator cannot send a redo change message because the recovery slave is still actively applying redo that it has already received and has not yet released the channel.

Wait Time: 100ms

Parameters: None

C.3.110 parallel recovery coord wait for reply

The parallel recovery coordinator is waiting for all recovery slaves to exit.

Wait Time: 100ms

Parameters: None

C.3.111 parallel recovery coordinator waits for slave cleanup

The parallel recovery coordinator is waiting for all recovery slaves to exit gracefully.

Wait Time: 10ms

Parameters: None

C.3.112 parallel recovery read buffer free

The parallel recovery coordinator is waiting for a log read buffer to be released by all recovery slaves. Only after every recovery slave finishes applying redo from a log read buffer, can the buffer be used by the coordinator to issue the next log read.

Wait Time: 100ms

Parameters: None

C.3.113 parallel recovery slave next change

A parallel recovery slave is idle and waiting for the next change message from the coordinator.

Wait Time: 100ms

Parameters: None

C.3.114 pending global transaction(s)

This event should happen only during testing. The session waits for pending transactions to clear.

Wait Time: 30 seconds

Parameter	Description
scans	Number of times the session has scanned the PENDING_TRANS\$ table

C.3.115 pipe get

The session waits for a message to be received on the pipe or for the pipe timer to expire.

Wait Time: There is a 5 second wake up (check) and the pipe timer set by the user

Parameter	Description
handle address	The library cache object handle for this pipe
buffer length	The length of the buffer
timeout	The pipe timer set by the user

See Also:

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.116 pipe put

The session waits for the pipe send timer to expire or for space to be made available in the pipe.

Wait Time: There is the 5 second wakeup (check) and the user-supplied timeout value

Parameter	Description
<i>handle address</i>	The library cache object handle for this pipe
<i>record length</i>	The length of the record or buffer that has been put into the pipe
<i>timeout</i>	The pipe timer set by the user

C.3.117 PL/SQL lock timer

This event is called through the `DBMS_LOCK.SLEEP` procedure. This event will most likely originate from procedures written by a user.

Wait Time: The wait time is in hundredths of seconds and depends on the user context

Parameter	Description
<i>duration</i>	The duration that the user specified in the <code>DBMS_LOCK.SLEEP</code> procedure

C.3.118 pmon timer

This is the main wait event for PMON. When PMON is idle, it is waiting on this event.

Wait Time: Up to 3 seconds, if not posted before

Parameter	Description
<i>duration</i>	The actual amount of time that the PMON is trying to sleep

See Also:

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.119 prior spawner clean up

When a prior process has died while spawning a background, the current process which is trying to spawn new a background must wait until the prior process state is cleaned up.

Wait Time: Usually 3 - 10 seconds

Parameter	Description
<i>process_pid</i>	process identifier (see <code>V\$PROCESS.PID</code>) of the process whose state must be cleaned up.

Parameter	Description
<i>process_sno</i>	process serial number (see V\$PROCESS.SERIAL#) of the process whose state must be cleaned up.

C.3.120 process startup

Wait for a shared server, Dispatcher, or other background process to start.

Wait Time: Wait up to 1 second for a background process to start. If timed out, then re-wait until 5 minutes have passed and signal an error. If the process has started, the event will acknowledge this.

Parameter	Description
<i>type</i>	The process type that was started
<i>process#</i>	The process number of the process being started
<i>waited</i>	Cumulative time waited for the process to start

C.3.121 PX Deque wait

The process is waiting for a message during a parallel execute.

Wait Time: The wait time depends on how quickly the message arrives. Wait times can vary, but it will normally be a short period of time.

Parameter	Description
<i>reason</i>	The reason for dequeuing
<i>sleeptime</i>	The amount of time that the session slept
<i>loop</i>	The total number of times that the session has slept

C.3.122 PX qref latch

Each parallel execution process has a parallel execution qref latch, which must be acquired before the queue buffers can be manipulated.

Wait Time: Wait up to 1 second

Parameter	Description
<i>function</i>	Indicates the type of wait that the session is doing
<i>sleeptime</i>	The amount of time that the session waits (in hundredths of a second)
<i>qref</i>	The address of the process queue for which the session is waiting

C.3.123 PX server shutdown

During normal or immediate shutdown the parallel execution slaves are posted to shutdown cleanly. If any parallel execution slaves are still alive after 10 seconds, they are killed.

Wait Time: Wait up to 0.5 seconds

Parameter	Description
<i>native</i>	The number of parallel execution slaves that are still running
<i>sleeptime</i>	The total sleeptime since the session started to wait on this event
<i>loop</i>	The number of times the session waited for this event

C.3.124 PX signal server

This event occurs only in Exclusive mode. The query coordinator is signalling the Query Slaves that an error has occurred.

Wait Time: 0.5 seconds

Parameter	Description
<i>serial</i>	The serial number of the slave process queue
<i>error</i>	The error that has occurred
<i>nbusy</i>	The number of slave processes that are still busy

C.3.125 rdbms ipc message

The background processes (LGWR, DBWR, LMS0) use this event to indicate that they are idle and are waiting for the foreground processes to send them an IPC message to do some work.

Wait Time: Up to 3 seconds. The parameter *timeout* shows the true sleep time.

Parameter	Description
<i>timeout</i>	The amount of time that the session waits for an IPC message

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.126 rdbms ipc message block

This event indicates that all message blocks are in use and that the session had to wait for a message block to become available.

Wait Time: Wait up to 60 seconds

Parameters: None

C.3.127 rdbms ipc reply

This event is used to wait for a reply from one of the background processes.

Wait Time: The wait time is specified by the user and is indicated by the parameter *timeout*.

Parameter	Description
<i>from_process</i>	The background process for which the session is waiting. The wait is for a reply to an IPC message sent by the session.
<i>timeout</i>	The amount of time in seconds that this process will wait for a reply

C.3.128 read by other session

This event occurs when a session requests a buffer that is currently being read into the buffer cache by another session. Prior to release 10.1, waits for this event were grouped with the other reasons for waiting for buffers under the 'buffer busy waits' event.

Wait Time: Time waited for the buffer to be read by the other session (in microseconds)

Parameter	Description
<i>file#</i>	See " file# "
<i>block#</i>	See " block# "
<i>class#</i>	See " class "

C.3.129 recovery active instance mapping setup

This event is used to track the time taken (in centiseconds) to set up recovery context on remote instances.

C.3.130 recovery apply pending

This event tracks the time the logmerger process waited (in centiseconds) for apply slaves to apply all pending changes up to a certain SCN.

C.3.131 recovery cancel

This wait event is used to track the time taken (in centiseconds) to cancel multi instance media recovery.

C.3.132 recovery checkpoint

This wait event tracks the time (in centiseconds) spent waiting for DBWR processes on all instances to write dirty buffers to disk up to a certain SCN.

C.3.133 recovery file header update for checkpoint

This wait event tracks the time (in centiseconds) spent by MRP0 process waiting on master logmerger to update file headers to record the latest checkpoint.

C.3.134 recovery file header update for fuzziness

This wait event tracks the time taken (in centiseconds) to update file headers to record media recovery fuzziness.

C.3.135 recovery marker apply

This wait event is used to track the time (in centiseconds) taken to process a recovery marker.

C.3.136 recovery merge pending

This wait event is used to track the time spent (in centiseconds) by the MRP0 process waiting for remote logmergers to merge changes up to a certain SCN.

C.3.137 recovery metadata latch

This wait event tracks the time taken (in centiseconds) to get the active DataGuard metadata update latch to advance a query SCN.

C.3.138 recovery move influx buffers

This wait event is used to track the time spent (in centiseconds) waiting for all apply slaves to move their influx buffers to the dirty queue.

C.3.139 recovery read

A parallel recovery slave (or serial recovery process) is waiting for a batch of data block reads to complete.

Wait Time: Time it takes to complete the physical I/O (read)

Parameters: None

C.3.140 recovery receive buffer free

This wait event is used to track the time (in centiseconds) spent by the receiver process on instance waiting for apply slaves to apply changes from received buffers so that they can be freed for the next change.

C.3.141 recovery remote file verification

This wait event tracks the time spent (in centiseconds) by the MRP0 process waiting for remote logmergers to finish file verification on remote instances.

C.3.142 recovery send buffer free

This wait event is used to track the time spent (in centiseconds) by the sender process waiting for apply slaves to apply changes from the local instance so that the buffer can be reused for new changes.

C.3.143 recovery shutdown

This wait event is used to track the time (in centiseconds) taken for remote logmergers to shut down.

C.3.144 Redo Transport Attach

Used to track the time spent (in centiseconds) doing Connect, Logon, and RFSATTACH for *any* network process.

 **See Also:**

Oracle Data Guard Concepts and Administration for more information about using RFS to manage standby redo logs.

C.3.145 Redo Transport Close

Used to track the time spent (in centiseconds) by ARC n , NSS n , and TT n processes doing RFSCLOSE and RFSRGSTR operations.

 **See Also:**

Oracle Data Guard Concepts and Administration for more information about using RFS to manage standby redo logs.

C.3.146 Redo Transport Detach

Used to track the time spent (in centiseconds) doing RFSDETACH and Disconnect for *any* network process.

 **See Also:**

Oracle Data Guard Concepts and Administration for more information about using RFS to manage standby redo logs.

C.3.147 Redo Transport Open

Used to track the time spent (in centiseconds) by ARC n , NSS n , and TT n background processes doing RFSCREAT and RFSANNCE operations.

 **See Also:**

Oracle Data Guard Concepts and Administration for more information about using RFS to manage standby redo logs.

C.3.148 Redo Transport Ping

Used to track the time spent (in centiseconds) by ARC n background processes doing RFSPING operations.

 **See Also:**

Oracle Data Guard Concepts and Administration for more information about using RFS to manage standby redo logs.

C.3.149 Redo Transport Slave Shutdown

Used to track the time spent (in centiseconds) by LGWR doing NSS n and TT n process shutdown and termination.

C.3.150 Redo Transport Slave Startup

Used to track the time spent (in centiseconds) by LGWR doing NSS n and TT n process startup and initialization.

C.3.151 Redo Writer Remote Sync Complete

Used to track the time spent (in centiseconds) by LGWR reaping completed network writes to remote destinations.

C.3.152 Redo Writer Remote Sync Notify

Used to track the time spent (in centiseconds) by LGWR issuing network writes to remote destinations.

C.3.153 Remote SYNC Ping

Used to track the time spent (in centiseconds) by the LGWR and NSS n background processes doing synchronous PING operations.

C.3.154 resmgr:become active

The session is waiting for a resource manager active session slot. This event occurs when the resource manager is enabled and the number of active sessions in the session's current consumer group exceeds the current resource plan's active session limit for the consumer group. To reduce the occurrence of this wait event, increase the active session limit for the session's current consumer group.

Wait Time: The time the session waited to be allocated an active session slot

Parameter	Description
<i>location</i>	location of the wait

C.3.155 resmgr:cpu quantum

The session is waiting to be allocated a quantum of CPU. This event occurs when the resource manager is enabled and is throttling CPU consumption. To reduce the occurrence of this wait event, increase the CPU allocation for the session's current consumer group.

Wait Time: The time the session waited to acquire a CPU quantum

Parameter	Description
<i>location</i>	Location of the wait
<i>Consumer Group ID</i>	Consumer group ID of the session waiting. This value is from the CONSUMER_GROUP_ID column in the DBA_RSRC_CONSUMER_GROUPS view.

 **See Also:**

["DBA_RSRC_CONSUMER_GROUPS"](#)

C.3.156 resmgr: I/O rate limit

The session is waiting for I/O bandwidth to be available to issue I/Os. This event occurs when PDB I/O rate limits are enabled by setting the MAX_IOPS and/or MAX_MBPS parameters.

To reduce the occurrence of this wait event, the PDB I/O rate limit values need to be increased. This can be achieved by increasing the values of MAX_IOPS and MAX_MBPS or by removing the limits altogether by setting the parameter value to 0.

Wait Time: The time the session waited for the I/O bandwidth to become available.

Parameter	Description
<i>P1: PDB_ID</i>	This is the PDB ID of the PDB that has its I/O throttled because the MAX_IOPS or MAX_MBPS parameter was set for it.

 **See Also:**

- "[MAX_IOPS](#)"
- "[MAX_MBPS](#)"

C.3.157 resmgr:pq queued

The session is waiting in the parallel statement queue.

Wait Time: The time the session waited for sufficient parallel query processes to become available to run this session with the requested degree of parallelism

Parameter	Description
<i>location</i>	Location of the wait

 **See Also:**

Oracle Database VLDB and Partitioning Guide for more information about this wait event

C.3.158 rolling migration: cluster quiesce

This is the wait event that instances wait on when cluster is about to start a rolling migration. The instances are waiting for any privileged operations that blocks rolling migration to complete before allowing rolling migration.

Wait Time: 1 second

Parameter	Description
<i>location</i>	Its value will be 1 if the wait is for completion of the privileged operations so that a rolling upgrade/downgrade can start. Its value will be 2 if the wait is for completion of the rolling upgrade/downgrade on all the nodes in the cluster.
<i>waits</i>	The number of seconds spent waiting at the current location.

C.3.159 row cache lock

The session is trying to get a data dictionary lock.

Wait Time: Wait up to 60 seconds.

Parameter	Description
<i>cache id</i>	The CACHE# column value in the V\$ROWCACHE view
<i>mode</i>	See " mode "
<i>request</i>	The pipe timer set by the user

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.160 RVWR wait for flashback copy

Waits for a process to copy flashback database data into the flashback buffer, in order to write out the requested flashback data.

Wait Time: 10 milliseconds

Parameter	Description
<i>copy latch #</i>	The number of flashback copy latch RVWR is waiting on

C.3.161 sbtbufinfo

This function is called when Oracle needs to discover the size, and number, of I/O buffers that have been allocated by the SBT layer. It should be very fast and never block.

Wait Time: Less than one millisecond

Parameters: None

C.3.162 sbtgetbuf

This function obtains one I/O buffer that Oracle will use for I/O during a backup job.

Wait Time: Less than one millisecond

Parameters: None

C.3.163 sbtmapbuf

This is an internal function used to facilitate multi-process buffer management. It should be very fast and never block.

Wait Time: Less than one millisecond

Parameters: None

C.3.164 sbtrelbuf

This function releases an I/O buffer that has been already processed during a restore job, so that the SBT layer can fill it with more data. It should be very fast and never block.

Wait Time: Less than one millisecond

Parameters: None

C.3.165 scginq AST call

Called by the session to find the highest lock mode that is held on a resource.

Wait Time: Wait up to 0.2 seconds, but the wait will continue until the NULL mode Acquisition AST has fired.

Parameters: None

C.3.166 SGA: allocation forcing component growth

Process waiting on an immediate mode memory transfer with auto-tune SGA after a 4031 for MMAN to get the memory and post it.

Wait Time: 10 msec

Parameters: None

C.3.167 SGA: MMAN sleep for component shrink

MMAN to wait and post itself for satisfying an auto-tuned memory request while trying to fully free a component's quiesced granules. In Release 10.1, the name of this event was 'wait for SGA component shrink'.

Wait Time: 10 msec

Parameter	Description
P1	component_id (corresponding to the memory pool)
P2	Current size in granules
P3	Target size in granules

C.3.168 SGA: sga_target resize

Memory resize requests wait while sga target is being resized. In Release 10.1, the name of this event was 'wait for sga_target resize'.

Wait Time: 10 msec

Parameters: None

C.3.169 Shared IO Pool Memory

Wait until a shared I/O pool buffer becomes available. This happens when processes are using these buffers for I/O and the current process needs to wait for the release of any one of the buffers to the shared I/O pool.

Wait Time: 10msec

Parameters: None

C.3.170 shared server idle wait

Idle wait event for a shared server.

The server waits on the common queue for a virtual circuit. (See also "[virtual circuit wait](#)".)

Wait Time: 30 seconds

Parameters: None

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.171 single-task message

When running single task, this event indicates that the session waits for the client side of the executable.

Wait Time: Total elapsed time that this session spent in the user application

Parameters: None

C.3.172 smon timer

This is the main idle event for SMON. SMON will be waiting on this event most of the time until it times out or is posted by another process.

Wait Time: 5 minutes (300 seconds)

Parameter	Description
<i>sleeptime</i>	The amount of time that SMON tries to wait on this event in seconds
<i>failed</i>	The number of times SMON was posted when there some kind of error

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.173 SQL*Net break/reset to client

The server sends a break or reset message to the client. The session running on the server waits for a reply from the client.

Wait Time: The actual time it takes for the break or reset message to return from the client

Parameter	Description
<i>driver id</i>	See " driver id "
<i>break?</i>	See " break?"

C.3.174 SQL*Net break/reset to dblink

Same as **SQL*Net break/reset to client**, but in this case, the break/reset message is sent to another server process over a database link.

Wait Time: The actual time it takes for the break or reset message to return from the other server process

Parameter	Description
<i>driver id</i>	See " driver id "
<i>break?</i>	See " break?"

C.3.175 SQL*Net message from client

The server process (foreground process) waits for a message from the client process to arrive.

Wait Time: The time it took for a message to arrive from the client since the last message was sent to the client

Parameter	Description
<i>driver id</i>	See " driver id "
<i>#bytes</i>	The number of bytes received by the server (foreground process) from the client.

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.176 SQL*Net message from dblink

The session waits while the server process (foreground process) receives messages over a database link from another server process.

Wait Time: The time it took for a message to arrive from another server (foreground process) since a message was sent to the other foreground process.

Parameter	Description
<i>driver id</i>	See " driver id "
<i>#bytes</i>	The number of bytes received by the server (foreground process) from another foreground process over a database link.

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.177 SQL*Net message to client

The server (foreground process) is sending a message to the client.

Wait Time: The actual time the **send** takes

Parameter	Description
<i>driver id</i>	See " driver id "
<i>#bytes</i>	The number of bytes sent by the server process to the client

C.3.178 SQL*Net message to dblink

The server process (foreground process) is sending a message over a database link to another server process.

Wait Time: The actual time the **send** takes

Parameter	Description
<i>driver id</i>	See " driver id "
<i>#bytes</i>	The number of bytes sent by the server process to another server process over a database link

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.179 SQL*Net more data from client

The server is waiting on the client to send more data to its client shadow process, in an already initiated operation.

Wait Time: The time waited depends on the time it took to receive the data (including the waiting time)

Parameter	Description
<i>driver id</i>	See " driver id "
<i>#bytes</i>	The number of bytes received from the client

C.3.180 SQL*Net more data from dblink

The foreground process is expecting more data from a data base link.

Wait Time: The total time it takes to read the data from the database link (including the waiting time for the data to arrive)

Parameter	Description
<i>driver id</i>	See " driver id "
<i>#bytes</i>	The number of bytes received

C.3.181 SQL*Net more data to client

The server process is sending more data/messages to the client. The previous operation to the client was also a **send**.

Wait Time: The actual time it took for the **send** to complete

Parameter	Description
<i>driver id</i>	See " driver id "
<i>#bytes</i>	The number of bytes that are being sent to the client

 **See Also:**

Oracle Database Performance Tuning Guide for more information about this wait event

C.3.182 SQL*Net more data to dblink

The event indicates that the server is sending data over a database link again. The previous operation over this database link was also a **send**.

Wait Time: The actual time it takes to send the data to the other server

Parameter	Description
<i>driver id</i>	See " driver id "
<i>#bytes</i>	The number of bytes that are sent over the database link to the other server process

C.3.183 Streams AQ: waiting for messages in the queue

The session is waiting on an empty OLTP queue (Advanced Queuing) for a message to arrive so that the session can dequeue that message.

Wait Time: The amount of time that the session wants to wait is determined by the parameter *wait time*

Parameter	Description
<i>queue id</i>	The ID of the OLTP queue for which this session is waiting
<i>process#</i>	The process number of the process in which this session runs
<i>wait time</i>	The intended wait time for this session

C.3.184 switch logfile command

The session waits on the user command `SWITCH LOGFILE` to complete.

Wait Time: 5 seconds

Parameters: None

C.3.185 SYNC Remote Write

Used to track the time spent by LGWR doing SYNC RFSWRITE operations.

 **See Also:**

Oracle Data Guard Concepts and Administration for more information about using RFS to manage standby redo logs.

C.3.186 TCP Socket (KGAS)

A session is waiting for an external host to provide requested data over a network socket. The time that this wait event tracks does not indicate a problem, and even a long wait time is not a reason to contact Oracle Support. It naturally takes time for data to flow between hosts over a network, and for the remote aspect of an application to process any request made to it.

An application that communicates with a remote host must wait until the data it will read has arrived. In addition, on Microsoft Windows, a separate thread monitors the arrival of traffic. This thread spends most of its life in waits tracked by the TCP Socket (KGAS) wait event.

Wait Time: The total elapsed time for the network connection to be established or for data to arrive from over the network

Parameter	Description
<i>P0</i>	For Oracle internal use only. Values 8, 9, and 10 occur within the special thread present on Microsoft Windows; other P0 values occur in normal user sessions.
<i>P1</i>	For Oracle internal use only

C.3.187 timer in sksawat

The session waits for the Archiver (ARCn) asynchronous I/O to complete.

Wait Time: 0.01 seconds

Parameters: None

C.3.188 transaction

Wait for a blocking transaction to be rolled back. Continue waiting until the transaction has been rolled back.

Wait Time: 1 second

Parameter	Description
<i>undo seg#</i>	The rollback segment ID
<i>slot#</i>	The slot ID inside the rollback segment
<i>wrap#</i>	The sequence number that is incremented for each transaction
<i>count</i>	The number of times that the session has waited on this transaction

C.3.189 unbound tx

The session waits to see if there are any transactions that have been started but do not have a Rollback Segment associated with them.

Wait Time: 1 second

Parameters: None

C.3.190 undo_retention publish retry

This wait can occur for two reasons. A session issuing an `ALTER SYSTEM SET UNDO_RETENTION` may wait on this event wait while a cluster reconfiguration takes place. Or the background process MMNL may wait for cluster reconfiguration while attempting to determine the `max UNDO_RETENTION`.

Wait time: 1 second

Parameter	Description
<i>P1</i>	Identifies where the retry is happening. Id = 1 retry while publishing into the max undo_retention namespace. Id = 2 retry while iterator accessing the max undo_retention namespace.
<i>P2</i>	Retry count (maximum number of retries is 5)

C.3.191 undo segment extension

The undo segment is being extended or shrunk. The session must wait until the operation on the undo segment has finished.

Wait Time: 0.01 seconds

Parameter	Description
<i>segment#</i>	The ID of the rollback segment that is being extended or shrunk

C.3.192 undo segment recovery

PMON is rolling back a dead transaction. The wait continues until rollback finishes.

Wait Time: 3 seconds

Parameter	Description
<i>segment#</i>	The ID of the rollback segment that contains the transaction that is being rolled back
<i>tx flags</i>	The transaction flags (options) set for the transaction that is being rolled back

C.3.193 undo segment tx slot

Wait for a transaction slot to become available within the selected rollback segment. Continue waiting until the slot is available.

Wait Time: 1 second

Parameter	Description
<i>segment#</i>	The ID of the rollback segment that contains the transaction that is being rolled back

C.3.194 utl_file I/O

Waits associated with operations performed using the `UTL_FILE` package.

C.3.195 virtual circuit wait

The session waits for a virtual circuit operation to complete.

Wait Time: 30 seconds

Parameter	Description
<i>circuit#</i>	Indicates the virtual circuit# being waited on
<i>type</i>	Indicates the type of operation the session is waiting for

C.3.196 WCR: replay client notify

During replay, the Workload Replay Client always keeps an open connection to the database to detect some special errors. This session will normally be in the wait state until some specific replay-related exception occurs.

Wait Time: Waits until notified. Times out every 30 seconds.

Parameter	Description
<i>who am I</i>	Identifies the reason for wait for the admin thread. 1 - waiting for REPLAY.START() to be issued. 2 - waiting for the replay to run to completion or REPLAY.CANCEL() to be issued.

C.3.197 WCR: replay clock

A session will wait on this event during replay if it has some logical dependencies on another session that has not yet committed its work.

Wait Time: Depends upon the amount of row lock contention in the original capture

Parameter	Description
<i>wait for scn's hi 4 bytes</i>	High 4 bytes of the 8-byte replay SCN that the session is waiting on
<i>wait for scn's lo 4 bytes</i>	Low 4 bytes of the 8-byte replay SCN that the session is waiting on

C.3.198 WCR: replay lock order

A session will wait on this event during replay if it saw some lock contention during capture.

Wait Time: Depends upon the amount of row lock contention in the original capture

Parameter	Description
<i>wait for scn's hi 4 bytes</i>	High 4 bytes of the 8-byte replay SCN that the session is waiting on
<i>wait for scn's lo 4 bytes</i>	Low 4 bytes of the 8-byte replay SCN that the session is waiting on

C.3.199 WCR: replay paused

When the user issues a DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY command, all the replayed sessions are waiting on this wait event until replay is resumed.

Parameters: None

C.3.200 WCR: Sync context busy

In the default replay mode, commits during replay are synchronized to follow the same order as capture. All commits are serialized using the Sync context. A replayed session will wait on this event if it is trying to commit at the same time as another replayed session.

Parameters: None

C.3.201 write complete waits

The session waits for a buffer to be written. The write is caused by normal aging or by a cross-instance call.

Wait Time: 1 second

Parameter	Description
<i>file#</i>	The rollback segment id that contains the transaction that is being rolled back
<i>block#</i>	The transaction flags (options) set for the transaction that is being rolled back
<i>id</i>	Identifies the reason for waiting

C.3.202 writes stopped by instance recovery or database suspension

The session is blocked until the instance that started Instance Recovery is finished.

Wait Time: 5 seconds

Parameter	Description
<i>bythread#</i>	The rollback segment id that contains the transaction that is being rolled back
<i>ourthread#</i>	The current instance thread number

D

Oracle Enqueue Names

This appendix lists Oracle enqueues. **Enqueues** are shared memory structures (locks) that serialize access to database resources. They can be associated with a session or transaction. Enqueue names are displayed in the `LOCK_TYPE` column of the `DBA_LOCK` and `DBA_LOCK_INTERNAL` data dictionary views.

A **resource** uniquely identifies an object that can be locked by different sessions within an instance (local resource) or between instances (global resource). Each session that tries to lock the resource will have an **enqueue** on the resource.

 **Note:**

The names of enqueues and their definitions may change from release to release.

 **See Also:**

["DBA_LOCK_INTERNAL"](#) and ["DBA_LOCK"](#)

The Oracle enqueues are:

- BL, Buffer Cache Management
- BR, Backup/Restore
- CF, Controlfile Transaction
- CI, Cross-instance Call Invocation
- CU, Bind Enqueue
- DF, Datafile
- DL, Direct Loader Index Creation
- DM, Database Mount
- DR, Distributed Recovery Process
- DW, SecureFiles
- DX, Distributed Transaction
- FP, File Object
- FS, File Set
- HW, High-Water Lock
- IN, Instance Number
- IR, Instance Recovery
- IS, Instance State

- IV, Library Cache Invalidation
- JI, Enqueue used during AJV snapshot refresh
- JQ, Job Queue
- KK, Redo Log "Kick"
- KP, contention in Oracle Data Pump startup and shutdown processes
- KO, Multiple Object Checkpoint
- L[A-P], Library Cache Lock
- LS, Log Start or Switch
- MM, Mount Definition
- MR, Media Recovery
- N[A-Z], Library Cache Pin
- PE, ALTER SYSTEM SET PARAMETER = VALUE
- PF, Password File
- PI, Parallel Slaves
- PR, Process Startup
- PS, Parallel Slave Synchronization
- Q[A-Z], Row Cache
- RO, Object Reuse
- RT, Redo Thread
- RW, Row Wait
- SC, System Change Number
- SM, SMON
- SN, Sequence Number
- SQ, Sequence Number Enqueue
- SR, Synchronized Replication
- SS, Sort Segment
- ST, Space Management Transaction
- SV, Sequence Number Value
- TA, Transaction Recovery
- TC, Thread Checkpoint
- TE, Extend Table
- TM, DML Enqueue
- TO, Temporary Table Object Enqueue
- TS, Temporary Segment (also TableSpace)
- TT, Temporary Table
- TX, Transaction
- UL, User-defined Locks
- UN, User Name

- US, Undo Segment, Serialization
- WL, Being Written Redo Log
- XA, Instance Attribute Lock
- XI, Instance Registration Lock
- ZA, Exclusive Lock When Moving Audit Table

E

Statistics Descriptions

This appendix describes the statistics stored in the `V$SESSTAT` and `V$SYSSTAT` dynamic performance tables. These statistics are useful in identifying and correcting performance problems.

This appendix contains the following topics:

- [Displaying Statistics](#)
- [Statistics Descriptions](#)

E.1 Displaying Statistics

The `V$SESSTAT` view displays statistics on a per-session basis and is valid only for the session currently connected. When a session disconnects, all statistics for the session are updated in `V$SYSSTAT`. The values for the statistics are cleared until the next session uses them.

The `V$STATNAME` view contains all of the statistics for an Oracle release.

Many of these statistics are tied to the internal implementation of Oracle and therefore are subject to change or deletion without notice, even between patch releases. Application developers should be aware of this and write their code to tolerate missing or extra statistics.

See Also:

["V\\$SESSTAT"](#), ["V\\$STATNAME"](#), and ["V\\$SYSSTAT"](#) for more information on these views

E.2 Statistics Descriptions

This section describes some of the statistics stored in the `V$SESSTAT` and `V$SYSSTAT` views. The statistics are listed in alphabetical order.

The `CLASS` column contains a number representing one or more statistics classes. The following class numbers are additive:

- 1, User
- 2, Redo
- 4, Enqueue
- 8, Cache
- 16, OS
- 32, Real Application Clusters
- 64, SQL
- 128, Debug

For example, a class value of 72 represents a statistic that relates to SQL statements and caching.

Some statistics are populated only if the `TIMED_STATISTICS` initialization parameter is set to `true`. Those statistics are flagged with a `Y` in the right-hand column.

Table E-1 Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
application wait time	1	The total wait time (in centiseconds) for waits that belong to the Application wait class	
background checkpoints completed	8	Number of checkpoints completed by the background process. This statistic is incremented when the background process successfully advances the thread checkpoint.	
background checkpoints started	8	Number of checkpoints started by the background process. This statistic can be larger than "background checkpoints completed" if a new checkpoint overrides an incomplete checkpoint or if a checkpoint is currently under way. This statistic includes only checkpoints of the redo thread. It does not include: <ul style="list-style-type: none"> • Individual file checkpoints for operations such as offline or begin backup • Foreground (user-requested) checkpoints (for example, performed by <code>ALTER SYSTEM CHECKPOINT LOCAL</code> statements) 	
background timeouts	128	This is a count of the times where a background process has set an alarm for itself and the alarm has timed out rather than the background process being posted by another process to do some work.	
branch node splits	128	Number of times an index branch block was split because of the insertion of an additional value	
buffer is not pinned count	72	Number of times a buffer was free when visited. Useful only for internal debugging purposes.	
buffer is pinned count	72	Number of times a buffer was pinned when visited. Useful only for internal debugging purposes.	
bytes received via SQL*Net from client	1	Total number of bytes received from the client over Oracle Net Services	
bytes received via SQL*Net from dblink	1	Total number of bytes received from a database link over Oracle Net Services	
bytes sent via SQL*Net to client	1	Total number of bytes sent to the client from the foreground processes	
bytes sent via SQL*Net to dblink	1	Total number of bytes sent over a database link	
Cached Commit SCN referenced	128	Useful only for internal debugging purposes	
calls to get snapshot scn: kcmgss	32	Number of times a snapshot system change number (SCN) was allocated. The SCN is allocated at the start of a transaction.	
calls to kcmgas	128	Number of calls to routine kcmgas to get a new SCN	
calls to kcmgcs	128	Number of calls to routine kcmgcs to get a current SCN	
calls to kcmgrs	128	Number of calls to routine kcsgrs to get a recent SCN	
cell flash cache read hits	8	Number of read requests that were satisfied by the cache	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
cell flash cache read hits for smart IO	8	Number of read requests for smart IO that were satisfied by the cache	
cell flash cache read hits for temp IO	8	Number of read requests for temp IO that were satisfied by the cache	
cell IO uncompressed bytes	64	Total size of uncompressed data that is processed on the cell For operations on segments compressed using Exadata Hybrid Columnar Compression, this statistic is the size of the data after decompression.	
cell num bytes in passthru due to quarantine	8	Number of bytes that were not offloaded and sent back to the database for processing due to a quarantine on the cell	
cell num bytes in passthru during predicate offload	64	Number of bytes that were not offloaded and sent back to the database for processing	
cell overwrites in flash cache	8	Total number of write requests that overwrote an existing cacheline in Exadata Smart Flash Cache that had not been written to disk In effect, this is the amount of disk I/O saved by using Write-Back mode. This statistic is incremented once per mirror write.	
cell partial writes in flash cache	8	Total number of write requests written to both Exadata Smart Flash Cache and disk Part of the data was written to flash, and the rest was written to disk. This statistic is incremented once per mirror write.	
cell physical IO bytes eligible for predicate offload	64	Number of bytes on-disk eligible for predicate offload	
cell physical IO bytes eligible for smart IOs	8	Number of actual bytes eligible for predicate offload For example, when using columnar cache, this is the size of columnar cache instead of the on-disk size.	
cell physical IO bytes processed for IM capacity	64	Number of bytes read from the columnar cache in memcompress for capacity format	
cell physical IO bytes processed for IM query	64	Number of bytes read from the columnar cache in memcompress for query format	
cell physical IO bytes processed for no memcompress	64	Number of bytes read from the columnar cache in no memcompress format	
cell physical IO bytes saved by columnar cache	8	Number of bytes saved by columnar cache, that is, the number of bytes of reading that were avoided	
cell physical IO bytes saved by storage index	8	Number of bytes saved by the storage index	
cell physical IO bytes saved during optimized file creation	64	Number of I/O bytes saved by the database host by offloading the file creation operation to the cells This statistic shows the benefit of optimized file creation operations.	
cell physical IO bytes saved during optimized RMAN file restore	64	Number of I/O bytes saved by the database host by offloading the RMAN file restore operation to the cells This statistic shows the benefit of optimized RMAN file restore operations.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
cell physical IO bytes sent directly to DB node to balance CPU	64	Number of I/O bytes sent back to the database server for processing due to high storage server CPU usage	
cell physical IO interconnect bytes	64	Number of I/O bytes exchanged over the interconnect between the database host and the cells	
cell physical IO interconnect bytes returned by smart scan	64	Number of I/O bytes that are returned by the cell for Smart Scan operations This value does not include bytes for other database I/O.	
cell pmem cache read hits	8	Number of non-RDMA read requests processed by <code>cellsrv</code> resulting in a PMEM cache hit	
cell pmem cache writes	264	Number of non-RDMA write requests processed by <code>cellsrv</code> resulting in a PMEM cache write	
cell ram cache read hits	8	Number of read requests that hit the RAM cache on the cell	
cell RDMA reads	8	Number of PMEM cache read requests using RDMA	
cell RDMA writes	264	Number of PMEM cache write requests using RDMA	
cell writes to flash cache	8	Total number of write requests written entirely to Exadata Smart Flash Cache This statistic is incremented once per mirror write.	
cell writes to flash cache for temp IO	8	Number of write requests for temporary segments that were absorbed by Exadata Smart Flash Cache	
change write time	8	Elapsed redo write time for changes made to CURRENT blocks in 10s of milliseconds.	Y
cleanouts and rollbacks - consistent read gets	128	Number of consistent gets that require both block rollbacks and block cleanouts. See Also: " consistent gets "	
cleanouts only - consistent read gets	128	Number of consistent gets that require only block cleanouts, no rollbacks. See Also: " consistent gets "	
cluster key scan block gets	64	Number of blocks obtained in a cluster scan	
cluster key scans	64	Number of cluster scans that were started	
cluster wait time	1	The total wait time (in centiseconds) for waits that belong to the Cluster wait class	
cold recycle reads	8	Number of buffers that were read through the least recently used end of the recycle cache with fast aging strategy	
commit cleanout failures: block lost	8	Number of times Oracle attempted a cleanout at commit but could not find the correct block due to forced write, replacement, or switch CURRENT	
commit cleanout failures: buffer being written	8	Number of times Oracle attempted a cleanout at commit, but the buffer was currently being written	
commit cleanout failures: callback failure	8	Number of times the cleanout callback function returns FALSE	
commit cleanout failures: cannot pin	8	Total number of times a commit cleanout was performed but failed because the block could not be pinned	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
commit cleanout failures: hot backup in progress	8	Number of times Oracle attempted block cleanout at commit during hot backup. The image of the block must be logged before the buffer can be made dirty.	
commit cleanout failures: write disabled	8	Number of times a cleanout block at commit was performed but the writes to the database had been temporarily disabled	
commit cleanouts	8	Total number of times the cleanout block at commit function was performed	
commit cleanouts successfully completed	8	Number of times the cleanout block at commit function completed successfully	
commit nowait performed	1	The number of asynchronous commits that were actually performed. These commits did not wait for the commit redo to be flushed and be present on disk before returning.	
commit nowait requested	1	The number of no-wait commit or asynchronous commit requests that were made either using SQL or the OCI transaction control API	
Commit SCN cached	128	Number of times the system change number of a commit operation was cached	
commit wait/nowait performed	1	The number of asynchronous/synchronous commits that were actually performed	
commit wait/nowait requested	1	The number of no-wait or wait commits that were made either using SQL or the OCI transaction control API	
commit wait performed	1	The number of synchronous commits that were actually performed. These commits waited for the commit redo to be flushed and be present on disk before returning.	
commit wait requested	1	The number of waiting or synchronous commit requests that were made either using SQL or the OCI transaction control API	
concurrency wait time	1	The total wait time (in centiseconds) for waits that belong to the Concurrency wait class	
consistent changes	8	Number of times a user process has applied rollback entries to perform a consistent read on the block Work loads that produce a great deal of consistent changes can consume a great deal of resources. The value of this statistic should be small in relation to the "consistent gets" statistic.	
consistent gets	8	Number of times a consistent read was requested for a block. See Also: " consistent changes " and " session logical reads " statistics	
consistent gets direct	8	Number of times a consistent read was requested for a block bypassing the buffer cache (for example, direct load operation). This is a subset of "consistent gets" statistics value.	
consistent gets from cache	8	Number of times a consistent read was requested for a block from buffer cache. This is a subset of "consistent gets" statistics value.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
CPU used by this session	1	<p>Amount of CPU time (in 10s of milliseconds) used by a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistic, and 0 milliseconds are added.</p> <p>A similar problem can exist in the reporting by the operating system, especially on systems that suffer from many context switches.</p>	Y
CPU used when call started	128	<p>The CPU time used when the call is started</p> <p>See Also: " CPU used by this session"</p>	Y
CR blocks created	8	Number of CURRENT blocks cloned to create CR (consistent read) blocks. The most common reason for cloning is that the buffer is held in a incompatible mode.	
cumulative begin requests	32	Total number of begin requests received by the Oracle database allowing the database to detect and process requests	
cumulative DB time in requests	128	Total database time DB Time (in microseconds) within requests to the Oracle database, measuring DB time used from the beginning to the end of each request. (See also DB time statistic.)	
cumulative DB time protected in requests	128	<p>Total database time DB Time (in microseconds) within requests to the Oracle database protected by Application Continuity or Transparent Application Continuity, measuring DB time used from the beginning to the end of each request. (See also DB time statistic.)</p> <p>This is a subset of "cumulative DB time in requests" value, which enables you to calculate the ratio of total time in requests to protected time in requests. See also Application Continuity Protection Check (ACCHK).</p>	
cumulative end requests	32	Total number of end requests received by the Oracle database allowing the database to detect and process requests	
cumulative time in requests	128	Total wall clock time (in microseconds) within requests to the Oracle database, measuring time spent from the beginning to the end of each request. This statistic is used by draining and planned failover. (See <code>drain_timeout</code> .)	
cumulative user calls in requests	32	Total number of user calls received by the Oracle database within requests to the Oracle database	
cumulative user calls protected by Application Continuity	32	Total number of user calls received by the Oracle database within requests to the Oracle database that were protected by Application Continuity or Transparent Application Continuity	
current blocks converted for CR	8	Number CURRENT blocks converted to CR state	
cursor authentications	128	Number of privilege checks conducted during execution of an operation	
data blocks consistent reads - undo records applied	128	Number of undo records applied to data blocks that have been rolled back for consistent read purposes	
data warehousing cooling action	8	Number of times that cooling occurred on this instance	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
data warehousing evicted objects	8	Number of times that objects got evicted by automatic big table caching on this instance	
data warehousing evicted objects - cooling	8	Number of times that objects got evicted on this instance due to a cooling action	
data warehousing evicted objects - replace	8	Number of times that objects got evicted due to caching replacement, that is, when an object is evicted because a hotter object forces it to be evicted from the cache	
data warehousing scanned blocks	8	Number of blocks scanned by automatic big table caching on this instance using parallel query	
data warehousing scanned blocks - disk	8	Number of blocks scanned by automatic big table caching on this instance by direct read from disk	
data warehousing scanned blocks - memory	8	Number of blocks scanned by automatic big table caching on this instance by cache read from memory	
data warehousing scanned blocks - offload	8	Number of blocks scanned by automatic big table caching on this instance by Exadata offloading	
data warehousing scanned objects	8	Number of times the objects in automatic big table caching are scanned using parallel query	
db block changes	8	Closely related to " consistent changes ", this statistic counts the total number of changes that were part of an update or delete operation that were made to all blocks in the SGA. Such changes generate redo log entries and hence become permanent changes to the database if the transaction is committed. This approximates total database work. This statistic indicates the rate at which buffers are being dirtied (on a per-transaction or per-second basis, for example).	
db block gets	8	Number of times a CURRENT block was requested See Also: " consistent gets "	
db block gets direct	8	Number of times a CURRENT block was requested bypassing the buffer cache (for example, a direct load operation). This is a subset of "db block gets" statistics value.	
db block gets from cache	8	Number of times a CURRENT block was requested from the buffer cache. This is a subset of "db block gets" statistics value.	
DBWR checkpoint buffers written	8	Number of buffers that were written for checkpoints	
DBWR checkpoints	8	Number of times the DBWR was asked to scan the cache and write all blocks marked for a checkpoint or the end of recovery. This statistic is always larger than " background checkpoints completed ".	
DBWR lru scans	8	Number of times that DBWR scans the LRU queue looking for buffers to write. This count includes scans to fill a batch being written for another purpose (such as a checkpoint).	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
DBWR revisited being-written buffer	8	<p>Number of times that DBWR tried to save a buffer for writing and found that it was already in the write batch. This statistic measures the amount of "useless" work that DBWR had to do in trying to fill the batch.</p> <p>Many sources contribute to a write batch. If the same buffer from different sources is considered for adding to the write batch, then all but the first attempt will be "useless" because the buffer is already marked as being written.</p>	
DBWR transaction table writes	8	Number of rollback segment headers written by DBWR. This statistic indicates how many "hot" buffers were written, causing a user process to wait while the write completed.	
DBWR undo block writes	8	Number of rollback segment blocks written by DBWR	
DDL statements parallelized	32	Number of DDL statements that were executed in parallel	
deferred (CURRENT) block cleanout applications	128	Number of times cleanout records are deferred, piggyback with changes, always current get	
DFO trees parallelized	32	Number of times a serial execution plan was converted to a parallel plan	
dirty buffers inspected	8	Number of dirty buffers found by the user process while it is looking for a buffer to reuse	
DML statements parallelized	32	Number of DML statements that were executed in parallel	
DML statements retried	64	<p>When a long-running DML is executing, the cursor may get invalidated due to some concurrent DDL on one of the cursor's dependencies. In this case, an internal ORA-14403 error is thrown and is caught and cleared in one of the calling functions. The current work is rolled back and the DML is restarted without the user being notified of this.</p> <p>The statistic counts the number of times that the thrown, caught, and cleared (ORA-14403) sequence occurred for DML statements. Should a DML vary widely in execution time, check this statistic to see if it increments during the DML execution. If so, then concurrent DDL may be the cause of the extra elapsed time.</p>	
enqueue conversions	4	Total number of conversions of the state of table or row lock	
enqueue deadlocks	4	Total number of deadlocks between table or row locks in different sessions	
enqueue releases	4	Total number of table or row locks released	
enqueue requests	4	Total number of table or row locks acquired	
enqueue timeouts	4	Total number of table and row locks (acquired and converted) that timed out before they could complete	
enqueue waits	4	Total number of waits that occurred during an enqueue convert or get because the enqueue get was deferred	
exchange deadlocks	8	Number of times that a process detected a potential deadlock when exchanging two buffers and raised an internal, restartable error. Index scans are the only operations that perform exchanges.	
execute count	64	Total number of calls (user and recursive) that executed SQL statements	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
fbda woken up	128	Number of times the flashback data archive background process was woken up to do archiving	
file io wait time	1	Total time spent in wait (in microseconds) for I/O to datafiles, excluding the service time for such I/O. This is cumulative for all I/Os for all datafiles. The service time for one I/O operation is estimated as the minimum time spent in the I/O call seen so far. This service time is subtracted from the time spent in each I/O call to get the wait time for that I/O.	
flash cache eviction: aged out	8	Flash cache buffer is aged out of the Database Smart Flash Cache	
flash cache eviction: buffer pinned	8	Database Smart Flash Cache buffer is invalidated due to object or range reuse, and so on. The Database Flash Cache Buffer was in use at the time of eviction.	
flash cache eviction: invalidated	8	Database Smart Flash Cache buffer is invalidated due to object or range reuse, and so on. The Database Smart Flash Cache buffer was not in use at the time of eviction.	
flash cache insert skip: corrupt	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because the buffer was corrupted	
flash cache insert skip: DBWR overloaded	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because DBWR was busy writing other buffers	
flash cache insert skip: exists	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was already in the flash cache	
flash cache insert skip: modification	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was being modified	
flash cache insert skip: not current	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was not current	
flash cache insert skip: not useful	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because the type of buffer was not useful to keep	
flash cache inserts	8	Total number of in-memory buffers inserted into the Database Smart Flash Cache	
flashback log write bytes	2	Total size in bytes of flashback database data written by RVWR to flashback database logs	
flashback log writes	2	Total number of writes by RVWR to flashback database logs	
foreground propagated tracked transactions	128	Number of transactions modifying tables enabled for flashback data archive which were archived by a foreground process	
free buffer inspected	8	Number of buffers skipped over from the end of an LRU queue to find a reusable buffer. The difference between this statistic and " dirty buffers inspected " is the number of buffers that could not be used because they had a user, a waiter, or were being read or written, or because they were busy or needed to be written after rapid aging out.	
free buffer requested	8	Number of times a reusable buffer or a free buffer was requested to create or load a block	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
gc read wait failures	40	A read wait is when a CR server waits for a disk read to complete before serving a block to another instance. This statistic displays the number of times a read wait ended in failure, that is, after waiting it was unable to serve a block.	
gc read wait timeouts	40	A read wait is when a CR server waits for a disk read to complete before serving a block to another instance. This statistic displays the number of times a read wait timed out, that is, the disk read did not complete in time, so the wait was aborted.	
gc read waits	40	The number of times a CR server waited for a disk read, and then successfully served a block	
global enqueue CPU used by this session	32	Amount of CPU time (in 10s of milliseconds) used by synchronous and asynchronous global enqueue activity in a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistics, and 0 milliseconds are added.	
global enqueue get time	32	Total elapsed time in 10s of milliseconds of all synchronous and asynchronous global enqueue gets and converts	
global enqueue gets async	32	Total number of asynchronous global enqueue gets and converts	
global enqueue gets sync	32	Total number of synchronous global enqueue gets and converts	
global enqueue releases	32	Total number of synchronous global enqueue releases	
hot buffers moved to head of LRU	8	When a hot buffer reaches the tail of its replacement list, Oracle moves it back to the head of the list to keep it from being reused. This statistic counts such moves.	
HCC analyze table CUs	128	Number of Compression Units that were decompressed for ANALYZE TABLE	
HCC analyzer calls	128	Number of times ANALYZE TABLE has been run on Hybrid Columnar Compression (HCC) compressed tables	
HCC block compressions attempted	128	Number of times the system failed to recompress an OLTP compressed block in HCC format	
HCC block compressions completed	128	Number of times an OLTP compressed block was successfully recompressed in HCC format	
HCC DML conventional	128	Number of searched DML statements (UPDATE and DELETE) issued against HCC compressed tables	
HCC DML CUs	128	Number of Compression Units that were decompressed for searched DMLs (UPDATE and DELETE)	
HCC fetch by rowid CUs	128	Number of Compression Units that were decompressed by single row fetch	
HCC load conventional bytes compressed	128	Length of the data after compression stored in Compression Units by conventional loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
HCC load conventional bytes uncompressed	128	Length of the data before compression stored in Compression Units by conventional loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.	
HCC load conventional CUs	128	Number of Compression Units that were successfully compressed in any format from conventional loads	
HCC load conventional CUs archive high	128	Number of Compression Units that were successfully compressed in HCC ARCHIVE HIGH format from conventional loads	
HCC load conventional CUs archive low	128	Number of Compression Units that were successfully compressed in HCC ARCHIVE LOW format from conventional loads	
HCC load conventional CUs query high	128	Number of Compression Units that were successfully compressed in HCC QUERY HIGH format from conventional loads	
HCC load conventional CUs query low	128	Number of Compression Units that were successfully compressed in HCC QUERY LOW format from conventional loads	
HCC load conventional rows	128	Number of rows that were successfully compressed in HCC format from conventional loads	
HCC load conventional rows not compressed	128	Number of rows that were unable to be compressed in HCC format from conventional loads because the compression resulted in taking more space, not less	
HCC load direct bytes compressed	128	Length of the data after compression stored in Compression Units by Direct Path Loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.	
HCC load direct bytes uncompressed	128	Length of the data before compression stored in Compression Units by Direct Path Loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.	
HCC load direct CUs	128	Number of Compression Units that were successfully HCC compressed by Direct Path Loads	
HCC load direct CUs archive high	128	Number of rows from Direct Path Loads that were HCC compressed with ARCHIVE HIGH successfully	
HCC load direct CUs archive low	128	Number of rows from Direct Path Loads that were HCC compressed with ARCHIVE LOW successfully	
HCC load direct CUs query high	128	Number of rows from Direct Path Loads that were HCC compressed with QUERY HIGH successfully	
HCC load direct CUs query low	128	Number of rows from Direct Path Loads that were HCC compressed with QUERY LOW successfully	
HCC load direct rows	128	Number of rows from Direct Path Loads that were HCC compressed successfully	
HCC load direct rows not compressed	128	Number of rows from Direct Path Loads that were OLTP compressed instead of HCC compressed due to negative compression	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
HCC scan cell bytes compressed	128	Length of the compressed data stored in Compression Units prior to decompression. This is the length of all columns, not just the columns accessed.	
HCC scan cell bytes decompressed	128	Length of the data after decompression stored in Compression Units. This is the length of all columns, not just the columns accessed.	
HCC scan cell CUs archive high	128	Number of Compression Units scanned that had been compressed with ARCHIVE HIGH	
HCC scan cell CUs archive low	128	Number of Compression Units scanned that had been compressed with ARCHIVE LOW	
HCC scan cell CUs columns accessed	128	Number of columns that needed to be decompressed on the storage server to process the Compression Unit	
HCC scan cell CUs decompressed	128	Number of Compression Units that needed to be decompressed on the storage server	
HCC scan cell CUs decompression time	128	Total time spent decompressing the columns that were needed on the storage server	
HCC scan cell CUs optimized read	128	Number of Compression Units where all the rows were within the stored Min/Max values. Evaluation of those predicates was optimized out.	
HCC scan cell CUs pruned	128	Number of Compression Units that were pruned based on the Min/Max value checks	
HCC scan cell CUs query high	128	Number of Compression Units scanned that had been compressed with QUERY HIGH	
HCC scan cell CUs query low	128	Number of Compression Units scanned that had been compressed with QUERY LOW	
HCC scan cell CUs sent compressed	64	Number of Compression Units that the storage server returned to the RDBMS still compressed after predicate evaluation was done	
HCC scan cell CUs sent head piece	64	Number of Compression Units that the storage server was unable to process and the block header was returned to the RDBMS to be processed	
HCC scan cell CUs sent uncompressed	64	Number of Compression Units that the storage server returned to the RDBMS in uncompressed columnar format	
HCC scan cell rows	128	Number of rows from columnar formatted data that were returned by the storage server to the RDBMS	
HCC scan CUs pcode aggregation pushdown	128	Number of Compression Units that were aggregated on the cell using P(ortable)-byte code	
HCC scan CUs pcode pred evalued	128	Number of predicates that were evaluated using P(ortable)-byte code	
HCC scan CUs pcode pred evalued using rowsets	128	Number of predicates that were evaluated using P(ortable)-byte code using vectorized data	
HCC scan CUs predicates applied	128	Number of predicates where at least some value passed the Min/Max check	
HCC scan CUs predicates optimized	128	Number of predicates that could be evaluated directly against columnar data	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
HCC scan CUs predicates received	128	Number of predicates sent to the storage server that could be evaluated directly against HCC format data after decompression	
HCC scan rdbms bytes compressed	128	Length of the compressed data stored in Compression Units prior to decompression. This is the length of all columns, not just the columns accessed.	
HCC scan rdbms bytes decompressed	128	Length of the data after decompression stored in Compression Units. This is the length of all columns, not just the columns accessed.	
HCC scan rdbms CUs archive high	128	Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with ARCHIVE HIGH	
HCC scan rdbms CUs archive low	128	Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with ARCHIVE LOW	
HCC scan rdbms CUs columns accessed	128	Number of columns that were decompressed	
HCC scan rdbms CUs decompressed	128	Number of Compression Units that were decompressed on the RDBMS server	
HCC scan rdbms CUs decompression time	128	Total time spent decompressing the columns that were needed on the RDBMS server	
HCC scan rdbms CUs normal	128	Number of HCC Compression Units decompressed by the RDBMS regular table scan, i.e., 'Table Access Full' in a query plan. This is typically used in specialized scans that, for example, use row versions, row SCN, or use the LONG RAW datatype.	
HCC scan rdbms CUs pruned	128	Number of Compression Units that were eliminated by comparing the predicates to the stored Min and Max values for that Comprssion Unit	
HCC scan rdbms CUs query high	128	Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with QUERY HIGH (which is the default)	
HCC scan rdbms CUs query low	128	Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with QUERY LOW	
HCC scan rdbms CUs turbo	128	Number of HCC Compression Units decompressed by the RDBMS fast table scan (TurboScan). This is separate to decompression that happens on an Exadata cell.	
HCC scan rdbms rows	128	Number of rows returned from HCC blocks or that were returned from an Exadata cell in columnar format that passed the predicates on that table	
HCC scan rows pcode aggregated	128	Number of rows from HCC blocks or from columnar format blocks returned by an Exadata cell that could be aggregated using the P(ortable)-code style of query compilation	
HCC usage cloud	128	Internal count of how often TurboScan is invoked for HCC data stored in an Oracle Cloud environment. It does not include Oracle on other vendor's clouds. This may or may not correspond with the number of queries or granules scanned.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
HCC usage pillar	128	Internal count of how often TurboScan is invoked for HCC data stored on Pillar storage. This may or may not correspond with the number of queries or granules scanned.	
HCC usage ZFS	128	Internal count of how often TurboScan is invoked for HCC data stored on ZFS storage. This may or may not correspond with the number of queries or granules scanned.	
immediate (CR) block cleanout applications	128	Number of times cleanout records are applied immediately during consistent-read requests	
immediate (CURRENT) block cleanout applications	128	Number of times cleanout records are applied immediately during current gets. Compare this statistic with " deferred (CURRENT) block cleanout applications "	
IM default area resized	128	The amount of memory by which the column store got resized	
IM populate accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent populating CUs into the IM column store due to segment scans	
IM populate bytes in-memory EU data	128	Size in bytes of in-memory EU data populated due to segment scans	
IM populate bytes uncompressed EU data	128	Uncompressed size in bytes of in-memory EU data populated due to segment scans	
IM populate CUs	128	Number of CUs populated in the IM column store due to segment scans	
IM populate CUs memcompress for capacity high	128	Number of CUs populated in the IM column store due to segment scans using memcompress for capacity high	
IM populate CUs memcompress for capacity low	128	Number of CUs populated in the IM column store due to segment scans using memcompress for capacity low	
IM populate CUs memcompress for dml	128	Number of CUs populated in the IM column store due to segment scans using memcompress for DML	
IM populate CUs memcompress for query high	128	Number of CUs populated in the IM column store due to segment scans using memcompress for query high	
IM populate CUs memcompress for query low	128	Number of CUs populated in the IM column store due to segment scans using memcompress for query low	
IM populate CUs no memcompress	128	Number of CUs populated in the IM column store due to segment scans without compression	
IM populate CUs requested	128	Number of CUs requested to be populated due to segment scans	
IM populate EUs	128	Number of EUs populated in the IM column store due to segment scans	
IM populate EUs accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent populating EUs into the IM column store due to segment scans	
IM populate EUs columns	128	Number of columns populated in EUs due to segment scans	
IM populate EUs memcompress for capacity high	128	Number of EUs populated in the IM column store due to segment scans at memcompress for capacity high	
IM populate EUs memcompress for capacity low	128	Number of EUs populated in the IM column store due to segment scans at memcompress for capacity low	
IM populate EUs memcompress for dml	128	Number of EUs populated in the IM column store due to segment scans at memcompress for dml	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM populate EUs memcompress for query high	128	Number of EUs populated in the IM column store due to segment scans at memcompress for query high	
IM populate EUs memcompress for query low	128	Number of EUs populated in the IM column store due to segment scans at memcompress for query low	
IM populate EUs no memcompress	128	Number of EUs populated in the IM column store without compression due to segment scans	
IM populate EUs requested	128	Number of EUs requested to be populated in the IM column store due to segment scans	
IM populate no contiguous inmemory space	128	Number of CUs that fail to populate due to lack of contiguous space in In-Memory area	
IM populate segments	128	Number of segments populated due to segment scan	
IM populate segments requested	128	Number of segments requested to be populated due to segment scan	
IM populate segments wall clock time (ms)	128	Total amount of wall clock time (in milliseconds) spent populating CUs into the IM column store due to segment scans	
IM prepopulate accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent prepopulating CUs into the IM column store priority	
IM prepopulate bytes in-memory EU data	128	Size in bytes of in-memory EU data populated due to priority	
IM prepopulate bytes uncompressed EU data	128	Uncompressed size in bytes of in-memory EU data populated due to priority	
IM prepopulate CUs	128	Number of CUs prepopulated in the IM column store due to priority	
IM prepopulate CUs memcompress for capacity high	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for capacity high	
IM prepopulate CUs memcompress for capacity low	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for capacity low	
IM prepopulate CUs memcompress for dml	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for DML	
IM prepopulate CUs memcompress for query high	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for query high	
IM prepopulate CUs memcompress for query low	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for query low	
IM prepopulate CUs no memcompress	128	Number of CUs prepopulated in the IM column store due to priority without compression	
IM prepopulate CUs requested	128	Number of CUs requested to be prepopulated due to priority	
IM prepopulate EUs	128	Number of EUs populated in the IM column store due to priority	
IM prepopulate EUs accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent populating EUs into the IM column store due to priority	
IM prepopulate EUs columns	128	Number of columns populated in EUs due to priority	
IM prepopulate EUs memcompress for capacity high	128	Number of EUs populated in the IM column store due to priority at memcompress for capacity high	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM prepopulate EUs memcompress for capacity low	128	Number of EUs populated in the IM column store due to priority at memcompress for capacity low	
IM prepopulate EUs memcompress for dml	128	Number of EUs populated in the IM column store due to priority at memcompress for dml	
IM prepopulate EUs memcompress for query high	128	Number of EUs populated in the IM column store due to priority at memcompress for query high	
IM prepopulate EUs memcompress for query low	128	Number of EUs populated in the IM column store due to priority at memcompress for query low	
IM prepopulate EUs no memcompress	128	Number of EUs populated in the IM column store without compression due to priority	
IM prepopulate EUs requested	128	Number of EUs requested to be populated in the IM column store due to priority	
IM prepopulate segments	128	Number of segments prepopulated due to priority	
IM prepopulate segments requested	128	Number of segments requested to be prepopulated due to priority	
IM repopulate accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent repopulating CUs into the IM column store due to DML changes	
IM repopulate bytes in-memory EU data	128	Size in bytes of in-memory EU data repopulated due to EU reaching staleness threshold	
IM repopulate CUs	128	Total number of CUs requested to be repopulated due to CU reaching staleness threshold	
IM repopulate CUs memcompress for capacity high	128	Number of CUs repopulated in the IM column store using memcompress for capacity high due to CU reaching staleness threshold	
IM repopulate CUs memcompress for capacity low	128	Number of CUs repopulated in the IM column store using memcompress for capacity low due to CU reaching staleness threshold	
IM repopulate CUs memcompress for dml	128	Number of CUs repopulated in the IM column store using memcompress for DML due to CU reaching staleness threshold	
IM repopulate CUs memcompress for query high	128	Number of CUs repopulated in the IM column store using memcompress for query high due to CU reaching staleness threshold	
IM repopulate CUs memcompress for query low	128	Number of CUs repopulated in the IM column store using memcompress for query low due to CU reaching staleness threshold	
IM repopulate CUs no memcompress	128	Number of CUs repopulated in the IM column store without compression due to CU reaching staleness threshold	
IM repopulate CUs requested	128	Total number of CUs requested to be repopulated due to CU reaching staleness threshold	
IM repopulate (doublebuffering) CUs	128	Number of CUs repopulated with double-buffering enabled on the earlier version of the CUs	
IM repopulate (doublebuffering) CUs requested	128	Number of CUs requested to be repopulated with double-buffering enabled on the earlier version of the CUs	
IM repopulate EUs	128	Number of EUs requested to be repopulated due to EU reaching staleness threshold	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM repopulate EUs accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent repopulating EUs into the IM column store due to DML changes	
IM repopulate EUs columns	128	Number of columns repopulated in EUs due to EU reaching staleness threshold	
IM repopulate EUs memcompress for capacity high	128	Number of EUs repopulated in the IM column store at memcompress for capacity high due to EU reaching staleness threshold	
IM repopulate EUs memcompress for capacity low	128	Number of EUs repopulated in the IM column store at memcompress for capacity low due to EU reaching staleness threshold	
IM repopulate EUs memcompress for dml	128	Number of EUs repopulated in the IM column store at memcompress for DML due to EU reaching staleness threshold	
IM repopulate EUs memcompress for query high	128	Number of EUs repopulated in the IM column store at memcompress for query high due to EU reaching staleness threshold	
IM repopulate EUs memcompress for query low	128	Number of EUs repopulated in the IM column store at memcompress for query low due to EU reaching staleness threshold	
IM repopulate EUs no memcompress	128	Number of EUs repopulated in the IM column store without compression due to EU reaching staleness threshold	
IM repopulate EUs requested	128	Total number of EUs requested to be repopulated due to EU reaching staleness threshold	
IM repopulate (incremental) CUs	128	Number of CUs repopulated incrementally from earlier versions of the CUs	
IM repopulate (incremental) CUs requested	128	Number of CUs requested to be repopulated incrementally from earlier versions of the CUs	
IM repopulate (incremental) EUs	128	Number of EUs repopulated using unchanged data from the current EU due to EU reaching staleness threshold	
IM repopulate (incremental) EUs requested	128	Number of EUs requested to be repopulated using unchanged data from the current EU due to EU reaching staleness threshold	
IM repopulate no contiguous inmemory space	128	Number of CUs that failed to repopulate due to lack of contiguous space in In-Memory area	
IM repopulate (scan) CUs	128	Number of CUs repopulated in the IM column store due to scans	
IM repopulate (scan) CUs requested	128	Number of CUs requested to be repopulated in the IM column store due to scans	
IM repopulate (scan) EUs	128	Number of EUs repopulated in the IM column store that were triggered by scans on the EU	
IM repopulate (scan) EUs requested	128	Number of EUs requested for repopulation in the IM column store that were triggered by scans on the EU	
IM repopulate segments	128	Number of segments repopulated	
IM repopulate segments requested	128	Indicates the number of segments requested to be repopulated	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM repopulate (trickle) accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent trickle repopulating CUs into the IM column store due to DML changes	
IM repopulate (trickle) bytes in-memory EU data	128	Size in bytes of in-memory EU data repopulated due to DML changes	
IM repopulate (trickle) bytes uncompressed EU data	128	Uncompressed size in bytes of in-memory EU data repopulated due to EU reaching staleness threshold	
IM repopulate (trickle) CUs	128	Number of CUs trickle repopulated in the IM column store due to DML changes	
IM repopulate (trickle) CUs memcompress for capacity high	128	Number of CUs trickle repopulated in the IM column store using memcompress for capacity high due to DML changes	
IM repopulate (trickle) CUs memcompress for capacity low	128	Number of CUs trickle repopulated in the IM column store using memcompress for capacity low due to DML changes	
IM repopulate (trickle) CUs memcompress for dml	128	Number of CUs trickle repopulated in the IM column store using memcompress for DML due to DML changes	
IM repopulate (trickle) CUs memcompress for query high	128	Number of CUs trickle repopulated in the IM column store using memcompress for query high due to DML changes	
IM repopulate (trickle) CUs memcompress for query low	128	Number of CUs trickle repopulated in the IM column store using memcompress for query low due to DML changes	
IM repopulate (trickle) CUs no memcompress	128	Number of CUs trickle repopulated in the IM column store without compression due to DML changes	
IM repopulate (trickle) CUs requested	128	Total number of CUs requested to be trickle repopulated due to DML changes	
IM repopulate (trickle) CUs resubmitted	128	Number of CUs trickle repopulate tasks submitted	
IM repopulate (trickle) EUs	128	Number of EUs trickle repopulated in the IM column store due to DML changes	
IM repopulate (trickle) EUs accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent trickle repopulating EUs into the IM column store due to DML changes	
IM repopulate (trickle) EUs columns	128	Number of columns repopulated in EUs due to DML changes	
IM repopulate (trickle) EUs memcompress for capacity high	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for capacity high	
IM repopulate (trickle) EUs memcompress for capacity low	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for capacity low	
IM repopulate (trickle) EUs memcompress for dml	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for dml	
IM repopulate (trickle) EUs memcompress for query high	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for query high	
IM repopulate (trickle) EUs memcompress for query low	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for query low	
IM repopulate (trickle) EUs no memcompress	128	Number of EUs trickle repopulated in the IM column store without compression due to DML changes	
IM repopulate (trickle) EUs requested	128	Number of EUs requested to be trickle repopulated in the IM column store due to DML changes	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM scan CUs column not in memory	128	Number of extents that could not be read from the IM column store because one of the columns required was not in memory	
IM scan CUs invalid or missing revert to on disk extent	128	Number of extents where no IMCU exists	
IM scan CUs memcompress for query low	128	Number of memcompress for query high CUs scanned in the IM column store	
IM scan CUs memcompress for query high	128	Number of memcompress for query high CUs scanned in the IM column store	
IM scan CUs memcompress for capacity low	128	Number of memcompress for capacity low CUs scanned in the IM column store	
IM scan CUs memcompress for capacity high	128	Number of memcompress for capacity high CUs scanned in the IM column store	
IM scan CUs memcompress for dml	128	Number of memcompress for DML CUs scanned in the IM column store	
IM scan CUs predicates applied	128	Number of where clause predicates applied to the In-Memory storage index	
IM scan CUs predicates optimized	128	Number of where clause predicates applied to the IM column store for which either all rows pass min/max pruning via an In-Memory storage index or no rows pass min/max pruning	
IM scan CUs pruned	128	Number of CUs pruned by the storage index	
IM scan (dynamic) multi-threaded scans	128	Number of In-Memory table scans which benefited from In-Memory dynamic scans	
IM scan (dynamic) tasks processed by parent	128	Number of IMCUs processed normally because of Resource Manager limit	
IM scan (dynamic) tasks processed by thread	128	Number of IMCUs processed in parallel by a worker thread	
IM scan (dynamic) rows	128	Number of rows processed by In-Memory dynamic scans	
IM scan EU bytes in-memory	128	Size in bytes of in-memory EU data accessed by scans	
IM scan EU bytes uncompressed	128	Uncompressed size in bytes of in-memory EU data accessed by scans	
IM scan EU rows	128	Number of rows scanned from EUs in the IM column store before where clause predicate applied	
IM scan EUs columns accessed	128	Number of columns in the EUs accessed by scans	
IM scan EUs columns decompressed	128	Number of columns in the EUs decompressed by scans	
IM scan EUs columns theoretical max	128	Number of columns that would have been accessed from the EU if the scans looked at all columns	
IM scan EUs memcompress for capacity high	128	Number of memcompress for capacity high EUs scanned in the IM column store	
IM scan EUs memcompress for capacity low	128	Number of memcompress for capacity low EUs scanned in the IM column store	
IM scan EUs memcompress for dml	128	Number of memcompress for DML EUs scanned in the IM column store	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM scan EUs memcompress for query high	128	Number of memcompress for query high EUs scanned in the IM column store	
IM scan EUs memcompress for query low	128	Number of memcompress for query low EUs scanned in the IM column store	
IM scan EUs no memcompress	128	Number of uncompressed EUs scanned in the IM column store	
IM scan EUs split pieces	128	Number of split EU pieces among all IM EUs	
IM scan rows	128	Number of rows in scanned In-Memory Compression Units (IMCUs)	
IM scan rows optimized	128	Number of rows that were not scanned in the IM column store as they were pruned via a number of optimizations such as min/max pruning via In-Memory storage indexes	
IM scan rows projected	128	Number of rows returned from the IM column store	
IM scan rows valid	128	Number of rows scanned from the IM column store after applying valid vector	
IM scan segments minmax eligible	128	Number of CUs that are eligible for min/max pruning via storage index	
IM space CU bytes allocated	128	Number of In-Memory bytes allocated	
IM space CU creations initiated	128	Number of space requests for CUs	
IM space CU extents allocated	128	Number of In-Memory extents allocated	
IM space segments allocated	128	Number of snapshot segments created	
IM space segments freed	128	Number of snapshot segments deleted	
IM transactions	128	Number of transactions that triggered data to be journaled in the IM column store	
IM transactions CUs invalid	128	Number of CUs in the IM column store invalidated by transactions	
IM transactions rows invalidated	128	Number of rows in the IM column store invalidated by transactions	
IM transactions rows journalized	128	Number of rows logged in the transaction journal	
in call idle wait time	1	The total wait time (in microseconds) for waits that belong to the Idle wait class. See Also: " non-idle wait count " and " non-idle wait time "	
index cmph cu, uncomp sentinels	128	Number of CUs created with uncompressed sentinels	
index cmph dm, cu lock expand	128	Number of times CU lock structure expanded	
index cmph dm, cu migrate row	128	Number of times a row migrated from a CU	
index cmph dm, insert unpurge CU row	128	Number of times a CU row was unpurged during insert	
index cmph dm, purge dummy CU	128	Number of times dummy CU purged from leaf block	
index cmph dm, split for cu lock expand	128	Number of times leaf block split for CU lock expansion	
index cmph dm, split for cu migrate row	128	Number of leaf block splits due to CU row migration	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
index cmph Id, CU fit	128	Number of times load created a well sized CU, no space for uncompressed rows	
index cmph Id, CU fit, add rows	128	Number of times load created a well sized CU, with space for uncompressed rows	
index cmph Id, CU negative comp	128	Number of times load CU gave negative compression	
index cmph Id, CU over-est	128	Number of times load created an oversized CU	
index cmph Id, CU under-est	128	Number of times load created a small CU	
index cmph Id, infinite loop	128	Number of times shrink CU attempts resulted in uncompressed rows	
index cmph Id, If blks flushed	128	Number of leaf blocks flushed by load	
index cmph Id, If blks w/ und CU	128	Number of leaf blocks flushed with small CU	
index cmph Id, If blks w/o CU	128	Number of leaf blocks flushed without a CU	
index cmph Id, If blks w/o unc r	128	Number of leaf blocks flushed without uncompressed rows	
index cmph Id, retry in over-est	128	Number of times CU was resized after creating an oversized CU	
index cmph Id, rows compressed	128	Number of rows compressed by load	
index cmph Id, rows uncompressed	128	Number of rows left uncompressed by load	
index cmph sc, ffs decompress buffers	128	Number of blocks decompressed for fast scan	
index cmph sc, ffs decompress buffers released and found valid	128	Number of times decompressed CU buffer was reused by fast scan	
index cmph sc, ffs decompress buffers rows avail	128	Number of rows in decompressed buffer for fast scan	
index cmph sc, ffs decompress buffers rows used	128	Number of rows used from decompressed buffer for fast scan	
index cmph sc, ffs decompress failures	128	Number of time decompress CU was not possible for fast scan	
	128	Number of times 90-10 leaf block CU splits were made 50-50	
index cmph sp, leaf norecomp limit	128	Number of times leaf block recompression reached the recompression limit	
index cmph sp, leaf norecomp negcomp	128	Number of times leaf block recompression returned negative compression	
index cmph sp, leaf norecomp nospace	128	Number of times leaf block recompression returned not enough space	
index cmph sp, leaf norecomp notry	128	Number of times leaf block recompression not attempted	
index cmph sp, leaf norecomp oversize	128	Number of times leaf block recompression returned an oversized CU	
index cmph sp, leaf norecomp zerocur	128	Number of times leaf block recompression returned a CU with 0 rows	
index cmph sp, leaf recomp fewer ucs	128	Number of CUs created with reduced number of sentinels	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
index cmph sp, leaf recomp zero ucs	128	Number of CUs created with zero sentinels	
index cmph sp, leaf recompress	128	Number of times a leaf block CU was recompressed	
index cmpl co, prefix mismatch	128	Number of times reorg found a neighboring block prefix count mismatch	
index cmpl ro, blocks not compressed	128	Number of times prefix compression was not applied to avoid negative compression	
index cmpl ro, prefix change at block	128	Number of times prefix count was changed to an optimal value	
index cmpl ro, prefix no change at block	128	Number of times prefix count was already the optimal value	
index cmpl ro, reorg avoid load new block	128	Number of times a block reorg avoided a new block being created during load	
index cmpl ro, reorg avoid split	128	Number of times a block reorg avoided a block split during DML	
index fast full scans (direct read)	64	Number of fast full scans initiated using direct read	
index fast full scans (full)	64	Number of fast full scans initiated for full segments	
index fast full scans (rowid ranges)	64	Number of fast full scans initiated with rowid endpoints specified	
large tracked transactions	128	For tables tracked by flashback data archive, the number of transactions modifying rows in those tables which are large in terms of size or number of changes	
leaf node splits	128	Number of times an index leaf node was split because of the insertion of an additional value	
lob reads	8	Number of LOB API read operations performed in the session/system. A single LOB API read may correspond to multiple physical/logical disk block reads.	
lob writes	8	Number of LOB API write operations performed in the session/system. A single LOB API write may correspond to multiple physical/logical disk block writes.	
lob writes unaligned	8	Number of LOB API write operations whose start offset or buffer size is not aligned to the internal chunk size of the LOB. Writes aligned to chunk boundaries are the most efficient write operations. The internal chunk size of a LOB is available through the LOB API (for example, DBMS_LOB.GETCHUNKSIZE()).	
logons cumulative	1	Total number of logons since the instance started. Useful only in V\$SYSSTAT. It gives an instance overview of all processes that logged on.	
logons current	1	Total number of current logons. Useful only in V\$SYSSTAT.	
memopt r failed puts	128	Total failed puts on hash index	
memopt r failed reads on blocks	128	Total lookup failures due to read failure on blocks because of concurrent changes	
memopt r failed reads on buckets	128	Total lookup failures due to concurrent hash bucket changes	
memopt r hits	128	Total hits on hash index – primary key found	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
memopt r lookup detected CR buffer	128	Total lookup failures due to block pointed to by hash index being no longer the current version	
memopt r lookups	128	Total number of lookups on hash index	
memopt r misses	128	Total misses on hash index due to primary key not found	
memopt r puts	128	Total puts on hash index	
memopt r successful puts	128	Total successful puts on hash index	
messages received	128	Number of messages sent and received between background processes	
messages sent	128	Number of messages sent and received between background processes	
no buffer to keep pinned count	72	Number of times a visit to a buffer attempted, but the buffer was not found where expected. Like " buffer is not pinned count " and " buffer is pinned count ", this statistic is useful only for internal debugging purposes.	
no work - consistent read gets	128	Number consistent gets that require neither block cleanouts nor rollbacks. See Also: " consistent gets "	
non-idle wait count	1	The total number of waits performed with wait events that were not part of the Idle wait class. See Also: " in call idle wait time " and " non-idle wait time "	
non-idle wait time	1	The total wait time (in microseconds) for waits that do not belong to the Idle wait class. See Also: " in call idle wait time " and " non-idle wait count "	
OLAP Aggregate Function Calc	64	The number of times the AGGREGATE function computes a parent value based on the values of its children.	
OLAP Aggregate Function Logical NA	64	The number of times an AGGREGATE function evaluates to a logical NA value. This could be because the AGGINDEX is on and the composite tuple does not exist.	
OLAP Aggregate Function Precompute	64	The number of times the AGGREGATE function is to compute a value and finds it precomputed in the cube.	
OLAP Custom Member Limit	64	The number of times an OLAP table function issues a custom member limit	
OLAP Engine Calls	64	The total number of OLAP transactions executed within the session. This value provides a general indication of the level of OLAP activity in the session.	
OLAP Fast Limit	64	The number of times an OLAP table function issues a fast limit	
OLAP Full Limit	64	The number of times an OLAP table function issues a full limit	
OLAP GID Limit	64	The number of times an OLAP table function issues a Cube Grouping ID (CGID) limit. Typically, this type of limit occurs for query rewrite transformations that resolve to a cube organized materialized view.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
OLAP Import Rows Loaded	64	The number of OLAP import rows loaded. This statistic provides the number of rows of the source cursor that are actually loaded into an Analytic Workspace (AW). The difference between the OLAP Import Rows Pushed and OLAP Import Rows Loaded provides the number of rejected rows.	
OLAP Import Rows Pushed	64	The number of OLAP import rows pushed. This statistic refers to the number of rows encountered from a source cursor and is useful during cube build operations.	
OLAP INHIER Limit	64	The number of times an OLAP table function issues an in-hierarchy limit. This type of limit can occur when you use cube dimension hierarchy views.	
OLAP Limit Time	64	The total time taken by all the OLAP Limit operations that were performed during the last call to the OLAP table function	
OLAP Paging Manager Cache Changed Page	64	The number of times the OLAP page pool is changed for any attached AW.	
OLAP Paging Manager Cache Hit	64	The number of times a requested page is found in the OLAP page pool. Use this statistic in conjunction with OLAP Paging Manager Cache Miss to determine the OLAP page pool efficiency ratio.	
OLAP Paging Manager Cache Miss	64	The number of times a requested page is not found in the OLAP page pool. Use this statistic in conjunction with OLAP Paging Manager Cache Hit to determine the OLAP page pool efficiency ratio.	
OLAP Paging Manager Cache Write	64	The number of times the OLAP paging manager writes to a page in the OLAP page pool.	
OLAP Paging Manager New Page	64	The number of newly-created pages in the OLAP page pool that have not yet been written to the workspace LOB	
OLAP Paging Manager Pool Size	64	Size, in bytes, of the OLAP page pool allocated to a session and the sum of all OLAP page pools in the system.	
OLAP Perm LOB Read	64	The number of times data was read from the table where the AW is stored. These are permanent LOB reads.	
OLAP Row Id Limit	64	The number of times an OLAP table function issues a row Id limit.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
OLAP Row Load Time	64	<p>The total time spent loading rows into an AW during cube build and OLAP SQL import operations.</p> <p>Use this statistic along with the OLAP engine elapsed time to measure time spent running OLAP engine routines that involve loading data into AWs from a SQL source.</p> <p>This statistic has the following levels of precision:</p> <ul style="list-style-type: none"> • Low precision timer <p>This captures the elapsed time of the entire fetch phase of the SQL cursor that is being loaded into AWs. It includes the SQL execution time that occurs during a fetch operation from a source cursor and time taken by the OLAP engine to populate AWs.</p> <ul style="list-style-type: none"> • High precision timer <p>This captures the elapsed time, excluding the SQL processing of the cursor being loaded. It records the time spent in the OLAP engine only.</p> <ul style="list-style-type: none"> • Default timer precision: <p>This is based on the STATISTIC_LEVEL parameter. If the low precision is used, then STATISTICS_LEVEL is TYPICAL. The high precision timer is used when STATISTIC_LEVEL is set to ALL. No timing is captured when STATISTICS_LEVEL is BASIC.</p>	
OLAP Row Source Rows Processed	64	The number of rows processed by the OLAP row source	
OLAP Session Cache Hit	64	The number of times the requested, dynamically-aggregated value of an AW object, was found in the OLAP session cache.	
OLAP Session Cache Miss	64	The number of times the requested, dynamically-aggregated value of an AW object, was not found in the OLAP session cache.	
OLAP Temp Segment Read	64	The number of times data was read from a temporary segment and not from the OLAP page pool	
OLAP Temp Segments	64	The number of OLAP pages stored in temporary segments for analytic workspaces	
OLAP Unique Key Attribute Limit	64	The number of times an OLAP table function issues a unique key attribute limit	
opened cursors cumulative	1	<p>In V\$SYSSTAT: Total number of cursors opened since the instance started.</p> <p>In V\$SESSTAT: Total number of cursors opened since the start of the session.</p>	
opened cursors current	1	Total number of current open cursors	
OS CPU Qt wait time	1	The time a session spends on the CPU run queue (in microseconds), waiting to get the CPU to run	
OS Involuntary context switches	16	Number of context switches that were enforced by the operating system	
OS Signals received	16	Number of signals received	
OS Swaps	16	Number of swap pages	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
OS Voluntary context switches	16	Number of voluntary context switches (for example, when a process gives up the CPU by a SLEEP() system call)	
Parallel operations downgraded 1 to 25 pct	32	Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers	
Parallel operations downgraded 25 to 50 pct	32	Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers	
Parallel operations downgraded 50 to 75 pct	32	Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers	
Parallel operations downgraded 75 to 99 pct	32	Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers	
Parallel operations downgraded to serial	32	Number of times parallel execution was requested but execution was serial because of insufficient parallel execution servers	
Parallel operations not downgraded	32	Number of times parallel execution was executed at the requested degree of parallelism	
parse count (describe)	64	Total number of parse calls on a describe cursor. This operation is a less expensive than a hard parse and more expensive than a soft parse.	
parse count (hard)	64	Total number of parse calls (real parses). A hard parse is a very expensive operation in terms of memory use, because it requires Oracle to allocate a workheap and other memory structures and then build a parse tree.	
parse count (total)	64	Total number of parse calls (hard, soft, and describe). A soft parse is a check on an object already in the shared pool, to verify that the permissions on the underlying object have not changed.	
parse time cpu	64	Total CPU time used for parsing (hard and soft) in 10s of milliseconds	Y
parse time elapsed	64	Total elapsed time for parsing, in 10s of milliseconds. Subtract "parse time cpu" from this statistic to determine the total waiting time for parse resources.	Y
physical read bytes	8	Total size in bytes of all disk reads by application activity (and not other instance activity) only.	
physical read flash cache hits	8	Total number of reads from flash cache instead of disk	
physical read IO requests	8	Number of read requests for application activity (mainly buffer cache and direct load operation) which read one or more database blocks per request. This is a subset of "physical read total IO requests" statistic.	
physical read requests optimized	8	Number of read requests that read one or more database blocks from the Database Smart Flash Cache or the Exadata Smart Flash Cache.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
physical read total bytes	8	Total size in bytes of disk reads by all database instance activity including application reads, backup and recovery, and other utilities. The difference between this value and "physical read bytes" gives the total read size in bytes by non-application workload.	
physical read total IO requests	8	Number of read requests which read one or more database blocks for all instance activity including application, backup and recovery, and other utilities. The difference between this value and "physical read total multi block requests" gives the total number of small I/O requests which are less than 128 kilobytes down to single block read requests.	
physical read total multi block requests	8	Total number of Oracle instance read requests which read 128 kilobytes or more in two or more database blocks per request for all instance activity including application, backup and recovery, and other utilities.	
physical reads	8	Total number of data blocks read from disk. This value can be greater than the value of "physical reads direct" plus "physical reads cache" as reads into process private buffers also included in this statistic.	
physical reads cache	8	Total number of data blocks read from disk into the buffer cache. This is a subset of "physical reads" statistic.	
physical reads cache prefetch	8	Number of contiguous and noncontiguous blocks that were prefetched.	
physical reads direct	8	Number of reads directly from disk, bypassing the buffer cache. For example, in high bandwidth, data-intensive operations such as parallel query, reads of disk blocks bypass the buffer cache to maximize transfer rates and to prevent the premature aging of shared data blocks resident in the buffer cache.	
physical reads direct (lob)	8	Number of buffers that were read directly for LOBs	
physical reads direct temporary tablespace	8	Number of buffers that were read directly from temporary tablespaces	
physical reads for flashback new	8	Number of blocks read for newing (that is, preparing a data block for a completely new change) blocks while flashback database is enabled	
physical reads prefetch warmup	8	Number of data blocks that were read from the disk during the automatic prewarming of the buffer cache.	
physical write bytes	8	Total size in bytes of all disk writes from the database application activity (and not other kinds of instance activity).	
physical write IO requests	8	Number of write requests for application activity (mainly buffer cache and direct load operation) which wrote one or more database blocks per request.	
physical write total bytes	8	Total size in bytes of all disk writes for the database instance including application activity, backup and recovery, and other utilities. The difference between this value and "physical write bytes" gives the total write size in bytes by non-application workload.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
physical write total IO requests	8	Number of write requests which wrote one or more database blocks from all instance activity including application activity, backup and recovery, and other utilities. The difference between this stat and "physical write total multi block requests" gives the number of single block write requests.	
physical write total multi block requests	8	Total number of Oracle instance write requests which wrote two or more blocks per request to the disk for all instance activity including application activity, recovery and backup, and other utilities.	
physical writes	8	Total number of data blocks written to disk. This statistics value equals the sum of "physical writes direct" and "physical writes from cache" values.	
physical writes direct	8	Number of writes directly to disk, bypassing the buffer cache (as in a direct load operation)	
physical writes direct (lob)	8	Number of buffers that were directly written for LOBs	
physical writes direct temporary tablespace	8	Number of buffers that were directly written for temporary tablespaces	
physical writes from cache	8	Total number of data blocks written to disk from the buffer cache. This is a subset of "physical writes" statistic.	
physical writes non checkpoint	8	Number of times a buffer is written for reasons other than advancement of the checkpoint. Used as a metric for determining the I/O overhead imposed by setting the FAST_START_IO_TARGET parameter to limit recovery I/Os. (Note that FAST_START_IO_TARGET is a deprecated parameter.) Essentially this statistic measures the number of writes that would have occurred had there been no checkpointing. Subtracting this value from "physical writes" gives the extra I/O for checkpointing.	
pinned buffers inspected	8	Number of times a user process, when scanning the tail of the replacement list looking for a buffer to reuse, encountered a cold buffer that was pinned or had a waiter that was about to pin it. This occurrence is uncommon, because a cold buffer should not be pinned very often.	
prefetched blocks aged out before use	8	Number of contiguous and noncontiguous blocks that were prefetched but aged out before use	
process last non-idle time	128	The last time this process executed	Y
PX local messages recv'd	32	Number of local messages received for parallel execution within the instance local to the current session	
PX local messages sent	32	Number of local messages sent for parallel execution within the instance local to the current session	
PX remote messages recv'd	32	Number of remote messages received for parallel execution within the instance local to the current session	
PX remote messages sent	32	Number of remote messages sent for parallel execution within the instance local to the current session	
queries parallelized	32	Number of SELECT statements executed in parallel	
recovery array read time	8	Elapsed time of I/O during recovery	
recovery array reads	8	Number of reads performed during recovery	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
recovery blocks read	8	Number of blocks read during recovery	
recovery blocks read for lost write detection	8	Number of blocks read for lost write checks during recovery.	
recovery blocks skipped lost write checks	8	Number of Block Read Records that skipped the lost write check during recovery.	
recursive calls	1	Number of recursive calls generated at both the user and system level. Oracle maintains tables used for internal processing. When Oracle needs to make a change to these tables, it internally generates an internal SQL statement, which in turn generates a recursive call.	
recursive cpu usage	1	Total CPU time used by non-user calls (recursive calls). Subtract this value from " CPU used by this session " to determine how much CPU time was used by the user calls.	
redo blocks checksummed by FG (exclusive)	2	Number of exclusive redo blocks that were checksummed by the generating foreground processes. An exclusive redo block is the one whose entire redo content belongs to a single redo entry.	
redo blocks checksummed by LGWR	2	Number of redo blocks that were checksummed by the LGWR.	
redo blocks written	2	Total number of redo blocks written. This statistic divided by " redo writes " equals number of blocks per write.	
redo buffer allocation retries	2	Total number of retries necessary to allocate space in the redo buffer. Retries are needed either because the redo writer has fallen behind or because an event such as a log switch is occurring.	
redo entries	2	Number of times a redo entry is copied into the redo log buffer	
redo entries for lost write detection	2	Number of times a Block Read Record is copied into the log buffer.	
redo log space requests	2	Number of times the active log file is full and Oracle must wait for disk space to be allocated for the redo log entries. Such space is created by performing a log switch. Log files that are small in relation to the size of the SGA or the commit rate of the work load can cause problems. When the log switch occurs, Oracle must ensure that all committed dirty buffers are written to disk before switching to a new log file. If you have a large SGA full of dirty buffers and small redo log files, a log switch must wait for DBWR to write dirty buffers to disk before continuing. Also examine the log file space and log file space switch wait events in <code>V\$SESSION_WAIT</code>	
redo log space wait time	2	Total time waited in centiseconds for available space in the redo log buffer. See also " redo log space requests "	Y
redo ordering marks	2	Number of times that a system change number was allocated to force a redo record to have a higher SCN than a record generated in another thread using the same block	
redo size	2	Total amount of redo generated in bytes	
redo size for lost write detection	2	Total amount of Block Read Records generated in bytes.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
redo synch time	8	Elapsed time of all "redo sync writes" calls in 10s of milliseconds	Y
redo synch writes	8	Number of times the redo is forced to disk, usually for a transaction commit. The log buffer is a circular buffer that LGWR periodically flushes. Usually, redo that is generated and copied into the log buffer need not be flushed out to disk immediately.	
redo wastage	2	Number of bytes wasted because redo blocks needed to be written before they are completely full. Early writing may be needed to commit transactions, to be able to write a database buffer, or to switch logs.	
redo write broadcast ack count	2	Number of times a commit broadcast acknowledgment has not been received by the time when the corresponding log write is completed. This is only for Oracle RAC.	
redo write broadcast ack time	2	Total amount of the latency associated with broadcast on commit beyond the latency of the log write (in microseconds). This is only for Oracle RAC.	Y
redo write time	2	Total elapsed time of the write from the redo log buffer to the current redo log file in 10s of milliseconds	Y
redo writes	2	Total number of writes by LGWR to the redo log files. "redo blocks written" divided by this statistic equals the number of blocks per write	
rollback changes - undo records applied	128	Number of undo records applied to user-requested rollback changes (not consistent-read rollbacks)	
rollbacks only - consistent read gets	128	Number of consistent gets that require only block rollbacks, no block cleanouts. See Also: " consistent gets "	
rows fetched via callback	64	Rows fetched via callback. Useful primarily for internal debugging purposes.	
scheduler wait time	1	The total wait time (in microseconds) for waits that belong to the Scheduler wait class	
SCN increments due to another database	128	SCN increments due to communication with another database	
serializable aborts	1	Number of times a SQL statement in a serializable isolation level had to abort	
session connect time	1	The connect time for the session in 10s of milliseconds. This value is useful only in V\$SESSTAT. It is the wall clock time since the logon to this session occurred.	Y
session cursor cache count	64	Total number of cursors cached. This statistic is incremented only if SESSION_CACHED_CURSORS > 0. This statistic is the most useful in V\$SESSTAT. If the value for this statistic in V\$SESSTAT is close to the setting of the SESSION_CACHED_CURSORS parameter, the value of the parameter should be increased.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
session cursor cache hits	64	Number of hits in the session cursor cache. A hit means that the SQL (including recursive SQL) or PL/SQL statement did not have to be reparsed. Subtract this statistic from " parse count (total) " to determine the real number of parses that occurred.	
session logical reads	1	The sum of "db block gets" plus "consistent gets". This includes logical reads of database blocks from either the buffer cache or process private memory.	
session logical reads - IM	128	Number of database blocks read from the IM column store (number of blocks in IMCU - number of blocks with invalid rows)	
session pga memory	1	Current PGA size for the session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.	
session pga memory max	1	Peak PGA size for the session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.	
session stored procedure space	1	Amount of memory this session is using for stored procedures	
session uga memory	1	Current UGA size for the session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.	
session uga memory max	1	Peak UGA size for a session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.	
shared hash latch upgrades - no wait	8	A shared hash latch upgrade is when a hash latch is upgraded from shared mode to exclusive mode. This statistic displays the number of times the upgrade completed immediately.	
shared hash latch upgrades - wait	8	A shared hash latch upgrade is when a hash latch is upgraded from shared mode to exclusive mode. This statistic displays the number of times the upgrade did not complete immediately.	
shared io pool buffer get failure	128	Number of unsuccessful buffer gets from the shared I/O pool from instance startup time.	
shared io pool buffer get success	128	Number of successful buffer gets from the shared I/O pool from instance startup time.	
slave propagated tracked transactions	128	Number of transactions modifying tables enabled for flashback data archive which were archived by a slave process	
sorts (disk)	64	Number of sort operations that required at least one disk write Sorts that require I/O to disk are quite resource intensive. Try increasing the size of the initialization parameter SORT_AREA_SIZE . For more information, see " SORT_AREA_SIZE ".	
sorts (memory)	64	Number of sort operations that were performed completely in memory and did not require any disk writes You cannot do much better than memory sorts, except maybe no sorts at all. Sorting is usually caused by selection criteria specifications within table join SQL operations.	
sorts (rows)	64	Total number of rows sorted	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
SQL*Net roundtrips to/from client	1	Total number of Oracle Net Services messages sent to and received from the client	
SQL*Net roundtrips to/from dblink	1	Total number of Oracle Net Services messages sent over and received from a database link	
summed dirty queue length	8	The sum of the dirty LRU queue length after every write request. Divide by write requests to get the average queue length after write completion.	
switch current to new buffer	8	Number of times the CURRENT block moved to a different buffer, leaving a CR block in the original buffer	
table fetch by rowid	64	Number of rows that are fetched using a ROWID (usually recovered from an index) This occurrence of table scans usually indicates either non-optimal queries or tables without indexes. Therefore, this statistic should increase as you optimize queries and provide indexes in the application.	
table fetch continued row	64	Number of times a chained or migrated row is encountered during a fetch Retrieving rows that span more than one block increases the logical I/O by a factor that corresponds to the number of blocks than need to be accessed. Exporting and re-importing may eliminate this problem. Evaluate the settings for the storage parameters PCTFREE and PCTUSED. This problem cannot be fixed if rows are larger than database blocks (for example, if the LONG data type is used and the rows are extremely large).	
table scan blocks gotten	64	During scanning operations, each row is retrieved sequentially by Oracle. This statistic counts the number of blocks encountered during the scan. This statistic tells you the number of database blocks that you had to get from the buffer cache for the purpose of scanning. Compare this value with the value of " consistent gets " to determine how much of the consistent read activity can be attributed to scanning.	
table scan disk IMC fallback	128	Number of rows fetched from the buffer cache because they were not present in the IM column store (in a scan that was otherwise performed in memory)	
table scan disk non-IMC rows gotten	128	Number of rows fetched during non-In-Memory scan	
table scan rows gotten	64	Number of rows that are processed during scanning operations	
table scans (cache partitions)	64	Number of range scans performed on tables that have the CACHE option enabled	
table scans (direct read)	64	Number of table scans performed with direct read (bypassing the buffer cache)	
table scans (IM)	128	Number of segments / granules scanned using In-Memory	
table scans (long tables)	64	Long (or conversely short) tables can be defined as tables that do not meet the short table criteria as described in " table scans (short tables) "	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
table scans (rowid ranges)	64	During parallel query, the number of table scans conducted with specified ROWID ranges	
table scans (short tables)	64	Long (or conversely short) tables can be defined by optimizer hints coming down into the row source access layer of Oracle. The table must have the CACHE option set.	
tracked rows	128	Number of rows modified in tables enabled for flashback data archive	
tracked transactions	128	Number of transactions which modified a table enabled for flashback data archive	
transaction lock background get time	128	Useful only for internal debugging purposes	
transaction lock background gets	128	Useful only for internal debugging purposes	
transaction lock foreground requests	128	Useful only for internal debugging purposes	
transaction lock foreground wait time	128	Useful only for internal debugging purposes	
transaction rollbacks	128	Number of transactions being successfully rolled back	
transaction tables consistent read rollbacks	128	Number of times rollback segment headers are rolled back to create consistent read blocks	
transaction tables consistent reads - undo records applied	128	Number of undo records applied to transaction tables that have been rolled back for consistent read purposes	
user calls	1	Number of user calls such as login, parse, fetch, or execute When determining activity, the ratio of user calls to RPI calls, give you an indication of how much internal work gets generated because of the type of requests the user is sending to Oracle.	
user commits	1	Number of user commits. When a user commits a transaction, the redo generated that reflects the changes made to database blocks must be written to disk. Commits often represent the closest thing to a user transaction rate.	
user I/O wait time	1	The total wait time (in centiseconds) for waits that belong to the User I/O wait class	
user rollbacks	1	Number of times users manually issue the ROLLBACK statement or an error occurs during a user's transactions	
very large tracked transactions	128	For tables tracked by flashback data archive, number of transactions modifying those tables which are very large in terms of size or number of changes	
write clones created in background	8	Number of times a background or foreground process clones a CURRENT buffer that is being written. The clone becomes the new, accessible CURRENT buffer, leaving the original buffer (now the clone) to complete writing.	
write clones created in foreground	8	Number of times a background or foreground process clones a CURRENT buffer that is being written. The clone becomes the new, accessible CURRENT buffer, leaving the original buffer (now the clone) to complete writing.	

F

Background Processes

An Oracle Database **background process** is defined as any process that is listed in V\$PROCESS and has a non-null value in the PNAME column.

[Table F-1](#) describes Oracle Database background processes.

The External Properties column lists the type of instance in which the process runs. If the process is specific to a particular feature, then the column names the feature.

 **Note:**

When the THREADED_EXECUTION initialization parameter is set to TRUE on Linux and UNIX, the DBW, PMON, PSP, and VKTM background processes run as operating system processes, and the other background processes run as operating system threads.

See "[THREADED_EXECUTION](#)" for more information about the THREADED_EXECUTION initialization parameter.

Table F-1 Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
ABMR	Auto BMR Background Process	Coordinates execution of tasks such as filtering duplicate block media recovery requests and performing flood control	When a process submits a block media recovery request to ABMR, it dynamically spawns slave processes (BMR n) to perform the recovery. ABMR and BMR n terminate after being idle for a long time. See Also: <i>Oracle Database Backup and Recovery User's Guide</i>	Database instances
ACFS	Oracle Automatic Storage Management Cluster File System (Oracle ACFS) CSS Process	Tracks the cluster membership in CSS and informs the file system driver of membership changes	The ACFS process delivers CSS membership changes to the cluster file system. These membership changes are required for the file system to maintain file system consistency within the cluster.	Oracle ASM instances, Oracle RAC
ACMS	Atomic Control File to Memory Service Process	Coordinates consistent updates to a control file resource with its SGA counterpart on all instances in an Oracle RAC environment	The ACMS process works with a coordinating caller to ensure that an operation is executed on every instance in Oracle RAC despite failures. ACMS is the process in which a distributed operation is called. As a result, this process can exhibit a variety of behaviors. In general, ACMS is limited to small, nonblocking state changes for a limited set of cross-instance operations.	Database instances, Oracle RAC
AMB n	See ASMB, AMBn			

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
AP nn	Database Apply Process Coordinator Process	Obtains transactions from the reader server and passes them to apply servers	The coordinator process name is AP nn , where nn can include letters and numbers. For more information about the coordinator process, see V\$XSTREAM_APPLY_COORDINATOR for XStream and V\$GG_APPLY_COORDINATOR for Oracle GoldenGate. See Also: <i>Oracle Database XStream Guide</i>	Database instances, Logical Standby, XStream Inbound servers, XStream Outbound servers, GoldenGate Integrated Replicat
AQPC	AQ Process Coordinator	Per instance AQ global coordinator	AQPC is responsible for performing administrative tasks for AQ Master Class Processes including commands like starting, stopping, and other administrative tasks. This process is automatically started on instance startup.	Database instances Advanced Queueing
ARB0	ASM Rebalance Process	Rebalances data extents within an Oracle ASM disk group	ARB0 uses the value of the ASM_POWER_LIMIT initialization parameter for the Oracle ASM instance as the maximum power for disk rebalancing.	Oracle ASM instances
ARC n	Archiver Process	Copies the redo log files to archival storage when they are full or an online redo log switch occurs	ARC n processes exist only when the database is in ARCHIVELOG mode and automatic archiving is enabled, in which case ARC n automatically archives online redo log files. LGWR cannot reuse and overwrite an online redo log group until it has been archived. The database starts multiple archiver processes as needed to ensure that the archiving of filled online redo logs does not fall behind. Possible processes are ARC0-ARC9 and ARCa-ARCr. The LOG_ARCHIVE_MAX_PROCESSES initialization parameter specifies the number of ARC n processes that the database initially invokes. See Also: <i>Oracle Database Concepts</i> and <i>Oracle Database Administrator's Guide</i>	Database instances
ARS n	ASM Recovery Slave Process	Recovers ASM transactional operations	The ASM RBAL background process coordinates and spawns one or more of these slave processes to recover aborted ASM transactional operations. These processes run only in the Oracle ASM instance. Possible processes are ARS0-ARS9.	Oracle ASM instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
ASMB, AMBn	ASM Background Process	Communicates with an Oracle ASM instance, managing storage and providing statistics	<p>In a database instance, the ASMB and AMBn processes enable the database instance to connect to an Oracle ASM instance in order to access Oracle ASM disk groups. Possible processes are ASMB and AMB1-AMB3.</p> <p>In an Oracle ASM instance, the ASMB process runs when the ASMCMD cp command runs, or when a database instance first starts if the server parameter file is stored in Oracle ASM. ASMB also runs with Oracle Cluster Registry on Oracle ASM. The only possible process is ASMB; AMBn processes do not run in Oracle ASM instances.</p> <p>In an Oracle IOServer (IOS) instance, the ASMB process enables the IOS instance to connect to an Oracle ASM instance in order to access Oracle ASM disk groups. The only possible process is ASMB; AMBn processes do not run in IOS instances.</p>	Database instances, Oracle ASM instances, Oracle IOServer (IOS) instances
ASnn	Database Apply Reader or Apply Server	<p>Computes dependencies between logical change records (LCRs) and assembles messages into transactions (Reader Server)</p> <p>Applies LCRs to database objects or passes LCRs and user messages to their appropriate apply handlers (Apply Server)</p>	<p>When the reader server finishes computing dependencies between LCRs and assembling transactions, it returns the assembled transactions to the coordinator process. Query V\$STREAMS_APPLY_READER, V\$XSTREAM_APPLY_READER, and V\$GG_APPLY_READER for information about the reader server background process.</p> <p>An apply server receives the transactions from the coordinator background process, and either applies database changes in LCRs or sends LCRs or messages to apply handlers. Apply servers can also enqueue a queue. If an apply server encounters an error, then it tries to resolve the error with a user-specified conflict handler or error handler. If an apply server cannot resolve an error, then it rolls back the transaction and places the entire transaction, including all of its messages, in the error queue. When an apply server commits a completed transaction, this transaction has been applied. When an apply server places a transaction in the error queue and commits, this transaction also has been applied. Query V\$STREAMS_APPLY_SERVER for information about the apply server background process. For XStream Inbound servers, query V\$XSTREAM_APPLY_SERVER. For GoldenGate Integrated Replicat, query V\$GG_APPLY_SERVER.</p> <p>The coordinator process name is ASnn, where nn can include letters and numbers.</p>	Database instances, XStream Outbound servers, XStream Inbound servers, GoldenGate Integrated Replicat

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
BMR n	Automatic Block Media Recovery Slave Pool Process	Fetches blocks from a real-time readable standby database	When a process submits a block media recovery request to ABMR, it dynamically spawns slave processes (BMR n) to perform the recovery. BMR n processes fetch blocks from a real-time readable standby database. ABMR and BMR n terminate after being idle for a long time. See Also: <i>Oracle Database Backup and Recovery User's Guide</i>	Database instances
B nnn	ASM Blocking Slave Process for GMON	Performs maintenance actions on Oracle ASM disk groups	B nnn performs actions that require waiting for resources on behalf of GMON. GMON must be highly available and cannot wait. A B nnn slave is spawned when a disk is taken offline in an Oracle ASM disk group. Offline timer processing and drop of the disk are performed in this slave. Up to five process (B000 to B004) can exist depending on the load.	Oracle ASM instances
BW nn	Database Writer Process	Writes modified blocks from the database buffer cache to the data files	See the Long Description for the DBW n process in this table for more information about the BW nn process.	Database instances
CJQ0	Job Queue Coordinator Process	Selects jobs that need to be run from the data dictionary and spawns job queue slave processes (J nnn) to run the jobs	CJQ0 is automatically started and stopped as needed by Oracle Scheduler. The <code>JOB_QUEUE_PROCESSES</code> initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. CJQ0 starts only as many job queue processes as required by the number of jobs to run and available resources. See Also: <i>Oracle Database Concepts</i> and <i>Oracle Database Administrator's Guide</i>	Database instances
CKPT	Checkpoint Process	Signals DBW n at checkpoints and updates all the data files and control files of the database to indicate the most recent checkpoint	At specific times CKPT starts a checkpoint request by messaging DBW n to begin writing dirty buffers. On completion of individual checkpoint requests, CKPT updates data file headers and control files to record most recent checkpoint. CKPT checks every three seconds to see whether the amount of memory exceeds the value of the <code>PGA_AGGREGATE_LIMIT</code> initialization parameter, and if so, takes the action described in " "PGA_AGGREGATE_LIMIT" ". See Also: <i>Oracle Database Concepts</i>	Database instances, Oracle ASM instances
CL nn	Cleanup Slave Process	Performs cleanup of dead processes	Cleanup slaves assist in the cleanup of dead processes and killed sessions. The number of slaves will be proportional to the amount of cleanup work to be done and the current efficiency of cleanup.	Database instances, Oracle ASM instances
CLG	Persistent Cluster Flash Cache Background Process	For Oracle Data Appliance only, this process performs actions related to recovery of a dead instance's database flash cache	For Oracle Data Appliance only, in the event of an instance crash, the surviving instance will recover the dead instance's database flash cache. The CLG process will perform actions related to scanning the dead instance's database flash cache and claim flash blocks mastered by the dead instance.	Database instances, Oracle RAC

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
CLMN	Cleanup Main Process	Performs cleanup of dead processes, killed sessions, killed transactions, and killed network connections	CLMN periodically performs cleanup of all the following: dead processes, killed sessions, transactions, network connections, idle sessions, detached transactions, and detached network connections that have exceeded their idle timeout.	Database instances, Oracle ASM instances
CP nn	Database Capture Process	Captures database changes from the redo log by using the infrastructure of LogMiner	The capture process name is CP nn , where nn can include letters and numbers. The underlying LogMiner process name is MS nn , where nn can include letters and numbers. The capture process includes one reader server that reads the redo log and divides it into regions, one or more preparer servers that scan the redo log, and one builder server that merges redo records from the preparer servers. Each reader server, preparer server, and builder server is a process. Query the V\$XSTREAM_CAPTURE and V\$GOLDENGATE_CAPTURE views for information about this background process. See Also: <i>Oracle Database XStream Guide</i>	Database instances, XStream Outbound Servers
CR nn	LMS CR Slave Process	Offloads the work from LMS so that blocks that require lots of UNDO to be applied do not block the LMS. Such requests are passed on to the slave so that the LMS is not stalled	There can be a maximum of eight CR processes per LMS process, with names from CR00 to CR07. Each LMS has its own set with similar name. The CR nn processes are threads and the process ID part will be the same as the owning LMS's process ID. The names for CR nn processes will have the format CR0 n _<spawning process id>_<thread id>.	Oracle RAC
CS nn	I/O Calibration Process	Issues I/Os to storage as part of storage calibration.	CS nn slave processes are started on execution of the DBMS_RESOURCE_MANAGER.CALIBRATE_IO() procedure. There is one slave process per CPU on each node of the database.	Database instances, Oracle RAC
CTWR	Change Tracking Writer Process	Tracks changed data blocks as part of the Recovery Manager block change tracking feature	CTWR tracks changed blocks as redo is generated at a primary database and as redo is applied at a standby database. The process is slightly different depending on the type of database. See Also: <i>Oracle Database Backup and Recovery User's Guide</i>	Database instances
CX nn	Propagation Sender Process	Sends LCRs to a propagation receiver	The propagation sender process name is CX nn , where nn can include letters and numbers. Query V\$PROPAGATION_SENDER for information about a propagation sender.	Database instances, XStream Outbound Server
DBRM	Database Resource Manager Process	Sets resource plans and performs other tasks related to the Database Resource Manager	If a resource plan is not enabled, then this process is idle. See Also: <i>Oracle Database Administrator's Guide</i>	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
DBW n	Database Writer Process	Writes modified blocks from the database buffer cache to the data files	<p>The primary responsibility of the Database Writer Process is to write data blocks to disk. It also handles checkpoints, file open synchronization, and logging of Block Written records.</p> <p>In many cases the blocks that the Database Writer Process writes are scattered throughout the disk. Thus, the writes tend to be slower than the sequential writes performed by LGWR. The Database Writer Process performs multiblock writes when possible to improve efficiency. The number of blocks written in a multiblock write varies by operating system.</p> <p>The DB_WRITER_PROCESSES initialization parameter specifies the number of Database Writer Processes. There can be 1 to 100 Database Writer Processes. The names of the first 36 Database Writer Processes are DBW0-DBW9 and DBWa-DBWz. The names of the 37th through 100th Database Writer Processes are BW36-BW99. The database selects an appropriate default setting for the DB_WRITER_PROCESSES parameter or adjusts a user-specified setting based on the number of CPUs and processor groups.</p> <p>See Also: "DB_WRITER_PROCESSES"</p>	Database instances
DIA0	Diagnostic Process	Detects and resolves hangs and deadlocks		Database instances, Oracle ASM instances
DIAG	Diagnostic Capture Process	Performs diagnostic dumps	DIAG performs diagnostic dumps requested by other processes and dumps triggered by process or instance termination. In Oracle RAC, DIAG performs global diagnostic dumps requested by remote instances.	Database instances, Oracle ASM instances
DM nn	Data Pump Master Process	Coordinates the Data Pump job tasks performed by Data Pump worker processes and handles client interactions	The Data Pump master (control) process is started during job creation and coordinates all tasks performed by the Data Pump job. It handles all client interactions and communication, establishes all job contexts, and coordinates all worker process activities on behalf of the job.	Database instances, Data Pump

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
DMON	Data Guard Broker Monitor Process	Manages and monitors a database that is part of a Data Guard broker configuration	<p>When you start the Data Guard broker, a DMON process is created. DMON runs for every database instance that is managed by the broker. DMON interacts with the local database and the DMON processes of the other databases to perform the requested function. DMON also monitors the health of the broker configuration and ensures that every database has a consistent description of the configuration.</p> <p>DMON maintains profiles about all database objects in the broker configuration in a binary configuration file. A copy of this file is maintained by the DMON process for each of the databases that belong to the broker configuration. The process is created when the DG_BROKER_START initialization parameter is set to true.</p> <p>See Also: Oracle Data Guard Broker</p>	Database instances, Data Guard
Dnnn	Dispatcher Process	Performs network communication in the shared server architecture	<p>In the shared server architecture, clients connect to a dispatcher process, which creates a virtual circuit for each connection. When the client sends data to the server, the dispatcher receives the data into the virtual circuit and places the active circuit on the common queue to be picked up by an idle shared server. The shared server then reads the data from the virtual circuit and performs the database work necessary to complete the request. When the shared server must send data to the client, the server writes the data back into the virtual circuit and the dispatcher sends the data to the client. After the shared server completes the client request, the server releases the virtual circuit back to the dispatcher and is free to handle other clients.</p> <p>Several initialization parameters relate to shared servers. The principal parameters are: DISPATCHERS, SHARED_SERVERS, MAX_SHARED_SERVERS, LOCAL_LISTENER, REMOTE_LISTENER.</p> <p>See Also: Oracle Database Concepts</p>	Database instances, shared servers
DSKM	Slave Diskmon Process	Acts as the conduit between the database, Oracle ASM instances, and the Master Diskmon daemon to communicate information to Exadata storage	This process is active only if Exadata Storage is used. DSKM performs operations related to Exadata I/O fencing and Exadata cell failure handling.	Oracle ASM instances, Exadata
DWnn	Data Pump Worker Process	Performs Data Pump tasks as assigned by the Data Pump master process	The Data Pump worker process is responsible for performing tasks that are assigned by the Data Pump master process, such as the loading and unloading of metadata and data.	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
EMNC	EMON Coordinator Process	Coordinates database event management and notifications	EMNC is a master background process that coordinates event management and notification activity in the database, including Streams Event Notifications, Continuous Query Notifications, and Fast Application Notifications.	Database instances
Ennn	EMON Slave Process	Performs database event management and notifications	The database event management and notification load is distributed among the EMON slave processes. These processes work on the system notifications in parallel, offering a capability to process a larger volume of notifications, a faster response time, and a lower shared memory use for staging notifications.	Database instances
FBDA	Flashback Data Archiver Process	Archives historical rows for tracked tables into flashback data archives and manages archive space, organization, and retention	When a transaction that modifies a tracked table commits, FBDA stores the pre-image of the rows in the archive. FBDA maintains metadata on the current rows and tracks how much data has been archived. FBDA is also responsible for automatically managing the flashback data archive for space, organization (partitioning tablespaces), and retention. FBDA also keeps track of how far the archiving of tracked transactions has progressed.	Database instances
FDnn	Oracle ASM Stale FD Cleanup Slave Process	Cleans up Oracle ASM stale file descriptors on foreground processes	This process cleans up Oracle ASM stale file descriptors on foreground processes if an Oracle ASM disk is globally closed.	Database and Oracle ASM instances
FENC	Fence Monitor Process	Processes fence requests for RDBMS instances which are using Oracle ASM instances	CSS monitors RDBMS instances which are connected to the Oracle ASM instance and constantly doing I/Os. When the RDBMS instance terminates due to a failure, all the outstanding I/O's from the RDBMS instance should be drained and any new I/O's rejected. FENC receives and processes the fence request from CSSD.	Oracle ASM instances
FMON	File Mapping Monitor Process	Manages mapping information for the Oracle Database file mapping interface	The DBMS_STORAGE_MAP package enables you to control the mapping operations. When instructed by the user, FMON builds mapping information and stores it in the SGA, refreshes the information when a change occurs, saves the information to the data dictionary, and restores it to the SGA at instance startup. FMON is started by the database whenever the FILE_MAPPING initialization parameter is set to true.	Database instances, Oracle ASM instances
FSFP	Data Guard Broker Fast Start Failover Pinger Process	Maintains fast-start failover state between the primary and target standby databases	FSFP is created when fast-start failover is enabled.	Database instances, Data Guard
GCRn	Global Conflict Resolution Slave Process	Performs synchronous tasks on behalf of LMHB	GCRn processes are transient slaves that are started and stopped as required by LMHB to perform synchronous or resource intensive tasks.	Database instances, Oracle ASM instances, Oracle RAC

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
GEN0	General Task Execution Process	Performs required tasks including SQL and DML		Database instances, Oracle ASM instances, Oracle ASM Proxy instances
GMON	ASM Disk Group Monitor Process	Monitors all mounted Oracle ASM disk groups	GMON monitors all the disk groups mounted in an Oracle ASM instance and is responsible for maintaining consistent disk membership and status information. Membership changes result from adding and dropping disks, whereas disk status changes result from taking disks offline or bringing them online.	Oracle ASM instances
GTx n	Global Transaction Process	Provides transparent support for XA global transactions in an Oracle RAC environment	These processes help maintain the global information about XA global transactions throughout the cluster. Also, the processes help perform two-phase commit for global transactions anywhere in the cluster so that an Oracle RAC database behaves as a single system to the externally coordinated distributed transactions. The GLOBAL_TXN_PROCESSES initialization parameter specifies the number of GTx n processes, where n is 0-9 or a-j. The database automatically tunes the number of these processes based on the workload of XA global transactions. You can disable these processes by setting the parameter to 0. If you try to run XA global transactions with these processes disabled, an error is returned. See Also: <i>Oracle Real Application Clusters Administration and Deployment Guide</i>	Database instances, Oracle RAC
I n n n	Disk and Tape I/O Slave Process	Serves as an I/O slave process spawned on behalf of DBWR, LGWR, or an RMAN backup session	I/O slave process can be configured on platforms where Database asynchronous I/O support is not available. These slaves instances are started by setting the corresponding slave enable parameter in the server parameter file. The I/O slaves simulate the asynchronous I/O behavior when the underlying platform does not have native support for asynchronous I/O.	
IMCO	In-Memory Coordinator	Initiates background population and repopulation of in-memory enabled objects	The IMCO background process initiates population (prepopulation) of in-memory enabled objects with priority LOW/MEDIUM/HIGH/CRITICAL. In-memory enabled objects with priority NONE will not be prepopulated but will be populated on demand via W n n n processes when queried. The IMCO background process can also initiate repopulation of in-memory objects. Starting with Oracle Database 19c, IMXT (In-Memory External Table) segments are dropped by the IMCO background process. In previous releases, IMXT segments were dropped by foreground processes.	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
IMR0	Instance Membership Recovery Slave Process	Performs synchronous tasks on behalf of LMON	The IMR0 background process performs the Instance Member Recovery synchronous operations on behalf of LMON	Oracle RAC, Database instances, Oracle ASM instances
INSV	Data Guard Broker Instance Slave Process	Performs Data Guard broker communication among instances in an Oracle RAC environment	INSV is created when the DG_BROKER_START initialization parameter is set to true.	Database instances, Data Guard
IPC0	IPC Service Background Process	Common background server for basic messaging and RDMA primitives based on IPC (Inter-process communication) methods.	IPC0 handles very high rates of incoming connect requests, as well as, completing reconfigurations to support basic messaging and RDMA primitives over several transports such as UDP, RDS, InfiniBand and RC.	Oracle RAC
Jnnn	Job Queue Slave Process	Executes jobs assigned by the job coordinator	Job slave processes are created or awakened by the job coordinator when it is time for a job to be executed. Job slaves gather all the metadata required to run the job from the data dictionary. The slave processes start a database session as the owner of the job, execute triggers, and then execute the job. After the job is complete, the slave processes commit and then execute appropriate triggers and close the session. The slave can repeat this operation in case additional jobs need to be run.	Database instances
JPn	Java Patching Slave Process	Patches and updates the Java in the database classes	JPn patches and updates the Java in the database classes. It is only started for Oracle Real Application Clusters (Oracle RAC) databases, and one of the database instances is responsible for patching the Java in the database objects. For multitenant container databases (CDBs), the process updates each pluggable database (PDB) individually. JPn is started automatically and does not require user intervention.	Oracle RAC
LCKn	Lock Process	Manages global enqueue requests and cross-instance broadcasts	The process handles all requests for resources other than data blocks. For examples, LCKn manages library and row cache requests. Possible processes are LCK0 and LCK1.	Database instances, Oracle ASM instances, Oracle RAC
LDL n	Global Enqueue Service Daemon Helper Slave	Helps the LMD n processes with various tasks	LDL n processes are slave processes spawned on demand by LMD n processes. They are spawned to help the dedicated LMD n processes with various tasks when certain workloads start creating performance bottlenecks. These slave processes are transient as they are started on demand and they can be shutdown when no longer needed. There can be up to 36 of these slave processes (LDL0-LDLz).	Database instances, Oracle ASM instances, Oracle RAC

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
LGnn	Log Writer Worker	Writes redo log	On multiprocessor systems, LGWR creates worker processes to improve the performance of writing to the redo log. LGWR workers are not used when there is a SYNC standby destination. Possible processes are LG00-LG99.	Database instances
LGWR	Log Writer Process	Writes redo entries to the online redo log	Redo log entries are generated in the redo log buffer of the system global area (SGA). LGWR writes the redo log entries sequentially into a redo log file. If the database has a multiplexed redo log, then LGWR writes the redo log entries to a group of redo log files. See Also: <i>Oracle Database Concepts</i> and <i>Oracle Database Administrator's Guide</i>	Database instances, Oracle ASM instances
LMnn	See LMSn, LMnn			
LMDn	Global Enqueue Service Daemon Process	Manages incoming remote resource requests from other instances	LMDn processes enqueue resources managed under Global Enqueue Service. In particular, they process incoming enqueue request messages and control access to global enqueues. They also perform distributed deadlock detections. There can be up to 36 of these processes (LMD0-LMDz).	Database instances, Oracle ASM instances, Oracle RAC
LMFC	Lock Manager Flash Cache Process	For Oracle Database Appliance only, performs actions related to recovery of a dead instance's database flash cache.	For Oracle Database Appliance only, in the event of a instance crash, the surviving instance will recover the dead instance's database flash cache. The LMFC process will perform actions related to scanning the dead instance's database flash cache and claim flash blocks mastered by the dead instance.	Database instances, Oracle RAC
LMHB	Global Cache/Enqueue Service Heartbeat Monitor	Monitor the heartbeat of several processes	LMHB monitors the CKPT, DIAn, LCKn, LGnn, LGWR, LMDn, LMON, LMSn , and RMSn processes to ensure they are running normally without blocking or spinning.	Database instances, Oracle ASM instances, Oracle RAC
LMON	Global Enqueue Service Monitor Process	Monitors an Oracle RAC cluster to manage global resources	LMON maintains instance membership within Oracle RAC. The process detects instance transitions and performs reconfiguration of GES and GCS resources. See Also: <i>Oracle Real Application Clusters Administration and Deployment Guide</i>	Database instances, Oracle ASM instances, Oracle RAC
LMSn, LMnn	Global Cache Service Process	Manages resources and provides resource control among Oracle RAC instances	LMSn and LMnn processes maintain a lock database for Global Cache Service (GCS) and buffer cache resources. These processes receive, process, and send GCS requests, block transfers, and other GCS-related messages. There can be up to 100 of these processes, named as follows: LMS0-LMS9 LMSA-LMSZ LM10-LM19 LM1A-LM1Z LM20-LM29 LM2A-LM2R See Also: <i>Oracle Real Application Clusters Administration and Deployment Guide</i>	Database instances, Oracle ASM instances, Oracle RAC

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
LREG	Listener Registration Process	Registers the instance with the listeners	LREG notifies the listeners about instances, services, handlers, and endpoint.	Database instances, Oracle ASM instances, Oracle RAC
LSP0	Logical Standby Coordinator Process	Schedules transactions for Data Guard SQL Apply	LSP0 is the initial process created upon startup of Data Guard SQL Apply. In addition to managing LogMiner and Apply processes, LSP0 is responsible for maintaining inter-transaction dependencies and appropriately scheduling transactions with applier processes. LSP0 is also responsible for detecting and enabling run-time parameter changes for the SQL Apply product as a whole.	Database instances, Data Guard
LSP1	Logical Standby Dictionary Build Process	Performs a logical standby dictionary build on a primary database	The LSP1 process is spawned on a logical standby database that is intended to become the new primary database. A logical standby database becomes a primary database because of switchover or failover. The dictionary is necessary for logical standby databases to interpret the redo of the new primary database.	Database instances, Data Guard
LSP2	Logical Standby Set Guard Process	Determines which database objects will be protected by the database guard	The LSP2 process is created as needed during startup of SQL Apply to update the list of objects that are protected by the database guard.	Database instances, Data Guard
Lnnn	Pooled Server Process	Handles client requests in Database Resident Connection Pooling	In Database Resident Connection Pooling, clients connect to a connection broker process. When a connection becomes active, the connection broker hands off the connection to a compatible pooled server process. The pooled server process performs network communication directly on the client connection and processes requests until the client releases the server. After being released, the connection is returned to the broker for monitoring, leaving the server free to handle other clients. See Also: <i>Oracle Database Concepts</i>	Database instances, Database Resident Connection Pooling
MARK	Mark AU for Resynchronization Coordinator Process	Marks ASM allocation units as stale following a missed write to an offline disk	MARK essentially tracks which extents require resynchronization for offline disks. This process runs in the database instance and is started when the database instance first begins using the Oracle ASM instance. If required, MARK can also be started on demand when disks go offline in the Oracle ASM redundancy disk group.	Database instances, Oracle ASM instances
MMAN	Memory Manager Process	Serves as the instance memory manager	This process performs the resizing of memory components on the instance.	Database instances, Oracle ASM instances
MMNL	Manageability Monitor Lite Process	Performs tasks relating to manageability, including active session history sampling and metrics computation	MMNL performs many tasks relating to manageability, including session history capture and metrics computation.	Database instances, Oracle ASM instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
MMON	Manageability Monitor Process	Performs or schedules many manageability tasks	MMON performs many tasks related to manageability, including taking Automatic Workload Repository snapshots and performing Automatic Database Diagnostic Monitor analysis.	Database instances, Oracle ASM instances
Mnnn	Shared MMON Slave Process	Performs manageability tasks on behalf of MMON	The Mnnn processes are a pool of slave processes that can be shared by multiple MZnn processes. See the Long Description for MZnn in this table for more information about the MZnn processes.	Database instances, Oracle ASM instances
MRP0	Managed Standby Recovery Process	Coordinates the application of redo on a physical standby database	MRP0 is spawned at the start of redo apply on a physical standby database. This process handles the extraction of redo and coordinates the application of that redo on a physical standby database. See Also: <i>Oracle Data Guard Concepts and Administration</i>	Database instances, Data Guard
MSnn	LogMiner Worker Process	Reads redo log files and translates and assembles into transactions	Multiple MSnn processes can exist, where n is 0-9 or a-Z. A minimum of three MSnn processes work as a group to provide transactions to a LogMiner client, for example, a logical standby database or a database capture. There may be more than one such group, for example, multiple capture processes configured for either local or downstream capture in a database.	Database instances, Logical Standby, XStream Outbound servers, Oracle GoldenGate
MZnn	Dedicated MMON Slave Process	Performs manageability tasks on behalf of MMON	MZnn is a dedicated process for a single MMON slave action. It performs manageability tasks dispatched by MMON, which include taking Automatic Workload Repository snapshots and performing Automatic Database Diagnostic Monitor analysis.	Database instances, Oracle ASM instances
Nnnn	Connection Broker Process	Monitors idle connections and hands off active connections in Database Resident Connection Pooling	In Database Resident Connection Pooling, clients connect to a connection broker process. When a connection becomes active, the connection broker hands off the connection to a compatible pooled server process. The pooled server process performs network communication directly on the client connection and processes requests until the client releases the server. After being released, the connection is returned to the broker for monitoring, leaving the server free to handle other clients. See Also: <i>Oracle Database Concepts</i>	Database instances, Database Resident Connection Pooling
NFSn	Direct NFS Dispatcher IO Slave Process	Performs direct NFS I/O for database processes	The dispatcher slave processes enable scaling of Direct NFS connections to a clustered NAS storage. These dedicated set of slaves will be used to perform Direct NFS I/Os on behalf of database processes. The dispatcher processes are enabled by the <code>ENABLE_DNFS_DISPATCHER</code> initialization parameter. NFSn is spawned only if Direct NFS library is enabled for I/O to NFS servers. The number of slave processes spawned is based on the <code>CPU_COUNT</code> value. See Also: " <code>ENABLE_DNFS_DISPATCHER</code> "	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
NSSn	Network Server SYNC Process	Transfers redo from current online redo logs to remote standby destinations configured for SYNC transport	NSSn can run as multiple processes, where n is 1-9 or A. See Also: <i>Oracle Data Guard Concepts and Administration</i>	Database instances, Data Guard
NSVn	Data Guard Broker NetSlave Process	Performs broker network communications between databases in a Data Guard environment	NSVn is created when a Data Guard broker configuration is enabled. There can be as many NSVn processes (where n is 0- 9 and A-U) created as there are databases in the Data Guard broker configuration.	Database instances, Data Guard
OCFn	ASM CF Connection Pool Process	Maintains a connection to the Oracle ASM instance for metadata operations		Database instances, Oracle ASM instances
OFSD	Oracle File Server Background Process	Serves file system requests submitted to an Oracle instance	This background process listens for new file system requests, both management (like mount, unmount, and export) and I/O requests, and executes them using Oracle threads.	Database instances, Oracle RAC
OFnn	Oracle File Server Background Process Thread	Serves file system requests submitted to an Oracle instance	This is a thread for the OFSD background process This background process thread is available only on Linux systems.	Database instances, Oracle RAC
Onnn	ASM Connection Pool Process	Maintains a connection to the Oracle ASM instance for metadata operations	Onnn slave processes are spawned on demand. These processes communicate with the Oracle ASM instance.	Database instances, Oracle ASM instances
PING	Interconnect Latency Measurement Process	Assesses latencies associated with communications for each pair of cluster instances	Every few seconds, the process in one instance sends messages to each instance. The message is received by PING on the target instance. The time for the round trip is measured and collected.	Database instances, Oracle ASM instances, Oracle RAC
PMAN	Process Manager	Manages several background processes including shared servers, pooled servers, and job queue processes	PMAN monitors, spawns, and stops the following as needed: <ul style="list-style-type: none">• dispatcher and shared server processes• connection broker and pooled server processes for database resident connection pools• job queue processes• restartable background processes	Database instances, Oracle ASM instances, Oracle ASM Proxy instances
PMON	Process Monitor	Scans for dead processes and coordinates cleanup	PMON periodically scans all processes to find any that have died abnormally. PMON is then responsible for coordinating cleanup performed by the CLMN process and the CLnn slaves. See Also: <i>Oracle Database Concepts and Oracle Database Net Services Administrator's Guide</i>	Database instances, Oracle ASM instances, Oracle ASM Proxy instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
Pnnn	Parallel Query Slave Process	Perform parallel execution of a SQL statement (query, DML, or DDL)	<p>Parallel Query has two components: a foreground process that acts as query coordinator and a set of parallel slaves (Pnnn) that are background processes. These background processes are spawned or reused during the start of a parallel statement. They receive and perform units of work sent from the query coordinator.</p> <p>The maximum number of Pnnn processes is controlled by the initialization parameter PARALLEL_MAX_SERVERS. Slave processes are numbered from 0 to the PARALLEL_MAX_SERVERS setting. If the query is a GV\$ query, then these background processes are numbered backward, starting from PPA7.</p>	Database instances, Oracle ASM instances
PRnn	Parallel Recovery Process	Performs tasks assigned by the coordinator process performing parallel recovery	PRnn serves as a slave process for the coordinator process performing parallel media recovery and carries out tasks assigned by the coordinator. The default number of these processes is based on number of CPUs.	Database instances
PSP0	Process Spawner Process	Spawns Oracle background processes after initial instance startup		Database instances, Oracle ASM instances
PXMN	Parallel Execution Monitor	Spawns parallel server processes on local instances in an Oracle RAC environment for Query Coordinator in remote instances.		Database instances
QMNC	Non-sharded queue master process	Monitors AQ	<p>QMNC is the non-sharded queue master process responsible for facilitating various background activities required by AQ: time management of messages, management of nonpersistent queues, cleanup of resources, and so on. QMNC dynamically spawns Qnnn processes as needed for performing these tasks.</p> <p>Note that if the AQ_TM_PROCESSES initialization parameter is set to 0, this process will not start. The database writes the following message to the alert log: WARNING: AQ_TM_PROCESSES is set to 0. System might be adversely affected.</p>	Database instances Advanced Queueing
QMnn	AQ Master Class Process	Per instance per AQ Master Class Process	Each of this type of process represents a single class of work item such as AQ notification, queue monitors, and cross process.	Database instances Advanced Queueing
Qnnn	AQ Server Class Process	Per AQ Master Class server process	Each server class process acts on behalf of an AQ master class process. This relationship is maintained until the master requires services of a particular service process. Once released, the server class processes are moved to a free server pool.	Database instances Advanced Queueing

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
Rnnn	ASM Block Remap Slave Process	Remaps a block with a read error	A database instance reading from an Oracle ASM disk group can encounter an error during a read. If possible, Oracle ASM asynchronously schedules a Rnnn slave process to remap this bad block from a mirror copy.	Oracle ASM instances
RBAL	ASM Rebalance Master Process	Coordinates rebalance activity	In an Oracle ASM instance, it coordinates rebalance activity for disk groups. In a database instance, it manages Oracle ASM disk groups.	Database instances, Oracle ASM instances
RCBG	Result Cache Background Process	Handles result cache messages	This process is used for handling invalidation and other messages generated by server processes attached to other instances in Oracle RAC.	Database instances, Oracle RAC
RECO	Recoverer Process	Resolves distributed transactions that are pending because of a network or system failure in a distributed database	RECO uses the information in the pending transaction table to finalize the status of in-doubt transactions. At timed intervals, the local RECO attempts to connect to remote databases and automatically complete the commit or rollback of the local portion of any pending distributed transactions. All transactions automatically resolved by RECO are removed from the pending transaction table. See Also: <i>Oracle Database Concepts</i> and <i>Oracle Database Net Services Administrator's Guide</i>	Database instances
RLnn	ResetLogs Process	Clear online redo logs when performing open resetlogs and converting to physical standby	RLnn processes are spawned to clear online redo logs. These slaves are terminated after the online redo logs are cleared, and the session does not persist. Possible processes are RL00-RL31.	Database instances
RM	RAT Masking Slave Process	Extracts and masks bind values from workloads like SQL tuning sets and DB Replay capture files	This background process is used with Data Masking and Real Application Testing.	Database instances
RMON	Rolling Migration Monitor Process	Manages the rolling migration procedure for an Oracle ASM cluster	The RMON process is spawned on demand to run the protocol for transitioning an ASM cluster in and out of rolling migration mode.	Oracle ASM instance, Oracle RAC
RMSn	Oracle RAC Management Process	Performs manageability tasks for Oracle RAC	RMSn performs a variety of tasks, including creating resources related to Oracle RAC when new instances are added to a cluster. See Also: <i>Oracle Real Application Clusters Administration and Deployment Guide</i>	Database instances, Oracle RAC

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
RP <i>n</i>	Capture Processing Worker Process	Processes a set of workload capture files	<p>RP<i>n</i> are worker processes spawned by calling DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (capture_dir,parallel_level). Each worker process is assigned a set of workload capture files to process.</p> <p>Worker processes execute in parallel without needing to communicate with each other. After each process is finished processing its assigned files, it exits and informs its parent process.</p> <p>The number of worker processes is controlled by the parallel_level parameter of DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE. By default, parallel_level is null. Then, the number of worker processes is computed as follows:</p> <pre>SELECT VALUE FROM V\$PARAMETER WHERE NAME='cpu_count';</pre> <p>When parallel_level is 1, no worker processes are spawned.</p>	Database instances
RPOP	Instant Recovery Repopulation Daemon	Responsible for re-creating and/or repopulating data files from snapshot files and backup files	The RPOP process is responsible for re-creating and repopulating data files from snapshots files. It works with the instant recovery feature to ensure immediate data file access. The local instance has immediate access to the remote snapshot file's data, while repopulation of the recovered primary data files happens concurrently. Any changes in the data are managed between the instance's DBW processes and RPOP to ensure the latest copy of the data is returned to the user.	Database instances
RS <i>n</i>	Global Cache Service Remaster Process	Performs remastering for cluster reconfiguration and dynamic remastering	<p>Each RS<i>n</i> process is a slave process for LMS<i>n</i> to handle remastering work. They are also helper processes for LMS to handle non-critical work from global cache service.</p> <p>The RS<i>n</i> processes were named RMV<i>n</i> in Oracle Database 12c and earlier releases.</p>	Database instances, Oracle RAC
RSM0	Data Guard Broker Worker Process	Performs monitoring management tasks related to Data Guard on behalf of DMON	The process is created when a Data Guard broker configuration is enabled.	Database instances, Data Guard
RSMN	Remote Slave Monitor Process	Manages background slave process creation and communication on remote instances in Oracle RAC	This background process manages the creation of slave processes and the communication with their coordinators and peers. These background slave processes perform tasks on behalf of a coordinating process running in another cluster instance.	Database instances, Oracle RAC
RVWR	Recovery Writer Process	Writes flashback data to the flashback logs in the fast recovery area	RVWR writes flashback data from the flashback buffer in the SGA to the flashback logs. RVWR also creates flashback logs and performs some tasks for flashback log automatic management.	Database instances, Flashback Database

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
Snnn	Shared Server Process	Handles client requests in the shared server architecture	<p>In the shared server architecture, clients connect to a dispatcher process, which creates a virtual circuit for each connection. When the client sends data to the server, the dispatcher receives the data into the virtual circuit and places the active circuit on the common queue to be picked up by an idle shared server. The shared server then reads the data from the virtual circuit and performs the database work necessary to complete the request. When the shared server must send data to the client, the server writes the data back into the virtual circuit and the dispatcher sends the data to the client. After the shared server completes the client request, the server releases the virtual circuit back to the dispatcher and is free to handle other clients.</p> <p>Several initialization parameters relate to shared servers. The principal parameters are: DISPATCHERS, SHARED_SERVERS, MAX_SHARED_SERVERS, LOCAL_LISTENER, REMOTE_LISTENER.</p> <p>See Also: Oracle Database Concepts</p>	Database instances, shared servers
SAnn	SGA Allocator	Allocates SGA	<p>A small fraction of SGA is allocated during instance startup. The SAnn process allocates the rest of SGA in small chunks. The process exits upon completion of SGA allocation.</p> <p>Possible processes are SA00-SAzz.</p>	Database instances
SCCn	ASM Disk Scrubbing Slave Check Process	Performs Oracle ASM disk scrubbing check operation	<p>SCCn acts as a slave process for SCRB and performs the checking operations.</p> <p>Possible processes are SCC0-SCC9.</p>	Oracle ASM instances
SCM0	DLM Statistics Collection and Management Slave	Collects and manages statistics related to global enqueue service (GES) and global cache service (GCS)	<p>The DLM Statistics Collection and Management slave (SCM0) is responsible for collecting and managing the statistics related to global enqueue service (GES) and global cache service (GCS). This slave exists only if DLM statistics collection is enabled.</p>	Database instances
SCRB	ASM Disk Scrubbing Master Process	Coordinates Oracle ASM disk scrubbing operations	<p>SCRB runs in an Oracle ASM instance and coordinates Oracle ASM disk scrubbing operations.</p>	Oracle ASM instances
SCRn	ASM Disk Scrubbing Slave Repair Process	Performs Oracle ASM disk scrubbing repair operation	<p>SCRn acts as a slave process for SCRB and performs the repairing operations.</p> <p>Possible processes are SCR0-SCR9.</p>	Oracle ASM instances
SCVn	ASM Disk Scrubbing Slave Verify Process	Performs Oracle ASM disk scrubbing verify operation	<p>SCVn acts as a slave process for SCRB and performs the verifying operations.</p> <p>Possible processes are SCV0-SCV9.</p>	Oracle ASM instances
SMCO	Space Management Coordinator Process	Coordinates the execution of various space management tasks	<p>This background process coordinates the execution of various space management tasks, including proactive space allocation and space reclamation. SMCO dynamically spawns slave processes (Wnnn) to implement these tasks.</p>	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
SMON	System Monitor Process	Performs critical tasks such as instance recovery and dead transaction recovery, and maintenance tasks such as temporary space reclamation, data dictionary cleanup, and undo tablespace management	<p>SMON performs many database maintenance tasks, including the following:</p> <ul style="list-style-type: none"> • Creates and manages the temporary tablespace metadata • Reclaims space used by orphaned temporary segments • Maintains the undo tablespace by onlining, offlineing, and shrinking the undo segments based on undo space usage statistics • Cleans up the data dictionary when it is in a transient and inconsistent state • Maintains the SCN to time mapping table used to support Oracle Flashback features <p>In an Oracle RAC database, the SMON process of one instance can perform instance recovery for other instances that have failed.</p> <p>SMON is resilient to internal and external errors raised during background activities.</p> <p>See Also: <i>Oracle Database Concepts</i></p>	Database instances
SP	SPA Exec Slave	Analyzes single SQL statements sent from SQL Performance Analyzer (SPA)	Executions of SPA tasks created from a SQL tuning set use this slave to analyze the SQL statements of the SQL tuning set concurrently.	Database instances
SVCB	Service Background Process	Provides database service run-time load balancing and topology information to clients.	Every 30 seconds the process processes and publishes Oracle RAC run-time load-balancing information and keeps the topology information current. This process is started only if Oracle Real Application Clusters (Oracle RAC) is enabled.	Oracle RAC
TEM n	ASM disk Test Error Emulation Process	Emulates I/O errors on Oracle ASM disks through named events	I/O errors can be emulated on Oracle ASM disk I/O through named events. The scope can be the process, instance, or even cluster. Optionally, a set of AUs can be chosen for error emulation.	Oracle ASM instances
TT nn	Redo Transport Slave Process	Ships redo from current online and standby redo logs to remote standby destinations configured for ASYNC transport	<p>TTnn can run as multiple processes, where nn is 00 to ZZ.</p> <p>See Also: <i>Oracle Data Guard Concepts and Administration</i></p>	Database instances, Data Guard

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
Unnn	Container process for threads	Host processes where database processes execute as threads.	<p>Unnn processes are database container operating system processes where database backgrounds processes like SMON, CJQ0, and database foreground processes run. The V\$PROCESS view lists database processes running in these container processes. These container processes are created only when the THREADED_EXECUTION initialization parameter is set to TRUE. The number of these processes vary depending on the active database processes. On a host with multiple NUMA nodes, there will be at least one Unnn process per NUMA node.</p> <p>These processes are fatal processes, if any of them is killed, it will result in instance termination. These processes exit when the instance is shut down or terminated.</p>	Database instances
VBGn	Volume Background Process	Communicates between the Oracle ASM instance and the operating system volume driver	<p>VBGn handles messages originating from the volume driver in the operating system and sends them to the Oracle ASM instance.</p> <p>VBGn can run as multiple processes, where n is 0-9.</p>	Oracle ASM instances, Oracle ASM Proxy instances
VDBG	Volume Driver Process	Fowards Oracle ASM requests to perform various volume-related tasks	VDBG handles requests to lock or unlock an extent for rebalancing, volume resize, disk offline, add or drop a disk, force and dismount disk group to the Dynamic Volume Manager driver.	Oracle ASM instances, Oracle ASM Proxy instances
VI n	Volume I/O	Route ADVM volume I/O for ASM instances on compute nodes within an Exadata	<p>These processes handle requests for I/Os targeted at storage not locally accessible. They are used for Exadata targeted storage as well. These background processes only start when an ASM Volume is created and set up to be used. One process will start for each NUMA node on target machines. Under normal operation on non-Exadata hardware and on Exadata hardware that is not utilizing ASM volumes, these processes will not be started.</p> <p>There can be up to 32 VI processes, and they are named sequentially from VI00 to VI31.</p>	Oracle ASM Proxy instances
VKRM	Virtual Scheduler for Resource Manager Process	Serves as centralized scheduler for Resource Manager activity	VKRM manages the CPU scheduling for all managed Oracle processes. The process schedules managed processes in accordance with an active resource plan.	Database instances
VKTM	Virtual Keeper of Time Process	Provides a wall clock time and reference time for time interval measurements	VKTM acts as a time publisher for an Oracle instance. VKTM publishes two sets of time: a wall clock time using a seconds interval and a higher resolution time (which is not wall clock time) for interval measurements. The VKTM timer service centralizes time tracking and offloads multiple timer calls from other clients.	Database instances, Oracle ASM instances
VMB0	Volume Membership Process	Maintains cluster membership on behalf of the Oracle ASM volume driver	This process membership in the cluster as an I/O-capable client on behalf of the Oracle ASM volume driver.	Oracle ASM instances, Oracle ASM Proxy instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
VUBG	Volume drive Umbilicus Background	Relays messages between Oracle ASM instance and Oracle ASM Proxy instance that is used by ADVM (for ACFS)		Oracle ASM instances, Oracle ASM Proxy instances
Wnnn	Space Management Slave Process	Performs various background space management tasks, including proactive space allocation and space reclamation	<p>Wnnn slave processes perform work on behalf of Space Management and on behalf of the Oracle Database In-Memory option.</p> <ul style="list-style-type: none"> When performing work on behalf of Space Management, Wnnn processes are slave processes dynamically spawned by SMCO to perform space management tasks in the background. These tasks include preallocating space into locally managed tablespace and SecureFiles segments based on space usage growth analysis, and reclaiming space from dropped segments. After being started, the slave acts as an autonomous agent. After it finishes task execution, it automatically picks up another task from the queue. The process terminates itself after being idle for a long time. When performing work on behalf of the Oracle Database In-Memory option, Wnnn processes execute tasks for population or repopulation of objects that are enabled for the In-Memory column store (IM columns store), and tasks that drop in-memory segments when an object is disabled for the IM columns store. <p>For in-memory population and repopulation, both the IMCO background process and foreground processes will utilize Wnnn slaves. Wnnn processes are utilized by the IMCO background process for prepopulation of in-memory enabled objects with priority LOW/MEDIUM/HIGH/CRITICAL, and for repopulation of in-memory objects. In-memory populate and repopulate tasks running on Wnnn slaves are also initiated from foreground processes in response to queries and DMLs that reference in-memory enabled objects.</p>	Database instances
XDMG	Exadata Automation Manager	Initiates automation tasks involved in managing Exadata storage	XDMG monitors all configured Exadata cells for state changes, such as a bad disk getting replaced, and performs the required tasks for such events. Its primary tasks are to watch for when inaccessible disks and cells become accessible again, and to initiate the ASM ONLINE operation. The ONLINE operation is handled by XDWK.	Oracle ASM instances, Exadata
XDWK	Exadata Automation Manager	Performs automation tasks requested by XDMG	XDWK gets started when asynchronous actions such as ONLINE, DROP, and ADD an Oracle ASM disk are requested by XDMG. After a 5 minute period of inactivity, this process will shut itself down.	Oracle ASM instances, Exadata
Xnnn	ASM Disk Expel Slave Process	Performs Oracle ASM post-rebalance activities	This process expels dropped disks after an Oracle ASM rebalance.	Oracle ASM instances
